ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac., acre(s).
 agric., agricultural.
 ambas., ambassador(s).
 Amer., American.
 anot., ancient.
 ann., annual.
 arron., arrondissement
 A.-S., Anglo-Saxon.
 A.V., Authorised Version.
 b., born.
 Biog. Dic., Biographical
 Dictionary.
 bor., borough.
 bp., birthplace.
 Brit., British.
 C., Contigrade.
 c., about.
 cap., capital.
 cf., compare.
 co., court.
 com., communuc.
 cub. ft., cubic feet.
 d., died.
 Dan., Danish.
 dept., department
 dist., district.
 div., division.
 E., east; eastern.
 eccles., ecclesiastical
 ed., edition; edited.
 e.g., for example.
 Ency. Brit., Encyclopædia
 Britannica.
 Eng., English.
 estab., established; establish-
 ment.
 F., Fahrenheit.
 fl., flourished.
 fort. tn., fortified town
 Fr., French.
 ft., feet.
 Ger., German.
 Gk., Greek.
 gov., government.
 Heb., Hebrew.
 hist., history.
 horticult., horticultural
 h.p., horse-power.
 hr., hour.
 i.e., that is.
 in., inch(es).
 inhab., inhabitant(s).

is., island(s).
 It., Italian.
 Jap., Japanese.
 jour., journal.
 Lat., Latin.
 lat., latitude.
 lb., pound(s).
 l. b., left bank.
 long., longitude.
 m., mile(s).
 manuf., manufacture.
 min., minute(s).
 mrkt. tn., market town.
 MS., manuscript.
 mt., mount; mountain
 N., north; northern.
 N.T., New Testament.
 O.E., Old English.
 O.F., Old French.
 O.T., Old Testament.
 oz., ounce(s).
 par., parish.
 parl., parliamentary
 pop., population.
 prin., principal.
 prof., professor.
 prov., province; provincial.
 pub., published; publication.
 q.v., which see.
 R., riv., river.
 r. b., right bank.
 Rom., Roman.
 R.V., Revised Version.
 S., south; southern
 sec., second(s).
 sev., several.
 Sp., Spanish.
 sp. gr., specific gravity
 sq. m., square mile(s).
 temp., temperare.
 ter., territory.
 tn., town.
 trans., translated; translation.
 trib., tributary.
 univ., university.
 urb., urban.
 vil., village.
 vol., volume.
 W., west; western.
 Wm., William.
 yd., yard.

The article ABBREVIATIONS contains a list of those in general use
 See also ABBREVIATION (music) and ELEMENTS (chemical symbols).

Ragnarök, in Norse mythology the doomsday after which Alfadur (the All-Father) is to create a new heaven and earth where toil, pain, misery, and sin are unknown.

Ragstone, see KENTISH RAG.

Ragtime, form of popular music-hall song, in which both the air and words are 'ragged' or syncopated, i.e. broken in rhythm and with accent displaced, the accompaniment being in normal rhythm. There is, of course, nothing new in syncopation; Beethoven and later composers have exploited its artistic possibilities; but in R. it is carried to extremes, and the words generally rank below the level of ordinary nonsense-rhyme doggerel. R. probably originated from Negro folk-music, and preceded the later refinements of jazz and swing.

Ragusa, Duke of, see MARMONT, AUGUSTE FREDÉRIC LOUIS VIESSE DE.

Ragusa: 1. Tn. in Yugoslavia, see DUBROVNIK. "fr in the prov. and 32 m. W.S.W. of the tn. of Syracuse, Sicily; it is the anc. site of Hybla Heraca. It has manufs. of silk, cotton, woollens, and furniture, and a trade in wine, oil, cattle, and cheese. Pop. (including R. Inferiore), 50,000.

Ragwort (*Senecio*), name for a number of composite plants belonging to the genus *Senecio*. The common R. (*S. jacobea*) is an abundant weed in waste places, bearing a corymb of bright yellow flower heads and pinnatifid leaves. Among other Brit. species is the marsh R. (*S. aquaticus*), common in wet places.

Rahel, Antonie Friederike Levin (b. 1771), wife of Varnhagen von Ense (q.v.).

Rahere, see under BARTHOLOMEW'S (ST.) HOSPITAL.

Rahway, tn. of Union co., New Jersey, U.S.A., 20 m. S.W. of New York. It manufs. chemicals, printing presses, oils and carriages. Pop. 17,500.

Raiatea, one of the Society Is., in the Pacific Ocean, belonging to France, 150 m. N.W. of Tahiti.

Rai Bareli, or **Rae Bareli**, tn. in the dist. of R. B., United Provs., India, 49 m. S.E. of Lucknow. It has a well-built fort. Pop. 20,000.

Rairolini, Francesco, see FRANCIA.

Raichur, dist. and tn. of Hyderabad, India. The dist. lies in the S.W. The tn. is 79 m. N.E. of Bellary. It manufs. a kind of glazed pottery. Pop. of state, 994,000; of tn. 32,000.

Raidrug, fort and tn. of Madras, India, in the Bellary dist., 34 m. S.W. of Bellary. Pop. 9000.

Raikes, Robert (1735-1811), Eng. philanthropist, b. at Gloucester, and in 1757 succeeded his father as printer and proprietor of the *Gloucester Journal*. He continued this work till 1802. He had early been active in the agitation for

prison reform, and in 1780 started a Sunday school at Gloucester, which developed into a national movement. A statue of him stands on the Thames Embankment. See A. Gregory, *Robert Raikes: Journalist and Philanthropist*, 1877, and a study by G. Kerdall, 1939.

Raikes, Thomas (1777-1848), Englishman about tn., was a London merchant and a governor of the Bank of England, who spent much of his leisure at the clubs and in society. He was an associate of Brummell. R. resolutely cultivated dandyism, but without much success. A portion of his jour. between the years 1831 and 1847 was pub. in 1856-57, and his *Private Correspondence with the Duke of Wellington* (ed. by H. Raikes) in 1861.

Rail, name for the members of the Rallidae, a family of birds with a long bill curved at the tip. The Brit. representatives include the land-R. or corn crane, coot, moor-hen or water-hen, and the water-R. (*Rallus aquaticus*). The last mentioned is typical of the family.

Railton, Herbert (1857-1910), Eng. etcher, b. at Pleasington, Lancashire, and educated at Mechlin and at Ampleforth College, Yorkshire. He contributed architectural and other drawings to the illustrated press, and was well known as a black-and-white artist. He illustrated a work on Westminster Abbey, a jubilee ed. of *Pickwick*; C. W. Stubbs's *Cambridge and its Story*, 1903, and C. Headlam's *Oxford and its Story*, 1904 (both in the *Medieval Towns* series); and, in collaboration with H. Thomson, W. O. Tristram's, *Coaching Days and Coaching Ways* (1888).

Railwaymen, **National Union** of (N.U.R.), forms, together with the Associated Society of Locomotive Engineers and Firemen and the Railway Clerks' Association, the prin. railway trade unions in the United Kingdom. The N.U.R. became organised as one of the strongest unions in the country during the first decade of the present century, being greatly influenced by syndicalist views (see SYNDICALISM) as interpreted by Tom Mann, who subordinated the peculiarly Br. ideal of a collectivist state, then much discussed, to the more practical policy of founding political influence on industrial power. Rates of wages, hours, and conditions of work are regulated by national agreements between the Railway Executive and the N.U.R. Disputes with the N.U.R. are subject to negotiation by the Central Wages Board and the National Wages Board, which latter body includes representatives of the N.U.R. as well as of the Railway Executive and the public.

Railways. **HISTORICAL**.—The first railway or 'tram road' is said to have been laid down at a Newcastle colliery during the reign of Charles I. and consisted simply of wooden planks laid on the ground.

The construction was improved from time to time by laying a second line of planks or an iron plate, renewable when worn, on top of the 'sleepers' and by using iron wheels on the wagons, and in this form R. became widely used in the eighteenth century for the carriage of coal from collieries to the nearest waterways. Flanged wheels on cast-iron edge rails were first tried in 1789. With the growth of mining and metallurgical industries after 1790 the use of railway transport became more common, and in 1811 S. Wales had a network of lines, some extending up to 21 m. totalling 150 m., while Tyneside and the Ironbridge area were also well provided. In 1801 the Surrey iron railway was built from Wandsworth to Croydon, partly as a public way, partly for the carriage of general goods; with its double track and double horseway it had a width of 24 ft. In 1810-16 came the Gloucester-Cheltenham line and about the same time the line from the Brecon and Abergavenny canal to Hay, which ran through the first railway tunnel. All these early R. were short local lines, often privately owned, intended for the carriage of heavy goods, mainly coal, relieving the roads of heavy traffic, and as an adjunct to the canal system. Speed was not a consideration and wagons, of no special design, were horse-drawn. The sight of a horse pulling a wagon on smooth rails was so like the familiar one of a horse pulling a boat on a canal that the term navigation was used to cover both forms of transport. Later skilled workers on railway line construction became known as navigators, 'navvies' for short. Wrought-iron bars were tried as rails in 1805 but cast-iron remained in favour, especially in the dumb-bell shape, until John Birkinshaw of Bedlington patented a method for rolling wrought iron in that shape (1820). Being adopted by the Liverpool and Manchester Railway these rails became generally used, and the modern design is based on them, though steel was used from the seventies.

Meanwhile Trevithick was experimenting with locomotives on the Cardiff-Merthyr line (1804). Blenkinsop constructed a rack-and-pinion engine which ran on a line near Leeds (1811), Blackett was busy at Wylam (1813) and George Stephenson at Killingworth (1815), and stationary engines pulling wagons by cable were tried, but in spite of Thomas Gray's vigorous plea in his *Observations on a General Iron Railway or Land Steam Conveyance* (1821), the 'present pitiful methods' of horse traction were still seriously considered when the Newcastle-Carlisle line was nearing completion (1834). However, in 1825 the Stockton and Darlington line was opened, worked by Stephenson's locomotive, and in 1827 the directors reported favourably. When the Liverpool and Manchester line was nearly complete discussion on locomotive versus stationary engines led to the famous Rainhill competition (Oct. 1829), won by Stephenson's 'Rocket' (q.v.). In 1834 a previous Act prohibiting the use of locomotives on the Newcastle-Carlisle

line was rescinded and the victory of the locomotive was complete.

In 1830 the Whitstable-Canterbury ('oyster') line was opened and worked by Stephenson's 'Invicta,' and in 1833 came the Leicester-Swannington, the germ of the Midland system. There followed a feverish projecting of lines and promotion of companies; 54 railway Acts were passed in 1825-35 covering 500 m., and 39 Acts in 1836-37 added 1000 m., and while the former included the London-Birmingham-Preston (112 m., opened 1838) and the Grand Junction, and the latter the Manchester-Leeds with its 11-m. tunnel, the G.W., and lines from London to Southampton, Portsmouth, Dover, Brighton, Colchester, Cambridge, and York, many projects were still-born and the activity subsided in 1841.

In 1844 a new period begins with the emergence of the railway 'kings,' George Hudson, Carr Glyn, and Mark Huish, who started the amalgamation of lines into dist. systems such as the Midland, the L.N.W.R., the Lancashire and Yorkshire, the S.W., etc. The York, Newcastle, and Berwick line was built with the Newcastle high-level and the Royal Border bridges, and, through amalgamation with the Yorkshire and North Midland and the acquisition of the Newcastle-Carlisle and the Stockton and Darlington (1863), became the first complete dist. monopoly, the North-Eastern Railway, controlling all the lines between the border and the Humber, the Pennines, and the North Sea. Linking up with the King's Cross to York line (opened 1850) the E. coast route to Scotland was complete. By 1870 the mileage had increased to 13,600, by 1885 to 16,700; amalgamation and leasing of lines between the various companies was estab., and all the main lines of the modern system were operating; later additions were mostly branch lines, except the Manchester, Sheffield, and Lincolnshire Railway, later named the Great Central; the last London terminus (Marylebone) was completed in 1899. Under the Railways Act, 1921, the R. of Britain were grouped into four systems: L.M.S. (6940 m.); L.N.E.R. (6380 m.); G.W.R. (3793 m.); S.R. (2185 m.); total 19,298 m. of route. In 1916 the number of passenger journeys was 1,266,000,000 (including 257,000,000 by holders of workmen's tickets); in 1949 the figures were 992,782,000 and 223,626,000 respectively.

On the outbreak of the Second World War emergency legislation placed the R. under control of the minister of war transport, their finances being regulated under the Railway Control Agreement. This arrangement continued until, under the Transport Act, 1947, responsibility for the administration, maintenance, and operation of British Railways, together with certain ancillary services, passed on Jan. 1, 1948, to the Railway Executive, which acts as agents of the Brit. Transport Commission, in accordance with a scheme of delegation made by the commission, and approved by the minister of transport. The Railway Executive has the status of a public authority and deals with the public,

is the employer of the staff, and the body which enters into contracts and sues, or is sued, in the courts of law. The members of the Railway Executive are appointed by the minister of transport after consultation with the commission.' (Brit. Transport Commission, *Report and Accounts for 1948*, H.M.S.O. 1949.) The detailed supervision, operation, and maintenance of this, the most important unified railway system in the world, is vested in departmental officers in six regions; these are the London Midland, covering (with some exceptions) the former L.M.S. in England and Wales; the W., covering the former G.W.R., with additional lines in Wales and Cornwall; the S., covering the former S.R. E. of Exeter; the E., covering the S. area of the former L.N.E.R., Doncaster and Sheffield to London; N.E., covering the N.E. area of the former L.N.E.R., Doncaster, Huddersfield, and Bradford to Berwick; and Scottish, covering the former L.M.S. and L.N.E.R. lines in Scotland. To implement the plan of the Labour Gov. for the nationalisation of transport, five other executives were organised, namely, Road Haulage, Road Passenger, London Transport, Docks and Inland Waterways, and Hotels.

At the end of 1949 the staff of British Railways numbered 521,528, as against 649,792 at the end of 1918. There were 19,875 locomotives (steam 19,752, electric 16, Diesel and Diesel-electric 100, petrol 2, narrow-gauge 5); 41,073 passenger carriages, including rail motor vehicles; 1,113,143 freight vehicles; and 52,293 road vehicles. The estimated total passenger train mileage was 240,716,000 (228,128,000 in 1948); freight train mileage was 139,458,000 (137,444,000 in 1948).

Up to the 1880s Brit. R. served as a model for the world, both as regards construction and organisation. Brit. engineers built railroads both in Europe and overseas and both engines and rails were important items of export, though most European countries favoured the Vignoles flat-bottom rail spiked direct on the sleepers, the bull-head or dumb-bell type fixed in stools continuing in use in Great Britain; recently some stretches of track have been laid with flat-bottom rails, and this type has now been adopted as standard, as this design is more economic. Later improvements, mainly in rolling stock, have come also from the U.S.A. and European countries, where development was not hampered by earlier track construction which limited speed and weight.

In Canada the early railway building (1850-60) was not successful owing to lack of capital and the difficulty of envisaging the future trend of development of the country, and some of the work was inferior in quality. The Confederation Act (1867) provided a new stimulus and in 1871 the project of a transcontinental line was first formed, but some lean years followed and the financial arrangements were not completed until 1881. The Canadian Pacific line was opened in 1885, the Grand Trunk in 1903, and by 1908 there were 23,000 m. of line in operation. In 1949 the mileage was 42,338.

In Australia and New Zealand railway building began about 1870, mostly with gov. aid and under gov. control. Lines naturally ran from coast to inland. By 1871 Australia had 1030 m. of R.; by 1907 this had increased to nearly 16,000 m.; in 1949 the total was 28,471. New Zealand then had 3528 m.

The origin of European land settlement in Kenya is closely connected with the construction of the Kenya-Uganda railway. This system consists of the main line from Mombasa to Kampala, 879 m., with a connection to Kisumu, 131 m., and a number of minor branch lines (421 m.). The Benguela Railway in Angola was completed to Diolo in 1929; it has since been extended through Rhodesia to Beira in Mozambique, thus completing the transcontinental route.

The lines of India form an extensive system of some 42,600 m. (including Burma) of various gauges. The three which are most important are the broad (5 ft. 6 in.), the metre, and the narrow (2 ft. 6 in.). The largest R. are the Great Indian Peninsular, the East Indian, and the Madras and Southern Mahratta. The various types of Indian locomotives are standardised, being built to the specifications of the Standards Committee. There are various small lines in India which run up into the hills, with many ingenious devices for overcoming the grades, such as reversing stations and circular tunnels. The most famous is the Darjeeling line.

The tremendous importance of railway development in the U.S.A. cannot be properly appreciated without close study of the geography and of the early history of the settlements. At the end of the 1812-15 war activities in the E. states were mainly commercial and industrial; in the S. were the cotton states, while the middle W., separated from the E. by the mts., was just beginning to develop as grain-, timber-, and coal-producer. The W. sold to the S., the bulky goods being floated down the rvs. (Ohio, Mississippi) on flat-bottom boats which were usually sold with the cargo as transport up-stream was not feasible. The W. bought from the E. but did not sell to them, as the heavy produce could not be carried over the mt. paths. R. were the only means of linking E. to W., and on the closer commercial connections followed a feeling of solidarity rooted in common interests of grave portent in the civil war, where the W. sided with N. states. The first line projected was to run from Baltimore linking the coast with the Ohio valley (1831), though Ohio was not actually reached until 1853. In 1842 came the Boston-Albany line and the line from New York to Buffalo. The first locomotives were imported from the Stephenson works in England, and the iron rails were, in the main, imported from England until civil war days. It was the manuf. of rails, about this time, that gave the stimulus to the development of Kloman's forge in Pittsburgh, which was to become the Carnegie Steel Works. Railway systems were gradually expanded in

the organised states of the union, with more in the N. than in the S. The civil war gave a tremendous impetus to the railroads of the N., and they played their part in winning the war by quick transportation of troops, munitions, and food. By the same token the R. of the S. deteriorated, because, with its meagre supply of iron and steel industries, the Confederacy was not able to keep them up to standard.

The period following the civil war saw a great expansion in the railway systems of the U.S.A. On July 1, 1862, even before the war was over, President Lincoln gave his approval to a Bill of Congress incorporating the Union Pacific Railroad, the first transcontinental railway in the U.S.A. This company was to receive immense land grants and \$45,000 for each mile of railway completed. The route was to be from the little tn. of Omaha through Nebraska, Wyoming, and the Rockies to the Great Salt Basin in Utah. The Central Pacific had before that received a somewhat similar right to build eastwards from Sacramento, California, through the Sierra Mts. and the ter. of Nevada and on to Utah. Actual work started on both these roads simultaneously in 1864, while the war was still in progress. The labour engaged on the R. section was mostly Irish and that on the W. Chinese, a fact which strikingly typified 'the meeting of two worlds on American soil.' The two sections were dramatically joined in May 1869, near Ogden, Utah, where, with a characteristic gesture, a golden spike was driven in to celebrate the great occasion when for the first time the Atlantic and Pacific were 'bound together by iron bands of communication.'

In the meantime three other great transcontinental lines received similar charters. The Northern Pacific was to run from the waters of Lake Superior across Minnesota, through the Dakotas, the Yellowstone valley, the Rocky Mts. to Portland, Oregon. The Southern Pacific was to run from New Orleans across Texas, and thence to Los Angeles and San Francisco. The Santa Fé was to run from Atchison, Kansas, through Colorado, the Rockies, and thence to Santa Fé, New Mexico, and San Diego, California. By 1884 all had reached the Pacific Ocean.

In 1865 there were 35,000 m. of R. in the U.S.A. By 1873 this had been doubled, and by 1887 had increased to 87,000 m. Tns. like Kansas city, Cheyenne, St. Paul, Portland, and Seattle were originally creations of the R. Not only had the R. enormously increased their mileage, but they had been made more effective than those in Europe by reason of many Amer. inventions and discoveries which were adapted to Amer. usage. The first locomotives had been wood-burners. They were rapidly replaced by coal-burning expansion machines capable of enormous steam pressure. They steadily increased until they reached a size unknown anywhere else in the world. This was rendered necessary by the heavy

weight of the trains, the long distances they travelled, and the mountainous country through which many of them ran. In 1869 the Westinghouse air brake was invented; in 1871 came the automatic coupler; in 1874 the block-signal system; in 1875 the refrigerator car, which made possible the shipment of meat, fish, fruit, and vegetables all over the country. The Pullman sleeping-car had been invented in 1864. In 1900 the all-steel passenger and freight cars began to be used. While very expensive, this was done to lessen the dangers of fire and death in case of accidents.

The 1949 statistics showed that the U.S.A. had a greater railway mileage than any other country in the world, with a total of 227,244 m. Other figures were: Argentina, 26,710; Australia, 28,471; Canada, 42,336; France, 40,348 (1937); Germany, 36,256 (1937); Great Britain, 19,863; India, 42,600; U.S.S.R., 57,847. For its area Great Britain has the most. In the U.S.A. there were in service in 1916 45,511 locomotives, 1,768,400 freight cars, and 38,697 passenger cars; passenger revenue amounted to \$1,261,416,000 and freight revenue to \$5,866,351,000; employees numbered 1,387,000. The mileage of the longest Amer. R. is as follows. Southern Pacific System, 8171; Southern Railway System, 7706; Chicago, Milwaukee, St. Paul, and Pacific, 10,671; Pennsylvania, 10,113; Atchison, Topeka, and Santa Fé, 9096; Chicago, Burlington, and Quincy, 8814; Chicago and North Western, 8076; Great Northern, 8336; Chicago, Rock Is., and Pacific, 7031; Missouri Pacific, 7007; New York Central, 10,745; Northern Pacific, 6889; Baltimore and Ohio, 6192; St. Louis-San Francisco, 4925; Louisville and Nashville, 1755; Atlantic Coast Line, 5570; Illinois Central, 6552; Seaboard Railroad, 4132; Minneapolis, St. Paul, and Sault Ste-Marie, 4198; and Union Pacific, 9777.

Other Foreign Systems.—The R. of Europe form a very complete and extensive system, being nearly all of the same gauge, the exceptions being those of Russia and the whole of the Iberian Peninsula. Switzerland is pre-eminent in the matter of engineering triumphs, the great tunnels under the Alps being masterpieces of construction. Electric traction plays a large part in the lines of Europe generally, many lines having been constructed in almost every country. The Compagnie Internationale des Wagons-Lits provides a service of through trains between various points on the Continent. These trains consist solely of dining- and sleeping-cars, and run as the Orient Express from Paris to Istanbul, and from Calais to Trieste and Venice, and from Calais to Rome. In S. America several great amalgamations were made before the First World War, whereby the system of Argentina and the S. portions of Brazil were brought into close communication. The Andes have been tunneled and the lines extend to the N. of Peru, while the Mexican system links up with that of Guatemala. Elsewhere some of the most important R. are the

trans-Siberian (*q.v.*), a notable feature of which is the section that circumvents part of Lake Baikal; the Turk-Sib (*q.v.*); the Bagdad Railway (*q.v.*); the so-called Cape-to-Cairo Railway; the Hedjaz Railway; and the Damascus-Mecca line. (See also under the names of the different countries.)

LOCOMOTIVES. Steam Locomotives.—The design of locomotives did not change greatly from that of the 'Rocket' up to the seventies. The early engines had a long life and the track laid down was not adequate to support a much increased weight, nor did the curves allow of a much greater speed. Even the locomotives of the eighties were nearer in design to the original ones than to their modern successors; the express speed was still about 40 m.p.h. As traffic increased with the trade boom after 1870 larger locomotives had to be built. This chiefly meant larger cylinders, for all locomotives had low-pitched boilers between the wheels to give a low centre of gravity (mistakenly supposed to be necessary for safety), which limited the size of the boiler. Compounding was adopted on sev. R., notably the L.N.W.R., where F. W. Webb built sev. hundreds of engines on his patent system (1883-1903), with two small high-pressure cylinders outside and one enormous low-pressure cylinder inside. It was not until the end of the century that J. P. McIntosh of the (Aledonian Railway introduced his 'Dunalastairs' (1897), with large boilers placed over the driving-wheels; his example was soon followed on other lines, particularly by H. A. Ivatt of the G.N.R., whose 'Atlantics' (1902) had very large boilers and small cylinders. Compounds by now were out of favour, largely owing to the defects of Webb's engines, but the Midland Railway, under R. M. Deeley, built some large-boilered compounds on the Smith system (1901-5), with one large high-pressure cylinder inside, and two slightly larger low-pressure cylinders outside, which proved very successful. In 1906 the superheater was introduced to Great Britain by G. Hughes on the Lancashire and Yorkshire Railway, and from 1908 onwards it was widely adopted. The superheater, invented by Schmidt in Germany, dries and superheats the wet steam from the boiler, making it more like a gas, and enables larger cylinders to be used with the same size of boiler. During this period also the long-travel piston valve was introduced on the G.W.R. by G. J. Churchward. Modern Brit. locomotives usually have two simple cylinders for goods and slow passenger work, and three or four balanced cylinders for express work, to reduce hammering of the track at high speeds. Large boilers are fitted with superheaters; and outside Walschaerts valve gear, in combination with long-travel piston valves and large cylinders, results in a very free-running engine. Poppet valves worked by cams have been tried, and are proving very successful. Modern Amer. locomotives are of very large size, engines of normal type weighing up to 390 tons with tender,

as compared with the Brit. maximum of 150 tons. Two outside cylinders are almost invariably used, with Walschaerts or Baker valve gear, and long-travel valves; the boiler, fitted with superheater, is generally much oversized. Owing to the large grate to be fired a mechanical stoker is usually fitted. Cast-steel bar frames 7 in. thick or so are used, instead of the Brit. plate frame 1 in. thick; sometimes the cylinders and cross-stays are cast in one piece with the main frames, forming an 'engine-bed.' Modern continental locomotives may have plate frames combined with two outside cylinders, although three or four simple cylinders are used in countries where the track is light. Compounds are favoured in some countries, notably in France, where the four-cylinder engines of the Nord and Paris-Lyon-Méditerranée Railway are unexcelled for speed and power. In Germany compounds and plate frames have been superseded by simple engines with bar frames; this practice is being followed in other countries. Large boilers with superheaters are generally fitted. European locomotives of normal type weigh up to 210 tons with tender (Belgium). Colonial locomotives, as might be expected, vary very greatly; some R. (e.g. S. Australia) use locomotives of Amer. design, but of reduced size; others (e.g. Argentina) use locomotives of Brit. design, but of increased size; yet others (e.g. S. Africa) have their own standards. Locomotives are classified by their wheel arrangement, on the Whyte system; e.g., a locomotive with a four-wheeled bogie in front, six coupled wheels driven by the cylinders, and a two-wheeled trailing truck under the cab, is called a 4-6-2. Similarly a locomotive with eight coupled wheels and no carrying wheels is called a 0-8-0. Locomotives may have a tender (or separate vehicle) attached to carry their supplies of coal and water, or they may be built as tank engines, carrying fuel and water in tanks on the main frames. The latter are designated by the letter T on the Whyte classification, e.g. 2-6-4T. Tank engines are very rare in Amer. practice, but extensively used elsewhere. Common express locomotive types are 4-4-0, 4-6-0, 4-6-2 (England), 4-6-2, 4-6-4, 4-8-2, 4-8-4 (America), 4-6-0, 4-6-2, 4-8-2 (continental). Common freight locomotive types are 0-6-0, 2-6-0, 0-8-0, 2-8-0 (England), 2-8-2, 2-8-4, 2-10-0, 2-10-2 (America), 0-8-0, 2-8-0, 0-10-0, 2-10-0 (continental). Suburban and passenger traffic is worked by 0-6-2T, 2-6-2T, 4-4-0, 2-6-0 (England), 4-6-0, 4-6-2 (America), 4-6-0, 4-6-4T, 2-8-2T (continental). Common shunting engine types are 0-6-0T (England), 0-6-0, 0-8-0 (America), 0-6-0T, 0-8-0T (continental). Recent experimental locomotives (1931), differing radically from the normal steam locomotive, include the Ljungstrom and Zoelly turbine locomotives, and the Schmidt-Henschel, Gresley, Muhlfield, and Loeffler high-pressure compound locomotives with water-tube boilers. The largest steam

locomotive in the world (1944) is 'Big Boy', built by the Amer. Locomotive Company. It is a huge articulated engine, with 4-8-8-4 wheel arrangement and coupled wheels 5 ft. 8 in. diameter, designed for a maximum speed of 80 m.p.h.; total wheelbase (engine only) is 72 ft. 5½ in., and the overall length is 85 ft. 3 in.; indicated h.p., 7000. The largest and most powerful express passenger locomotives of each of the Brit. companies in 1944 were G.W.R., 'King George V.' (type 4-6-0, total working weight 135 tons); L.N.E.R., 'Cock o' the North' (2-8-2, 165 tons); L.M.S., 'Duchess' (4-6-2, 164 tons); and S.R., 'Merchant Navy' (4-6-2, 142 tons). But the largest and most powerful locomotive in Britain is the L.N.E.R. Garratt freight locomotive (type 2-8-0 to 0-8-2), with a weight of 178 tons. (See STEAM ENGINES.)

Articulated Locomotives.—A limit to the size of the normal locomotive is reached when the number of driving coupled wheels exceeds eight or ten, as trouble is then experienced in traversing sharp curves. Various types of articulated locomotives have therefore been evolved, in which one boiler is placed over two sets of wheels and motion, on separate frames flexibly connected together; this of course involves flexible steam and exhaust pipes. The Fairlie, the Mallet, and the Garratt are the most important types of articulated locomotive. The Fairlie, which came into use in 1865, had a double-ended boiler with the firebox between the two engine units, and is now obsolete. The first Mallet was built in 1887, and very large engines of this type are used in U.S.A. for heavy gradient traffic, a recent example weighing 500 tons with tender. The boiler of a Mallet is rigidly fixed to the rear engine unit, and is supported on slides by the movable front engine unit, which is pivoted at its back end. Most Mallets are compounds, with two high-pressure cylinders on the (rigid) back unit, and two low-pressure cylinders on the (movable) front unit; but modern Amer. Mallets have four simple outside cylinders, two on each unit. Common Mallet types are 2-6, 6-2, and 2-8, 8-2. Mallets are rapidly being superseded, except in U.S.A., by Garratts, of which the first example was built in 1909. The boiler of a Garratt is supported on a sort of bridge between two widely spaced engine units; it can thus be of any size that the loading gauge will allow, not being restricted by the presence of wheels and frames. Water and fuel are carried in tanks on the engine units. The Garratt is the only articulated type that can run at express speeds, and Garratts have with ease reached 60 m.p.h. on narrow-gauge lines. Garratts are in use in all parts of the world (except U.S.A.), the South African Railway alone having over 200, of which the largest type weighs 215 tons. Common Garratt types are 2-6-2+2-6-2 and 4-8-2+2-8-4.

Diesel Locomotives.—The absence of a boiler, the high thermal efficiency and the ease of handling and refuelling make the internal combustion (I.C.) engine a serious competitor to the steam engine

for locomotives. The most important disadvantage of the I.C. engine is its low torque at slow running; it can therefore not be directly coupled to the driving wheels. In some cases hydraulic transmission has been successfully used, and friction clutch and gear change has been tried, but so far electric transmission seems to offer the greatest advantage. The engine drives a generator supplying current to ordinary electric traction motors or, in other words, the locomotive becomes an electric locomotive carrying its own power station. The first high-speed train to use Diesel-engined locomotives was the Ger. State Railways' 'Flying Hamburger' (1933). Later a number of such trains were used, each with two Maybach 410 h.p. engines. Diesel-driven express trains have been put into service in Holland, Belgium, France, Argentina, Denmark, Italy, and in the U.S.A., where 6000 out of some 45,000 locomotives (1948) were Diesel-electric. Current production of Diesel-electric locomotives in the U.S.A. is at the rate of 1800 units per annum.

Railcars.—These combine the engine and the passenger and goods compartments on one chassis and are the means of meeting the modern demand for frequent service. In electric traction systems the design of a railcar presents no particular problems; transformers and motors can be built in any size. Steam-driven railcars are still in use but are gradually giving way to Diesel-electric cars, which need no boiler, have a higher thermal efficiency and thus require less fuel space, are easy to refuel and to handle and give off no smoke. The modern engine differs in design from those developed for road transport by the same manufacturers. There may be from three to twelve cylinders developing 120-500 b.h.p. at 1000-2000 r.p.m. The engine is usually of the four-stroke vertical type, though a number of two-stroke engines are in use. A horizontal engine for under-frame mounting was developed in Germany before 1939. The engine drives an electric generator supplying current to ordinary electric traction motors coupled to the driving wheels. Among the earliest Brit. builders were Wm. Beardmore & Company Ltd. The A.E.C. railcars built for the G.W.R. in 1934 were the first streamlined railcars in Great Britain. The Gardner L.W. engine is used in large numbers of railcars in Argentina, Belgium, India, and Australasia.

ELECTRIC RAILWAYS.—The question of railway electrification differs widely in its application to main-line and to suburban traffic, in its economical as well as in its technical aspect. Suburban service requires frequent trains throughout the day, with frequent stops, and increased seating capacity during rush-hours. Electric trains made up of train units, each consisting of one motor coach with one or more trailers, provide the necessary flexibility of operation and the direct current (D.C.) series motor with its excellent accelerating characteristics, light weight, and simple (continuous) speed

control is ideal for the purpose, as it enables a high schedule speed to be attained, and thus a higher train mileage can be achieved with less rolling stock than is possible with steam trains. Further congestion at terminal stations is avoided owing to the quick turn-round, and no time is lost in fuelling. Suburban lines radiate from or connect large cities where power stations are otherwise available, and suburban traction constitutes a useful load-balancer on the power station as the load is fairly evenly distributed through the day when the lighting load is least, and the power demand can usually be met without substantial increase in the generating capacity and, in particular, without additional reserve capacity or increase in staff. Distances are shorter and trains are lighter than in main-line services, and very high voltages, which alone make long-distance transmission of large power amounts possible, are not required. Main-line electrification has been largely confined to countries disposing of large water-power resources and where coal is not available at prices to compete with hydro-electric generation. Electric trains are technically superior to steam trains in tunnels, owing to the absence of smoke, and on lines with steep gradients, but otherwise a choice of system can only be made after careful consideration of capital and working costs; the former are considerably higher for electric lines, and both vary according to the locality. In countries where either steam traction or electric traction has become established it is not likely that any radical change-over would prove economically feasible at present. The question of electric generation by means of steam raised by atomic pile heating cannot as yet be adequately discussed.

Two systems of electrification are at present in general use: D.C. at voltages from 600 to 3000 V, and single-phase alternating current (A.C.) at up to 15,000 V at low frequency, 16½ cycles (c/s) in Europe, 25 c/s in the U.S.A. The only notable large-scale exception is the It. State Railway, three-phase 3600-V system in N. Italy. For suburban lines the D.C. system is now universally employed, at voltages of 600-1200 V, most services being operated on the motor coach unit principle. Each motor coach has two or four motors, each of between 150 and 300 h.p., and the power per driving axle is 100-250 kW. The weight of a motor coach without passengers is between 20 and 70 tons. The adhesive weight of a train consisting of sev. units is thus distributed over a large number of axles, usually two or four per motor coach, and the total weight of the train is more uniformly distributed on the track than would be the case with a locomotive-hauled train. Current is supplied to the trains through an overhead contact wire for higher voltages, the track rails carrying the return current. For low-voltage lines the supply is usually through conductor rails supported on insulators; one rail may be placed in the middle between the track rails and the

other at the side, or both at the side, and if the track rails are used for carrying the return current only one conductor rail is required.

In the case of overhead contact lines the current is carried to the motors through a bow or a pantograph collector sliding on the under-side of the contact wire, contact being maintained by a spring attachment on the roof of the vehicle for the bow collector, while links in the pantograph are joined by springs. In the case of contact rails a collector shoe slides on the rails, its weight being usually sufficient to maintain contact. In some cases the contact rails are suspended from insulators and the collector shoe slides on the under-side, being pressed against the rail by a spring. This arrangement allows of protecting the upper rail surface against contact with other objects and keeps the contact surface free from dust, rain, sleet, or falling leaves. Side-contact with a specially shaped contact rail has also been used. The contact rail system has been used for up to 1200 V, but for voltage above 1000 the overhead system is preferable. To ensure constant height and adequate rigidity of the contact wire it is suspended (and insulated) from a steel cable by a number of closely spaced vertical hangers. The steel cable is supported (and insulated) from the masts and naturally hangs with a sag between the masts, in the shape of a catenary. Sometimes double catenary suspension is used.

As the power transmitted by the line is measured by the product of voltage (V) and current (I), whereas the losses due to dissipation (heat) in the wire are the product of wire resistance (R) and I^2 and the consequent drop in voltage is RI , high-voltage transmission is most economical, but a limit is set to the voltage in a D.C. system by the switchgear which becomes unmanageable above 3000 V, though experiments with 4000 V have been carried out. High current values would require heavy (low-resistance) contact lines and the current collectors would become unwieldy. There is thus a limit to the power that can be supplied on the D.C. system, i.e. to the traffic that can be handled. The volt drop in the line is kept within limits by feeding the line at intermediate points by cables direct from the substations. Energy is delivered from the large generating stations or tapped from the main A.C. high voltage network to substations suitably placed along the line, where it is converted by mercury-vapour rectifiers into D.C. The modern substations are automatic in operation and remote-controlled.

Main-line traffic involves both passengers and heavy freight, and trains are locomotive-hauled. The longer distances and the greater power required make high voltages imperative. The Fr. R. (Midi, Paris-Lyon-Méditerranée, Orléans) use 1500 V D.C. and this system is also employed in Holland, Belgium, Spain, N. Italy, Australia, New Zealand, and India, while some Amer. lines, notably the Chicago, Milwaukee, and St. Paul, the Paulista in Brazil, and the Transandine,

and the Chilean, use 3000 V D.C. single-phase (A.C.) is used in Norway, Sweden, Germany, Switzerland, Austria, and Italy, and in the U.S.A. The limits to the D.C. system were discussed above. They hinge on the impossibility of stepping down the high voltage required on the contact line for efficient transmission, to the low voltage manageable on the locomotive. As modern electric locomotives are built for powers up to 3000 kW, or more this would require a contact wire of a carrying capacity, at 3000 V, of 1000 amps., which involves a formidable amount of copper. On the other hand, it is possible to use the ordinary three-phase 50 c/s supply as generated, for conversion into D.C. in the substations by the mercury-vapour converter. It has been suggested that the locomotive itself might act as substation, carrying transformer and rectifier, while the contact wire is fed at high voltage direct from the generating station. At present, however, the mercury-vapour converter is too sensitive to vibration, and the additional weight of the locomotive is a drawback. Conversion by rotating machinery is too inefficient to be considered; the power would have to be built in twice: in the motor and in the generator. A.C. is easily stepped down to a suitable low voltage by the ordinary, highly efficient transformer, but the only satisfactory A.C. traction motors so far developed are single-phase motors of the series type, compensated commutator motors, compensated repulsion or series-repulsion (Déri) motors, working at low frequency (16½ c/s). It is therefore necessary either to build separate generating stations for supplying the railway system, with sufficient capacity to cope with peak load, and with adequate reserves, or to convert the available 50 c/s supply in substations. Special low-frequency generators are sometimes installed in the main power stations. The mercury-vapour converter for frequency conversion presents some problems, and conversion is therefore usually done by rotary converters, though with some loss in efficiency. Experiments have been carried out in Germany with a 50 c/s commutator motor and the results seem promising, but long experience under working conditions is necessary before final judgment can be made. The only three-phase motor used in traction is the induction motor at 45 or 50 c/s, but three-phase supply needs three contact wires, two if the track rails are used, and the speed of the motor can only be varied by changing the number of poles, or by using two motors connected in cascade. The speed of the induction motor depends on the frequency of supply and the number of poles, but with increase of load the 'slip' (sagging behind the synchronous speed) increases slightly. Speed control of the series motor is effected by varying the voltage. In the A.C. system, where transformers are necessary for stepping down the high line voltage to that suitable for the motors (about 400 V maximum) the transformer windings are provided

with the requisite number of taps giving the required voltage values. The D.C. motor is built for full line voltage and supplied through regulating-resistances successively cut out as the motor gains speed. To save the losses in the resistances during the starting and accelerating periods the motors are first connected in series and when constant speed is attained they are connected in parallel. With four motors series, series-parallel, and parallel combinations in turn are possible. These operations and the insertion and cutting out of resistances are effected by moving the handle of the controller (*see under TRAMWAYS*). Multiple-unit motor-coach trains may be controlled from one master controller, which either operates the controllers in the other motor coaches pneumatically or electrically, or controls the switching of all the motors directly. When a train is running downhill the motor armature is driven by the wheels

and the motor acts as a generator. In case of the D.C. motor this 'regenerative braking,' that is, feeding back the energy thus developed into the line while the motion of the armature is thereby retarded is a simple matter; it is only necessary to provide some additional excitation of the field to ensure that the voltage generated exceeds the line voltage. The A.C. commutator presents some difficulties as the frequency of the A.C. is involved. Regeneration braking is also possible with induction motors. On motor coaches the motors are usually nose-suspended, one side of the frame being supported on the driving axle, the other on the frame of the coach, but on high-speed locomotives frame suspension is always used. In the latter case flexible transmission to the driving wheels is necessary, either through crank and connecting rods or mounting the gear wheel on a so-called jack shaft, or through 'quill' drive. In motor-coaches the motors are usually connected to the driving wheels through single 64:1 spur gear, but gearless motors with their armature keyed on the driving axle and the field magnets supported on the frame are also in use.

In 1942 the Brit. S.R. introduced a new type of electric locomotive for the

operation of freight and passenger services. It consists of a box-type cab carried on two six-wheel bogie trucks. The cab contains an electrically fired boiler for supplying steam for heating passenger trains. A novel feature embodied in the design enables the locomotive to continue a drawbar pull when passing over the gaps in the conductor rail when no collector shoes are in contact with the conductor rail. With a 1000-ton freight train the engine has an acceleration to 24 m.p.h. in 100 sec. and hauls the heaviest passenger train at a speed of 75 m.p.h. A gas turbine, driving electric motors, was used in a Swiss-built locomotive introduced into Britain.

The Liverpool overhead railway was opened in 1893, being electrified at the start, and was the first overhead railway in the world to be so operated. The under-riv. Mersey railway was converted from steam to electric traction in 1903, the Liverpool-Southport, 1904, and, in the Manchester suburban area, the Bury line was electrified in 1916. The Altrincham route, electrified in 1931, was the first railway in Britain to adopt the 1500-V overhead conductor system, as recommended by the Pringle Committee. Electrification has characteristic features which make it suitable for some kinds of traffic, e.g. the trains can be driven from either end, the number of coaches can be adjusted to traffic requirements, uniform speeds are possible, and so on, and these features make electrification particularly suitable to the operating of intensive suburban services, such as those mentioned above. The British Railways S. Region has now the largest electrified suburban system in the world, and the conversion has made possible a 70 per cent increase in services to and from London in the rush hours.

UNDERGROUND RAILWAYS AND TUNNELS.—Under this heading is comprised not only underground city R., but also that specially difficult part of the contractor's business, viz. tunnelling. Where possible the centre-line is set out on the surface under which the tunnel will run, and a series of shafts are sunk from 100 to 300 yds. apart. To transfer this line underground two marks are made in the cross-timbers, in the centre-line, at the bottom of each shaft and prolonged in both directions when the tunnel is being opened out. In tunnels of great length, e.g. the St. Gothard, the centre line is determined by a triangulation survey. Small section tunnels are usually driven from one end to the other at their full dimensions. With large section tunnels a pilot heading is excavated in advance and later enlarged to the full section. Under suitable surface conditions long tunnels are generally driven from a number of 'faces' by sinking shafts along the line of the tunnel and starting working faces in both directions from each shaft bottom. In heavily watered rocks or clay a Great-head shield is sometimes used, consisting of a ring of steel which is forced forward by hydraulic rams. In difficult cases work under pressure with an air lock may be required. (See further under TUNNEL-

LING.) Famous tunnels include the Simplon, between Switzerland and Italy, 12½ m. (the longest of the five big Alpine tunnels); the Apennine tunnel in Italy, 11½ m.; the New Cascade tunnel through the Rocky Mts., 7½ m., the longest in America; and the Severn tunnel, England, 4½ m. The 'tubes' of London's excellent system were all constructed with the Great-head shield, whilst the Metropolitan and the District were constructed where possible by 'cut and cover'. The prin. London 'tubes' are the Edgware, Highgate, and Morden (a combination and extension of the old Hampstead and Highgate, and City and S. London lines), the Piccadilly, the Bakerloo, the Central London, and the Post Office Tube. The latter, which is a narrow-gauge tube, is automatically operated and carries only mails.

The London underground railway has 280 stations, 4000 coaches, 10,000 m. of telephone wire, and the longest tunnel in the world (17½ m.), from E. Finchley to Morden. New York has an extensive underground (subway) and tube system, while the main-line R. on Manhattan also travel in tunnels, and are electrically operated. Underground systems are also to be found in Paris, Berlin, Moscow, Madrid, Buenos Aires, Tokyo, Glasgow, and other large cities. Underground city R. in nearly all cases are worked with 'multiple unit' trains, on the 600-800 V D.C. system. The track of the London underground railway is laid with an up-gradient at the entrance to, and a down-gradient at the exit from, the stations, to facilitate stopping and starting.

MOUNTAIN RAILWAYS.—It is to Switzerland that attention must be turned to see how the railway engineer has scaled the peaks and brought his lines up to the summit of great mts. like the Jungfrau. These lines would have been impossible but for the use of the rack; the one mostly used, invented by M. Abt, consists really of two racks placed side by side, the teeth on one corresponding to the spaces on the other. The first rack-and-pinion railway was constructed by Blenkinsop near Leeds (1811) and for some time the curious opinion prevailed that no other way of working was possible with a locomotive. The rack-and-pinion system really came into its own in 1869, in which year the Amer. engineer March built a mt.-climber, the Mt. Washington Railway in New Hampshire, U.S.A., on this system, and three years later, through the ingenuity of Riggenbach, Europe saw its first rack-and-pinion up the Ulgi, in Switzerland. The gradients which formed part of the problem of building this famous railway were of formidable magnitude. The rock is nearly 7000 ft. high and rises 5600 ft. above the valley. The slope varies, however, even the easiest being 1 in 5, and the average over the 3 m. of line is 1 in 3. There is probably no railway which has ever tackled gradients steeper than 1 in 2, but mechanical transport of some kind can be provided for any inclination. Lifts negotiate the steepest rise of 1 in 0. But the funicular railway, which may be classified between the lift and the rack-

and-pinion, is practically independent of the gradient. The Virgil line in the Tyrol, for instance, has a rise of 1 in 1.43.

In the early days the funicular was almost always employed, consisting of two cars, one ascending and the other descending, connected by a rope passing round a pulley at the top. In this system the descending car, plus a sufficient water ballast, draws up the ascending car. For long hauls electric motors are used to assist the winding of the rope. A good example of the latter type is up Salvatore outside Lugano, of a length of 1 m., the maximum grade being 63 per cent.

In the pre-electric days a system was largely employed in which the engine pushes the car up, and the car follows the engine down. In the case of the Righi Railway the boiler is placed as usual in a locomotive, but in the Pilatus Bahn it is placed across the frames, so that the water is equal in depth at both ends. Such a line exists in Wales from Llanberis to the summit of Snowdon, and has been running for many years. It is steam operated, $4\frac{1}{2}$ m. in length, with gauge, 2 ft. $7\frac{1}{2}$ in. The only other line to the top of a mt. in the Brit. Isles is the Fell line to the top of Snaefell in the Isle of Man.

The modern type of purely mt. line is worked by electric traction, either continuous or A.C. being employed. Such lines are numerous, and the most modern are constructed largely in tunnel, e.g. the line up the Jungfrau, the last portion of which is almost entirely concealed from view, the stations being opened out in the form of galleries. Certain lines, too, must be classed under this heading, in which for a portion of the distance racks are laid down to assist the locomotives on heavy grades; an example of this type runs over the Brenner Pass, and another occurs in New Zealand, where the grade in one place is exceedingly long and adverse. Special locomotives, of course, have to be built for these services, it being usual for the cylinders driving the wheels which engage the rack to be separate from the ordinary 'adhesion' mechanism. The Jungfrau Railway still ranks as possibly the most noteworthy feat of railway engineering in Europe, but there are mt. R. in other parts of the world which are at least equal achievements; for instance in S. America remarkable work has been accomplished in joining the great cities of the Pacific coast to the Atlantic ports. A fine example is the line connecting Valparaiso with Buenos Aires, over 1000 m. long, the first section passing over the Andes at a height of 14,000 to 16,000 ft. A famous cable railway for ordinary passenger traffic ascends the Wetterhorn in the Bernese Oberland. It was designed by Feldmann (the engineer who built the curious suspension railway at Wuppertal); he employed two carrier cables in each direction, corresponding to the rails of a railway track, but the cables lay above each other, not side by side. He thereby eliminated the swaying of the car, an objectionable feature in other systems, especially in a strong wind. Another cable railway leads

to the Kohler Peak in the Tyrol. The cables are 1 m. long and the journey takes 13 min.

LIGHT RAILWAYS.—In dists. where the traffic is insufficient to support a railway of main-line class, facilities are often provided by light R., especially abroad and in the colonies. In England, where there are metalled roads even in the most thinly populated dists., a service is more easily given by omnibus, and such light R. as there are were laid down before the coming of the motor car, and are now generally in a poor condition. Exceptions are to be found in light R. catering for a special class of traffic, such as the East Kent Railway, which feeds the Kent coalfield, and the 15-in. gauge Romney, Hythe, and Dymchurch Railway, which is worked by scale model locomotives, and carries mostly holiday-makers. Outside England light R. and steam tramways are much used, since a single line of railway costs much less to construct and to maintain than a metalled road of corresponding capacity. They are often laid in undeveloped country, such as Africa, or in dists. where travel is a novelty, such as parts of India, with a view to being replaced by main-line R. as soon as the traffic has grown sufficiently. They are generally laid to a narrow gauge (metre, 3 ft., 2 ft. 6 in., and 1 ft. 11 in. being usual sizes), though standard gauge light R. are not unknown. The latter have the advantage of being easily convertible to main-line standard should the traffic warrant it, and are not much more expensive than narrow-gauge lines in first cost; the latter, however, permit more flexibility in curves.

MONO-RAILWAYS.—During the first few years of the present century the high-speed line at Zossen brought forward inventors with all sorts of schemes for linking up important cities by very fast trains. Such schemes were propounded for running between Liverpool and Manchester, and London and Brighton. Electricity was to be the motive power, and in order to minimise friction some sort of single-rail design was to be devised. The Listowel and Ballybunion had been running since 1888 on the Lartigue monorail system quite successfully. In this system the coaches, locomotives, etc., run on a rail shaped like an A, the seats being back to back with the running wheels inside the backs of the seats; small wheels at the base of the carriages serve to balance the whole system. The locomotives have two of everything, one on either side of the central rail. This principle was to be employed on these fast inter-urban lines, but the projects fell through. The most successful form was that invented by Brennan, involving the use of two high-speed gyroscopes revolving in opposite directions and in a vertical plane parallel to the direction of motion. These large wheels were kept working on ball bearings in a vacuum, and therefore continued to run for a long period, even if any mishap occurred. Owing to the precessional action of these gyroscopes, the cars tended to tilt outwards when

rounding a curve, instead of inward as provided for by banking the outer rail on an ordinary line. In spite of the great weight of each car, since it has to carry its own gyroscopes, there seems an undoubted field for their use where a temporary line has to be laid very quickly, as the track seems to require next to no foundation, and the straightness of the running rail does not seem to affect the running of the cars.

PASSENGER SERVICES AND ROLLING STOCK.—In the early days passengers were conveyed at speeds varying with the class or fare charged; thus first and second class and those who travelled, as many did, in their own carriages placed on trucks were moved more rapidly than the third class or 'parliamentary' passenger. This state of affairs continued till 1872, when the then general manager of the Midland announced the startling news that third-class passengers would be conveyed on all trains. As at that date the Midland were employing Pullman cars at a supplementary fare on first class, in 1875 they abolished second-class carriages, and reduced first-class fares almost to second-class level. Originally fares were fixed on the basis of 3d., 2d., and 1d. per m. for the three classes, but as one line after another abandoned second-class carriages or retained them only for a restricted service, and also reduced their first-class fares, 1d. per m. for the third class and about 2d. per m. for first class became very general. In 1917, in consequence of the First World War, all fares were increased by 50 per cent, excepting workmen's, season, zone, and those on the London tubes. In 1920, owing to the inflation of money, there was a still further increase to 75 per cent over pre-war level. But this addition remained in force only till 1923, when 50 per cent over pre-war rates became the recognised standard.

From 1872 to the time of the outbreak of the First World War was a period of active railway expansion, and, although during the last few years of that time motor traffic was already drawing upon the business of the R. in many parts of the country, the companies were experimenting with electric power in suitable areas, particularly in the S. of London. Broadly the hist. of the period was one of railway enterprise and public response. Just as speeds increased, so also the style of accommodation improved, so much so that the last part of the nineteenth and the early part of the twentieth century witnessed a remarkable revolution in railway travelling. Dining-cars, long vestibuled expresses, corridor carriages, and means of getting refreshments *en route* provided attractive travelling, while traffic superintendents and general managers attracted their traffic by providing the right sort of train at the right time. Typewriting compartments were introduced on two trains each way between London and Birmingham. Even suburban lines, like the Metropolitan Extension, started their Pullman breakfast cars; Clacton had its midnight supper car—everything was done to attract the man

who need not travel, *i.e.* who goes only because it is sufficiently attractive. After the First World War this progressive policy was well maintained in long-distance passenger traffic. Carriages are steam-heated at the control of the passengers; improved ventilation has eliminated draughts and, on some modern trains, air-conditioning is provided, but of course not all rolling stock reaches the high standards of the best trains, and there is still much out-of-date stock in use, especially on local and cross-country services.

A notable improvement in recent years has been the introduction of buffet cars, the first modern car of this kind running between London and Cambridge in 1932. Recently experiments have been carried out both in England and France on

LOUNGE CAR ON THE PERE MARQUETTE RAILWAY, U.S.A.

pneumatic rubber-tyred wheels for passenger coaches. This adds to the comfort of travelling by eliminating the 'hammer-blows' of the steel tyre at rail joints, but on high-speed trains the life of the rubber tyre would be short, and experience in working is still lacking. Three trains with pneumatic-tyred cars hauled by steam engines were put into service on Fr. R. after the Second World War, railcars with such tyres having been introduced in 1931.

Owing to their increasing luxuriousness, express trains have become very heavy. Corridor coaches weigh 35 tons, dining cars 40, sleeping-cars (holding ten to twelve passengers) also 40; hence the modern express total up to 500 or more tons exclusive of the locomotive, or with it 670. Platforms were the next difficulty, as at some stations, especially terminals, long trains could not be accommodated, and even if they could the locomotives were hampered by loading gauges. The length of the Cornish Riviera express is 1050 ft., or nearly a fifth of a m. Admitting the necessity for depuncting long-distance traffic, the

superintendent finds that there is no room for local trains. This entails duplication of the line, and that too probably in the most expensive part. On a line with a fine long-distance traffic a sudden growth of suburban trains is a serious thing. Admitting that this is largely a two-period traffic, yet it may have to overflow to the express lines, and so the problem comes of what steps are to be taken to meet this expanding traffic. On the old G.E.R. section of the L.N.E.R., with probably the heaviest suburban traffic in the world, everything possible was done without altering its lines. The carriages were widened to seat six aside, the platforms were lengthened, two more coaches added to the trains, and more powerful locomotives were built. One obvious remedy, if it be called on to meet any further increase in traffic, is the electrification of its existing metals: this has been done between Liverpool Street and Shenfield.

Eng. R., looked at from a point of view of speed and precision, stand pre-eminent. On certain lines trains of enormous weight are taken at speeds that do not fall far short of the m.-a.-min. timing. The long non-stop runs that are such a feature of Eng. services have been made possible by Ramsbottom's pick-up water troughs, whereby the water can be renewed at speed, and (most important still) at places where the water is suitable for boilers. The longest daily non-stop run in the world is from King's Cross to Edinburgh, 392.7 m. in 460 min. Other long runs are from Euston to Carlisle, 301 m. in 400 min. The W. Region 'Cornish Riviera,' which long held the record by its run from Paddington to Plymouth, 225.7 m. in 240 min., lost the place of honour purely because it had no stretch long enough to compete economically with the run from London to Scotland.

Speed is a ruling factor and the R. have not been able to disregard it. The public in Britain naturally think that the 60 m.p.h. level ought to be accepted, as it is in France and Germany (before 1939) as the standard of speed on the main services from the metropolises. The demand for higher speed, however, gives rise to numerous special difficulties, such as track improvement, bridge strengthening, elimination of sharp curves, effect on local services, improvement of brakes, and greater visibility of signals. An express train of twelve to thirteen coaches travelling at 60 m.p.h. can be brought to a stand in approximately 360 yds. The vacuum brake is used on most steam trains and the Westinghouse compressed air brake on electric trains.

The R. also run purely postal trains which only convey passengers by permission, solely composed of travelling post office vans and the like, whereby bags are discharged or picked up at speed. Newspaper specials, too, are chartered by the prin. London dailies, which, by going to press an hour or two earlier, reach their destination ahead of the pub. of local papers. Railway stations, especially in industrial districts, are often grimy and depressing. The London Passenger Trans-

port Board has set a high standard and many of its stations are even attractive. Waterloo station has been greatly improved, and Paddington is also a model of convenience. The companies made considerable improvements in many prov. stations, notably at Chesterfield, Exeter, Leeds, Sheffield (Victoria), and Twickenham, some of which have been completely remodelled.

GOODS SERVICES.—It is from these that the R. derive the greater part of their income, and the prin. portion of the goods is carried under the classification of minerals. Indeed it was for this purpose that the Stockton and Darlington line was originally promoted, as at that time the whole of London's coal supply came by sea from the N.E. ports. When the Midland and S. Yorkshire coal pits had lines constructed in their vicinity, the only railway then running to London (the London and Birmingham) refused to carry coal as being detrimental to the better-paying passenger and merchandise traffic. It was not till the G.N.R. was opened in 1850 that London had its first regular railborne supply. Here be it said that in order to equalise matters in the case of collieries, the strict mileage charge is often abandoned, as it is found more profitable to charge the traffic what it will bear. Goods in general are divided into eight classes: A, B, C, and 1-5. The rates charged are lowest for Class A, which includes minerals in the raw state, and highest for Class 5, which includes the most expensive and fragile manufactured articles. Again the lettered classes are generally removed by the consignee, whilst the numbered goods have to be collected and delivered. It has often been remarked that the Eng. R. employ such small wagons for such a lot of traffic, but the reason is not far to seek. The R. cannot afford to wait till they have collected enough goods to form a 30-ton load, and so the smaller-sized trucks are employed. The same applies even in the case of coal, though there must also be added the reason that colliery sidings often do not allow large trucks in them, owing to the loading gauge, which is more restricted than usual. The R. have now ample numbers of the newer big trucks and certain specially built ones for carrying awkward consignments, like big guns, girders, or large castings and boilers. 'Containers,' or big enclosed steel or wooden receptacles, have proved of great value. These containers in many cases are just adapted to occupy a railway truck, and also to stand upon a trolley. They have appliances and fittings by which they can be transferred from one vehicle to another or into the hold of a ship. Much attention has been paid in recent years to the modernisation of goods depots and terminals, and the lay-out of the latter has been entirely remodelled to facilitate more rapid handling of goods. The greatest pre-war improvement was the speeding up of freight trains. Express freight trains run throughout the night between all important centres and the fastest are

composed entirely of vehicles fitted with continuous vacuum brakes, like passenger trains, and this enables them to average speeds of 45 m.p.h. In meeting the needs of modern traders the R. have developed ancillary road services. The railroad depot system, too, offers the advantages of rapid transit in bulk by rail with the flexibility of road transport distribution in small quantities. Though the general trend in retail trading has been in the direction of smaller consignments (largely owing to fluctuating prices) there has been a period in the opposite direction for some kinds of traffic, in connection with wholesale and industrial traffic, notably milk, oil, and petrol, which are carried in tank wagons, and grain, bricks, steel sheets, etc., which are also carried in specially constructed vehicles. Bulk forwarding of liquids enables economies to be effected in handling and in the capital outlay required as compared with carriage in barrels or other small containers. During recent years experiments have been made in providing shock-absorbing wagons for conveying glass, concrete pipes, and other articles particularly liable to damage.

SIGNALLING.—The route mileage of the R. of Great Britain is 19,630, and the number of train m. is about 330,000,000, worked by about 20,000 locomotives, giving an average of a train every half-hour each way over each m.; taking into account the large amount of single track (about 7200 m.) this is a very high traffic density. Before the days of block signalling and telegraphs the time interval was the only means of keeping a proper distance between following trains, so that, if the front train broke down, and notice could not be sent back to the nearest semaphore, a collision was most probable owing to the imperfect brakes then available. To-day the tendency is to replace as much of the signalling apparatus as possible by automatic or semi-automatic installations. First of all, from the ordinary telegraphic instruments came the block signalling, in which there is always a clear section between two following trains. Next came the lock and block, which interlocks the signals and telegraphic instruments, and so forces the signalman to maintain that section unoccupied. This is the system in most general use to-day. Lines with very intense traffic, however, require something better, which is found in automatic signalling, whereby the trains themselves automatically work the signals behind them. This, coupled with a trip-catch for applying the brake, makes it possible to run forty-five trains per hour on the London Underground. Automatic signals are worked electrically by means of a track circuit, and are kept at danger behind a train until it has passed out of the section. The salient advantage of automatic signalling is that it allows of the number of block sections being increased, thereby speeding up train movements without involving the expense of installing extra signal-boxes. Electric colour light signals of the searchlight type are used for both night and day operation.

They have great penetrative powers in fog and mist. Increasing use has for some time been made in all the Brit. systems of electric colour light signalling. Progress has also been made in the power operation of points and manual levers are being superseded by miniature levers operating electric circuits. The most effective solution to the problem of fog working is through automatic train control, whereby the position of each signal on passing is indicated to the driver by either an audible or visual signal in the engine cab. The G.W.R. had, by 1939, extended its system of automatic train control over the whole 2800 m. of main-line routes from London to Penzance, Chester, and Fishguard.

On single lines it is necessary to prevent collisions not only between following trains, but also between opposing trains. At first, each section of the line had a corresponding 'staff,' and no engine was allowed in a section unless its driver had the staff in his possession. But sometimes a staff might get left at one end of a section, when a train wanted to traverse it from the other. Nowadays the electric staff is used; there are sev. staffs for each section, but they are kept in special machines at each end, which are electrically interconnected so that not more than one staff at a time can be removed from the two machines. The staff machines also lock the signals. Formerly signal-boxes were independent units, responsible only to the station-master, and dealing with traffic as it came along. Nowadays 'train control' is largely installed, by which signalmen are still responsible for the area covered by their boxes, but they report to and receive instructions from a central office called 'Control,' which has a bird's-eye view of the whole line, and can decide better than the signalman which trains to let by, and which to hold up.

ECONOMICS.—The only justification of railway making (in Britain before the Transport Act, 1947) is economical haulage, which term implies both mechanical power and concentration of load. The provision of the former naturally falls on the railway company, as being beyond the means and requirement of an individual carrier, and in practice the R. nearly always perform the carriage of passengers, except in the cases of the Compagnie Internationale des Wagon-Lits, the Pullman Company, and of certain other instances. In the case of mineral traffic in England it was usual for the wagons to belong to the private owner, but when on the railway they were in entire charge of the company. When speaking of a railway company and its general merits, it must be considered in three lights: (1) As owning the road, (2) as owning the rolling stock, and (3) as a carrier of all sorts of traffic. This combination differentiates a railway company and its charges from all other modes of transport and the charges usually in force. Steamship companies have not to provide the road, omnibuses use roads provided by taxation, so did stage-coaches; canal owners and turnpike trusts merely pro-

vided the road. Hence railway rates have to cover interest on capital spent, together with charges on current expenditure.

Taking only round figures of Eng. R., before nationalisation, as illustrative of railway working throughout the world, it will be found that the money actually spent on the lines and their miscellaneous property, like hotels, steamers, etc., was well over £1,200,000,000. To show for this the R. possessed about 20,000 m. of line and approximately 1,000,000 vehicles, including over 20,000 locomotives. Of this large sum about £900,000,000 represented irrecoverable capital because, after paying all preliminary expenses, if the line was of no use *qua* railway, it was of no use for anything else; none of the 'way and works' could be moved elsewhere: viaducts, bridges, platforms, etc., were all fixtures, and even the buildings were too specialised to admit of any other use. But once made the ann. expenses were low, as some £15,000,000 served (1939) to keep in repair these large capital works. With regard to the huge sums invested in rolling stock it may be noted that, though a railway has to be complete at the time of opening, the full amount of stock need not be provided till the traffic requires it, as additions can be made without much difficulty. But against this fact must be put the necessity of providing enough stock to meet the maximum demand. This maximum requirement probably only exists for a limited period in the year, so that during this period the vehicles should earn enough to cover, in addition to current expenses, the capital charge of their construction. For this reason the R. found it profitable to run cheap excursions during the rest of the year, so as to employ vehicles which would otherwise be standing idle. The earliest lines, as has been seen, were merely mineral lines, carrying no passengers. The first passenger line was the Liverpool and Manchester, opened in 1830. Although it was primarily promoted to carry goods, the passenger traffic was so heavy that at first the goods were crowded off the roads. In 1845, when most of the trunk lines were opened, 75 per cent of the revenue came from passengers, and on some lines, like the London and Birmingham and (I.W.R.), it was as high as 85 per cent. In 1939 the ratio was changed and the average of goods and passengers was 55 per cent and 37 per cent respectively, the other 8 per cent coming from canals, hotels, etc. In the forties passenger traffic consisted of well-to-do people, customers of the post-chaises and stage-coaches paying an average fare of fully 2d. per m. Seventy years later 90 per cent travelled third class at an average fare of under 1d. per m.

During the First World War, and, later, owing to the increase in competition from motor-drawn vehicles, such a serious change took place in railway economics that most of, if not all, the old methods of statistical calculation were no longer the precise guides by which future policy could be shaped. In consequence many bigger

issues, which at one time could have been ignored, were then necessarily brought into any consideration of the subject. One of these was the important subject of railway expansion. The principle has been expressed that when the provision of new R., such as the recent extension of tubes in London, is necessary for the public, the public must provide the fund, or join in some guarantee to those who do so. Again the formation of a Ministry of Transport, and the active part that that ministry took in the arrangement of London traffic in particular, was a reminder both to the R. and the general public that there were mutual obligations, and whatever happened the public must be served. The nationalisation of Brit. R. was the culmination of this line of development. A third point that has a great deal of significance is the growing belief that the steam-drawn train with all its brilliant hist. belongs to a vanishing period.

Ann. expenditure by the R. of Great Britain has risen greatly since 1913 owing to the wage and price increases. In 1923 expenditure was about £157,000,000; it decreased subsequently and was £139,000,000 in 1930, £142,000,000 in 1933, and, just before the Second World War, it was £148,000,000. In 1948 it was £311,000,000. Gross revenue is the total income from all kinds of traffic and revenues which are derived from ancillaries; net revenue is the total gross receipts minus working expenses; and the proportion of the receipts absorbed by working expenses is known as the 'operating ratio.' In 1913 this ratio was 65 per cent, in 1939 about 90 per cent, and in 1948 92 per cent. The Railways Act, 1921, limited the ann. revenue that might be earned by the four groups to approximately £50,000,000. This standard revenue was based on 1913 revenues, but minor adjustments could be made from year to year. In 1937 railway companies were authorised by the Railway Rates Tribunal (now Transport Tribunal) to increase their charges by 5 per cent in order to bring railway revenues nearer to the standard.

Financial results for 1948 show the following figures: total gross receipts £337,314,096 (passengers £122,572,809, freight, parcels, and mails £211,064,189; miscellaneous £3,677,998); total working expenses £311,057,250; net traffic receipts £26,257,737. The Transport Commission as a whole, however, showed a deficit on net revenue account at Dec. 31, 1948, of £1,732,824 (£2,474,128 being provided for redemption of Brit. Transport Stock). The position in 1949 was still more unsatisfactory; a revenue deficit of over £20,000,000 was expected, and the commission reported that, unless immediate action were taken, an accumulated deficit of between £50,000,000 and £60,000,000 could be forecast. Railway charges were only 55 per cent more than before the Second World War, whereas costs were more than doubled.

In the U.S.A. the great transcontinental R. had been given princely domains by the U.S. Gov. Every alternate section along the road was theirs. In all

116,000,000 ac. had thus been given away. The Union Pacific received 20,000,000, Santa Fe 17,000,000, and the Northern Pacific 44,000,000. But the R. were entirely dependent on business, and there was no business unless these and other tracts were settled with people consuming manufactured products and raising crops for the E. markets and for export. The great roads, therefore, scoured the E. part of the U.S.A. and Europe with a view to inducing people to settle in the wilderness of plains. They offered them cheap transportation, and land at from \$1 to \$10 an acre. In this way the empty spaces began to be filled with people. The states and ters. began to grow. The hunger for more railway services increased. These were essentially the days when popular favour ran high. States and ters. granted the R. exemption from state taxes and further land grants, and bought stock in the companies in order to induce them to extend their lines. Tns. and cities, desiring to have railway connections, gave them free sites for stations and tracks and also subscribed for their stock. But this period of mutual goodwill was soon followed by an era of intense bickering. The R. were guilty of various abuses. There were stock-watering and other financial manipulations. In many instances exorbitant freight rates were charged. Free passes were given to members of the state legislatures to influence their attitude on various Bills. Freight rebates were given to favoured concerns. By entering state politics railway managers prevented just taxation and regulation. Finally the state of Illinois took the lead by the new constitution it adopted in 1870. It provided for a railroad commission to prevent unjust discrimination, and to fix maximum rates which might be charged. By 1874 Iowa, Minnesota, and Wisconsin had followed suit. The R. attacked the constitutionality of these enactments. In 1876 the U.S. Supreme Court held that when private property was affected with a public interest, it ceases to be private property only, and so was subject to regulation. The same day it decided in another case that it was perfectly legal for states to pass laws fixing the maximum rates for passengers and freight traffic. Later decisions, however, modified this position, and put the onus of the proof on the regulating bodies. These decisions, in fact, made it clear that while states could regulate commerce which was local in character, they could not touch it if it had in any way an inter-state character, and as most commerce was inter-state this put the issue squarely on Congress. The latter replied to this by passing in 1887 an inter-state commerce Act which prohibited pooling, freight rebates, and higher charges for short hauls than for long ones as was done in many flagrant cases, and required that all charges should be 'just' and 'reasonable.'

More important than these vague prohibitions and requirements was the provision in the Act for a Federal Inter-state Commerce Commission to supervise the

operation of the law. The Act was, however, long ineffective, but in 1903 Congress passed the Ellis Act, which once more forbade freight rebates and made the R. subject to prosecution and penalties. In 1906 the Hepburn Act made rate regulation possible by giving the Inter-state Commerce Commission power to fix them, subject to judicial review, but with onus of proof now on the railroads. It also forbade the giving of any passes save to bona fide employees of the R. or to the members of their families. In 1920 the new law enacted by Congress gave the Inter-state Commerce Commission complete power to make all rates, with a view to giving the shareholders a fair return on their investment and the public fair rates. This last law was passed as a measure of justice to the R. after the First World War. When the U.S.A. entered that war it took charge of all the R., and ran them practically as one system. The railway managers, upon getting their property back, claimed that immense harm had been done to their earning capacity. The law was the answer. But the law did not fix what Congress thought would be a fair return on the value of the railway property. For two years, therefore, Congress fixed it at 6 per cent, of which one-half of 1 per cent was to make provision for capital expenditures. Thereafter the Inter-state Commerce Commission was to decide the question. In 1922 this body fixed the return at 5½ per cent, and at that figure it still stood in 1940.

Another important section of the law of 1920 provided for the ultimate consolidation of all the railroads in the U.S.A. into a limited number of competing systems, the object being to reduce overhead expenses and to increase efficiency. The Inter-state Commerce Commission commissioned Prof. W. Z. Ripley of Harvard Univ. to prepare such a plan of consolidation. After various hearings the Inter-state Commerce Commission, on Dec. 9, 1929, announced its final plan, which provided for the consolidation of all the R. in the U.S.A. into twenty-one major systems. The railway managers of the R. serving part of the E. U.S.A. prepared a plan in accordance with this, whereby the four main competing systems should be the Pennsylvania, Baltimore and Ohio, New York Central, and the Chesapeake and Ohio-Nickel Plate system. This was not ratified by the Inter-state Commerce Commission, and some of the railroaders it was proposed to incorporate in these systems did not fully agree to it. The New Deal (q.v.) came to the aid of the R., which had been hard hit by the great world economic depression of the 1930s, brought about consolidation of facilities, and financed long-overdue improvements.

Raimondi, see MARC'ANTONIO.

Rain and Rainfall. Rain is the form in which water falls from the sky. The complete physical explanation of the formation of rain is not yet understood. At all temps. water can exist in vapour form up to a 'maximum' or saturated vapour pressure which increases markedly with increase in temp. (being, in the presence of a plane water surface, 1.5 millibars (mb.) at 0° F., 3.7 mb. at 20° F., 8.4 mb. at 40° F., 17.7 mb. at 60° F. and 34.3 mb. at 80° F.). When this saturation pressure is exceeded the water vapour tends to condense into water droplets or ice particles; in the atmosphere, this is achieved by cooling the air either by contact with the ground when dew, frost, or fog are formed or by lifting and cooling by adiabatic expansion (because of the decrease in pressure), when first cloud droplets are formed, and later, as the upcurrent becomes insufficient to support them, solid or liquid particles which fall to the ground as drizzle, rain, sleet, snow, or hail. Since the saturation pressure in the presence of ice is lower than with water for given temps. below freezing, ice particles should form more easily than water droplets. However, another necessary condition is the presence of a nucleus, i.e. tiny particle of matter, on which the water vapour can begin to condense into a water drop or to sublimate into an ice crystal; this is because the surface tension over a small water drop requires a certain amount of super-saturation which is very large for the smallest droplets which must be formed first, and a nucleus gives the drop a flying start over the difficult first stages. Condensation nuclei are always present in the atmosphere but sublimation nuclei are of three kinds: a few on which ice crystals begin to form when the temp. falls below -10° C., many more on which ice forms below -32° C., and all other nuclei on which ice forms below -41° C. Although ice crystals have been observed in the atmosphere at temps. as high as -6° C., these values, which were discovered in the laboratory by Findeisen and Schultz, are considered fairly reliable; so that, between 0° and -10° C. clouds consist of super-cooled water droplets, between -10° and -32° C. of supercooled water droplets with a few ice crystals, between -32° and -41° C. of more ice crystals but still many more droplets than crystals, and below -41° C. of ice crystals only. Water

droplets and ice crystals thus formed are visible as cloud and tend to fall to the ground through the air. Because of air resistance the velocity of fall soon reaches a maximum and, if the rate of ascent of the air is greater than this, the cloud remains in place. Cloud droplets vary in size from a fog droplet of radius 10^{-5} cm. up to 10^{-3} cm. with corresponding maximum falling velocity from 2½ ft. per min. to 140 ft. per min. (i.e. less than 2 m.p.h.). Dr. T. Bergeron claims to have shown that these drops cannot grow or coalesce with each other and, in fact, that in the cloud at any one part they tend to become uniform in size, so that they can only fall as very small droplets (usually less than ½ mm. in diameter) which are known as drizzle. Bigger drops such as raindrops can only be formed, according to Bergeron, by condensation of water vapour on or collision with ice crystals falling at a different speed through the cloud. From this follows the theory that all rain-bearing clouds must extend into regions where ice crystals begin to form, i.e. well above the freezing level. Above this the drops on collision will freeze into sleet and hail, melting into rain as they pass into warmer regions. As they become larger they fall faster through the air, continuing to grow whilst within the cloud but tending to evaporate on passing through cloud-free dry air. The maximum velocity of fall of different sized raindrops for diameters 0.5, 1.0, 2.0, 3.0, 4.0, and 5.5 mm. is 10, 14, 19, 23, 25, and 26 ft. per sec. respectively; above 5.5 mm. diameter the maximum velocity no longer increases with size because of the change in shape caused by external pressure and viscosity, which also set up internal stresses and strains breaking the drop into smaller drops, so that raindrops are never observed larger than this nor do they fall to the ground faster than 26 ft. per sec. or 18 m.p.h.

Artificial Production of Rain.—Recently experiments have been made in Russia, America, Australia, and England to utilise the consequences of Bergeron's theory of the formation of rain and to produce the rain artificially by speeding up the growth of the droplets. The usual method is to dust the top of a suitable cloud with solid carbon dioxide (seeding as it is called). As these very cold particles pass through the cloud they form a large number of ice crystals which will fall through the cloud to produce rain in the normal way. If the whole of the cloud is below the freezing level then ice crystals will not persist for long before melting and only a very few (if any) raindrops will reach the ground. If the cloud reaches to such a height that the temp. at the top is below -10° C. then ice crystals will be formed naturally and rain will result naturally. Again, if the cloud top is overseeded, then most of the cloud droplets will be transformed into individual ice crystals and these will be too small to fall and produce rain; at the same time enough seeding must be done to produce a sufficient number of raindrops to overcome evaporation in falling to the

ground. Furthermore, the total quantity of water in any cloud is only sufficient to produce light rainfall for a very short period unless new cloud particles are continually being formed to replace those made to precipitate. Consequently the artificial production of rain is only possible as a trigger action, starting rain from clouds that only just fail to reach the ice-crystal-producing height. This was well illustrated in the Australian experiments, reported by E. B. Kraus and P. Squires in *Nature*, vol. clix., 1947, p. 489, when the seeded clouds grew rapidly in height showing that enough latent heat of fusion of ice was released to cause the cloud to become more buoyant, rise to the natural crystal-forming level, and to continue to produce rain for a long time. In addition to producing rain in favourable conditions it is also possible to seed a shallow stable layer of cloud sufficiently to cause all the cloud droplets to grow and fall to the ground or into evaporating regions, which might be useful in clearing persistent sheet cloud but cannot produce much rain. R. was 'manufactured' for the first time in Britain in Aug. 1949 by an R.A.F. bomber which seeded solid carbon dioxide into suitable clouds.

Distribution of Rainfall.—If the temp. is high then more water can be present as vapour in the atmosphere (because of the higher saturation vapour pressure) so that more water is available for condensation, and therefore heavier rainfall is likely in summer or in warm climates. Heavier rain is also more likely with strong up-currents, for then the water vapour is being condensed more quickly; consequently the more violent rain clouds such as cumulonimbus are likely to produce more intense rainfalls than the steadily rising sheet clouds, although since these are very widespread and all the air is being lifted instead of just the small area of the cumulonimbus cloud, their rainfall is usually prolonged with a heavier total rainfall over a large area. Mts. will accentuate the uplifting in both cases, and therefore heavy rainfall is typical of mountainous or even hilly regions. On the other hand descending air, because of the increase in pressure, is warmed adiabatically so that the air becomes unsaturated and the cloud droplets become smaller and evaporate, the rainfall being decreased considerably if not missing altogether. Thus mts. and even quite low hills exhibit a much increased rainfall on the exposed side and comparatively dry conditions on the lee side. This sheltering effect is referred to as a rain shadow. Depressions and anticyclones are regions of generally ascending and descending air, so that rainfall is prevalent towards the centres of low pressure and very rare in centres of high pressure. Thus high temps. (with high humidity), low pressure, mts., and nearness to the sea all contribute to high rainfall, whilst low temp., low humidity, high pressure, shelter from moist winds and remoteness from the seas contribute to low rainfall. In different places these conditions occur in different proportions, so that the prevalence of

winds from the sea may be balanced against low temps., high mts. against dry air as in Turkestan or S. Rockies, persistent high pressure against moist air as in the Azores, and high temps. against persistent land winds as in the Sahara or India during the N.E. monsoon.

This balancing of conditions is well illustrated in the Brit. Isles where the more stormy weather brings in winter about the same average rainfall as the warmer, not so stormy weather in summer. The average monthly rainfall (1881-1915) in the Brit. Isles, taken as a whole, is shown in the following table, reproduced from *Book of Normals of Meteorological Elements for the British Isles* by permission of the Director of the Meteorological Office.

	in.
January . . .	3.74
February . . .	3.26
March . . .	3.22
April . . .	2.52
May . . .	2.61
June . . .	2.64
July . . .	3.25
August . . .	3.88
September . . .	3.09
October . . .	4.25
November . . .	4.19
December . . .	4.72

Total for the year . . . 41.41

It will be noticed that Dec. is the wettest month, April the driest; Feb., traditionally 'dill-dyke,' is the driest winter month, whilst the popular holiday month, Aug., is the wettest summer month. Along the E. coast of England July and Aug. are in fact the wettest months of the year because of summer thunderstorms. But the rainfall over the Brit. Isles is very variable; in some months no rain fell over large parts of the country, notable dry months being Feb. 1891 for central and S.E. England, and Aug. 1948 for Scotland; and at Ballabus in Islay rain fell every day for 89 days from Aug. 12 to Nov. 8, 1923.

A belt of heavy rainfall extends along the region N. and S. of the equator, bounded on each side by regions of drought in the lats. of Cancer and Capricorn. The trade wind regions are not rainy. The regions of the westerlies, N. and S., are marked by cyclonic disturbances and good precipitation, the polar caps again being comparatively dry because of low temps. This general scheme is greatly modified but not obliterated by the distribution of land and water. The trade winds striking the E. coasts of the continents make them regions of rain, especially in summer, the W. coasts, where they leave, being dry. Australia, Africa, and S. America are good examples of this. In the region of the westerlies of the S. hemisphere, the W. coasts are rainy and the E. drier; in the N. hemisphere the W. coasts are rainy towards the N., e.g. Europe and Brit. Columbia, the E. coasts more to the S.,

e.g. China and U.S.A., where the trades are drawn into the continents by the formation of summer cyclonic areas. The interiors of the two great N. land-masses are regions of slight rainfall, but the heat of summer causes them to form draughts from the ocean, adding a further complication to the planetary scheme; and in winter they form the centres of anticyclones, with dry winds flowing out over the oceans. This action predominates in the Far E., where S.E. Asia, the monsoon region, gets summer rains and winter drought. Certain regions are marked by uncertain rains and droughts, e.g. the Deccan in India, W. New S. Wales and Queensland, and parts of S. Africa and S. America; places lying on the boundary of rain shadows or where conformation of land renders them particularly sensitive to alterations in strength of wind. The swing of the sun from Cancer to Capricorn and back again in the year produces a sympathetic change in wind systems, giving seasonal variations in rains: within the tropics the 'rain follows the sun.' The westerlies produce more rain in the winter, when their cyclonic eddies are more intense; winter rains are characteristic of 'Mediterranean regions,' 28-40°, which are influenced by trade winds in summer, but are fringed by the westerlies in winter, e.g. Cape Prov. and W. Australia; the E. coast of S. India, of Ceylon, and the Indo-Chinese peninsula get rain with the N.E. monsoon when the main region is dry, and they are drier during the S.W. monsoon. Over the ocean the heaviest rainfall occurs in the Pacific Ocean between the E. Indian Archipelago and the Ladrões; on land it is found where the winds from the warmer oceans encounter high mts. near the coast, e.g. Nigeria, W. Indies, Burma, etc. Cherra Punji (Assam) has a mean ann. rainfall of 461 in. (40.8 in. were recorded on June 14, 1876); Mahabuleswar, near Bombay, 260 in.; while in the track of the westerlies, New Zealand, S. Chile, Norway, and N.W. America show similar conditions.

Heavy rainfall, as we have seen, is associated with strong updrafts; these are typical of intense cyclones and thunderstorms; such heavy falls in England have included 1.25 in. all within 5 min. at Preston, Lancashire, on Aug. 10, 1893; 2.90 in. within half an hour, at Cowbridge, Glamorganshire, on July 22, 1880; 3.63 in. in 1 hr. at Maldenhead on July 12, 1901; 4.65 in. in 2½ hrs. at Campden Hill, Kensington, on July 16, 1917; and as much as 8 in. in 5 hrs. near Bridgewater on Aug. 18, 1924; the greatest fall in one day in Britain was 9.56 in. at Bruton, Somerset, on June 28, 1917. Abroad, 30.11 in. fell at Gibraltar on Oct. 25, 1836, and at Baguio in the Philippines a typhoon between July 14 and 17, 1911, deposited 35, 29, 17, and 8 in. respectively, a total of 89 in. in four days, 45.99 in. falling within 24 hrs. on 14th-15th which is the world record. On mt. ranges the rainfall has a maximum at a varying height depending on the wind current of the season; in the Alps this is 3000-4000 ft. in winter,

6000-7000 ft. in summer; in the mt. stations of Hindustan the height is about 4000 ft.; in the Eng. Lake Dist. over 1000 ft. The level above which the rainfall decreases has been named by Supan the inversion level.

Rainbow Corner, the corner of Shaftesbury Avenue and Great Windmill Street, London, on which stood the Amer. Red Cross club during the Second World War. In 1949 a plaque, bearing the name R. C., was erected by the Fellowship of U.S.-Brit. Comrades as a tribute to all ranks of the U.S. services who knew the original R.C.

Rainbows are caused by refraction and internal reflection of light from the sun upon raindrops. The first explanation of the rainbow was given by Descartes in 1637 depending on geometric optics. Using Snell's law of refraction he found that of 10,000 parallel rays striking one side of a spherical raindrop, after refraction on entering, one internal reflection at the opposite side and refraction again on leaving, those between 8500 and 8600 all had an angle of deviation within a few minutes of the minimum angle of deviation. There is therefore a narrow concentrated beam of light emerging from the raindrop at the minimum angle of deviation, which, as the colours are dispersed, gives a coloured spectrum, red, orange, yellow, green, blue, indigo, violet, the red having an angle of deviation of about 137°, the violet 139½°. Thus, all drops on a cone centred about the shadow of the observer at an angle of about 42° will appear bright in the sunlight, the colour varying from violet at about 40½° to red at about 43°. The bow cannot be seen from the ground if the sun is at a greater elevation than 40° unless viewed from a height it is less than a semicircle, whilst from an aircraft the bow can sometimes be seen as a complete circle. This is the primary bow.

With two internal reflections, as in Fig. 3, the raindrops will reflect a secondary bow, at angles from about 50° for red to 54° for violet. With three or four internal reflections the bow would appear between the sun and the observer, but they are not seen because the directly transmitted light is much stronger than the concentrated beam after so many internal reflections. With five and six reflections the bows would appear near the

FIG. 1. PATHS TAKEN BY SOME OF THE DESCARTES' 10,000 RAYS OF LIGHT THROUGH A RAINBOW WITH ONE REFLECTION.

primary and secondary bows if they were not too faint to be seen.

This explanation, due to Descartes, explains many of the R. seen, but on occasions some of the colours are missing, and the bow may not even be part of a true circle. A better explanation, from the wave theory of light, shows that, so far from there being a simple intense beam of light along the 'Descartes' angle of minimum deviation, the beam forms two foci very close together, the waves from which interfere and reinforce one another alternately along sev. angles, the most intense being almost along the Descartes angle. The other reinforced rays are on the violet side of the primary angle and the bows which they form are sometimes seen as supernumerary bows. The position and distance between the two foci (which depend on the drop size) determine

the angle of these bows; if the colours of a second bow begin before those of the first finish, the colours mix, so that the rainbow does not have its normal colour sequence. The primary angle also depends on the size of the drop, being less than the Descartes angle and closer to it the larger the drop; it is sev. degrees less for very small drops. If, therefore, the drops within the sunlight are of different sizes in different parts of the bow, it will be both out of shape and with differing colour sequences. With large drops the red of the first supernumerary coincides with the green of the primary so that the yellow band is wider than normal. With smaller drops the first colour is no longer red but orange; with still smaller drops it is yellow; other colours appear such as pink just inside the violet. With very small fog droplets a bow is sometimes seen

FIG. 2. HOW THE RAINBOW IS FORMED AT AN ANGLE OF ABOUT 42° FROM THE 'SHADOW OF THE OBSERVER

which is white with a faint coloration at the edges—the fog bow. Lunar R. are also seen, but as a general rule the light is so faint that, to the eye, it appears white. See J. M. Perntner and F. M. Exner, *Meteorologische Optik*, 1910, and R. W. Wood, *Physical Optics*, 1911, 1934.

Rainerius, see PASCHAL (popes), *Paschal II*.

Rainfall Stations, see under METEOROLOGY.

Rainford, par. and urb. dist. of Lancashire, England, 4½ m. N.W. of St. Helen's. The dist. is mainly residential, but the manuf. of earthenware drain pipes, from clay mined in the dist., has been carried on for nearly a century. Pop. 5000.

Rain-gauge. Rain is collected for measurement in a R. It is usually made of copper, the upper detachable cylinder containing a funnel, above which it rises considerably and terminates in a clean-cut edge 5 or 8 in. in diameter. The measuring-glass is graduated to show the amount of rainfall to the nearest tenth of 1 mm. or hundredth of 1 in., and tapers towards the bottom to show small amounts. Many precautions are necessary as to the placing of the R., for which see works on meteorology; the most important precaution is the selection of a perfectly open site to catch the rain from every direction, far enough from the ground (best covered with short grass) to prevent splashes bouncing into it, and yet not so far from the ground that in a high wind its own eddies blow away some of the rain. Brit. practice is to place the R. at a distance from any object more than twice the height of the object and with its rim 1 ft. above level short grass. Self-recording Rs. are in use; these work by means of a float and style tracing on a revolving barrel, or are emptied at definite points by siphons or overturning of the collecting vessels. See *Meteorological Observer's Handbook*, 1942 ed.: H.M.S.O., 1946.

Rainham, suburb of Gillingham, Kent, England, 4 m. E. of Rochester. Rom. remains have been found here. Pop. 3900.

Rainier, or Tacoma, volcano in Washington, U.S.A., in the Cascade range, 14,408 ft. high. It is considered to be extinct, although fumes are sometimes given off from it.

Rain-making. Among peoples of primitive culture, notably in E. Africa, W. Africa, and (at one time) Australia, R. is the purpose of various rites and usages, practised by professional rain-makers, who are generally important individuals in their community (see on this especially NIOLOTES; SHILUK). Formerly the Garpugares, i.e. 'rain-makers', formed a distinct caste in many Maharratta vils. of Central India. More widely prevalent than astrology and far more ancient, the art of 'controlling' the weather, and particularly the rain, survives when society rises to higher levels, becoming, as indicated above, the function of the most eminent wizards and priests. Rain-rites being very apt to fail of their purpose the

wizard runs the risk of losing his reputation or of some worse fate. His attention is therefore drawn to the signs of the weather, the character and course of the seasons, the connection of rain with the aspect of the sky and the direction of the wind, so that he learns to operate for rain only when rain may reasonably be expected. He has in fact familiarised himself with the rudiments of meteorology, but by observation rather than by *hocus pocus* (see C. Ikeda, *Man and his Superstitions*, 1925). For scientific methods of R. see RAIN and RAINFALL, *Artificial Production of Rain*.

Rainy Lake, N. America, 120 m. from Lake Superior, and part of the boundary between Canada (Ontario) and the U.S.A. (Minnesota). Length 40 m., breadth 3 to 8 m.

Raipur, headquarters of a dist. of the same name in Central Prov., India, and until 1947 of a political agent for the Feudatory States, 188 m. E. of Nagpur. It has an extremely strong fort dating from 1460, and trades in cotton and grain. Pop. of dist. 1,516,700; of tn. 63,500.

Rais, Gilles de Laval, Seigneur de, see RITZ.

Raised Beaches, see BEACHES, RAISED.

Raisins, name given to the grape when dried. Quantities of R. are exported from the Mediterranean shores, while others come from France, Smyrna, and California. The variety known as muscels is dried while partly attached to the vine, and is grown near Malaga. The process of drying takes place in the sun or in specially heated houses.

Raisnes, comm. of the dept. of Nord, France, 5 m. from Valenciennes. It has steel works and mechanical engineering. Pop. 12,200.

Rajagopalacharia, Chakravarti (b. 1879). Indian lawyer and statesman, b. at Hosur, Salem dist., India, son of Chakravarti Venkatarya and Singarenma. He was educated at Central College, Bangalore, and at the Presidency College and Law College of Madras, and practised law at Salem, India, from 1900 to 1919. An ascetic Brahman, known as 'the Tamil Mahatma,' he was closely associated with Gandhi from 1918 and joined Gandhi's non-co-operation movement, 1919-20. A prominent member of the right wing bloc of Indian nationalists, he was general secretary of the Indian National Congress, 1921-22, and a member of its working committee, 1922-47. He advocated economy in administration and supported prohibition—being secretary of the Prohibition League of India in 1930. R. underwent imprisonment in connection with the Indian Freedom movement severally between 1921 and 1942. From 1937 to 1939 he was Prime Minister of Madras prov., and in 1940 he induced All India Congress to offer co-operation in the war effort. He was a member of the interim gov. of India, 1946-47; governor of W. Bengal, 1947-48; acted as governor-general of India in 1947; and was governor-general in succession to Earl Mountbatten of Burma, from June 1948 to Jan. 1950, when India became a republic. His pub.

are *Marcus Aurelius and Socrates in Tamil; Tamil Mahabharat in Story Chapters; Upantshads for Lay Readers; Bhagavad Gita Selections and Notes* (1923-42); *Fatal Card and Other Stories and Prohibition Manual* (1935); and *Way Out and Reconciliation* (booklets, 1942).

Rajah, or (better) **Raja** (from Sanskrit *rajan*, king; cf. Lat. *rex*), title borne by a Hindu prince. Other forms of R. are *rao*, *rana*, and *raual*. The title of the Hindu emperor of Vijayanagara in S. India was *raya*. Rs. have been in existence in India from very early times; the title was hereditary as a rule, whilst men of conspicuous valour and wisdom were also elected Rs. Chiefs of greater importance than the ordinary Rs. were called *maharaja* (*maharas*, *maharana*), or great R. The Brit. Gov. recognised in many cases the sovereignty of Rs., who were allowed to rule over their own ter., and to transmit the title to their heirs. Hindu subjects of eminence, great landowners, subject princes, etc., were also called R., having the title conferred on them by the Brit. Gov. for life.

Rajamahendri, tn. and important river-crossing in the dist. of Godavery, Madras, India, on the Godavery R., 45 m. N. of Masulipatam. It manufactures carpets, woolen goods, etc. R. was occupied by the Fr. from 1753 to 1758. Pop. 60,000.

Rajasthan, or the United States of Rajasthan, union of sixteen Rajput states, forming (next to Madras) the largest single political unit in the dominion of India. It is practically co-terminous with the former collection of states known as Rajputana (area 132,559 sq. m.; pop. 13,670,000) and has an area of 121,000 sq. m. and a pop. of over 12,000,000. R. came into existence as a political unit in April 1948, but apart from Udaipur (13,170 sq. m.; pop. 1,927,000), the most ant. and honoured of Rajput states, it then included only nine other smaller states. By the date of the new state's formal inauguration (March 30, 1949) by Sardar Vallabhai Patel, deputy Prime Minister of India and minister for states, it included four of the largest and most powerful Rajput states, namely Jaipur (15,610 sq. m., pop. 3,041,000), Jodhpur (36,120 sq. m., pop. 2,556,000), Bikaner (23,181 sq. m., pop. 1,293,000), and Jaisalmer (16,000 sq. m., pop. 93,000). Thus, for the first time in the hist. of a colourful and proud people, it welded nearly all the Rajputs and their Jat peasantry into one entity. This union, the most notable achievement of the states ministry of India in Delhi, was not brought about without difficulty. There were jealousies and rivalries, not only between the princes, with their thousand-year-old lineages and their feudal barons, or *jagirdars*, with their ant. privileges which they sought to preserve, but also between the new democratic leaders of the Congress party in the various states. But the strong hand of Delhi prevailed on them to compose their differences and to choose one leader as Prime Minister of united R. on whom should devolve the responsibility of distributing appoint-

ments between the Congress party workers in all the component states. The maharaja of Jaipur was selected to be Rajpramukh (roughly governor) for life of the new union and the former Rajpramukh of the first union was granted the honorific title of Maharajpramukh. The smaller Rajput states of Alwar, Karauli, Bharatpur, and Dholpur were merged in March 1948 with the new Matsya union, but of these the first two were merged later with R., and the latter two with the United Provs. to which their ters. were adjacent.

The Aravalli range of mts. stretches across the middle of the country, the land E. and S.W. of these being fertile and possessing stretches of forest and rich soil. In the N.W. sandy, ill-watered plains make the country unproductive and difficult to cultivate. The chief rvs. are the Chambal and the Banas. The former is the largest, 580 m. in length, flowing into the Jumna. The only natural lake is Sambhar, whose water is salt. Sev. large artificial lakes have been constructed for the purpose of storing water. Cattle are extensively reared, and grain, wool, cotton, and opium are the staple products. The climate is hot and dry in summer and bitterly cold in winter. R. is said to be the healthiest part of the sub-continent of India. The people are mainly engaged in agriculture. The Rajputs (g.p.) were formerly the ruling class, and Rajasthan is the chief language of the country.

Rajbansl, see Korch.

Rajkot, cap. of the state of R. in the Kathiawar peninsula, Bombay, India, 110 m. W. of Cambay. Among its buildings is a college for the sons of native chiefs. It was formerly the residence of the E. Kathiawar political agent. Pop. (state) 104,000; (tn.) 16,000.

Rajpur, tn. in the dist. of Twenty-Four Parganas, W. Bengal, India, 12 m. S.E. of Calcutta. Pop. 11,200.

Rajput, race of India, spread over the N. of the country and not confined to Rajputana. The Rs. claim to be the descendants of the Kshatriyas. Their early hist. is obscure, but they appeared in the eighth century, and spread into the Punjab, Kashmir, and the Central Himalayas. Their unity was destroyed at the Moslem conquest. The majority adhere to the Hindu religion, the remainder are Muslims. They are a fine race, noted for their courage and their pride; none but the poorest will humiliate himself by performing manual labour. No occupation except arms or governing can be followed by them. They are divided into clans; the prin. are the Rahtor, the Kachwaha, the Chauhan, the Jadu, the Sisohyas, and the Ponwar. Roughly the whole number of Rs. in India is 10,000,000.

Rajputana, name given, before the partition of India, to a collection of more than a score of native states and one chiefship, bordered on the N. by the Punjab and lying between the United Provs. and the former Bombay presidency. See RAJASTHAN.

Rajput Painting, see INDIA (INDIAN ART).

Rajshahi, former div. and dist. in Bengal, India, situated to the N. of the Ganges. R. was divided between India and Pakistan in 1947. The Pakistani R. div. has an area of 13,488 sq. m. and a pop. of 9,482,000. India received 6164 sq. m. with a pop. of 2,557,000. The dist. of R. went to Pakistan; area 2526 sq. m.; pop. 1,571,000.

Rakaanga, or **Rierson Island**, is. in the Manihiki group, Pacific Ocean, included in the Cook Is. (annexed by New Zealand). Pop. 300.

Rakiuru, see STEWART ISLAND.

Raleigh, Sir Walter (1552-1618), Eng. courtier, soldier, explorer, founder of colonies, and author, b. at Hayes Barton Farm, Budleigh, Devonshire. His family

SIR WALTER RALEGH

were of the gentry class, and he was related to Sir John, Sir Humphrey, and Sir Adrian Gilbert on his mother's side. His name is variously spelt in thirteen different ways, including R., Raleigh, Rawleigh, Rawley, Ralego, Reali, etc.; but the orthography of R. himself is 'Ralegh.' Richard Hooker and Lord Bacon both agree that he studied at Oxford, and Anthony Wood records in his *Athenæ Oxonienses* that R. became a commoner of Oriel College about 1568 and that, under an excellent tutor, he was 'the ornament of the Juniors and was worthily esteemed a proficient in oratory and philosophy.' In 1569, however, he went to France as a gentleman volunteer of the Huguenot army, being present at the battles of Jarnac and Montcontour. In 1577 he served under the prince of Orange in the Netherlands. On his return he joined Sir Humphrey Gilbert in the latter's expedition under a royal patent to plant settlements in N. America. Although the expedition was not successful, R.'s active interest in the field of exploration and colonisation dates from this

time. When the rebellion in Ireland broke out in 1580 R. received a captain's commission under Lord Arthur Grey, lord deputy of Ireland. R.'s name is associated with the merciless massacre of the greater part of the Sp. and It. garrison of Fort del Oro at Smerwick in Kerry, where they were besieged by Grey. It was on his return from Ireland that Leicester, his patron, gave him the chance to appear at court. The story of R.'s gallantry to the queen in throwing his cloak to the ground for her to walk over may indeed be true; but his first introduction to court is rather to be ascribed to Leicester. R. possessed the indispensable accomplishment of an Elizabethan courtier, namely, the art of flattery, in a high degree, and his brilliant qualities and high mental endowments contributed to his rapid advance in the queen's favour. In the course of a few years he was knighted, made lord warden of the Stannaries, captain of the guard, and lieutenant-general of the co. of Cornwall (1587). He also received the valuable grant of the forfeited lands of the earls of Desmond and a lucrative patent for wine-vendor's licences. These marks of favour naturally exposed him to envy at court. According to Wotton it was Leicester, R.'s former patron, who extolled the rising talents of the young Essex to counteract R.'s increasing influence with the queen.

Meanwhile, in 1581, R. was again thinking of colonisation. He drew up a plan for colonising what is now Virginia and Carolina (he named Virginia in honour of the Virgin Queen) and laid it before the queen and her council for approval. On March 25, 1584, the queen granted him letters patent 'to discover, search, find out, and view such remote heathen and barbarous lands . . . not actually possessed of any Christian prince, nor inhabited by Christian people' (Hakluyt's *Voyages*, vol. iii.). On April 7 two vessels, fitted out at the cost of R. and of his associates, sailed round the W. Indies and Carolina and their report induced R. vigorously to prosecute his design of planting a colony in Virginia. A fleet under R.'s cousin, Sir Richard Grenville, planted a settlement at the Is. of Roanoke, but mismanagement led to great distress among the settlers. By 1588 R. had spent £40,000 upon his colonial enterprises and the experience taught him that so great a design could not be carried out by a single individual. He therefore assigned his patent to a company of merchants, reserving to himself a fifth part of the gold and silver ore raised. It also joined in the enterprise to find the N.W. Passage, the conduct of which under Capt. Davis (*q.v.*) resulted in the discovery of Davis Strait. A successful privateering expedition to the Azores in 1586 was carried out in pinnares fitted out at R.'s expense. R.'s fame now extended far outside England; he was known not only as the promoter of maritime discovery and the founder of colonies, but also as a patron of science in general. Hakluyt (*q.v.*), who pub. his *Voyages* in 1582, sought the acquaintance of R. and acknowledges him as one of those

benefactors 'from whom he received his chief light into the western navigations'. About this time R wrote some of his treatises on military operations. Probably R. took no direct part in the fight against the Sp. Armada in 1588: he was, however, a member of the council of war which met to consider the best means for securing England's safety, and helped to draw up the final plan of defence.

R. then suggested attacking the Sp. in the W. Indies by a daring interception of the Sp. Plate fleet. R. was given a commission as general of the fleet which was to conduct this operation. In 1592 he sailed but was overtaken by Frobisher with letters from the queen recalling him. He continued on his course but after a storm off Cape Finisterre, which scattered the fleet, he resolved to obey the queen's orders and returning to England, was sent to the Tower by his jealous sovereign to atone for his intrigues with the beautiful Elizabeth Throckmorton who eventually became his wife.

During his period of exile from court he matured a project for a voyage to Guiana. It is difficult to assign the motives which first induced him to take this step but Naunton (q.v.) states that, finding his favour declining, his imagination suggested the discovery and conquest of a second empire of the Incas, which would not only invest him with the fame that his restless ambition desired, but restore him to favour at court and fill his exchequer from the wealth of El Dorado, in the existence of which he believed as fully as did most of his contemporaries. He therefore devised his famous voyage in search of El Dorado or Manoa and after his return from Guiana published his celebrated *Discoverie of Guiana*, a narrative which still fascinates by its persuasive style, though R.'s statements about El Dorado, the tribe without head, and other phenomena are proof of the gullibility which made him too ready to listen to the quack as well as to the genius.

Restored to the favour of the queen, he was appointed an admiral in the expeditions to Cadiz, 1596 and in the following year was engaged in an attack on the Azores, in both of which he added greatly to his reputation. The death of Elizabeth, however, was the turning point in his fortunes. The new sovereign and his old enemies combined to bring about his downfall. In a secret correspondence with the Scottish king before the death of Elizabeth, Sir Robert Cecil succeeded in impressing James with a belief that R. was unfavourable to his succession. James had already been prejudiced against R. by the earl of Essex. R. was dismissed from his post as captain of the guard, and absurdly charged with complicity in the Sp. plot or Lord Cobham's treason which planned to dispossess James of his crown, and to place his cousin, the Lady Arabella Stuart, upon the throne, with the aid of Sp. gold. R.'s trial took place in 1603. He defended himself with eloquence and force, but in vain, for Coke, the attorney-general, conducted the trial on behalf of the Crown in a manner scandalous even by

the standards of the age. The trial is fully reported in Haiggrave's *State Trials*, vol. 1.). The subservient jury returned a verdict of guilty, and R. was sentenced to death.

Although his estates were confiscated, the capital sentence was not at that time carried out, and R. spent the next twelve years in prison. During his confinement he spent much time in chemical experiments and research, but most of his intellectual energy in this period was bestowed upon the conception and composition of his *History of the World*. Reflective in manner and dignified and grave in style this work is one of the finest specimens of Elizabethan prose and shows the finest side of R.'s character.

Eventually what impartial intercession could not effect was achieved by an appeal to the king's greed. It is probable that the idea of the existence of a great goldmine in Guiana from which appreciable benefits might be reaped, induced the needy James to listen eagerly to Sir George Villier's intercession prompted by a bribe of £1500. R. was released in March 1615, and at once made every preparation for his second voyage to Guiana, promising the king that he would not interfere with the Sp. settlements. Like the first it failed of its object. He had embarked in it his remaining fortune and lost both that and his eldest son, Walter, who was among the fallen at Santo Thomé. R.'s ill health had prevented him being an effective leader of this expedition to the Orinoco, and Lawrence Keymis his old associate and deputy did nothing more than burn the Sp. settlement. On R.'s return to England in 1618 a broken and dying man, the Sp. ambas. demanded his punishment for the outrage. R. met with no pity from James, who had him beheaded on Tower Hill on Oct. 29, 1618. The 'time of execution was contrived to be on my Lord Mayor's Day, that the pageants and fine shewes might draw away the people from beholding the tragedie of one of the gallantest worthies that ever England bred' (Aubrey's *Letters*).

R. typified the spirit of his age and his career is a vivid illustration of the different facets which made up the Elizabethan court. It was primarily a courtier and a royal favourite. His important court connections made his voyages possible. Later ages over-emphasised R. the explorer. His achievements in this field were of less importance than those of the Cabots, and of Willoughby and Chancellor. The Victorians extolled him as the founder of empire, but his own age saw him more accurately as a spectacular favourite. It was not a good coloniser. Ideas came to him rapidly, fantastic, daring, and over-ambitious, but he lacked the staying power and capacity for organisation to bring them to fruition, and his voyages had little lasting effect on colonial life. His enterprise was little more than greed. Like all his contemporaries he saw colonies as a ground for immediate exploitation, and, when they yielded no gold, lost interest in them. In his attitude to Spain he was simply a splendid pirate, though, indeed, without such pirates

England might well have perished. R. was a man of his time, and should be judged accordingly. Gullibility and superstition blended with a scientific thirst for knowledge and a mature philosophy. Great ideas emerged momentarily, to be lost in the constant, hectic desire to gamble all and sacrifice all for quick results; for at the court from which he derived his existence quick results were essential to maintain his position. R. never had the genuinely sentimental hold on Elizabeth which Leicester and Essex possessed, and he lacked the diplomacy and apparent servility which enabled Hatton to survive. He could flatter, but he was too arrogant to keep up the continuous flow of exaggerated compliments which Hatton, Elizabeth's 'Sheep's lids' could sustain. R. played with Elizabeth's orders more than once, and lacked the sense to crawl back into favour. His outspokenness made him James's enemy, and his egotism, obvious greed, and magnificence made the court afraid of him. In the atmosphere of cut-throat competition which marked the Elizabethan and Jacobean court, R. could only survive by direct favour of the ruler, or by entering into the game of faction directed by the Cecils. He did neither, playing, after his introduction to court, a lone hand. Elizabeth tolerated him because in her struggle with Spain, he could be useful, but R. was merely a danger to James's peace policy, and he had too much pride to maintain himself when he had outlived his usefulness. Essex could rely on some support in London, but R.'s contempt for the people robbed him of popular affection. R. was a magnificent failure, his career illustrating admirably the complexities, dangers, and callousness of court life. He possessed in great measure the qualities demanded of the system on which he chose to hazard his future. He had the courage, brutality, and greed to make him both an explorer and a Sp. menace, and the splendour, intelligence, and a genuine thirst for knowledge demanded by Elizabeth of all her favourites, but he lacked adaptability. His downfall is proof of the strength and ultimate supremacy of the court system built up by Elizabeth and Burleigh.

Of his literary accomplishments mention has already been made above. The pure and nervous style in which *The Discoverie of Guiana* (1596) is written gives it an enduring charm. Camden characterises it as an elegant production and it attracted such attention when it first appeared that it was trans. into the prin. European languages. It was reprinted in Hakluyt's *Voyages* in 1598, in T. Brob's *Works of Raleigh* (1751), in A. Cayley's *Life of Sir Walter Raleigh, Knight* (1805), and in *The Works of Sir Walter Raleigh, Knight, now first collected, to which are prefixed the Lives of the Author by Oldys and Birch* (Oxford, 1829). A few years after the pub. of the original an abridged Lat. trans. appeared in 1599 in Nuremberg at the cost of the geographer Levinus Hulsius. A literal trans. is also contained in De Bry's *Collection of American Navigations and Voyages* which was

pub. in Lat., Ger., and Fr. (1590-99). The original text is reproduced in the Hakluyt Society's reprint (1848), ably ed. by Sir Robert H. Schomburgk (q.v.) with a biographical memoir. R. possessed great talent for poetry, and if he considered the exercise of it mere as light recreation, the contemporary criticisms of George Puttenham (q.v.) declare 'for ditty and amorous ode, Sir Walter Raleigh's vein most lofty, insolent and passionate.' His poems are, however, largely of a philosophic cast. The authenticity of some of the poems attributed to him has been questioned. One of the finest is that beginning 'Go, Soul, the Body's Guest'; another is the poem known as *His Pilgrimage*, and 'If all the World and Lovo were Young' is widely known. No collection of his poems was made in his lifetime or shortly after his death, the first collection being that of Sir Egerton Brydges (1813). It may be mentioned that Spenser committed the first three books of his *Faerie Queene* to the press under the encouragement of R. Among his other prose works are *A Report of the Truth of the Fight about the Isles of the Azores* and his *Journal* of his second voyage to Guiana, printed from the original Cotton MSS. in the Brit. Museum. See lives by W. Oldys and T. Birch (see above), and by P. Fraser Tytler, 1833; W. Stebbing, 1892; M. A. S. Huene, 1898; R. Rold, 1901; M. Waldmann, 1928 (new ed. 1943); E. Thompson, 1935. See also H. L. Stephen (ed.), *State Trials*, 1899; C. H. Firth, *Sir Walter Raleigh's History of the World*, 1919; V. T. Harlow, *Sir Walter Raleigh's Last Voyage*, 1932; I. Anthony, *Raleigh and his World*, 1934; and D. B. Quinn, *Raleigh and the British Empire*, 1949.

Raleigh, Sir Walter Alexander (1861-1922). Eng. scholar, b. in London, son of Dr. Alexander R., Scottish Congregational minister. Educated at Univ. College, London, and King's College, Cambridge, he was prof. of modern literature at Univ. College, Liverpool, of Eng. literature at Glasgow, 1890-1904, and Merton prof. of Eng. literature at Oxford from 1901. Amongst his writings are *The English Novel* (1891); *Robert Louis Stevenson* (1895); *Milton* (1900); *Wordsworth* (1903); 'The English Voyages of the Sixteenth Century' (in Hakluyt's *Voyages* vol. xii., 1905); *Shakespeare* (1907); *Romance* (1910); *England and the War* (1918); and vol. 1. of *History of the War in the Air* (1922). Knighted in 1911. See life by V. Crum, 1923; also H. W. Garrod, *The Profession of Poetry*, 1929, and D. MacCarthy, *Portraits*, 1931.

Raleigh, cap. of N. Carolina, U.S.A., and also of Wake co. It is a well-built town and has iron foundries, cotton underwear, and hosiery mills, railroad shops, overall factories, office and school furniture factories, fertiliser factories, and an important tobacco market. R. has the state college of agriculture and engineering, Meredith Baptist College, Shaw Univ., and other educational institutions. Pop. 46,900.

Rallentando (It. slowing down), musical

term for a gradual reduction in the speed of the music. The same instruction is also expressed by *ritenuto* (holding back) or *ritardando* (retarding).

Rallidæ, see RAIL.

Ram, see HYDRAULIC MACHINERY and PUMPS.

Ram, The, see ARIES.

Rāma, in Hindu mythology, the hero of the great Sanskrit epic, the *Rāmāyana* (q.v.), the Rāma-Chandra, or seventh incarnation of Vishnu. See *Rāmāyana*.

Rāmādan, ninth month of the Muslim year. It was in this month that Mohammed received the revelation of the Koran, and hence it is of peculiar sanctity. During R. strict abstinence from food, drink, perfume, smoking, etc., must be observed from sunrise to sunset, and the extra devotional practices include a complete reading of the Koran. Those whom such a strict fast might injure are exempt from it. The rules are given in the Koran.

Ramadie, tn. of Iraq, 59 m. N.W. of Bagdad, on the Euphrates. Turkish forces surrendered here, on Sept. 29, 1917, to Brit. troops under Gen. Maude.

Ramah, name of sev. places in Palestine, of which two (which may be identical) are important: (1) City of Benjamin, the traditional site of Rachel's tomb. (2) Bp. of Saul.

Raman Effect. When monochromatic light passes through a transparent medium the emergent beam consists of a mixture of light of the same wave-length as the incident beam, together with a small amount of scattered light of longer wave-length. This fact was first discovered in 1923 by the Indian physicist, Sir C. V. Raman, and is known as the R. E. It is not to be confused with the familiar phenomenon of fluorescence (q.v.), in which the wave-length of the emergent beam depends only on the nature of the fluorescent substance, not on the wave-length of the incident beam. In the R. E. the change of wave-length produced by the scattering of the light varies with the wave-length of the incident light. The effect is explained by the quantum theory (q.v.) of light as being due to a loss of energy of the light-quant of the incident light. The lost energy reappears as molecular energy of the scattering medium. The R. E. may be compared and contrasted with the Compton Effect (q.v.), where the scattering of hard X-rays by media of light atomic weight results in an increase of the wave-length of the emergent beam, but the loss of energy of the light-quant reappears as the kinetic energy of an electron knocked out of an atom of the scattering substance.

Ramanuja (d. c. 1137), Brahmin, founder of the Vaishnava sect, b. at Perambur, near Madras. He was buried in the great temple of Shrirangnath. He maintained the personal existence of a supreme deity.

Rāmāyana, one of the two great Sanskrit epics of anc. India, the other being the *Mahābhārata* (q.v.). The R. is believed to be the older of the two, and is the shorter; it differs from the *Mahābhārata* in that it is apparently the work of a single

mind, and not a compilation. It is attributed to Vālmiki, who seems, at any rate, to have been a real personage. The date of composition of R. is uncertain: the geographical, political, and social outlook of the poem suggest the fifth century B.C., but the general regularity of language and metre, and other facts, make it seem probable that the great poet who gave to R. its present form belonged to the second century B.C. A complete ed. of the older text was pub. at Madras in 1856, trans. into Eng. verse (1870-75) by R. T. H. Griffith and R. Duft in Everyman's Library and Temple Classics. The poem is held to typify the expansion of Hindu influence over the S. of India, although it seems a product of E. Hindustan. It celebrates the deeds of a certain king and his four sons and contains 48,000 verses. The central figure is Rāma-Chandra, a prince of the kingdom of Ayodhyā (Oudh). He wanders over the S. parts of India, and his wife Sītā is captured by Rāvana, a giant who rules over Ceylon. With the aid of Vibhishana, a brother of Rāvana, and Sugriva, king of the monkeys, Rāma conquers Ceylon, and recovers his wife Sītā. Finally he is restored to the throne of his ancestors in Ayodhyā. There are sev. Rāmas in Sanskrit literature; Chandra, the surname of the hero of the R., signifies the moon. See also *SANSKRIT LANGUAGE AND LITERATURE*.

Rambouillet, Catherine de Vivonne, Marquise de (1588-1665), b. at Rome, her father being Fr. ambas. there. In 1600 she married Charles d'Angennes, who became marquis of R. in 1611. About 1615 she started her famous *salon* at the Hôtel de R., to which all the greatest and most brilliant men in Paris flocked, and where were found also her successors in the literary *salon*, Mlle de Scudéry and Mme de Sévigné. Her influence was all for the refinement which degenerated in her successors into *préciosité*.

Rambouillet, tn. of France in the dept. of Seine-et-Oise, 20 m. S.W. of Versailles. There is a picturesque, anc., and formerly royal château, with beautiful parks. In 1830 Charles X. here signed his abdication. Pop. 7000.

Ramée, Louise De La, see OUIDA.

Ramés, Pierre de la, see RAMUS.

Rameses, name of sev. kings of anc. Egypt. **Rameses I.**, the founder of the nineteenth dynasty, lived about 1370 B.C.; he reigned only two years, and those were spent in severe fighting. **Rameses II.** (Osymandias), one of the most famous of Egyptian kings, the third of the nineteenth dynasty, was the son of Seti I. He reigned sixty-seven years, and during that time followed up the work begun by Seti I., and erected many monuments, his greatest achievements in architecture being the excavation of the rock temple of Abu-Simbel and the completion of the great hall of Karnak. He also enlarged and adorned the temple of Tanis, which contained a colossal figure (92 ft. high) of himself standing erect and crowned, sculptured in red granite. He was, too, a most successful warrior, his most notable campaign being against the Hittites. The great

battle of Kadesh, in which the issue was decided by his own personal courage, is celebrated in the epic poem of Pentaur. His oppressive rule, however, left Egypt impoverished and suffering from an incurable decline. *Rameses III.* (1225 a.c.), founder of the twentieth dynasty, was famous for his great victory over the confederation of people from Crete, Cyprus, Philistia, and the N. Mediterranean, who combined with the Libyans and attacked Egypt by land and sea. R. won the great naval battle near Pelusium, and also defeated the land force. His trading fleets were extremely successful, and considerably increased the commerce of Egypt. Nine other kings of the name of R. followed *Rameses III.*; they were not great men as far as we know, and the last of the name, *Rameses XII.* was entirely under the control of the priests. His son, Prince R., was probably murdered by the high priest, Ier-Hor, who seized the throne. *See Egypt, History.*

Ramganga, Western, riv. of India and a trib. of the Ganges. It rises in 30° 6' N. and 70° 20' E., and flows S.E. for 360 m., joining the Ganges, near Cawnpore.

Ramie, or China Grass, *see* BOEHMIA. **Ramillies**, vil. of N. Brabant, Belgium, 29 m. S.E. of Brussels. It was the scene of Marlborough's great victory in 1706. Pop. 640.

Ramleh ('the Sandy'), vil. of Palestine, 10½ m. S.E. of Joppa. Founded in the eighth century by the Ommayyads, it was taken by the crusaders in 1187, and became the headquarters of Richard Cœur de Lion. Its famous tower (the 'Tower of the forty Martyrs') is of Muslim origin, and dates from the fourteenth century. This tower was the minaret of a large mosque originally built by Khalif Suleiman, the founder of the tn. Pop. 15,200.

Ram Mohun Roy, Raja, sometimes **Rammohun Roy**, *see* BRAHMA, SAMAJ.

Ramnad, dist. and tn. of India, in the United Provs. The tn. has the palace of the raja of R. Area of dist. 4851 sq. m. Pop. 1,980,000; of tn. 21,400.

Ramnagar: 1. Tn. of India, in the United Provs., on the Ganges, 2 m. from Benares. Pop. 12,000. 2. Tn. of the W. Punjab, Pakistan, 63 m. N.W. of Lahore. Pop. 7000.

Ramón Y Cajal, Santiago (1852-1934), Sp. histologist and neurologist, b. at Petilla de Aragón. He was prof. of histology and pathological anatomy at the univ. of Madrid. R. y C. worked on the origin and termination of the olfactory nerve fibres, on the human cerebral cortex, on the structure of the sensory ganglia in man and animals, on the retina of the eye, and on the regeneration of nerves. His treatise in 3 vols., *Histología del Sistema Nervioso del Hombre y de los Vertebrados* (Histology of the Nervous System, in Man and Vertebrates), was pub. from 1897 to 1904. In 1906 he shared (with C. Golgi) the Nobel prize for medicine in virtue of his work on the histology of the nervous system. The horizontal cells of C. in the cerebral cortex, the olfactory area of P., the nucleus of C. (commissural nucleus), and

various staining methods are named after him.

Ramoth-Gilead (modern Reimun), vil. of Palestine, mentioned in the Bible as a tn. of Gad. It was a city of refuge.

Rampant, *see* under HERALDRY.

Rampart, *see* BASTION; FORTIFICATION.

Ramphastides, *see* TOUCANS.

Rampion, or *Campanula rapunculus*, biennial plant (family Campanulaceae), with long white radish-like roots which with the leaves were formerly and still are occasionally grown and used as a winter salad. The plant is a native of Britain, and bears small, pale blue flowers. Two other its, which occur in Britain are members of the genus *Phytuma*, of the same order.

Rampur, state of the United Provs. India, with an area of 892 sq. m., and watered by the Kosia and Nahul. The chief crops are maize, rice, and sugar-cane, and jewellery and pottery are made at the cap. R. Pop. state 477,000, tn. 89,300.

ALLAN RAMSAY, THE POET

Ramsay, Allan (1686-1758), Scottish poet, b. at Leadhills, Lanarkshire, settled in Edinburgh as a wig-maker, and soon had a business from which he derived a comfortable living. In the year he married (1712) he joined the Jacobite 'Easy Club', to the members of which he read poetry of his own composition. He then began to print his verses on single sheets, and found that there was a demand for them. About 1716 he became a bookseller, and began to publish his own writings. *Fables and Tales* and *A Tale of Three Bonnets*, a political allegory, appeared in 1722, *The Tea-table Miscellany* in 1724-27, and the pastoral drama, *The*

Gentle Shepherd, in 1725. After 1730 R. ceased to write. He ed. sev. vols. of old Scottish poetry. He wrote much that was charming if nothing that was great, and such pieces as *Bessy Bell* and *Farewell to Lochaber* will remain known. See lives by W. H. O. Smeaton, 1896, and B. Martin, 1931; also D. T. Holmes, *Lectures on Scottish Literature*, 1904.

Ramsay, Andrew Michael (1686-1743), Scottish writer and theologian, generally known as the Chevalier R., b. at Ayr and educated at Edinburgh. He went to France and formed the acquaintance of Fénelon, archbishop of Cambrai, who converted him to Rom. Catholicism. He became tutor to the duke of Châteaui-Thierry and afterwards to the prince of Turenne; and his reputation induced the Pretender, in 1724, to invite him to Rome, and to entrust him with the education of his children. The next year he revisited Scotland, where he remained some time, employed in literary labour. On visiting England he obtained the degree of doctor of civil law at Oxford, and was admitted a member of the Royal Society of London. After his return to France he was appointed intendant to the prince of Turenne, and he held this situation till his death, which took place at St. Germain-en-Laye. The writings of the Chevalier R. are more remarkable for purity of style than for depth or originality of thought. As a theologian he was visionary in the extreme, and his orthodoxy, even according to the principles of the Church he had adopted, is open to suspicion. His best-known works are *The Life of F. de Sales*, *de la Motte Fénelon* (1723) and *The Travels of Cyrus* (3rd ed., 1728), an imitation of the *Télémaque* of Fénelon.

Ramsay, Charlotte, see LENNOX.

Ramsay, Sir William (1852-1916), Scottish chemist, b. in Glasgow, only son of Wm. R., C.E., and nephew of Sir Andrew Crombie R., the geologist. He attended Glasgow Academy, then Glasgow Univ. till he was eighteen, and then went to Germany, to study chem. under Bunsen at Heidelberg and under Fittig at Tübingen. Returning to Glasgow in 1872, he was assistant at 'Young' Laboratory of Technical Chem. till 1874; tutorial assistant of chem., Glasgow Univ., 1874-1880; prof. of chem. in Univ. College, Bristol, 1880; principal in 1881; prof. of chem. in Univ. College, London, 1887-1913; and later prof. emeritus. He was early occupied in research in organic chem., but turned his attention to the physical side of chem., carrying out, while in Bristol, refined experiments on evaporation and dissolution in collaboration with Sydney Young. From this he pursued investigations into the molecular surface energy of liquids. After the discovery, by Lord Rayleigh, of the minute difference in density between atmospheric nitrogen and that prepared chemically, R., who had made the same discovery by different means, joined Rayleigh in research that resulted in the discovery of argon, a markedly inactive gaseous constituent of the atmosphere. This discovery they

jointly announced to the Brit. Association at Oxford, 1894. R. then investigated the inert gas contained in certain minerals, and in one (uraninite) he found helium, already spectroscopically discovered in the sun. Xenon, krypton, and neon, similarly inactive gases and present as traces in the atmosphere, were in turn discovered. In conjunction with Soddy, Collie, Cameron, Gray, and Roys, he carried on much research into radium emanation, and discovered that helium is a product of its disintegration. He was made a fellow of the Royal Society in 1888; K.C.B., 1902; and was awarded the Nobel prize in chem. in 1904.

Works, beyond those communicated to the Royal Society, Chemical Society, etc., include *System of Inorganic Chemistry* (1891); *The Gases of the Atmosphere* (the hist. of their discovery, 1896); *Modern Chemistry, Systematic and Theoretical* (2 vols., 1901, 1907); *Essays Biographical and Chemical* (1908); *Elements and Electrons* (1912). He was engaged in chemical work in connection with the First World War when he d., his fatal illness having been accentuated by his unsparring efforts in scientific work during the war. See life by Sir W. A. Tilden, 1918.

Ramsay, Sir William Mitchell (1851-1939), Brit. archaeologist and theologian; b. at Glasgow and educated at the univs. of Aberdeen, Oxford, and Göttingen. In 1882 he was made a fellow of Exeter College, Oxford; in 1885 prof. of classical art at Oxford; and in the following year prof. of humanity at Aberdeen Univ. He travelled much in Asia Minor, and was one of the foremost authorities on the Holy Land and the early Rom. Empire. The univs. of Oxford, Glasgow, and Edinburgh conferred honorary degrees on him, and he received medals from the Royal Geographical Society, the Royal Scottish Geographical Society, etc. He accompanied Sir Charles Wilson (then lately commissioned as consul-general for Anatolia, to supervise administrative reforms under the treaty of Berlin) into Anatolia and began to set the anc. geography of Asia Minor on a new basis. He made a European reputation by his articles in scientific periodicals. Among his works are *The Historical Geography of Asia Minor* (1890) (for which he was awarded, in 1906, the Victoria medal of the Royal Geographical Society, and, in 1907, the medal of the Royal Scottish Society); *The Church in the Roman Empire* (1893); *The Cities and Bishoprics of Phrygia* (2 vols., 1895-97); *St. Paul the Traveller and the Roman Citizen* (1895); *Impressions of Turkey* (1897); *Historical Commentary on Galatians* (1899); *The Education of Christ* (1902); *Studies in the History and Art of the Eastern Province of the Roman Empire* (1906); *The Cities of St. Paul* (1907); *The Revolution in Constantinople and Turkey* (1909); *Pictures of the Apostolic Church* (1910); *The First Christian Century* (1911); *The Imperial Peace* (1913); *The Bearing of Recent Research on the Trustworthiness of the New Testament* (1914); *The Making of a University* (1915); *Chapters from the*

History of Asia Minor (1924); and *Asiatic Elements in Greek Civilisation* (1927).

Ramsbottom, urban dist. of Lancashire, England, on the Irwell, 13 m. N. of Manchester. There are a number of industries, the chief being calico printing and bleaching, cotton-spinning and weaving, and paper making. Pop. 15,400.

Ramsey: 1. Seaport and popular holiday resort of the Isle of Man, on the N.E. coast, 14 m. N.N.E. of Douglas. The R. Sulby runs through the tn. and forms a harbour. R. exports farm produce. Pop. 4000. 2. Small tn. of Huntingdonshire, England, on the edge of the Fens, 11 m. N.N.E. of Huntingdon. Successive fires have destroyed nearly all trace of its antiquity. It owes its importance to the foundation of a Benedictine abbey here in 969 by Ailwyn, ealdorman of E. Anglia. The remains of the buildings are not extensive. The thirteenth century Lady Chapel, projecting eastwards from the site of the N. transept, is now the grammar school. It was converted into a house after the dissolution. There are the remains of a very fine fifteenth-century gatehouse, and the twelfth-century par. church was originally a guest-house or hospital attached to the monastery. Pop. 5200.

Ramsgate, par. and municipal bor., seaside resort, and mkt. ca. of E. Kent, England, situated on the S.E. corner of the Isle of Thanet, between the N. and S. Forelands. It is 4 m. S. of Margate and about 72 m. by road from London. The tn. has attained great popularity as a watering-place, its fine, firm sands and safe bathing rendering it suitable for family parties. Although the tn. faces southwards, the air is dry and bracing, yet with considerable natural shelter from rigorous weather. The rainfall is smaller than that of the great majority of meteorological stations in England. The tower of St. George's Church serves as a landmark for ships passing through the Downs. There are sev. other churches, colleges, etc., including a Benedictine abbey and school, a synagogue, and Townley Castle, a Jewish college; also St. Lawrence College (a boys' public school), and grammar, secondary, and primary schools. The harbour is noted as a yachting centre and rendezvous for light cruising craft.

R. is anct. in its origin. A primitive settlement is said to have once existed on the slopes leading to the sea. Many traces of Rom. occupation have in recent years been found in the bor. Five centuries later, about A.D. 455, the armies of Hengist and Horsa landed at Ebbsfleet, then a notable port. In A.D. 597 St. Augustine landed at Ebbsfleet, then on the coast line. The church of St. Lawrence, the original par. of R., built about a mile from the coast, was commenced in 1064 and named after Lawrence, who accompanied Augustine on his pilgrimage through Gaul and subsequently landed with him at Ebbsfleet. It was about this church that the first permanent settlement sprang up, and gradually extended to the sea. In the thirteenth century R. is spoken of as 'a

fairly populous and good class resort.' The popularity of R. as a fashionable watering-place grew, until in the eighteenth and nineteenth centuries the tn. was much patronised by royalty. E. Cliff Lodge was once the summer residence of George IV., and Albion House was once the residence of the duchess of Kent and later of Queen Victoria, her daughter. The Obelisk at the entrance to the E. pier of the harbour commemorates the return of George IV. from Hanover in 1821. The construction of the harbour was commenced in 1749-50 and completed in 1763 at a cost of £750,000, Smeaton being the engineer. A fishing fleet gradually came into existence, but scores of vessels were lost in the First World War, and were not replaced. Pop. (estimated) 35,000.

Ramus, Peter (Pierre de la Ramée) (1515-72). Fr. philosopher, humanist, and mathematician, b. in Picardy. His parents were extremely poor, and R. ran away to Paris, and at last entered the Collège de Navarre as a servant. When he presented himself for his degree he undertook as an exercise the task of showing that Aristotle was not infallible. This was the beginning of the anti-Aristotelian opinions by which R. gained his fame. In 1543 he pub. his new system of logic, with strictures on the logic of Aristotle. The king ordered his works to be suppressed, and forbade his teaching or writing against Aristotle on pain of corporal punishment. R. availed himself of his leisure to prepare an ed. of Euclid. In 1551 he was appointed prof. of philosophy and eloquence in the Collège de France. During the next ten years he pub. a Gk., a Lat., and a Fr. grammar, and sev. treatises on mathematics, logic, and rhetoric. R., who had embraced Protestantism, brought trouble upon himself by the zeal with which he advocated the new doctrines. He was driven from Paris sev. times, and in 1568 he went to Germany and gave lectures on mathematics at Heidelberg, where he made public profession of Protestantism. Shortly after his return to Paris he fell a victim in the massacre of St. Bartholomew. Although R. had many merits as a philosopher, he was wanting in depth and caution, and his strictures on Aristotle are by no means altogether just. He had many followers in France, England, and particularly Scotland. Andrew Melville introduced the logic of R. at Glasgow.

Rana, see FROG.

Rancagua, tn. of Chile, cap. of O'Higgins Prov., 160 m. S.E. from Valparaiso and 50 m. S. from Santiago. It is an agric. centre, and also serves the Tentén mining area. There are thermal springs in the vicinity. A battle fought in the streets in 1814 is its chief title to fame. Pop. 40,000.

Rancé, Dominique Armand Jean Le Bouthillier de (1626-1700), founder of the reformed Cistercian order of La Trappe (see TRAPPISTS) was b. of noble parents in Paris. Through the favour of Cardinal Richelieu he became canon of Notre Dame and prior of Boulogne. He was a favourite of Cardinal Mazarin, and lived a gay

life at court, but in 1662 resigned all his preferences, and retired to the abbey of La Trappe in Normandy, where he instituted the rigid discipline which distinguishes the order. He pub. an ed. of *Anacreon* with notes (1639); *Conduite chrétienne* (1697); and other religious treatises. See H. Brémond, *L'Abbe tempête*, 1929, and study by A. Cherel, 1930.

Ranch, or **Range**, name given to the vast areas over which sheep and cattle are grazed in the U.S.A. It is only in the W. that ranching is carried on, Texas, Kansas, Arizona, Colorado, Montana, Idaho, Arkansas, and New Mexico being the prin. states engaged. Cattle are kept in larger quantities than sheep, and that wild and picturesque figure, the cowboy, in his fringed 'chaps', sombrero, and revolvers, mounted on a bucking bronco, has become a familiar figure to Brit. cinema audiences. The Amer. Rs. are suffering from the effects of having been overstocked, and from the encroachment of cultivated land. The N. Amer. Rs. have their parallel in the *estancia* of S. America, in Uruguay, and the Argentine, and in the sheep 'stations' of Australia.

Ranchi, dist. and tn. in Bihar Prov., India. The tn. is the hot-weather seat of the prov. gov., and is situated in the Chota Nagpur div., 100 m. S.E. of Gaya. A trade is carried on in cotton goods, and there is a technical college, a missionary centre, and an Anglican diocese. Area 7159 sq. m. Pop. of dist. 1,875,400, of tn. 54,200.

Rand, or **Randt**, usual name of the gold-mining dist., situated on the Witwatersrand ridge, extending for about 120 m. at a distance of about 30 m. S. of Pretoria, Transvaal. The ridge forms the watershed between the Orange and the Limpopo; the word 'R.' is a Dutch word meaning 'edge', often used in S. Africa to describe a low range of hills. There has been much dispute over the question of the discovery of gold on the R., and recently a committee was appointed by the Commission for the Preservation of National and Historical Monuments to inquire into the facts. Summarised, the committee's findings were that one, Peter Jacob Marais, who had been a prospector in California and Australia, was the first person to find gold near the Witwatersrand. This was on Dec. 8, 1853, in the Jukskei R. Further, that the two brothers, H. W. and F. P. T. Struben, by their extensive prospecting and mining activities on the Witwatersrand, both N. and S. of the Main Reef Group of Conglomerates, from 1854 to 1856, attracted so much attention to this area that the subsequent discovery of the main reef became inevitable. The Strubens therefore made the greatest individual contribution to the discovery of the Witwatersrand goldfields. The Main Reef Group of Conglomerates was first found on G. C. Oosthuizen's part of the farm of Langlaagte shortly before the end of March 1886. This led directly to the prospecting contract of April 12, 1886. The find, which was accidental, was made

by George Walker, probably in association with George Harrison, but there is no record of either of these men having had assays made or milling done on the conglomerate, on which they subsequently pegged contract discoverers' claims. The Strubens were among the few pioneer discoverers, perhaps the only two, who profited by their discoveries; they were the original owners of the Crown mines, which became the largest gold-mine in the world.

The dist. having been made a public goldfield in 1886, the mining camp, at what appeared to be the richest point of the reef, sprang up on the bare veld. This was the site of Johannesburg. In a few years the representatives of the great financial interests had found their way to the new city. Lionel Phillips arrived on the R. in 1889. He was followed by others of his compatriots, notably Samuel Marks and Isaac Lewis, who were pioneers of manufacturing industry in the Transvaal. In an incredibly short time the corrugated iron sheds, which had theretofore encumbered the building lots of Johannesburg, began to give place to palatial buildings of marble and stucco. In 1889 the output of the goldfields was over 4,000,000 oz., and in 1904 over 3,500,000. In the latter year Chinese labour was introduced for mining purposes under an ordinance, with restrictive conditions, but in Dec. 1905 the granting of permits for their importation was stopped. Johannesburg remains the centre of the R. dist. but 'reef tns.', which were once mere suburbs of Johannesburg, have now become flourishing, independent tns., and four of them, Germiston, Benoni, Springs, and Krugersdorp, are among the first twelve tns. of the union. Until 1932 all the unrefined gold bullion produced from the mines of the R. was sent to England, and the refining done there, but in that year the mines decided to do their own refining, and the R. gold refinery was estab., Germiston being selected as the most central site in relation to the mines for its erection. Germiston has now become the largest railway junction in the Union, as well as the busiest airport, the R. airport there being the finest in the S. hemisphere. After Johannesburg Boksburg (named after the state secretary of the Transvaal Republic) is the oldest township on the R. Its importance was due to the discovery there, in 1888, of coal, which obviated the long haul from Natal and gave the gold-mining industry all the coal for power it needed. It was here that Montague White, mining commissioner for Boksburg goldfields, in 1888 constructed a lake and planted round it 40,000 trees, a veritable oasis in an otherwise ugly mine-scarred region. But the garden tn. of the reef is Benoni, with its gardens, avenues, parks, trees, and flowers, the work of Sir George Farrar. Within a 5-m. radius of Benoni are mines that produce nearly one-half of the R.'s gold output, and contribute more than £5,000,000 to the national revenue. Brakpan, another reef tn., was but bare veld twenty-nine years ago, and was first

laid out as a township in 1912 as part of Benoni. But the town which has developed still more rapidly is Springs, 6 m. beyond Brakpan. Its hist. goes back to 1883, and Ger. settlers seem to have played a big part in its settlement. Its site was noted for prodigious supplies of water and also for coal. The above are towns of the E. R. The towns of the W. R. include Langlaagte, Florida, Roodepoort, Randfontein, and Krugersdorp. At Langlaagte may be seen the homestead formerly occupied by the Oosthuizen, on which, as indicated above, gold and subsequently the reef were first discovered. The first of the

settlement was well understood by Cecil Rhodes, and utilised to promote the opening up of the tropical land N. of Cape Colony and the Transvaal.

The ore from which the R. gold is extracted is a conglomerate known as banket. In 1947 53,712,300 tons of ore were crushed, yielding 11,197,638 oz. of gold or 3.982 dwt. per ton valued at £92,740 023. The most successful year was 1941, when 67,255,450 tons of ore were crushed, yielding 14,039,912 oz. valued at £116,978,499. Some mines go to a depth of nearly 10,000 ft. The gold mines are a rapidly wasting asset,

BENONI MAIN STREET

South Africa in Ruessays

large scale exploiters was J. B. Robinson (later knighted), who purchased land to the W. of Randfontein for £26,000, which eventually was worth £18,000,000. After him came Rhodes, Beit, and Barnato. Rhodes is said to have received between £300,000 and £400,000 a year from the goldfields after they had been in existence only ten years. In the long run the gold mines have probably harmed agriculture by offering higher returns for transport driving, and attracting young men away from the land. The immediate effect, however, was to provide new markets for agric. products, and to link up the outlying districts by railway connection with the R. The mining industry has, moreover, supported a higher standard of living throughout S. Africa, whilst the accumulation of wealth has made possible the endowment of univs. The intimate connection between the mining of minerals and the development of European

and they will probably cease to contribute materially towards the revenue of S. Africa after no great number of years, but in Oct. 1932 geologists using the new methods of magnetic measurement, were able to announce that they had traced the westward extension of the main reef in this new area some 40 m. beyond its previously known limit. The value of the reef in this new area was tested by the sinking of boreholes and has given good results in the Orange Free State. If results continue to be favourable the opening up of an immense new area will safeguard the mining and industrial supremacy of the R., and probably lead to a new era of S. African prosperity.

See H. Gilver's *Out of the Crucible*, 1932; W. Macdonald, *Romance of the Golden Rand*, 1933; G. S. Preller, *The Argonauts of the Rand*, 1935; A. Macmillan, *Environ of the Golden City and Pretoria*,

1936; and F. Brett Young's novel, *The City of Gold*, 1939.

Randall, James Ryder (1839-1908), Amer. writer, b. at Baltimore. He began life as a journalist, and during the civil war in America turned his attention to composing the words for popular songs, among them being *Maryland, My Maryland*, his most famous.

Randazzo, tn. of Sicily, in the prov. of Catania, 26 m. N.N.W. of the tn. of Catania. It is situated at the N.W. base of Mt. Etna, 2474 ft. above sea level. Its old ducal palace is now a prison, and there are anct. fortifications. The tn. suffered severely in the invasion of 1943; many of its medieval houses were reduced to ruins, and the churches of S. Maria, S. Nicola, and S. Martino were all badly damaged. Pop. 13,700.

Randers, tn. of E. Jutland, Denmark, and cap. of the co. R., on the Gudon-Aa. It possesses a medieval monastery, and there are manufs. of gloves, etc., railway carriage works, and distilleries; dairy produce is exported. Pop. 30,000.

Randfontein, tn. in the Union of S. Africa, in the Transvaal, 23 m. from Johannesburg. It is one of the Witwatersrand 'gold towns'; there are some old estab. mines near the tn. and sev. new ones in the area. Pop. 32,200.

Randolph, John, of Roanoke (1773-1833), Amer. politician, b. at Cawsons, in Virginia, was descended from the Indian princess Pocahontas. He was in the National House of Representatives as a Republican, 1799-1813, in 1816, from 1819 till 1825, and again from 1827 till 1829; and in the Senate from 1825 till 1827. He was chairman of the committee of ways and means from 1801 till 1807. In 1826 he fought a duel with Henry Clay, but later they became firm friends. R. entered Congress when hardly more than a boy, and as a wit he has not often been surpassed in Congress. He was opposed to slavery, and freed his own slaves by his will. See lives by H. Adams, 1882, and W. C. Bruce, 1923.

Randolph, Thomas, first Earl of Moray (d. 1332), Scottish soldier and statesman, only son of Thomas R. of Nithsdale and Lady Isabel Bruce, sister of King Robert the Bruce. After the murder of Red Comyn, R. joined Bruce, 1306; in the same year he was made prisoner by Aymur de Valence at Methven, and his life was spared by his swearing fealty to Edward I. of England. He fought against Bruce, and in 1308 was captured by Sir James Douglas. His uncle, the Bruce, pardoned him, and, in 1314, created him earl of Moray and lord of Man and Annandale. In the same year he accomplished a brilliant feat of arms, the taking by surprise of Edinburgh Castle at night with thirty followers who scaled the rock by a secret path. At Bannockburn (1314) R. commanded a part of the Scottish Army, and in 1315 he distinguished himself in the expedition to Ireland by his courage. Returning to Scotland with Sir James Douglas, he seized Berwick. He was one of the ambas. sent to conclude peace with England. On the death of Bruce in 1329

he was appointed regent and guardian of David II., and died while preparing to drive back an invasion of the Eng. barons.

Randwick, metropolitan municipality of Sydney in Cumberland co., New S. Wales, Australia. It is situated 3 m. S.E. of the city of Sydney. Pop. (1939) 85,000.

Ranelagh: 1. Building erected at Chelsea in 1742 on a plot of ground which had belonged to the earl of R. The structure resembled the Pantheon at Rome, being a wooden rotunda built to accommodate some 6000 people. During the eighteenth century it was a popular pleasure resort and place of entertainment; the tea gardens were frequently visited by Johnson, Reynolds, Goldsmith, Walpole, and other notables. From 1788 it declined rapidly, and was demolished and the gardens closed in 1804. 2. Celebrated club at Barnes, on the S. bank of the Thames, founded in 1894, which now bears the name of R. It is famous for its polo matches.

Range, see RANCH.

Rangefinders, or **Telemeters**, instruments devised for calculating the distance of an object with the minimum of trouble in measuring a base. Fig. 1 shows the principle involved. If O be the observer, P the point whose distance OP is required, a base line OA is measured, 60 to 120 yds., so that the angle PAO is a right angle; an object C is observed at right angles to OA and the angle COP measured; since this equals the angle P, the triangle PAO is known and therefore the distance OP. Another method measures OD, a shorter base of some 6 yds. at right angles to AO and observes the angle OAD, from which AO is known and OP found as before. $OP = AO \cdot \csc \angle OPA$, or in the second

FIG 1.
PRINCIPLE OF RANGEFINDER

case (1) $\cot \angle OAD \cdot \sec \angle POA$. The rangefinder is of great importance in the navy and army, as well as being of service in surveying, and ease and rapidity of use are obtained by constructing an instrument on the principle of the sextant for observing the angles; the readings are, by suitable mechanism and graduations, given directly in yards. In the Labbez telemeter, observations are made at either end of a base line, coincidence of image being obtained by rotating a small toothed wheel and the milled end of the instrument respectively, the distance in yards being read on the barrel opposite a mark on the milled head; a base of 20 yds. is required, the range varying from 250 to 3000 yds. The Dredge-Steward omni-telemeter is a modification of the box sextant; at zero the mirrors are at an angle of 45° , and both are adjustable;

a table of distances for a calculated base of 50 yds. is read in connection with the turning of a micrometer screw.

Fig. 2 illustrates in a simple way the principle of the Watkin rangefinder, once

FIG. 2

PRINCIPLE OF WATKIN RANGEFINDER

used in the army. M, a fixed glass, half mirror, half transparent, allows a view of the point P whose range is required to be taken from O, the observer; the second object Q reflects from the mirror N carried firmly on the arm AB, both mirror and arm being pivoted so that Q may be aligned with P by a movement of the arm. This is obtained by turning the screw S which presses on another pivoted arm CD, thus urging the sliding collar K against A. A. CD is graduated so that K may be adjusted according to the length of the base line measured. The image Q being brought into coincidence with P, an index on the screw collar points out the range in yards, marked on the screw. With base (Fig. 1) AO = 60-130 yds. and (1) = 6 yds., ranges up to 500 yds. may be read; with OD = 12 yds. it will read up to 8000 yds., with an error not exceeding 2 per cent under conditions of well-selected bases.

The Monostatic Telemeter.—The monostatic telemeter has a very short base.

FIG. 3

PRINCIPLE OF MONOSTATIC TELEMETRIC

Left, Point A at infinity.

Right, Point A at a finite distance.

which is part of the instrument itself with a single screw at the observation post. This telemeter is the outcome of a series of instruments whose developments had their beginning in the bistatic telemeter

with horizontal base. The following equation will illustrate the principle: Let us suppose that there are two identical binoculars whose axes, in a horizontal plane, are parallel and at a distance b from each other. In Fig. 3 these two binoculars are represented by their objectives L_1 and L_2 , and the focal planes of these objectives by P_1 and P_2 . Let w_1 and w_2 be the points of junction of each optical axis with the corresponding plane, these points being in the focal planes. A point A at infinity in the common direction of the two axes gives in each of the binoculars an image coincident with w_1 and w_2 . If the point is in A', to infinity, in a different direction from that of the axes, it gives two images a'_1 and a'_2 , and it is evident that $w_1a'_1$, $w_2a'_2$. In the right-hand figure a point A is given at a finite distance. Let D be the distance of this point from the vertical plane containing the two objectives. This point gives in each binocular an image a_1 and a_2 and accordingly we get the properties of like triangles:

$$\begin{aligned} b_1 &= \frac{w_1 a_1}{f} \\ b_2 &= \frac{w_2 a_2}{f} \end{aligned}$$

meaning by f the common focal point of the two objectives. The monostatic telemeter is of great service to the surveyor, engineer, and explorer, for speedy measurement of distances.

Up to the Second World War it was regarded by experts as indispensable in naval and land warfare and anti-aircraft gunnery. The basic principle as generally adopted by then was the invention of Barr and Stroud. The first of their B. were for naval use and had a base of 3 ft. in the Second World War their largest naval R. had a base of 12 ft. Their land instruments comprise portable, mobile, and fixed-position types and are of various bases from 8 in. to 100 ft. The Coincidence rangefinder produces, in the field of view of a single central eyepiece, two images of an object formed by rays entering the two ends of the instrument. Such images are separated usually by a fine horizontal line. Separation may be effected: (1) by refraction through the faces of a bi-prism, intersecting at an obtuse angle in a very fine edge which is in the focus of the eyepiece or (2) by reflection, with or without the use of silvered surfaces. Coincidence of the images is obtained by means of a refracting prism of small angle, placed in the beam between the central prism combination and one of the end prisms. Movement of the refracting prism in the rangefinder tube displaces one image relatively to the other; when the prism is adjusted to give coincidence a scale moving with it indicates the range. Various forms of coincidence field of view are in use, having erect or inverted or inset strip images. The latter type is particularly useful in anti-aircraft observation, enabling the whole field to be used for following the target while the strip

FIG. 4
ELEMENTS OF COINCIDENCE RANGE-FINDER

Image is moved across the main image for the measurement. In some cases vertical base R. have been used, these having a vertical separating line in the field of view.

In Stereoscopic R. there are two eyepieces, through which the observer's eyes view the images formed respectively by the two ends of the range-finder. These images are combined in the brain to form a single image having apparent depth in space, the impression obtained being similar to that in ordinary binocular vision with the unaided eyes. In the range-finder, however, stereoscopic relief is exaggerated, because of optical magnification and the difference in optical base of the range-finder and of the observer's eyes. A fixed reference mark is usually provided in each field of view and the range-finder so adjusted that, when the two fields are observed together, the mark appears at an infinite distance; the image of an infinitely distant object (say a star) will then appear to be at the same distance as the mark. To see a nearer object stereoscopically the eyes of the observer must converge and the image will appear stereoscopically to be nearer than the mark. By movement of a refracting prism, similar to that in Coincidence R., the object is made to appear equidistant with the mark and a scale associated with the prism indicates range. To assist the observer to a proper mental attitude for stereoscopic measurement it is usual to provide, in addition to the reference mark, a series of subsidiary marks which appear at different depths in space. Only the prin. mark, however, is used for range measurement. Some Stereoscopic R. dispense with movable parts. A series of marks, say A, B, C, etc., appears in one field, and a corresponding series, a, b, c, etc., in the other. Pairs Aa, Bb, etc., are so disposed that Aa, seen stereoscopically, appear to represent a single mark at, say 1000 yds., Bb one at 1100 yds., and so on. By observing the target image stereoscopically its position with reference to the index marks can be determined. This method is not so accurate as the moving image type, but is useful for certain purposes.

The accuracy of a range-finder depends on base, magnification, and the observer's visual acuity; the error at any range is also proportional to the square of the range, e.g. at 2000 yds. is four times the error at 1000. In general the parallax

FIG. 5
TYPICAL FORMS OF FIELD OF VIEW
RANGEFINDERS

Left, In coincidence. Right, Out of coincidence.

angle to which a modern large range-finder has to work is $\frac{1}{2}$ second, or the angle subtended by a penny at almost 8 m. Accuracies of Stereoscopic and Coincidence R. are comparable, and, on the basis quoted, the probable error at 10,000 yds. with a range-finder of 5 yds. base and magnification 28 is within $\frac{1}{2}$ per cent.

In A.A. gunnery target height is obtained automatically from slant range and angular elevation of the range-finder. Sev. types of range-to-height conversion systems have been used. Optical R. are naturally limited to conditions of reasonable visibility and cannot be used in fog or through clouds, while at night they require the aid of searchlights

Larr and Stroud
12-FOOT BASE STEREOGRAPHIC HIGH-
ANGLE RANGEFINDER

The eyepieces are fixed in elevation as the range-finder is elevated. It is mounted on a naval anti-vibration mounting.

Range-finding by Radar (q.v.), however, has in the last ten years been developed to a high degree of accuracy, and is only dependent upon the object whose range is to be measured, reflecting sufficient of the transmitted radar pulse to operate the detecting equipment. Short pulses of radio signals of about one μ s. (micro-second) duration and repeated a thousand or more times a second are transmitted by directional aerials (q.v.) towards the target. Simultaneously with the transmission of a pulse a time base circuit is triggered at the receiving equipment which causes the spot on a cathode-ray tube (see VALVES) to commence its travel

across the screen, which it does at an accurately determined speed. The echo pulse reflected from the target is made to deflect the cathode-ray tube trace, and the point at which this occurs along it is a direct measure of the time taken by the pulse to travel to the target and back and, as the speed of propagation is constant (186,000 m. per sec.), the range can be determined (i.e. a pulse travels 186,000 m. per sec., equivalent to 327.36 yds. per μ s.). But it does the double journey in practice, so that the range represented by μ s. of time is approximately equivalent to 164 yds. An accuracy of 25 yds. is easily attainable up to 15,000 yds., and ranges of 100 m. or more can be determined by this method.

Ranger, formerly in England a sworn officer of the forest appointed by the king to watch the deer and prevent theft, etc. The term is now applied to a gov. official connected with public parks and forests. A robber was also sometimes called a R., as he 'ranged' for plunder, whilst the name is also given to a dog who ranges over the ground. Irregular mounted troops were also called Rs. (cf. Connaught Rs.). In the Amer. Army commando troops are called Rs. The R. is also a senior grade in the garrison movement.

Rangoon, cap. of Burma, on the l. b. of the Rangoon R., 21 m. from the sea. Within the last century it became the third seaport of importance in Brit. India. The whole trade of the delta of the Irrawaddy concentrates here. The riv. is navigable for 900 m., and for some distance from the mouth is over 1 m. in width and excellent for shipping purposes. The rice exported before the Second World War averaged 2,000,000 tons per annum; timber and petroleum are next in importance. The city is dominated by the great pile of the Shway Dagon pagoda (the religious centre of Burmese life), covered with pure gold. R. passed, with the prov. of Pegu, into Brit. hands in 1852. It possessed two cathedrals, and every kind of mosque, church, temple, pagoda, and synagogue, but a great many of these have been wholly or partly destroyed. There was a gov. college and two non-conformist colleges. The teaching univ. of R. was constituted in 1920, with two art colleges. Before the Second World War the water supply and drainage had been improved, but the general death-rate still remained rather high. R. was bombed by the Jap. on Jan. 4, 1942, their advance in Burma led to the complete civilian evacuation of the city being ordered within two days (Feb. 21-22); the city was abandoned by the Allies on March 7. Jap. forces occupied R. on March 8, 1942, but after the total defeat of Japan in Aug. 1945 the Brit. governor returned to R. on Oct. 16 and the civil administration of Burma was resumed from that date. (For details of military operations see BURMA, SECOND WORLD WAR CAMPAIGNS IN.) Approached from the air in 1946, R. seemed at first glance not to have suffered excessively, but closer inspection on foot revealed a different and hideous picture. Along the waterfront

round the main station the devastation was complete. Acres of formerly dense housing had been wiped out and were no longer even rubble. Elsewhere structure after structure, superficially perhaps almost intact, were found to be unusable shells, their insides looted and charred. Probably about 80 per cent of the tn. needed to be rebuilt. Pop. (1940) 400,000.

Rangpur, cap. of the dist. of the same name, E. Bengal, Pakistan, 240 m. N.E. of Calcutta. Tobacco, jute, and rice are produced. Area of dist. 3606 sq. m. Pop. 2,877,900; tn. 34,000.

Ranjit Singh (1780-1839), 'the Lion of the Punjab', a native Indian ruler and founder of the Sikh kingdom in the Punjab, laid the foundation of his power when he obtained Lahore from Zaman Shah in 1799. In 1809 he made a treaty with the Brit. whose power he recognised and to whom he was always faithful. His ideal was realised by 1820, when the Punjab, from the Sutlej to the Indus, was consolidated under his rule. In 1833 he obtained the Koh-i-noor diamond from Shah Shuja.

Ranjitsinhji, Kumar Shri, H.H. Maharaja Jam Sahib of Nawanagar (1872-1935), Indian prince and famous cricketer, b. at Sarodar in the prov. of Kathiawar. He was educated at Rajkumar College, Rajkot, India, and Trinity College, Cambridge. He represented his univ. at cricket, and on joining the Sussex Cricket Club in 1895 was head of the co. averages for that year and until 1902. In 1896 he was head of the batting averages for England (aggregate runs 2780, average 57), and again in 1900 (aggregate 2563, average 83). In 1897 he accompanied Stoddart's team to Australia. His batting was remarkable for its extreme grace and ease, whilst the excellence of his 'leg-slide' has never been surpassed. He had been adopted by his uncle, Jam Shri Siv Vibhaji Sahib of Nawanagar, but the adoption had been set aside in favour of a son with the sanction of the Brit. Gov. The son, however, d. in 1906, and R. succeeded to the throne. He wrote *The Jubilee of Cricket* (1897). R. served in Europe in the First World War. See life by R. Wild, 1934.

Rank, Joseph Arthur (b. 1880), Brit. financier and film magnate, b. at Hull and educated at Leys School, Cambridge. He became joint managing director of Joseph R. Ltd., the flour-milling business estab. by his father, Joseph R. (d. 1943). He is chairman of the Brit. film exhibition and production organisations of the J. Arthur R. Organisation, Odeon Theatres, Gaumont Brit. Corporation, Denham and Pinewood Studios, and Alliance Productions. Also head of the General Cinema Finance Corporation Ltd.

Ranke, Leopold von (1795-1886), Ger. historian, b. at Wiehe, Thuringia, studied at Halle and Berlin, and in 1818 became a schoolmaster at Frankfurt-on-Oder. He was prof. of hist. at Berlin during 1825-1872, and examined the archives of Vienna, Venice, Rome, and Florence during 1823-1831. He ed. the *Historische Politische*

Zeitschrift, of which he wrote a considerable part, and in 1841 was appointed historiographer of Prussia. His numerous works include *Die römischen Päpste im 16. und 17. Jahrhundert* (1834-39); *Deutsche Geschichte im Zeitalter der Reformation* (1839-47, critical ed. by P. Joachimimsen, 1925-26); *Französische Geschichte im 16. und 17. Jahrhundert* (1852-68), 1876-77; *Englische Geschichte im 16. und 17. Jahrhundert* (1859-68, 1877-1879); *Deutsche Geschichte von 1780-90* (1871-1872); *Zwölf Bücher preussischer Geschichte* (1874, 1878-79); *Weltgeschichte* (to the death of Otto the Great, continued by others to 1450, 1881-88, 5th ed. 1922). See collected works in 54 vols., 1867-90, new ed. by P. Joachimimsen, 1925 ff., selection by L. von Muralet, 1945. See also bibliography (1910) and life (1921) by H. F. Helmolt, E. Fueter, *Geschichte der neueren Historiographie* (3rd ed.), 1936; F. Meinecke, *Leopold von Ranke: Gedächtnisrede*, 1936, and *Vom geschichtlichen Sinn*, 1939; and G. P. Gooch, *Studies in German History*, 1949.

Ranke, Sir George, see ASKWITH.

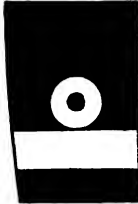

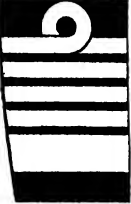

Ranget, see RACKET.

Rankine, William John Macquorn (1820-72). Scottish engineer and physicist, b. in Edinburgh. He was elected a fellow of the Royal Society in 1853 and prof. of civil engineering at Glasgow in 1855. He may be considered one of the founders of the science of thermo-dynamics. He pub., besides other works, *Manual of Applied Mechanics* (1858); *Manual of the Steam Engine* (1859); *Manual of Civil Engineering* (1862).

Ranks. Rank is the particular station occupied by a class of persons in a society, or degrees in a hierarchy. It is generally of two kinds, 'official' and 'social'; an example of social rank is the difference between citizens and subjects in the Rom. Empire. In modern times only official rank survives in Europe, notably in the armed forces of govts. Rank is here considered only in regard to male members of the R.N., army, air force, police, and fire services. R. in Queen Alexandra's Imperial Nursing Service are given under **MILITARY NURSING SERVICE**.

IN THE NAVY. Officers who enter the navy as such rise from cadet to midshipman, sub-lieutenant, lieutenant, lieutenant-commander, commander, captain, rear admiral, vice-admiral, admiral, admiral of the fleet. Time as sub-lieutenant varies from sixteen to twenty-eight months and depends on the number of first-class certificates awarded in examinations to lieutenant (see **NAVAL EDUCATION**). Thereafter promotion is automatic to lieutenant-commander after eight years' seniority as lieutenant. Promotion to commander and captain is selective for those of two to eight years' and four to eight years' seniority respectively in the previous ranks for executive officers. In other branches (engineering, supply, etc.) these zones for promotion are slightly different. All such promotions are promulgated on June 30 and Dec. 31 each year. For flag rank, officers are selected from the top five years of the

captains' list, which means, in practice, that the majority are promoted in their last and eighth year as captain. Others not promoted are compulsorily retired with pension as follows: lieutenant-commander at age of forty-five, commander at age of fifty, and captain on reaching eight years' seniority. The rank of commodore (first or second class) is a temporary rank given to senior captains when holding particular posts, e.g. commodore of barracks, chief of staff to an important commander-in-chief, etc. A limited number of men are promoted to sub-lieutenant by selection and examination from able seaman, in which rate they must have served nine months and be under the age of twenty-three, a limit which was to be reduced to twenty-two and a half in Nov. 1950. Of the above ranks that of admiral (g.r.) is one of the oldest and appears in Eng. records in the year 1300. It was first personal to the official in supreme command of all naval forces but by 1311 became general for officers in command of fleets. At about this time, also, the rank of captain came into use, though records indicate that Edward the Confessor's prin. ship carried a rector or captain—apart from the 'bat-suen' (boatswain)—who, in those days, commanded the crew in action, acting as master, pilot, or steersman. When first introduced, the precise duties of a captain were uncertain, but they were later defined as the supreme command of a ship, although the navigation and handling was left to the master. The rank of lieutenant was introduced in 1580 with the object of providing the captain with an assistant combatant officer qualified to take his place on occasions, and also to form a body of trained sea officers from whom the captains of the R.N. might be drawn. At first there was only one lieutenant for each ship and the captain chose him from among his personal friends. Midshipman as a grade was also used at this time and men were so called because they represented that part of a ship's company who worked between the main and mizzen masts. They were not given a special uniform until 1748, although in the reign of Queen Elizabeth they formed the basis of a scheme for 'breeding officers and gentlemen who should also be seamen.' Charles II. laid down, among other qualifications for the rank of lieutenant, that three years' service, including one as a midshipman, was essential. He also ruled that no person could become a captain until he had passed for lieutenant. The rank of sub-lieutenant was originally created by Lord St. Vincent in 1802 for those deserving officers who had served their time and passed for lieutenant, but for whom there were no vacancies. Indeed many officers never rose above the rank of midshipman. The rank of commander is of comparatively recent date, and that of lieutenant-commander for a lieutenant of eight years' seniority was not estab. until the middle of the First World War. The title naval cadet was substituted for that of volunteer in 1844. Before the estab. of the rank of lieutenant

SOME BADGES AND MARKS OF RANK IN THE ROYAL NAVY

The style of interlaced and wavy bands shown for lieutenant (R.N.R.) and lieutenant commander (R.N.V.R.) are worn by all officer ranks of these reserve forces. The badges in the two lower lines are of non-substantive ranks of these only a few are shown.

the only other officers in a ship were those who had received warrants from the Admiralty or Navy Office to act as master, purser, surgeon, boatswain, gunner, carpenter, cook, etc. These warrant officers formed an advisory board to the captain and wielded considerable power, the boatswain and gunner being, next to the captain, the chief fighting officers of the ship. They were, in fact, known as the 'standing officers' of the navy. As lieutenants grew in numbers and importance, the status of warrant officers declined and, in the reign of William III., their powers and privileges were much curtailed. Later, in the late eighteenth century, the master (who corresponds with the navigating officer of to-day), the purser (corresponding to present-day supply officers), and the surgeon were absorbed into the wardroom and became commissioned, while the remainder formed the basis of the modern warrant officer grade. There is thus no analogy with the naval warrant officer in either of the other two services and, to overcome the misunderstandings that arose over their status *vis à vis* the army and R.A.F., an order was issued in March 1949 that they were to be known henceforth as 'branch' officers. These officers include the commissioned shipwright, gunner, boatswain, engineer, writer, etc., and are selected from suitable ratings between the ages of twenty-five and thirty-four who pass the necessary qualifying examinations in their particular branch. A branch officer of ten years' seniority automatically becomes a senior commissioned gunner, etc., and further promotion is by selection. Branch officers, however, can receive direct promotion to lieutenant after three years' seniority so long as they are under the age of thirty-five, but must be qualified to carry out the more general duties of that rank, as opposed to the narrow limits of their specialised branch, if they are to be selected. Ratings (other than artisans) are entered as boys or ordinary seamen (ordinary signalmen, stokers II., etc.) if over the age of eighteen. On passing the necessary tests they are rated able seaman (signalman, stoker I., etc.). Promotion to the leading, petty officer, and finally the chief petty officer rates is first by examination and recommendation. Names are then placed on depot rosters for promotion as vacancies occur. Captains of H.M. ships, however, can authorise temporary promotions under certain circumstances. They also have the power to disrate for serious offences. Artisan ratings, when qualified, automatically acquire the rate of petty officer at the age of twenty-one.

IN THE ARMY. The use of titles denoting military R. with their present meaning is comparatively modern, only captain having been used in late medieval times to denote as now the commander of a company, which was the largest permanently organised body of professional soldiers that existed up to Elizabethan times. The captain's deputy was called lieutenant, like any other deputy, and for a long time had to be

particularised as lieutenant-captain. Next below him ranked the ensign or ancient, vulgarly known as the 'rag-carrier,' which sufficiently explains his duties in action. This rank still exists in the Brigade of Guards, where it corresponds to the second lieutenant of other arms. The equivalent rank in the cavalry up to about 1812 was 'cornet,' now totally obsolete. Sergeant in its military sense also dates from the Middle Ages and originally meant one whose feudal tenure of land obliged him to follow armed the tenant-in-chief to the field. It acquired the sense of one deputed to enforce discipline. As the unit of trained soldiers became larger, the chief sergeant of a regiment was called the sergeant-major, and at the time of the Civil War this officer ranked above captain and fulfilled the duties of the modern adjutant. Then the word was taken to mean the disciplinary chief of a company, and the corresponding officer of a regiment was called simply major. The whole force at this time was administered by the sergeant-major-general, now abbreviated to major-general, under the command of the captain-general (now simply general) whose deputy was the lieutenant-general. Colonel originally meant the commander of a column (of companies), and in the seventeenth century his primary function was to recruit and pay a regiment which would be named after him (e.g. 'Kirke's Lancers'). As the colonel might at the same time be a general, actual command of the regiment or its battalions if there were more than one was exercised by the lieutenant-colonel. This is the origin of the modern custom of appointing honorary colonels of regiments.

A relic of the condottieri (mercenaries, usually Eng. or Ger., in the service of the It. city-states) is found in the title corporal, an officer of the lowest rank commanding a small body ('corpo') of men, and in the prefix lance- (from an It. word meaning veteran). Lance-corporal thus meant a senior soldier acting in the place of a corporal, and lance-sergeant a senior corporal doing duty as a sergeant. In the Household Cavalry sergeants are known as corporals of horse and warrant officers (see below) as corporals-major.

Army rank is of the following qualities: *Substantive*, which is absolute. *Brevet*, which has the security of tenure of substantive, but it does not carry the pay of the higher rank, e.g. a sub-captain with the brevet of major is paid as a captain; brevet rank is somewhat in the nature of reward for good service and appears in the new year and birthday honours list half-yearly; it is essentially a peacetime institution and usually means that an officer cannot be promoted to the rank which his seniority and proficiency deserve, because owing to restricted establishment the appointments which go with the rank do not exist. *Temporary*: This is usually granted to an officer when holding an appointment usually held by an officer whose rank is higher than his own. *Acting and Local*: These are variants of temporary, but not so permanent; they

are usually granted to meet situations where an estab. must be completed quickly and is of short duration. *Honorary* carries the privileges (generally) but not the pay of the rank. It was formerly granted to bandmasters, quartermasters, etc., while serving, but now applies only to reserve and retired officers. Officers' substantive ranks and second lieutenant, lieutenant, captain, major, lieutenant-colonel, colonel, major-general, lieutenant-general, general, field marshal—promotion to these ranks is notified in the *London Gazette*.

There are at present two grades of warrant officer, holding their rank by virtue of a warrant signed by the secretary of state: warrant officers class I and class II. For a short time up to 1941 there were also warrant officers class 3, who commanded platoons or equivalent sub-units (platoon sergeant-major or troop sergeant-major).

Non-commissioned R. are those below warrant rank and above private (or trooper, guardsman, rifleman, fusilier, marine, gunner, sapper, signaller, driver, craftsman, etc., according to arm of the service). They are corporal, sergeant, and staff-sergeant.

The King's Regulations lay down the precedence of the various R. and the table of comparative rank in other services. The pay warrant lays down the pay and pension for each rank and in many cases the conditions of promotion. Originally the military R. corresponded exactly to the appointments or functions discharged by their holders. But as military organisation became more complex the variety of appointments greatly exceeded the number of R. As an example of modern practice in the Brit. Army, the following list of the estab. of an infantry battalion shows the R. held by commanders and staff: Battalion: commanding officer, lieutenant-colonel; second-in-command, major; adjutant, captain; quartermaster, captain; medical officer, captain; regimental sergeant-major, warrant officer, class I; quartermaster sergeant, warrant officer, class II. Company: commander, major or captain; second-in-command, captain; sergeant-major, warrant officer, class II; quartermaster-sergeant (colour-sergeant), staff-sergeant. Platoon: commander, lieutenant or 2nd lieutenant; second-in-command, sergeant. Section: commander, corporal; second-in-command, lance-corporal. It will be seen from this list that though the terms regimental sergeant-major, regimental quartermaster-sergeant, company sergeant-major, staff-quartermaster-sergeant, lance-sergeant, and lance-corporal are used as titles they are not in fact R. but appointments, as is brigadier, which means a substantive colonel commanding a brigade, and not, as in so many other armies, a corporal or sergeant of some arm other than infantry; brigadier was used in this sense in the reign of Charles II. to mean a corporal of the Horse Guards. The rank of brigadier-general was abolished soon after 1918.

Promotion.—In the Brit. service pro-

motion was by purchase up to 1870, when the system of promotion by seniority and examination, tempered by selection, was introduced. Above the rank of lieutenant-colonel promotion is normally by seniority and selection. Second-lieutenants may be promoted to lieutenant after three years' commissioned service on the recommendation of their commanding officer; promotions to higher ranks may only be made when a vacancy exists in those ranks. Professional examinations adapted to the arm of the service to which the officer belongs are prescribed for each rank, and examinations are held half-yearly. Lieutenants taken prisoners of war may be promoted to captain as if they were serving in their regiments; captains taken prisoners of war may be promoted to major on release or exchange. Promotion, irrespective of establishments, may be conferred on a colonel, a major-general, or a lieutenant-general (l.) during a period of war, (u.) for distinguished service in the field, or (d.) for distinguished service of an exceptional nature. The promotion of non-commissioned officers is by seniority and examination up to and including sergeant and thereafter by selection tempered by seniority. Bandmasters are promoted warrant officer Class I. on appointment. Promotion by 'time' is more prevalent than among officers. The above rules are those obtaining in time of peace. Obviously promotion is much more rapid for all ranks in wartime.

IN THE R.A.F. With the formation of the Royal Flying Corps on May 13, 1912, naval and military wings were estab. and officers who were transferred to the new corps retained their existing naval or military rank. In the middle of 1914, owing to the rapid growth of the naval wing, it was necessary that a reorganisation should be effected. On July 1, 1914, the separate existence of a naval air force was officially recognised when the naval wing of the Royal Flying Corps became the Royal Naval Air Service, in which new R. were instituted as follows: wing captain (relative rank, captain R.N.); wing commander (commander); squadron commander (lieutenant-commander); flight commander (lieutenant); flight lieutenant (lieutenant); flight sub-lieutenant (sub-lieutenant); warrant officer 1st grade (commissioned warrant officer); warrant officer 2nd grade (warrant officer).

Among the many questions which had to be dealt with when the R.A.F. was formed on April 1, 1918, was that of naming the officers of the new service. A list of titles was prepared as follows: ensign, lieutenant, flight leader, squadron leader, reeve, bannoret, fourth ardlan, third ardlan, second ardlan, ardlan, air marshal. An alternative list slightly varied the ranks above squadron leader. The suggestions were wing leader, leader, flight ardlan, squadron ardlan, wing ardlan, and so on. The War Cabinet decided, however, to adopt military titles. So it was that on April 1, 1918, all those naval officers who transferred to the R.A.F. changed their naval titles for

military ones. These military titles remained until the new titles for commissioned Lt. as they exist to-day were announced in orders promulgated by the Air Council on Aug. 27, 1919, and came into use immediately.

Commissioned Ranks.—The most junior commissioned rank in the R.A.F. is that of pilot officer, whilst the most senior is that of marshal of the R.A.F., intermediate R. being flying officer, flight lieutenant, squadron leader, wing commander, group captain, air commodore, air vice-marshal, air marshal, and air chief marshal. There are now twenty different branches in the R.A.F., viz. general duties (flying) technical, equipment, secretarial, R.A.F. Regiment, aircraft control, fighter control, marine, airfield construction, medical, dental, medical quartermaster, dental quartermaster, education, provost, catering, physical fitness, legal, chaplains, and directors of music, and officer R. are the same for all these branches, although the higher R. are not attainable in some branches with small establs.

In most branches promotion to the substantive R. of flying officer and flight lieutenant is given after certain qualifying periods of satisfactory commissioned service: in a few professional branches, however, promotion is given up to the substantive rank of squadron leader on a time basis—all other substantive promotions are by selection to fill vacancies in the estab. In most of the branches officers are required to pass a promotion examination in order to qualify for promotion to the substantive R. of flight lieutenant and squadron leader. Promotions are announced in the *London Gazette* normally at half-yearly intervals.

There are three kinds of rank in the R.A.F., i.e. substantive, acting, and honorary. *Substantive rank* is related to the peacetime estab. and is not normally subject to change except by promotion. *Acting rank* is granted to an officer filling a vacancy in a rank higher than his substantive rank and is withdrawn when the officer ceases to fill such a post. *Honorary rank* carries with it no executive command but is complimentary in nature. During the Second World War there were two additional R.: *temporary rank* was granted to officers selected for promotion to fill vacancies in the rank of flight lieutenant and above in the wartime estab., while *war substantive rank* was granted to officers in the junior R. on completion of certain qualifying periods of service, or to officers after holding higher paid acting or temporary rank (or both) for certain specified minimum periods. The substantive rank which an officer holds determines the age at which he will normally retire on pension. This age of retirement varies between branches, e.g. that for officers of the general duties (flying) branch is lower rank for rank than for officers serving in the ground or professional branches. The relative R. of R.A.F. officers with those of officers in other services are laid down in King's Regulations and Air Council Instructions.

Cadets hold the rank of airman but are given the status of officer cadet whilst under training at the R.A.F. College, Cranwell (for permanent commissions in the general duties, equipment, and secretarial branches) and at the Royal Military Academy, Sandhurst (for permanent commissions in the R.A.F. Regiment). On the successful completion of training, and subject to continued medical fitness, cadets are appointed to permanent commissions in the rank of pilot officer.

Airmen (other than Aircrew).—The rank of warrant officer corresponds with the army warrant officer class I. The other non-commissioned officer R. are flight-sergeant, sergeant, and corporal, whilst the classes of aircraftermen are leading aircrafterman, aircrafterman 1st class and aircrafterman 2nd class. R. and classes are the same for all trades. Airmen normally enter as aircraftermen 2nd class and are mustered to a specific trade after passing the necessary tests. Re-classification to aircrafterman 1st class and leading aircrafterman is effected after passing further tests, and in some cases completing specified periods of time. Promotion to non-commissioned officer and warrant rank is generally made to fill estab. vacancies.

Aircrew.—Prior to July 1, 1946, there were no distinctions in R. as between airmen employed on ground duties and those whose duties were performed in the air. With effect from that date, however, all airmen mustered in a flying category, whether under training or qualified, were designated 'aircrew' and given new R. as follows: cadet pilot, navigator, signaller, engineer, or gunner; pilot IV., navigator IV., etc.; pilot III., navigator III., etc.; pilot II., navigator II., etc.; pilot I., navigator I., etc.; and master pilot, master navigator, etc. These R. correspond to airmen's R. as follows: cadet pilot, etc.—A.C.II.; pilot IV., etc., and pilot III., etc.—corporal; pilot II., etc.—sergeant; pilot I., etc.—flight sergeant; and master pilot, etc.—warrant officer.

Police.—In the hors. and cos., R. in the police are constable, sergeant, inspector, superintendent, and chief constable. A chief constable may have an assistant with the rank of assistant chief constable, or an officer of lower rank, but with the title of deputy chief constable. Areas under local police authorities in the hors. and cos. are each in charge of a chief constable and are divided into divs. in charge of a superintendent, and into sub-divs. or smaller areas in charge of an inspector or, possibly, a sergeant. In tns. where the heat system is in use a sergeant has charge of a section of eight or ten men; his general duties are to supervise their duties and hours and visit them on their beats. A sergeant may have special station duties of various kinds without charge of a section. An inspector may have charge of a number of sections and sergeants or he may have charge of a sub-divisional or smaller station, or have various full-time duties as assistant to officers of higher rank in connection with station work. A chief inspector may have

special divisional or headquarters duties, but he is usually in charge of a sub-divisional station. A superintendent is usually in charge of a divisional station, or one of the larger units of area into which co. police areas are divided. In the Metropolitan Police there are no chief constables. The R. above that of superintendent are deputy commander, dist. commander, commander, assistant commissioner, deputy commissioner, and commissioner. The Metropolitan Police area is divided into four dists., each under a dist. commander assisted by a deputy commander, and with the divs. in them, five or six in each, and twenty-two in all, under superintendents. At headquarters at Scotland Yard there are three commanders and four assistant commissioners in charge of divs., and above these are one deputy commissioner and one commissioner. The R. of the C.I.D. in all forces are detective constable, detective sergeant, detective inspector, and detective superintendent. Women police have the same R. as all others, but with the official prefix 'Woman Police' in each case. Police in Scotland have an additional rank, that of lieutenant. It originally designated special duties in connection with the keeping of records, but is now nearly equivalent to the rank of chief inspector.

FIRE SERVICES.—R. and responsibilities attached thereto in the fire services in England, Wales, and Scotland are (Scottish R. in parentheses where titles differ): chief officer (firemaster), command of a co. or bor. (burgh) brigade; assistant chief officer (no corresponding rank in Scotland); divisional officer, grade I. (assistant firemaster), in charge of a div. of a brigade; divisional officer, grade II., in charge of a div. of a brigade; divisional officer, grade III. (column officer), in charge of a div. of a brigade; assistant divisional officer (senior company officer); station officer (company officer), in charge of a station; sub-officer (section leader), deputy to station officer, or in charge of a small station; fireman, in charge of a fire appliance.

Rannoch, Loch, in N.W. Perthshire, Scotland, is 9 m. long, about 1 m. wide, and 668 ft. above sea level. Out of it flows the Tummel, a trib. of the Tay.

Ranters, see **METHODISM.**

Ranunculaceæ, family of plants, with generally much divided leaves and conspicuous flowers. The flower is of an unspecialised type. There are usually five sepals, which may be petaloid. The petals are not united; they are frequently modified into nectaries, or absent. There are many stamens and carpels. The fruit is a collection of achenes or of follicles. The family includes many wild and cultivated plants of considerable beauty. Some are poisonous, but yield valuable drugs. Among the genera are Clematis (Traveller's Joy), Anemone, Ranunculus, Caltha (Marsh Marigold), Helleborus, Aquilegia (Columbine), Delphinium (Larkspur), Aconitum (Monkshood), and Prænia. **Ranunculus**, **Crowfoot**, or **Buttercup**, large genus of ann. and perennial plants.

Among the Brit. species are *R. aquatilis*, the water crowfoot; *R. flammula*, the lesser spearwort; *R. lingua*, great spearwort, the largest and handsomest Brit. species; *R. auricomus*, goldlocks; *R. arvensis*, the meadow crowfoot; *R. repens*, the creeping buttercup; *R. bulbosus*, bulbous buttercup; and *R. ficaria*, the lesser celandine. A large number of species are grown in gardens.

Raoul, see **SUNDAY ISLAND.**

Rap, counterfeit coin which passed current in Ireland for a halfpenny in the reign of George I., before the introduction of 'Wood's halfpence,' although its intrinsic value was only half a farthing. Hence come the phrases, 'Not worth a rap,' 'Don't care a rap,' etc. Rappen is also a Swiss coin equivalent to a centime.

Rapallo, seaport and winter resort in the prov. of Genoa, Italy, 15 m. E.S.E. of Genoa. Lace and olive oil are made, and there are tunny fisheries. Pop. 13,900.

Rapallo, Treaty of. After the First World War it became necessary to equate Italy's claims to Dalmatia by the treaty of London (April 26, 1915) with the claims of the new Yugoslav state. Fiume was not allotted to Italy by the treaty of London, but was claimed by It. Nationalists. In 1920 both Great Britain and the U.S.A. attempted the task of mediation, but when Giolitti became It. Premier he prepared the way to a settlement. Negotiations between Count Sforza and M. Trumbitch, the It. and Yugoslav foreign ministers respectively, were opened at Santa Margherita de Ligure. The T. of R. was signed on Nov. 12, 1920. By its terms Fiume was to be an independent port and Zara autonomous under It. suzerainty. Italy obtained Gorz, Gradisca, Trieste, Istria, part of Carniola, and the is. of Cherso, Lussin, Unie, and Lagosta. The It. boundary was drawn from Monte Nero to Volosera on the coast. All Dalmatia except Zara went to Yugoslavia. The treaty was ratified by both countries before the end of Nov. Another T. of R. was that signed on April 18, 1922, between Germany and Russia, for the mutual renunciation of reparations and the resumption of diplomatic and economic relations. This, the only tangible result of the Genoa Conference (*q.v.*), was largely the work of Rathenau, the Ger. foreign minister; it was extended to the new Russian republics in Nov.

Rapanui, see **EASTER ISLAND.**

Rape, The felony of having carnal knowledge of a woman against her will, by force, fear, or fraud. The prosecution must prove penetration, even the slightest, failing which there may still be a conviction for the attempt (punishable by seven years' imprisonment under the Attempted Rape Act of 1918) or at the least for an indecent assault. The punishment for R. is penal servitude to the extent of life.

Rape, div. of the co. of Sussex, England, mentioned in Domesday Book, and still extant. There are six Rs., Arundel, Bramber, Chichester, Hastings, Lewes, and Pevensey, and they correspond to hundreds elsewhere.

Rape, Cole, or Coleseed, names given to two distinct species which are cultivated as a catch crop, and also for their seeds, from which oil is extracted, the succulent leaves and stems providing in three months from the time of sowing a large bulk of green food for sheep. The *R. varieties of Brassica campestris* resemble, except in the absence of a root, the common turnip, which is thought to be only a variety. They yield *R. of colza oil* (see COLZA), but are not grown in Britain. The other species is *R. napus*, and of this species the swede turnip is possibly a variety. The *R. varieties* of this species are numerous, and when grown for seed fall into two varieties. The winter kinds are sown in Aug. and the seeds harvested the following July. The summer variety is sown in April and harvested in Sept.

Raphael, one of the seven archangels, referred to in the Apocryphal Book of Tobias. A special concern with medical matters is attributed to him, his name signifying 'God's healer.' His emblem is a fish or a pilgrim's staff. Feast, Oct. 4.

Raphael Santi, or Raffaello Sanzio (1483-1520), one of the most celebrated It. painters of the Rom. school, b. on April 6 at Urbino, on the borders of Tuscany and Umbria, son of Giovanni Santi, a painter of some note, and his wife, Magia di Battista Claria. The family house still stands, and a wall painting of the Madonna and Child is thought to be a portrait of Magia with her little son. When eight years old R.'s mother d. and two years later his father. He may have begun his apprenticeship as painter with his father, and later probably continued with the painter Timoteo Viti at Urbino, and subsequently entered the school of Perugino at Perugia, where he also came under the influence of Pinturicchio. Perugino's art no doubt influenced R. at an early age. In the animated beauty and tranquil, flowing lines of Perugino's compositions, R. saw the perfection of his own artistic aspirations. R.'s 'Vision of a Knight' (in the National Gallery), 'St. Michael' and 'St. George' (in the Louvre), and 'The Three Graces' (at Chantilly) were all painted during his early days at Urbino. Under Perugino he absorbed all the best qualities of this artist's work, and it is more than probable that parts of the master's pictures are attributable to R. In the Sala del Cambio, the assembly hall of the Banker's Guild in Perugia, he probably assisted Perugino in his work (c. 1500 or somewhat later). The allegorical figure of Fortitude, and perhaps also that of Justice, seem to be by the hand of R. But he had already executed independent works, such as the signed painting of the Madonna between St. Margaret and St. Lucy, dated 1499, which is in the possession of Prof. Ros in Baden, Switzerland; and on Dec. 10, 1500, he undertook, in collaboration with Evangelista di Meleto, a pupil of his father, the execution of an altarpiece for Città di Castello. Among his early independent works, executed from 1502, were 'The Crucifixion,' 'The Coronation of the Virgin,' 'St. Sebastian,' and the 'Conestable Madonna.' In 1504 he

went to Florence, where he came under the influence of Leonardo da Vinci and Michelangelo, and for four years lived an active and stirring life, rapidly developing new powers and acquiring an enlarged field of knowledge. With an extraordinary power of assimilation, he profited from individual attributes of one great master and another, though never becoming a servile imitator of any one. He combined a mastery of workmanship with perfection of design and form, and purity of taste and colour. Some of the chief paintings of this period are 'La Madonna del Granduca' (Pitti), 'Madonna del Giardiniere,' 'Holy Family with the Lamb,' 'Ansidei Madonna' (National

W. F. Mansell

RAPHAEL SANTI
Self portrait.

Gallery), 'La Belle Jardinière' (Louvre), 'The Entombment of Christ,' 'St. Catherine' (National Gallery), etc. About 1508 he was invited to Rome by Pope Julius II. to assist in the decoration of the apartments in the Vatican, the whole of the fresco work being entrusted to him in 1509. The amount of work produced by him from this year till 1511 was prodigious. His first large work was 'The Dispute of the Sacrament,' and he painted an almost endless number of frescoes, easel pictures, and designs. During the last six years of his life he produced many celebrated works, including 'S. Cecilia,' the 'Madonna di S. Sisto,' 'The Spasimo,' 'The Transfiguration' (unfinished at his death), etc. His versatility of power as a painter remains almost unrivalled, and notwithstanding the shortness of his life there are more than 1400 works attributed to him. As W. E. Suida says: R., in his latest works, is 'no longer the creator of the classical composition; he is Raphael, the Prophet, who foresees new artistic

possibilities beyond his time, and points the way to the future. . . . All, Titian, Correggio, Rubens, Poussin, and Rembrandt, the neoclassicists and the Romanticists, even the Moderns, made use of Raphael's inexhaustible richness." See J. Passavant, *Rafael und sein Vater*, 1839-58; G. Morelli, *Italian Masters*, 1880; E. Muntz, *Raphael, sa vie, son œuvre*, 1881; and B. Berenson, *Central Italian Painters*, 1897; and lives by R. Duppa, 1816; W. Wanscher, 1927; Phaidon Press, 1943; and O. Fischel, 1948.

Raphia, genus of tropical palms with large pinnatisect leaves and huge fruit spikes which sometimes exceed 200 lb. in weight. *R. pidunculata* (raphia or raffia palm) yields the useful tying material employed by gardeners. *R. vinifera* (the bamboo palm) yields wine. *R. tediigera* (the Japoti palm of the Amazon) is a magnificent species.

Raphoe, par. and mkt. tn. of Etire, in co. Down, 15 m. S.S.W. of Londonderry. It is the centre of the well-known 'Lagan Valley' agric. area and has many historical associations. The manu. of tweeds and other woollen materials is carried on at Convooy, a vil. 3 m. to the W. Pop. 800.

Rapier, long thin v. pointed sword, introduced in historic times into England from Spain, adapted for both cutting and thrusting, the former in a less degree. Later a light, highly tempered blade used for duelling, about 3 ft. long. The fencing sword, used only for thrusting and having no edge, is now sometimes called a R. The R. was known in the Bronze Age.

Rappahannock, riv. of Virginia, U.S.A., rising in the Blue Ridge of the Alleghany Mts. It flows 250 m. to Chesapeake Bay, S. of the Potomac mouth. This and the Rapidan were the scenes of the worst battles of the civil war.

Raratonga, see COOK ISLANDS.

Rare Earths, oxides of certain metals found in a few rare minerals occurring in Scandinavia, the Urals, Brazil, India, U.S.A., and a few other localities. The chief minerals in which the rare earths are found are gadolinite, cerite, orthite, samarskite, and monazite. The rare earth metals, their symbols, and atomic weights are: yttrium (Y, 89), lanthanum (La, 139), cerium (Ce, 140), praseodymium (Pr, 141), neodymium (Nd, 144), illium (Il, 141), samarium (Sa, 150), europium (Eu, 152), gadolinium (Gd, 157), terbium (Tb, 159), dysprosium (Dy, 162.5), holmium (Ho, 165), erbium (Er, 167), thulium (Tm, 169), ytterbium (Yb, 173), lutecium (Lu, 175). Although the oxides of these metals occur in very small quantity in the minerals gadolinite, etc., the greater part of all the members of the group are present, and their separation, which is usually done by fractional precipitation, is a matter of considerable difficulty. The first earths to be discovered were yttria in 1799 and ceria in 1803. Since then each of these has been fractionated, and nearly every earth separated has been shown to be a mixture. For example, the original ceria was split

up into true ceria and lanthana, lanthana into lanthana and didymia, didymia into samaria and didymia, samaria into samaria and europia, and the second didymia into praseodymia and neodymia. The rare-earth metals form oxides of the composition R_2O_3 ; some form oxides of the form RO_2 ; while chlorides, nitrates, and sulphates are formed by the reaction of the oxides with the appropriate acid. All the rare-earth metals are now known. Some are important technically, but most remain mere chemical curiosities. An alloy of iron and cerium with lanthanum and other rare-earth metals is used in cigarette- and gas-lighters, since when abraded it emits showers of white-hot sparks.

Rarefaction, process of reducing the density of a gas. This is usually accomplished by means of one of the devices described under AIR-PUMP. If the gas within a receptacle is rarefied, it exerts less pressure, so that there is a tendency for the atmospheric pressure to crush the receptacle. When the air in contact with a liquid is rarefied, dissolved gases tend to be liberated, and the liquid itself tends to evaporate more readily, that is, the boiling-point becomes lowered. The effect of R. of air on human beings is to cause the internal pressure of the body fluids to become apparent, leading to a sense of fullness and throbbing in the head, and to possible effusion of blood from the nose and ears.

Rare Gases, Noble Gases, or Inert Gases, name given collectively to the chemical elements helium, neon, argon, krypton, xenon, and radon, which are gases characterised by their complete lack of chemical affinity. They form a separate group in the periodic system (q.v.) and have a valency of 0. Helium is obtained from certain minerals, and from natural gas (e.g. in the U.S.A. and Canada), and occurs in certain springs (e.g. at Bath). All the R. G. except radon occur in traces in the atmosphere, whence they are extracted. Helium and radon (q.v.) are spontaneously evolved from radium. Helium is used for filling airships, being light and non-inflammable, argon is used in gas-filled electric lamps, and neon electrical discharge tubes are used in illuminated electrical advertisement signs, and in aeroplane beacons. All the R. G. were discovered by Sir Wm. Ramsay (q.v.), though helium had previously been detected on the sun by Sir N. Lockyer.

Raratonga, see COOK ISLANDS.

Rash, superficial eruption of the skin, generally consisting of minute papules or pustules. It may be caused by external irritation, by the action of certain drugs, or by gastric and intestinal disturbances, or it may be symptomatic of a specific fever, as measles, scarlet fever, etc. A characteristic R. often appears on the chest or abdomen after the operation of tonsillotomy.

Rashi (c. 1630-1105), name of the Rabbi Solomon Yischaki, one of the greatest of the rabbinical scholars; b. at Troyes. He was the first to compose a commentary on the Talmud and the books of the O.T.

Rashin, port in Korea, China. Once an insignificant fishing vill., to-day it is a commercial and shipping centre rivaling Dairen, and linked by rail with Hsinking. There is a fine natural harbour, which promises to be the chief outlet for the exports of N. Manchuria. Its development was due to Jap. enterprise.

Rasht, see **RASHT**.

Raskolniki (Russian, schismatics), general name applied to those who dissent from the Russian orthodox church. Besides the multitudinous modern sects, there is a large body of R. who finally separated from the orthodox church in the seventeenth century. They seceded because they refused to use the service books as revised by the Archbishop Nikon, and took the name of 'old believers' or 'old ritualists.' They have since divided into two or three parties.

Rasmussen, Knud Johan Victor (1879-1933), Dan. Arctic explorer, b. at Jakobshavn, Greenland, son of a missionary, and educated at Copenhagen Univ. He visited Lapland, 1901, and accompanied the Mjølhus-Erichsen (1902-4) expedition to Cape York which studied the heathen Eskimo. R. himself made ethnographical expeditions in 1905-8, 1909, and 1910. In 1912 he crossed from Inglefield Gulf to Danmark Fjords and Independence Bay, returning in 1914 to Wolstenholme Sound. From 1921 till 1924 R. journeyed from the W. of Baffin and westward to the N.E. corner of Siberia. He describes this latter journey in *Across Arctic America* (1927). In 1931 he reconnoitred N.E. Greenland in a small motor-vessel, travelling over 2500 m., and was in Greenland again in 1933.

The benefactor and saviour of Polar Eskimos (his mother was of Eskimo descent), R. estab. an Eskimo settlement at Thule, the most northerly permanently inhabited settlement in the world (Greenland), in 1910, with the aid of the Dan. Missionary Society; he set up a code of laws for local government, and instituted social services.

Raspberry (*Rubus idaeus*), prickly shrub with pinnate leaves, white and hoary beneath, and drooping white flowers, followed by red or white fruit, which are highly valued for dessert, preserves, and other culinary uses. Its. are propagated from seed or from suckers planted in the autumn in a deep rich loam, with which manure has been liberally incorporated. The plants are generally set in rows about 5 ft. apart each way, and are trained to poles or to a trellis of wire. After the fruit has been gathered the old fruiting wood is removed to the ground, and the young canes thinned out to from five to eight per stool. The plants are surface rooters, and therefore the ground must not be dug around them, though frequent hoeing is desirable, and an ann. mulch of manure should be forked into the soil in autumn; while the fruit is being produced a liberal watering with liquid manure is desirable. Autumn-fruiting Its. are of different habit, bearing fruit on shoots of the current season's growth. Hence all shoots should be cut down in Jan.

Raspe, Rudolf Erich (1737-93), Ger. scientist, antiquarian, and writer, b. in Hanover, and educated at Göttingen Univ. Versatile and widely read, the subjects of his pub. works include volcanic geology, Leibniz as a mathematician, an introduction to Perv's *Reliques*, and a study of Ossian that became one of the pioneer works of the Gothic revival in Germany. His book entitled *Baron Munchausen's Narrative of his Marvellous Travels and Campaigns in Russia* appeared in 1785, and it is for this fantasy that he is remembered. See E. Raspe and others, *Singular Travels, Campaigns and Adventures of Baron Munchausen*, with an introduction by J. Carswell, 1918.

GRIGORY RASPUTIN

E.N. 1

Rasputin, Grigory Efimovich (c. 1870-1916), Russian monk and charlatan; b. at Pokrovskoe vill., in Siberia, son of a peasant who is said to have been named Novikh, and nicknamed 'Rasputin' or 'He'er do-well-son.' Grigory had no education, but became a 'holy man,' wandering, and acquiring a reputation for healing, which occasioned his deserting his bp. altogether; he is believed to have gone as far as Jerusalem. Rodzianko places his introduction to the Imperial court as far back as 1900, and attributes it to Bishop Feofan; Prince Yusupov places it about 1905. At any rate It. apparent success in restoring to health the heir to the Crown confirmed his position, and he supplanted Feofan as the Empress Alexander's confessor. He belonged to

the *khllyety* sect, whose chief tenet was the necessity for sinning in order to obtain salvation by repentance. He and Manusevich-Manuilov (private secretary to Stürmer, who was Premier in 1918) were the all-powerful opponents of popular interests. On Dec. 16-29, 1916, R. attended a supper party at the St. Petersburg home of Prince Felix Yusupov, Count Sannikov-Kilton. Here he was first half poisoned with cyanide of potassium, and then shot by his host and the deputy Purishkevich, with the assistance of the Grand Duke Dmitri Pavlovich. R.'s body, thrown into the Neva, was recovered, and buried by the empress at Tsarskoe Selo. See also under RUSSIA (History). See Prince Yusupov, *Rasputin*, 1927; his daughter's book, *The Real Rasputin*, 1929; R. Filop-Miller, *Rasputin, the Holy Devil*, 1932; and K. Noetzel, *Rasputin*, 1933.

Rassemblement du peuple français (R.P.F.), see FRANCE, History.

Rās Siaghah, see PISGAIL.

Ras Tafari Makonnen, see HAILÉ SELASSIÉ.

Rastenburg (Polish Ketrzyn), tn. of E. Prussia, now in Poland, 36 mi. S.S.E. of Königsberg. There are iron and copper foundries, and br. wcr. Pop. 16,000.

Rat, name for a number of rodents, chiefly larger members of the genus *Mus*. The Common Brown, Norway, or Hanoverian R. (*M. decumanus*) is believed to have originated in China, but is now distributed over a very large area of the world, nearly always occurring in close association with man. Almost as widely distributed is the Black R. (*M. rattus*), which also was probably a native of Asia, having gradually spread westwards till it reached Britain, where for some centuries it was the prevailing species. The Brown R. began to arrive in considerable numbers during the Hanoverian dynasty, and has gradually displaced the other species, which now would probably be quite extinct in Britain but for frequent reintroductions by ships. As the name suggests, it is a rich black in colour, though the under parts of the body shade off to a dark ash. The black colour is not alone a sufficient means of identification, as occasionally brown varieties occur, while, on the other hand, melanism in the brown R. is not unknown. The black R. has larger and more prominent ears than the other, and its tail is long and fine. The snout is longer and more pointed, the upper jaw projecting beyond the lower to a greater extent. Its general build is slighter and more graceful, and its disposition considerably less savage, and consequently it and its varieties are more commonly kept as pets. The prin. checks on Rts., which are estimated to rob industry of some millions of pounds annually, are owls, cats, polecats, and the practice of ratting. For this white bitch ferrets, strong and well-nourished, (though ravenous on the day), and rough-coated terriers with good noses, and game dispositions are essential.

Research into the problems of R. infestation was spurred by wartime needs to

preserve food and supplies, and information about the numbers and the best methods of extermination was required. The problem is a responsibility of the Ministry of Agriculture's Infestation Control Div. Occupiers of premises and land may be fined for neglecting to destroy Rts. See H. Zinsser, *Rats, Lice, and History*, 1943.

Rata (*Metrosideros robusta*), New Zealand tree which in its native habitat attains a great height, and bears red flowers. Its hard timber has many uses, in shipbuilding, and for Maori clubs and canoe-paddles.

Ratæ Coritanorum, see LEICESTER.

Ratafia, cordial flavoured with fruits, or the kernels of fruits, and used generically to include sev. fruit liqueurs. The fruits, apricots, cherries, strawberries, peaches, plums, or their kernels, are crushed and steeped in alcohol or eau-de-vie, distilled, and flavoured with sugar or various spices. Some varieties are obtained by infusing the fruits entire. See LIQUEURS.

Ratak, see MARSHALL ISLANDS.

Ratany, see RHATANY.

Ratutöskr, see under YUGOSLAVIA.

Ratcliff, par. of E. London, on the N. bank of the Thames, in Stepney. Emanuel Swedenborg (d. 1772) is buried here. Pop. 4,000.

Ratel, or Honey Badger (*Mellivora*), genus of carnivorous animals. The body is powerfully built, the legs are short, with long fossorial claws. The tail is short, and the ears are rudimentary. The colour is ashy grey on the upper surface and black on the under parts, an interesting contrast with the usual protective colouring. A white strip runs either side from the head to the tail, dividing the grey and black. Though closely resembling one another, two species are commonly recognised: the Indian R. or Badger (*M. indica*) occurs throughout India, feeding on a variety of small animals and also on honey; the Cape R. (*M. capensis*) is widely distributed throughout S. Africa.

Rates and Rating.—The system of rating at present in operation in England has its foundation in the Poor Relief Act of 1601 which introduced local taxation for poor relief. A liability to be rated was imposed on every inhabitant, parson, vicar, every occupier of lands or houses, etc. The office of par. overseer was created, and these officers, who administered poor relief, were the rating authority for each par. In course of time a number of rates were levied in addition to the poor rate, such as the bor. rate, general dist. rate, and highway rate, but the general principles laid down for the levying of the poor rate formed the basis upon which all these rates were levied, and these received little alteration, except in the metropolitan area, until the passing of the Rating and Valuation Act, 1925, which abolished overseers and transferred their rating functions to bor., urb., and rural dist. councils. In 1869 the rating practice was revised for London, owing to the phenomenal growth of the pop., and as a result

the par. disappeared as the unit of local government in the metropolitan area. The 1925 Act estab. a single general rate in each bor., urb., and rural dist., and abolished the par. as the unit for rating generally, but the latter still retains limited powers of rating (see LOCAL GOVERNMENT).

The enlargement of the unit of administration had as its object the attainment of uniformity, and to assist assessment areas were constituted consisting of one or more rating areas grouped on the principle of convenience of size and simplicity of administration. The Act also set up a central valuation committee for England and Wales and co. valuation committees for each administrative co. to act in an advisory capacity to rating authorities. The latter committees were charged with the duty of taking such steps as they thought fit for promoting uniformity in the principles and practice of valuation and assisting rating authorities and assessment committees in the performance of their valuation functions.

Co. councils have no power to levy rates but obtain their funds by issuing precepts (i.e. demands) upon the rating authorities in the co., requiring them to levy and pay over the proceeds of a specified rate in the £.

The new system introduced by the 1925 Act also provided for a revaluation of all property to secure a more equitable distribution of the burden of rates, since at that time the anomalies of valuation were great. Ratable values were required to be shown in a valuation list, to be revised every five years, called a 'quinquennial valuation.' The list was, however, subject to revision during the interim as new properties or new uses arose. The method of valuation introduced and still in operation is for the rating authority to prepare proposals for the amendment of the valuation list which are submitted to the assessment committee for the area, notice thereof having been given to the occupier. The functions of the assessment committee are to revise the draft lists, to hear and determine proposals and objections by ratepayers, and eventually to approve the list as amended by the committee. The committee is concerned not only with the values of property in a particular rating area but has a duty to see that all the rating areas within its jurisdiction are equally and fairly assessed under uniform principles of valuation. A person aggrieved by a decision of an assessment committee has a right of appeal to the court of quarter sessions for the co. or place where the hereditament in question is situated.

Valuation.—The principle of all valuations is to estimate the rent at which the hereditament might reasonably be expected to let from year to year if the tenant undertook to pay all usual tenants' rates and taxes and tithe-rent charge, if any, and to bear the cost of repairs and insurance and the other expenses, if any, necessary to maintain the hereditament in a state to command that rent. This is the definition of 'net ann. value' in the

Act of 1925, and it is substantially the same as that of 'net ann. value' or 'ratable value' in the Union Assessment Committees Act, 1862, and the Valuation (Metropolis) Act of 1869.

Ratability.—The Act of 1601 mentions *inhabitants* as well as *occupiers*, so that liability to poor rate fell on inhabitants, as such, in respect of their trading profits, whether they occupied property in the par. or not. This legal interpretation of the Elizabethan Act endured until 1840, when the Poor Rate Exemption Act of that year provided that ratability should depend on the occupation of ratable property in the particular rating area. Judicial interpretation of the Act of 1601 exempted any classes of property if not specifically mentioned; e.g. inasmuch as 'coal' mines were mentioned, similarly all other mines were exempted by necessary implication, and sporting rights escaped, but these anomalies were ended by the Rating Act of 1874. Under the present law the occupier of any land or building, however used, is liable to be rated in respect of that land or building; similarly the right to receive the profits from land involves liability to rates, provided the occupation of land is necessary to earning such profits. Tithes have been rated since 1901. Exemptions include property in the occupation of the Crown and used for the purposes of the central gov., e.g. police stations and co. courts, but not buildings occupied for the purposes of local government; also churches, chapels, or other premises of the Estab. Church or, if certified, of other denominations; non-provided schools (exempted under the Education Act, 1921); and premises occupied by literary or scientific, etc., societies supported by ann. voluntary contributions and certified by the registrar of friendly societies.

The Rating and Valuation (Apportionment) Act, 1928, in conjunction with the Local Government Act, 1929, introduced rate relief for industrial and freight-transport hereditaments to the extent of three-fourths of the rate burden and gave complete relief from rates to agric. land and buildings, other than farmhouses and cottages. This relief is commonly known as de-rating and it was designed to assist productive industry and agriculture, which were experiencing financial difficulties at that time. Rating authorities lost considerable ratable value as a result of this measure and were compensated to some extent by a system of exchequer grants (see LOCAL GOVERNMENT). Even though ratable liability depends upon occupation, the owners of some properties, e.g. small properties, are liable to pay the rates, but in such cases the owner recoups himself by charging the occupier a rent inclusive of rates. Rating authorities may by resolution allow discount for prompt payment of rates and in the case of smaller properties (not exceeding £13 ratable value) may where the owner pays the rates give an allowance (called a compounding allowance) to the owner of varying percentage according to whether the owner pays the rates, whether the

property is occupied or not, or only so long as occupied, or only acts as collector on behalf of the rating authority. See also COMPOUND HOUSEHOLDER.

Rates are due and payable within seven days of demand, but action for recovery is not usually taken until towards the close of the rate period. Rating authorities have power to enforce payment of rates by distress warrant obtained from the justices, and if there are insufficient goods upon which to distrain can make application to the justices for the defaulter to show cause why he should not be committed to prison. The Money Payments (Justices Procedure) Act, 1935, empowers the justices to issue a warrant for imprisonment only where on inquiry they are of the opinion that failure to pay is due to either wilful refusal or culpable neglect. Rating authorities can require tenants and lodgers to pay rent direct to the rating authority in discharge of rates owing by the landlord.

Reform of the Rating System.—Many suggestions have been made for the reform of the rating system, and schemes for the rating of site values, land values, or capital values and a local income tax have been considered, but as the present system provides a fairly stable source of revenue, little affected by fluctuations in trade, and also fixed or localised in situation, it still remains as the basis for contribution to local authority expenditure. The valuation machinery has been reformed by the Local Government Act, 1918, and since Feb. 1950 the assessment and valuation committees have ceased to exist and rating authorities have no functions in relation to the preparation and amendment of valuation lists. Valuation lists are to be prepared and amended by valuation officers of the commissioners of Inland Revenue. New valuations lists are to be made in 1952, and an attempt will be made to obtain uniformity of valuation over much wider areas than hitherto by the application of statutory provisions indicating how the ratable values of dwelling-houses are to be calculated. Valuation courts were planned to take the place of assessment committees, to consist of a smaller number of members covering larger areas on a co. and co. bor. basis. These courts were to be formed from valuation panels, with members selected by the co. councils and co. bor. councils. Appeals were to lie to the co. court and not the court of quarter sessions as formerly. These reforms were all directed to obtaining greater uniformity of valuation, especially since exchequer grants in aid of local authority expenditure were directly linked up with the question of whether or not a co. or co. bor. council had a ratable value per head of pop. below the average for the country.

Probably the reason which prompted the gov. to introduce this reform in the machinery of valuation was that there was an obvious lack of uniformity of assessments throughout the country, and assessments themselves were not a true reflection of the rental value of premises.

The First World War brought about a change in the cost of living, so that local authorities were required to provide more extensive services on assessments in the main based upon 1914 rents. This arose from the statutory control of rents immediately following upon the war, and from the valuation of new properties by means of comparison with the assessments of controlled premises and not at the new values of the post-war period. Similar circumstances arose again as a result of the Second World War. This also caused the postponement of the quinquennial valuations. Obviously the failure of ratable values to rise commensurately with the increases in the cost of living, i.e. the cost of services provided by local authorities, meant that the local authorities had to find the money in the only other way possible, namely by increasing the rate in the £.

The gross estimated rental of ratable property in England and Wales in 1927-28 (the last year for which particulars are available in the *Statistical Abstract for the United Kingdom*) was £378,284,347, the ratable value being £278,382,818 and the assessable value under the Agricultural Rates Act, 1923 (i.e. the ratable value under the Union Assessments Acts of all property minus three-quarters of the ratable value of agric. land), £253,879,292 (£267,638,769 in 1928-29). These are ann. values for purposes of a poor rate. Later figures in respect of ann. values for purposes of a general rate show: net ann. value for 1936-37, £330,800,174, and ratable value for the same year £298,529,618. The total ratable value on which rates were leviable in England and Wales in 1944-45 was £319,093,000, and in 1945-46, £319,359,000. By far the largest part of the rates apportionment comes from dwelling-houses or other hereditaments (£295,055,288 in the year ending March 31, 1944). Industrial hereditaments or premises yielded £8,893,269; freight transport, non-freight transport, etc., £2,987,747. Contributions paid by the gov. on gov. property in lieu of rates amounted in 1943-44 to £12,156,884.

The average amount of rates per £ of ratable value was 6s. 8½d. in 1913-14; in 1914-15, 12s. 8d.; in 1945-46, 15s. 8d. In Scotland the estimated average amount per £ of ratable value of the rates, exclusive of water rates, in 1942-43 was 10s. 10d. The total sum collected from ratepayers in England and Wales in 1913-1914 was £71,276,000; to-day it exceeds £220,000,000, but it is less than one-third of the total receipts of the public authorities (£734,350,000 in 1940-41) (see also under PUBLIC DEBT). The ratable value of the co. of London (1947-48) is £54,418,000 (that of the city being £6,107,000 and of Westminster £9,801,000 in 1945-46).

Rate Services.—A typical demand note for rates is ended with a statement showing how the rate in the £ demanded is made up. It sets out the rate in the £ which would be required to meet the net expenses of each of the prin. services, after allowing for specific gov. grants

towards the expenses of certain services (e.g. education, highways, rivs., and housing), but without allocation to particular services of the gov. grants under the Local Government Act, 1948. The gov. grants under this Act, being in aid of local gov. expenses generally, cannot be allocated to any particular service; they reduce by the amount shown on the back of the demand note for the general rate the total rate in the £ which would otherwise be demanded.

Rath: 1. Tn. of the United Provs., India, in the dist. and 43 m. S.W. of the tn. of Hamirpur. The tn. trades in cotton goods. Pop. 10,500. 2. Formerly a tn. of Rhenish Prussia, 3 m. N.N.E. of Düsseldorf, is now incorporated in that city. 3. In Ireland, a prehistoric ring-fort, a fortified farmstead. Many were still in occupation in the Dark Ages. When the earthen ring-wall is replaced by stone, the structure is known as a *cashel*.

Staatliche Landesbildstelle, Hamburg
THE RATHAUS, HAMBURG

Rathaus, Ger. term (Dutch, *radhuys*) for the seat of tn. gov., usually trans. by the Eng. tn. hall. In fact this trans. is historically inaccurate, since in the past, the Ger. R. (like the Fr. *hôtel de ville*) occupied a far more important position than the Eng. tn. hall, though their modern functions are more similar. The medieval Ger. and Flem. merchant cities, such as Hamburg, Nuremberg, and Bruges, possessed a degree of autonomy never gained by any Eng. city, even London, in the same period. The R. became a symbol of mercantile sovereignty, and, in the Middle Ages, its size and splendour were regarded as proof of the independence and wealth of its city. Many medieval Rs. still exist. They usually conform to a general plan, being distinguished by an imposing central

tower, e.g. Bruges, Hamburg, and containing chambers for every dept. of gov. They were the seats of justice and commerce, as well as centres of administration, and contained vaults for the city archives and treasure. The R. at Hamburg belongs to the Renaissance period; there is a Gothic R. at Bruges.

Rathbone, Eleanor (1878-1946), Eng. social reformer, b. at Liverpool, daughter of Sir Wm. R., who represented Liverpool in the House of Commons from 1868 to 1896, and was one of the founders of Liverpool Univ. She was educated at Kensington High School and Somerville College, Oxford. Helped to found a dept. of social science in Liverpool Univ. and lectured there on that subject. She was the first woman member of the Liverpool city council, the first woman M.P. for Lancashire, was independent M.P. for the Combined Univs. from 1929, and at the general election was returned unopposed, being the first woman to be so honoured. She was closely associated with the movements for raising the status of women, the welfare of children and, above all, for family allowances, for which she carried on a campaign which resulted in the passing of the Family Allowances Act of 1945. It is for this that she will be chiefly remembered, but the legislation which resulted in widows' pensions and the extension of the franchise to women also owed much to her influence. During the First World War she organised the Soldiers' and Sailors' Families Association. The Eleanor Rathbone School was opened at the Magdiel children's agric. institute, near Tel Aviv, Palestine, on Oct. 19, 1949. The inscription of the plaque reads 'In memory of Eleanor Rathbone, champion of justice and lover of children.' Pubn.: *The Disinherited Family* (1924); *Child Marriage: The Indian Minotaur* (1934); and *The Case for Family Allowances* (1940). See Mary D. Stokes, *Eleanor Rathbone*, 1949.

Rathenau, Walther (1867-1922), Ger. statesman and writer, of Jewish descent. His father, Emil R., was one of many spies who came to England in the years before the First World War, serving as a voluntary draughtsman in an Eng. engineering firm. Returning to Germany, he organised the A.E.G. (Allgemeine Elektrizitäts-Gesellschaft), which later became a concern of world-wide importance. Emil R. was purely a business man, but Walther was more: he studied physics, chem., engineering, and philosophy, and early discovered a method of obtaining alkalis, which was commercially exploited. In 1908 he accompanied Dernburg on his famous tour of the Ger. and Brit. African colonies. In 1915 he succeeded his father as president of the A.E.G. During the First World War he presented to Falkenhayn, then war minister, an economic plan for countering the allied blockade, and was appointed economic director. After the war he was appointed minister of reconstruction. In 1920 he became foreign minister when he negotiated the Rapallo Treaty (q.v.) which all but wrecked the Genoa Conference (q.v.). He was

assassinated on June 24, 1922. His chief book, *Von kommenden Dingen* (1917; trans. into Eng. as *In Days to Come*, 1921), is a criticism of Socialism and a protest against the domination of machinery in the widest sense of the word. See G. Raphael, *Die Neue Gesellschaft*, 1919.

Rathenow, tn. in Brandenburg, Germany, 45 m. W.N.W. of Berlin, noted for manuf. of machinery and optical instruments. Pop. 28,000.

Rathlin, is. in the N. of co. Antrim, N. Ireland, 5½ m. N. of Ballycastle. Its shape is that of a crescent, and is about 1 m. wide. Here are situated the remains of Robert Bruce's castle. Pop. 300.

Rathmines, suburb of the city of Dublin, Eire. Pop. of R. and Rathgar 40,000.

Ratibor (Polish Raciborz), tn. in Silesia, Poland, formerly of Prussia, on the Oder, 40 m. S.S.E. of Oppeln. It is noted for its machines, furniture, paper, and chemicals, and has iron foundries and railway workshops. Pop. 51,700.

Ration: 1. *In the Navy*.—The victualling of the fleet was originally in the hands of contractors, who were paid a fixed daily sum for every man in the fleet. In the course of time, however, this duty was taken up by the Admiralty itself and the chief victualling depot was estab. at Deptford, where it remained until the Second World War, when severe bomb damage caused it to be largely abandoned. The prin. depot is now at Portsmouth. At the beginning of the seventeenth century the R. of the sailor were fixed, and amongst other allowances he was given a gallon of beer per diem. This remained in force until the end of the eighteenth century when grog was introduced, the allowance being half a pint, and this was still further reduced to one gill, when evening grog was replaced by tea. This constitutes the present R., which is not allowed to officers or men under twenty. Victuals, which the men were allowed but did not actually take, were called savings, and a small monetary allowance was given in place of them. To overcome the inherent monotony of the food, a new system was estab. in 1906 which introduced a standard modified R. of the basic items together with a monetary allowance. The first experiments in what is known as general messing, which displaced the standard R., were first started in the *Dreadnought* in 1907, but the system (whereby a supply officer is responsible for providing the full messing based on an authorised maximum overhead rate) did not develop fully until after 1918, when it expanded rapidly throughout the whole fleet. It is in general use to-day, but officers, if they so prefer, may be credited with a victualling allowance instead, by which sufficient money is given to them to arrange their own dietary or to obtain gov. provisions on repayment. In a few of the older and smaller ships this victualling allowance also applies to ratings. A daily issue of lemonade made from lemon powder and sugar to every person on board may be given on the requisition of the medical officer and approved by the

captain. Persons employed in the engine-room and stokehold may also receive, in addition, a ration of ormeal and sugar; those exposed to unusually severe weather an extra issue of bread, biscuit, and meat; and those on night duty are supplied with tea or cocoa. Special issues are also given to men in submarines, surveying vessels, and small ships employed in extreme climates.

2. *In the Army*.—The soldier's remuneration in most armies has always consisted of three elements: pay, R., and free quarters. If the last two are not provided, or fall short of what is to be regarded as the normal scale, this is adjusted, in theory at least, by an increase in the first. Bartering and sale of R. to civilians will always go on where civilians are underfed and soldiers are in more than usual need of cash or a change of diet. At certain times and places this has been recognised by the military authorities and the Ger. *Kommissbrot* and Fr. *pain commis* owe their name to the fact that they were bought by housewives at the barrack gate from soldiers who had just drawn their R. R. in the Brit. Army (formerly 'commons' or 'allowance') consisted for a long time of beef, bread, and beer. Small beer was called 'Act of Parliament' in the army during the Napoleonic wars, because by the ordinances then in force each man was entitled to five pints of it daily. In recent times R. scales have been of two main kinds, 'bulk rations' issued at home or in back areas abroad, the basis of which is fresh meat, bread, and vegetables; and 'preserved rations' issued on active service in forward areas where fresh meat is supplanted by canned beef and bread by biscuit.

In peacetime the basic R. are issued by the R.A.S.C. (Irish and Scottish regiments are entitled in their basic R. to extra quantities of potatoes and oats respectively in lieu of bread or flour), and a cash allowance is made for other items of diet to be bought by the president of the Regimental Institute or his deputy, the messing officer, either from the N.A.A.F.I. (g.v.) or from the local sources. Allowances for the purchase of extra foodstuffs are of great antiquity. Rom. soldiers drew 'salt money' (*salarium*, whence the modern salary).

Various kinds of preserved R. packed in small quantities and containing all the elements of a day's meals were introduced during the Second World War, ranging from 'assault R.' for one man for twenty-four hours issued to men landing on combined operations to 'composite rations' for the use of tank crews or small sub-units likely to be out of touch with their own supply echelon for some days.

3. *In the R.A.F.*.—There is little difference in the provision and supply of R. in the R.A.F. and that of the army, from whom the system was inherited. This was no doubt partly due to the fact that one of the forerunners of the R.A.F., the Royal Flying Corps, was an integral part of the Brit. Army, and, as such, had automatically followed general army procedure. On the formation of the R.A.F.

as a separate service much of this procedure was retained, including the system of rationing, which, apart from minor differences in administrative arrangements, is followed in broad principle today. While it may be said that the War Office are the general providers of food-stuffs for the R.A.F., only a certain proportion of the daily requirements are drawn from the R.A.S.C., the remainder being obtained from the N.A.A.F.I., or from R.A.F. unit farms or gardens, where these are established. The value of the commodities is charged against a daily monetary entitlement for each man. The aim is to provide well-balanced, palatable, and varied meals built up to a standard calorific value. Problems of feeding which are peculiar to the R.A.F. include special diets for aircrew on long-distance flights, such as distant bombing raids, 'in flight' meals on the service-scheduled routes, and feeding in connection with air-sea rescue arrangements. For many of these tasks research has produced 'emergency flying R.' special packs of R. in easily portable containers. The object of these packs is to contain in as little space as possible the maximum amount of nourishment and sustenance, compressed, block, and tabloid foods being employed. Water is issued in sealed cans, and, in addition, when considered necessary, water-purifying tablets are included in the packs. Provision has to be made in emergency meals of this type for use in extremes of temp. and climate.

On civilian rationing see FOOD CONTROL, BRITISH, IN WARTIME.

Rationalisation of Industry. A phrase used by economists and others to indicate the application of the most efficient methods in production, distribution, and transport. In its various uses, it would include ample modern equipment; mass production; co-operative effort; evenness and regularity of output; scientific organisation and management; and the elimination of unnecessary and wasteful competition. Like other compendious phrases, it has been eagerly adopted by politicians, economic teachers, business magnates, and commercial organisers, who use it, however, with such widely different interpretations that there is a danger of its being rather an illustrative phrase than the definition of a precise policy. Thus, in the sphere of politics, it may be taken as a counter-phrase to the Socialist policy of nationalisation of industry, and, in consequence, an argument for the individualist or capitalistic method as opposed to state ownership. Probably it is most clearly understood and most properly applied in relation to such great public concerns as the railways, or the greater industries such as collieries and the cotton trade. Some of the larger industries that before the Second World War had fallen on evil times owed part of their decline to antiquated methods, wasteful overlapping, and the handicap of unscientific equipment and machinery. In these cases too R. of I. implies a definite economic policy. But in the majority of cases to which the

words were, in recent years, commonly applied it is doubtful whether the phrase has any such precise import. The expression is loosely used to justify commercial policies of doubtful advantage to the community. Combines to maintain prices, manipulation of shares to control markets, crushing out weak opponents by underselling, gaining special legal privileges for particular groups of traders, and other such acts commonly associated with trusts have been made to appear almost benevolent acts under the new label of R. of I. Rationalisation has probably been carried to its greatest extreme in the U.S.A., especially in the great motor-car and steel plants. It was probably one of the contributory causes of the great business depression of 1930-1931. In the first place more goods were produced than the home market could absorb and more than an impoverished world could buy. In the next place, it contributed to unemployment, in that machinery largely did the work formerly done by men. Next to the U.S.A., Germany carried rationalisation to the greatest extreme. See also PRODUCTION AND PRODUCTIVITY. See J. A. Hobson, *Rationalisation and Unemployment*, 1930.

Rationalism, primarily a philosophical movement, but its results were felt principally in theology. It is an attitude rather than a definite doctrine; it assumes the superiority of reason over sensation as a medium of cognition, asserting reason to be an independent source of knowledge and the final standard of criticism in philosophy, aesthetics, and religion alike. It is opposed to irrationalism, which rejects or ignores all the conclusions of reason, relying upon emotion and the dictates of practical convenience. Philosophic R. was first formulated by Descartes in his *Discours de la methode* (1637); he contended that there are elementary *a priori* concepts from which the whole of knowledge can be deduced mathematically—as opposed to those schools who contend that the mind is blank until some sense-impression of an object is conveyed to it. In other words, R. claimed that true knowledge can be deduced by ratiocination rather than by such empirical processes as intuition and sense-perception. Certain compromises between the two schools were attempted; Locke, for instance, insisted on the validity of R. and empiricism alike. But no such middle course was adopted by Descartes, who started off with such ideas as are fundamentally certain, reducing them to two categories: (1) clear, i.e. intuitively and manifestly existent, and (2) distinct, i.e. having a precise absolute value and also a precise value relative to other ideas. The whole rationalistic process was accepted also by Spinoza, who constructed his *Ethics* (pub. 1677) on mathematical lines of axioms and postulates, definitions, and propositions; by Leibnitz, who advanced the idea of a logic and dialectic that should express philosophy in the same rational method that his calculus expressed truths in pure mathematics; by Wolff, who attempted

to formulate knowledge on the lines suggested by Leibniz. Kant showed the falsity of the mathematical analogy, and demonstrated that reason alone can lead only to tautology since a concept has its individual limits. Later attempts at reconciliation were made, although not ostensibly, by Hegel and Schleiermacher; and Spencer also used R. as his basis in some respects; but as a purely philosophical force it has had no great advocates since it was refuted by Kant. The theological movement of R. was most strongly in evidence in Germany during the late eighteenth and early nineteenth centuries. Sporadic outbursts of individual R. can be traced throughout the hist. of the Christian Church, but it was not until the pub. of Lord Herbert of Cherbury's *De veritate* (1824) and *De religione gentium* (1845) that a definite theological school of R. arose. In 1754 Hermann Reimarus circulated his rationalistic writings privately; twenty years later Lessing (*q.v.*) pub. them as fragments from the Wolfenbützel library, of which he was then in charge, as an assault on the Hamburg orthodox Lutherans. Johann Semler (1728-94) was the chief figure of the reaction, however; his attack was temperate, for whilst relegating the Bible to the ranks of all oriental symbolical writings of the same period, and urging that the true religion was an individual soul-force and not a universal dogmatic creed, he recognised the value of the Church from the sociologist's point of view as a disciplinary agent. Michaelis, Eichhorn, and Paulus followed Semler, Paulus being the exponent of the vulgarised 'rational morality' of Kant, which tended to a somewhat crude asceticism. Theological R. is opposed to supernaturalism and to rationally indefensible dogma, and refuses to accept Scripture as an infallible hist. of divine revelation. David Strauss, Renan, and Nietzsche brought vast philological knowledge to bear on the subject, with the result that not only was the O.T. rejected, but the divinity of Jesus Christ was considered as disestablished, and He was regarded as a sectarian teacher pure and simple. See W. E. H. Lecky, *History of Rationalism in Europe*, 1870; J. F. Hurst, *History of Rationalism*, 1901; C. Watts, *The Meaning of Rationalism*, 1905; and J. McCabe, *A Rationalist Encyclopedia*, 1918.

Rationing of Food, see **FOOD CONTROL**, **BRITISH**, in **WARTIME**.

Ratisbon, or **Regensburg**, city and riv. port of Bavaria, Germany, cap. of the Lower Bavaria and Upper Palatinate Regierungsbezirk, on the r. b. of the Danube, 85 m. N.E. of Munich. The tn. has a mediæval appearance, and is rich in works of art. The chief buildings of interest are the cathedral, begun in 1275 and completed in 1534; the Rathaus, dating from the fifteenth century; the villa of the king of Bavaria; and sev. schools and seminaries. There is a univ. The prin. manufs. include porcelain, pottery, tobacco, spirits, and machinery, and the chief industries boat-building, book-binding, and printing. R. was founded

by Tiberius, and was the residence of the early dukes of Bavaria. During the Middle Ages it was one of the most flourishing cities of S. Germany, and was raised to the position of a free imperial city. It was the seat of the Ger. Diets from 1645 to 1806. It was one of the last tns. to fall to the W. allies in the closing campaign of the Second World War in Europe. Pop. 82,700.

Ratites, or **Cursorcs**, one of the two main divs. of birds which once constituted an important group, but which is now represented only by the ostrich, rhea, emu, cassowary, and apteryx. They are all flightless, and their breast-bone is keel-less or flat.

Ratlam, or **Rutlam**, cap. of the state of R., Central India, 65 m. N.W. of Indore, and trading in opium and grain. Area of state 687 sq. m. Pop. 126,100; tn. 44,000.

Ratnagiri, cap. of the dist. of R., Bombay, India, 136 m. S. of Bombay. Sardine fishing is carried on off the coast, and rice is grown. Area of dist. 4069 sq. m. Pop. 1,373,500; tn. 18,500.

Ratnapura, tn. in the is. of Ceylon, 30 m. E.S.E. of Colombo. Rubies and sapphires are found in its rivs., and these and other gems are also mined. Pop. 8500.

Ratnavali ('The Pearl Necklace'), Sanskrit drama of the seventh century ascribed to King Shri Harsha, also to Bana and to Dhavaka. The heroine is Sagarika (owner of the necklace), a princess of Ceylon. See Cappeller's ed. in O. Bohtlingk's *Sanskrit Chrestomathie*, 1815. There are trans. in Eng. by H. H. Wilson, 1835, in Ger. by Fritze.

Raton, co. seat of Colfax co., New Mexico, U.S.A., on the Atchison, Topeka, and Santa Fé railroad, 20 m. S. of Denver. Coal is found in the vicinity. Pop. 7600.

Rat-Portage, see **KENORA**.

Rattan, see **ROATAN**.

Rattan-Cane, see **CALAMUS**.

Rattany, see **RHATANY**.

Ratti, **Achille**, see **PIUS** (popes), **Pius XII**.

Rattlesnake Root, see **SENEGAL**.

Rattlesnakes, or **Pit Vipers** (Crotalidae), sub-family of viperine snakes found only in America. The R. proper have the end of the tail made up of a number of horny flat rings, which are loosely connected together, and are capable when vibrated of making a loud noise. The head is large behind, and bears a characteristic depression or deep pit on each side of the face between the eyes and the nostril. The common R. (*C. durissus*) is now restricted to the S.E. of N. America, though once widely distributed. It averages about 4 ft. in length; the body is ash colour above, with irregular cross-bars and yellow flanks and vertebral line. It is a sluggish reptile, living on rodents, and rarely attacks human beings unless molested. Other species are *C. horridus*, which is more widely distributed in the U.S.A., the large diamond R. of Florida and Mexico, and *C. terrificus*, also abundant in Central America. The venom of R. is usually

fatal, but not invariably. The wild hogs, which are their chief enemies, generally escape serious harm from bites owing to their thick layer of fat. The flesh of R. is innocuous and edible.

RATTLESNAKE

Ratzeburg: 1. Prov. of Mecklenburg-Strelitz, Germany, on the S. side of the estuary of the Trave. It was constituted a principality in 1154. Area 148 sq. m. Pop. 15,000. Cap. Schoneberg. The *Landkreis* Schoneberg approximates to the old prov. 2. Tn. in Schleswig-Holstein, Germany, 12 m. S.S.W. of Lubeck, built partly on an is. in Lake R.; it has a Romanesque cathedral (twelfth century). Pop. 5600.

Rauch, Christian Daniel (1777-1857), Ger. sculptor, one of the most noted of the nineteenth century, b. at Arolsen, Waldeck. In 1790 he was apprenticed there to the court sculptor, Valentin, and five years later became assistant to Ruhl, court sculptor at Kassel. In 1802 he exhibited his first statue, 'Sleeping Endymion and Artemis.' Soon after, he went to Rome, where he stayed for six years, his art being influenced by Thorwaldsen. His early works consist of classical and poetical statues, groups, reliefs, etc., but he excelled in portrait-busts, statues, and monuments. He was the founder of the Berlin school of sculpture. His crowning work was the colossal monument of Frederick the Great in Berlin, an equestrian statue in bronze surrounded by groups of generals and soldiers. Other works are the statue of Albrecht Durer in Nuremberg, and statues of Blücher, Luther, and Schiller. See lives by F. and K. Eggers, 1873-91; E. D. Cheney, 1893; and H. Mackowski, 1916.

Raudnitz (Ger. Raudnice), tn. of Czechoslovakia, on the Elbe, 42 m. N.W. of Prague. The prin. attraction is the castle of Prince Lobkowitz, which contains a library and an historical collection of pictures. Pop. 10,000.

Ravanastron, see under VIOLIN.

Ravel, Maurice (1875-1937), Fr. composer, b. at Ciboure, Basses-Pyrénées, one

of the chief modern composers of the young Fr. school, studied under Gabriel Fauré at the Paris Conservatoire. In 1934 he became director of the Conservatoire Américain at Fontainebleau. He was a member of the Legion of Honour, and an Hon. D.Mus. of Oxford. R. was a Fr. musician *par excellence*, an artistic descendant of Couperin and Rameau. His genius is witty, subtle, and emotionally restrained, and he combines a deep-rooted classicism of form with the boldest experiments in harmony; especially notable and delightful are his rhythmic figures. His most important works are the music for *Daphnis et Chloé* (Diaghilev's ballet, 1909); *La Valse*, the remarkable string quartet, the trio, the violin and 'cello sonata, many pianoforte works, including *Habanera*, *Jeux d'eau*, *Pavane pour une infante défunte*, *Gaspard de la nuit*, *Le Tombeau de Couperin*, and the popular orchestral work *Boléro*. After the death of Debussy in 1918 R. was regarded as the most representative of Fr. composers. But except for the ballet opera *L'Enfant et les sortilèges* (1924), and a piano concerto (1931), he abandoned the larger forms and concentrated on small-scale works notable for finish of detail. See studies by R. Manuel, 1933; M. Roland, 1945; and N. Demuth (Master Musicians), 1948.

Ravellin, see under FORTIFICATION.

Raven (*Corvus corax*), one of the largest of the passerine birds, widely distributed in the N. hemisphere, but rare in Britain on account of its persecution by farmers and gamekeepers, whom it undoubtedly robs of numbers of young birds. It is about 26 in. long, and has a wing expanse of nearly 40 in. The plumage is dense black, glossed with purple; the beak and mouth, tongue, legs, and feet are also black. The nest is built in cliffs or in the fork of a tall tree, and is a bulky structure. In it are laid four or five pale green eggs spotted with brown. The male assists in incubation. The R. is a mimic, and, though mischievous, is readily tamed, often living to a great age as a pet.

Ravenna: 1 walled city of Italy, cap. of the prov. of the same name, in Emilia, situated in a marshy plain, 37 m. S.E. of Ferrara. In ant. times it was a port on the Adriatic, but the sea having receded, it is now about 6 m. from the coast. It is the seat of an archbishopric, founded at the close of the fifth century. R. is famous for its architectural remains, having been the cap. of Italy from the beginning of the fifth to the middle of the eighth century. Its cathedral is a modern structure, though founded in the fourth century; but some of its churches and monasteries are very ant., San Vitale dating from the fourth and Santa Agata Maggiore from early in the fifth century. In the church of the Franciscan monastery, a fifth-century foundation rebuilt in 1793, is the tomb of Dante, who d. here in exile in 1321. The mausoleum of Theodoric, king of the Goths, is to be seen outside the tn. Before the Second World War there were colleges and religious institutions, a museum, a library, municipal buildings,

and a ruined citadel. Between the tn. and the sea there is now an extensive pine forest, and the Corsini canal affords communication with the coast. The chief manufs. are silk, wine, musical instruments, falcon-ware, linen, agric. tools, glass, soap, and lace, while in the neighbourhood rice, wheat, chestnuts, wine, olive oil, and hemp are produced. R. was a Rom. naval station on the Adriatic in the time of Augustus, and it later became the abode of Honorius, who strongly fortified it. Odoacer, who led the barbarian hordes which overthrew the W. empire of Rome, assumed the title of king of Italy, and held his court here. He was succeeded by Theodoric, under whose rule R. became a flourishing city, afterwards becoming the residence of the Gk. exarchs until it was captured by the Lombards under Aistulf in 752. In the fifteenth century the Venetians held the tn., and in 1512 the Fr. Army defeated the papal and Sp. forces here, but lost their gallant leader, Gaston de Foix. R. was captured by the Eighth Army (q.v.) on Dec. 5, 1944, as the result of a brilliant outflanking move. Although the city suffered from bombing and shelling, none of the mosaics was seriously injured and the sum total of damage to monuments and monumental buildings was relatively light. Pop.: prov. 285,500, tn. 86,400. See E. Hutton, *Ravenna*, 1926. 2. tn. in Portage co., Ohio. Pop. 8500.

Ravensburg, tn. of Wurttemberg, Germany, situated in a valley on the Schusslen, 22 m. E.N.E. of Constanz. It has remains of old fortifications, etc., and there are manufs. of textiles and machinery. Pop. 32,300.

Ravenscroft, Thomas (c. 1582-c. 1635), Eng. musical composer, chorister of St. Paul's under R. Pearce (Piors). He ed. and pub. the first collections of catches printed in England—*Pammelia Musickes Miscellanie* and *Deuteromelia* (1609). *Melismata Musicali Phantasies* appeared in 1611; *The Whole Booke of Psalmes*, a collection of psalm-tunes for four voices, was produced in 1621-33. Among these, Canterbury, Bangor, and others were composed by R.

Ravi, riv. in the Punjab, forming part of the boundary between W. Punjab, Pakistan, and E. Punjab, India, which rises in the Himalayas and flows into the Chenab. Length 450 m.

Ravilious, Eric (1903-42), Eng. engraver and water-colour artist, b. in London. He was educated at Eastbourne, and taught at the Royal College of Art. He illustrated eds. of the Golden Cockerel and Nonesuch presses, and made the decorations for Everyman's Library. His engravings are characterised by a strong sense of pattern. In the Second World War he became a war artist, and lost his life while flying from Ireland in 1942.

Rawal Pindi, name of a tn., dist., and div. of the W. Punjab, Pakistan. The tn. is the largest military station of India, and, in its irrigated valley, guards the Khyber Pass route to Afghanistan and Russia. It is situated on the N. bank of

the R. Leh, 111 m. S.E. of Peshawar near the site of the anct. city of Gajipur. It was here that the Sikhs surrendered after the battle of Gujrat, 1849. It has gas and locomotive works, iron foundries, a brewery, an arsenal, etc. There are refineries for the oil from the Khaur mineral-oil field in the Punjab, and from the small field at Digbail, Assam. Pop. 181,200. The dist. is watered by the Indus and the Jhelum, and grows principally wheat, barley, maize, millet, and pulse. Area 2022 sq. m. Pop. 785,200. The div. comprises the dists. of R. P., Gujrat, Attock, Shahpur, and Jhelum. Area 21,381 sq. m. Pop. 4,701,000.

'Rawalpindi', see NAVAL OPERATIONS IN SECOND WORLD WAR, *German War on Neutrals*.

Rawdon, or **Rawden**, par. and tn. of W. Riding, Yorkshire, England, 7 m. N.W. of Leeds. There is a Baptist theological college, and cloth is manufactured. Pop. 4700.

Rawlinson, Sir Henry Creswicke (1810-1895), Eng. soldier and orientalist, b. at Chadlington, Oxford. In 1827 he went to India under the E. India Company. In 1833 he was sent to reorganise the shah's troops in Persia, where he studied and transcribed the undeciphered cuneiform inscriptions. In 1844 as political agent at Bagdad he gained his valuable knowledge of the Iraqi cuneiform inscriptions. With Layard he visited Nineveh, and obtained a grant to enable him to excavate in Assyria and Babylonia. His collection of antiquities is in the Brit. Museum. His pub. works have been the foundation of our knowledge of cuneiform inscriptions and the hist. of Babylonia and Assyria, and include *A Commentary on the Cuneiform Inscriptions of Babylonia and Assyria* (1850); *Notes on the Early History of Babylonia* (1854); and with E. Norris, *The Cuneiform Inscriptions of Western Asia* (1861-84).

Rawlinson of Trent, Sir Henry Seymour Rawlinson, first Baron, and second Baronet (1864-1925), Eng. soldier. He was the elder son of the first baronet, Sir Henry Creswicke R. Educated at Eton and Sandhurst, he was commissioned in 1881, in the Royal Rifles. D.A.A.G. to Kitchener in the Sudan, 1898, he served in the S. African war. Commandant of the staff college, 1903-6, he became a major general in 1909. In 1911 he led the 7th Div. to Ypres, received command of the new Fourth Army in 1915, and organised the prin. Somme offensive of July 1916. After a period on the Versailles Council he returned to lead the reorganised Fourth Army in the last offensives. In 1919 R. carried out the evacuation of Murmansk and Archangel, and became baron. From Nov. 1920 he was commander-in-chief, India. He pub. *The Officer's Notebook* (1890.). See life from his letters and journals, ed. by Sir F. Maurice.

Rawmarsh, tn. of the W. Riding, Yorkshire, England, 24 m. from Rotherham, with coal-mines, ironworks, brickworks, steel rolling mills, and potteries. Pop. 18,500.

Raw Materials. In old text-books of political economy this term is ill-defined, its meaning being regarded as self-evident: thus in the 1899 ed. of Palgrave's *Dictionary of Political Economy* the subject is altogether omitted. Generally speaking, R. M. may be said to be the basic or essential materials of manufacturing processes, the commodities in their natural unwrought state and not yet subjected to any process of dressing or manuf.; but it is obvious that a thing which may be included among R. M. to-day may to-morrow be transferred to the category of finished products; e.g. original R. M. are classed as finished products whenever there is a marketable substitute or synthetic product. The importance of R. M. in polemics to-day arises from the realisation of the decisive part played by them in the waging of war, e.g. crude oil and certain metal alloys, while derivatively the problem of obtaining and distributing more or less limited supplies of R. M. (and food) among the starving and suffering peoples of the world after the war gradually came to be recognised as the most serious one facing the post-war planner; and even before the Second World War broke out, the so-called 'Colonial Question' focused world attention on R. M. through the implicit assumption that the 'have-not' nations were inequitably deprived of access to R. M. and that the 'haves' were monopolists of the R. M. obtained from tropical dependencies. This article will consider the question of the international control of R. M. and the influence of substitutes in the economics of R. M.

International Control of Raw Materials.—The workers' representatives and the International Labour Office, soon after the First World War, strove to move the League of Nations to compel something in the nature of an equitable distribution of R. M., because they saw that natural inequalities allowed some countries to possess mineral riches or other valuable natural resources while others were completely lacking in them. But though strenuous efforts were made by left-wing delegates to secure some kind of reform, the League's Economic and Financial Commission did not think that any scheme for international control of the distribution of R. M. could be operated without fixing prices and allocating supplies on some principle of rationing and, in their opinion, that necessarily involved international control of the whole internal life of the countries concerned. Nor again was there any criterion by which an international office or body could fix a reasonable ratio of any raw material to be allowed to any country. The Geneva Conference of 1922 (q.v.) considered the question but did no more than adopt a resolution advocating abolition of import and export restrictions of prohibitions and admitting the right of states freely to dispose of their natural resources. Various forms of international control have been applied to, or proposed for, a great variety of commodities, including

aluminium, artificial silk, butter, cinchona bark, coal, cocoa, coffee, copper, cotton, diamonds, lead, maize, mercury, nitrates, oil, olives, opium, pepper, platinum, potash, quebracho, rubber, silver, sisal, steel, sugar, sulphite pulp, sulphur, tea, tin, timber, tobacco, whale-oil, wheat and other cereals, dairy produce, wine, wool, and zinc. The prin. object of these restriction schemes, however, was not in any way to secure equitable distribution among consumer countries, but, by controlling the exportable quantity, to secure a remunerative price to the producer. The consumer was not considered and, in the matter of rubber restriction, it is not surprising that, late in the operation of the second restriction scheme since the First World War, the Rubber Regulation Committee had to agree to the appointment on its board of an Amer. representative, the U.S.A. being by far the largest consumer of rubber.

Synthetic 'Raw' Materials.—There is no doubt that the world's R. M. will increasingly be faced with the serious threat of substitutes. The extent to which new materials, developed by technical science or chemistry, are used in the factory will always afford evidence as to whether the new product is a serious competitor of original R. M. The disposition, during the early years of the Second World War, in Great Britain to scorn ersatz materials was short-sighted. To-day there is hardly a raw material in the world for which a substitute has not been found; many of them are even now an improvement on the original R.M., despite the fact that, in many cases, the manufacturing costs are very high. Great Britain undoubtedly erred in under-rating the strength of the Ger. war machine in this respect; but substitute materials are important not only in war but for the whole of the future development of economy. It is stressed by economic realists that to-day science has advanced so far that it is able to produce new and exceedingly valuable materials out of apparent rubbish, and Brit. scientific and industrial circles have taken the question of substitutes seriously. Metals have been replaced by plastics, hard glass, and aluminium alloys; plantation rubber by buna; crude oil by synthetic fuels; wool by casein and glass; cotton by staple fibre; and attempts are being made to find an artificial leather or to substitute fish-skins for real leather.

Post-war Requirements.—After the cessation of hostilities (1945) the combatant nations suffered from a serious shortage of R. M. Purchasing commissions set up during the war bought raw material stocks for the post-war period and stored these stocks in the U.S.A., whence they were released as soon as the United Nations were sure that they would be used for the work of healing and not for their destruction.

Raw Materials and the Atlantic Charter.—At the 1919 peace conference the victor powers omitted economics from their considerations altogether (apart from reparations) with the consequences which

Lord Keynes predicted in his *Economic Consequences of the Peace*. Mindful of this omission, the authors of the Atlantic Charter (q.v.) promised all nations, victors and vanquished alike, access to R. M. Yet, in fact, the charter only promised them what, with a few minor exceptions, they already had. So long as the Brit., Amer., Dutch, and other colonial powers were prepared, as they always had been prepared, to take any people's money for their colonial tea, rubber, tin, coffee, copper, nickel, etc., and charge the same prices all round, the so-called 'have-nots' had no real ground of complaint other than might spring from wounded prestige. The trouble in the past has been, not that R. M. and foodstuffs were not available, but that the peoples who needed them most had not the means to pay for them. See G. B. Shirlaw and L. E. Jones, *You and the Peace*, 1944; also F. E. Lawley, *The Growth of Collective Economy* (2 vols.), 1938; O. Dutch, *Economic Peace Aims*, 1941; and P. Lauartine Yates, *Commodity Control: a Study in Primary Products*, 1943.

Rawson, tn. of Argentina, cap. of Chubut ter. on the Chubut R., about 6 m. from the coast. It derives its name from its founder, who est. a Welsh colony near its site. Pop. 2500.

Rawtenstall, municipal bor. of Lancashire, England, 8 m. N. of Bury. It manufs. cotton and woollen goods, boots and shoes, and has ancillary trades. Pop. 26,500.

JOHN RAY

Ray, or Wray, John (1627-1705), Eng. botanist, b. at Black Notley, Essex, took his M.A. degree, and became in turn Gk. lecturer, mathematical lecturer, and junior dean of Trinity College, Cambridge. In 1662 conscientious scruples induced him

to resign his fellowship. In his earlier life he enjoyed the friendship of Willughby, the zoologist (d. 1672), whose works he ed. In his company he toured for three years (1663-66) in Europe, the scientific fruits of his travels being embodied in *Stirpium Europaeorum extra Britannias nascentium Sylloge* (1694). No small interest attaches to his *Synopsis methodica stirpium Britannicarum* (1690), his more ambitious *Historia generalis Plantarum* (3 vols., 1686-1704), and his treatise on zoology, *Synopsis methodica Animalium Quadrupedum et Serpentinum Generis* (1693). The R. Society was founded in 1844. See E. Lankester, *Memorials of Ray*, 1834.

Ray, term applied to many clasp-branch fishes, of various families, distinguished by their flattened bodies and enormously expanded pectoral fins. They are closely allied to skates.

Ray, Electric, see TORREDO.

Rayahs ('cattle'), non-Muslim subjects of Turkey in Europe. They had always been very badly treated by the authorities before their emancipation in 1908.

Rayleigh, John William Strutt, third Baron (1842-1919), Brit. physicist, b. at Langford Green, Essex, eldest son of second baron. Entering Trinity College, Cambridge, as a fellow commoner in 1861 he graduated as senior wrangler and Smith's prizeman, 1865, and was a fellow of Trinity College, 1866-71. In 1871 he married Evelyn, sister of Arthur (afterwards earl of) Balfour. In 1873 he succeeded his father in the barony and was elected F.R.S. From 1879 to 1884 he was prof. of experimental physics at Cambridge, succeeding Clerk Maxwell. He presided over the Brit. Association at Montreal in 1884, and succeeded Tyndall as prof. of natural philosophy at the Royal Institute in 1887, resigning in 1905. He was secretary to the Royal Society, 1884-96, and president, 1905-8. He became a Privy Councillor in 1905. He received the Nobel prize for physics, 1904, the Albert medal of the Society of Arts, 1905, and the Order of Merit at the coronation of King Edward VII., and was chancellor of the univ. of Cambridge from 1908. His work included research in the fundamental electrical units, Boyle's law at low pressures, optics and capillarity, the dynamical theory of gases, hydrodynamics, the mechanics of flight, photography, theory of the telephone, the distribution of alternating currents in conductors, and pure mathematics. It was when experimenting with a view to recalculation of atomic weights that he discovered a discrepancy between atmospheric nitrogen (as then extracted) and nitrogen obtained from mineral compounds, which led in turn to his discovery of argon in 1894 simultaneous with the discovery by Sir Wm. Ramsay (q.v.). In practical affairs, being a considerable landowner, he opened dairy shops in London for the sale of pure milk. He took considerable interest in psychological research. His works include *Theory of Sound* (1877-78), *Scientific Papers* (1903), and an article in the 9th

ed. of the *Ency. Brit.* on 'Wave Theory,' which is a compendious treatise on light. An obituary notice occurs in the *Proceedings of the Royal Society*, vol. xcvi. (1920-21).

Rayleigh, Robert John Strutt, fourth Baron (1875-1947), Brit. physicist, eldest son of third baron; was educated at Eton and Trinity College, Cambridge. He was elected a F.R.S. in 1905, and received the Rumford medal in 1920. He carried out important investigations in spectroscopy, but is best known for his measurements of the amounts of radioactive materials present in the earth's crust. These showed that the heat generated by radioactive changes is sufficient to account for the observed flow of heat from the interior to the surface of the earth, and that, contrary to earlier belief, no appreciable cooling of the surface is likely in the course of many millions of years. He also showed that, by measuring the extent to which the end products of radioactive changes had accumulated in rocks since they were laid down, their ages could be estimated. He wrote a life of his father (1924) and of J. J. Thompson (1942).

Raymond, or Raymund, Count of Toulouse, celebrated crusader who slew Aladin, king of Jerusalem, and planted the Christian standard on the tower of David. He figures in Scott's novel, *Count Robert of Paris*.

Raymond, Walter (1852-1931), Eng. novelist and nature writer, b. at Yeovil; entered his father's wool business there—a life for which he was entirely unsuited. But in Somerset he was at least able to learn the secrets of wood and moor from old countrymen, and in 1888 his first novel, *Misterton's Mistake*, was pub., and four years later he decided to give up a commercial life for literature. The first book he wrote after becoming a professional author was *Gentleman Upcott's Daughter* (1892), which appeared under the pseudonym of 'Uncle Tom Cobleigh' and which shows something of his admiration of the work of the Dorset dialect poet, Wm. Barnes. After a short time in London he soon wearied of what to him was an artificial and enervating life and went to Withypool, an Exmoor vil., where he rented a cottage at a shilling a week (1905), an episode in his career which he felicitously describes in his *Book of Simple Delights* (1906), a work which reveals his powers as a rural essayist and portraitist. Among the works of R. which are worthy of study to-day should be mentioned *The Book of Simple Delights* (1906); *The Book of Crafts and Characters* (1907); and *English Country Life* (1910)—the second of these pub. in the Dent Memorial Edition.

Raymund, Lully, see LULLI, RAIMON.

Raymund of Fitero, St. (d. 1163), b. in Aragon. A Cistercian, he founded Fitero Abbey in Sp. Navarre. When the city of Calatrava was in danger from the Moors he founded the military order of Calatrava for its defence. Under his leadership the order acquired great fame in Spain.

Raymund of Peñafort, St. (1175-1275), b. at Villafraanca. After being a priest at Barcelona he joined the Dominican order in 1222. Gregory IX., whose confessor he became, charged him with the codification of the canon law, and his five books of decretals, completed in 1234, remained the standard authority until 1917. He became master-general of his order in 1238.

Raynaud's Disease, disease of the nervous centres characterised by three stages. The first stage, known as local syncope, is marked by numbness and whiteness of the extremities, such as the fingers, toes, ears, and nose. The condition is usually symmetrical and points to the circulation being restricted for the time being. The second stage is known as local asphyxia. The fingers, toes, and ears are most commonly affected. The parts become discoloured and swollen, and all sense of touch is lost. Sometimes this condition is accompanied by hemoglobinuria. The third stage, fortunately rare, is known as local or symmetrical gangrene. The parts affected become gangrenous, exhibiting small areas of blackened and shrivelled appearance, which may become extensive in severe cases. The cause of the disease is not definitely known. The symmetrical disposition of the affected areas points to a central nervous origin. It is probable that a spasm of the arterioles restricts the circulation in certain parts, with resulting anaesthesia and ultimate gangrene if the condition be prolonged. The disease may proceed through all three stages; it may be arrested at the first or second; or it may commence with local asphyxia without any preliminary syncope being noticeable. Sudden cold is said to initiate an attack, and the treatment should aim at avoiding low temps.; massage of the affected part is valuable, and electrical treatment can be applied. Congestion treatment of the extremities has been found valuable, but all gangrenous matter should be separated as soon as possible. The prognosis depends upon the extent of the gangrene.

Ray Therapy, see RADIUM, Radiotherapy.

Rayon, see ARTIFICIAL SILK.

Razakars, see under HYDERABAD, History.

Razor (O.F. *rasor*; Lat. *rasare*, to scrape), cutting instrument, used chiefly for shaving the beard. The manuf. of Rs. demands a high quality of cast steel and workmanship for forging and grinding. Good quality Rs. are produced in Germany and the U.S.A., but the processes are similar to those followed in the cutlery trade of Sheffield, Yorkshire. The steel is first supplied in bars whose thickness is represented by the maximum thickness of the completed Rt. The forger fashions a portion of the bar into the rough form of a Rt.; the blade is then more completely shaped on the anvil, the required amount of concavity effected, a good edge put on, and the tang drawn out. The blade is next dry-ground; this removes all trace of oxide and hollows out the metal still more completely to a fine edge. The

process of hardening is then carried out by heating the metal to a bright red and plunging it into cold water. This makes the steel very brittle, rendering tempering by loss extreme heating and cooling necessary. Wet-grinding on stones varying in diameter from 2 in. to a foot then serves to bring the edge to a fine, almost uniform sheet. The processes of polishing involve applying the blade to a wheel covered with a tin-lead alloy, and supplied with emery-powder paste. When the requisite degree of polish has been attained the blade is jointed into a haft made of bone, ivory, horn, or celluloid. Hollow-ground Rs. may be whetted time after time for years without the necessity for regrounding, and have altogether superseded the flat-ground form. Safety Rs. of various types have become popular; their essential feature is the provision of a guard which smooths out the skin as the blade comes in contact, thus reducing the risk of cutting. The blades of most safety Rs. are not meant to last and may be purchased for a few pence. Recently, however, safety Rs. have been made to enable certain blades to be stropped or resharpened.

Razor-backs, see FIN-WHALES.

Razorbill, or Black-billed Auk (*Alca torda*), only remains of species of a genus which included the now extinct great auk (*A. impennis*). It breeds on the sea rocks on various parts of the Brit. coasts, making no nest, and laying only one egg, which is white with brown markings. The R. is about 18 in. long; the head, neck, and upper surface are glossy black, and the breast and under parts pure white. The black beak is large and much compressed, and the end is curved. The bird is a capable swimmer and diver.

Razor-shell (*Solen*), genus of widely distributed lamellibranch molluscs with very elongated shells, the valves of which are open at both ends, and are almost straight. The foot is highly developed; it can be pointed or contracted for boring with great rapidity into sand, and with it the R. can retain so tight a hold that the foot often has to be torn off before the creature can be removed. *S. siliqua* and *S. ensis* are Brit. Both are edible, and though now not much eaten, were considered a delicacy by the anc. Gks.

Razure, see ERAZURE.

Ré, or Rhé, fle de, is. with an area of 28 sq. in. off the shores of the dept. of Charente-Maritime, France, 6 m. W. of La Rochelle. It has vineyards, orchards, salt deposits, cornfields, and oyster fisheries (this is the prin. industry). St. Martin is the cap. Pop. 10,000.

Read, Herbert (b. 1893), Eng. poet and critic, b. at Kirby Moorside, Yorkshire, educated at Crossley's School, Halifax, and Leeds Univ. He served during the First World War from 1915 to 1918, his war poems being among the best of their kind. From 1919 to 1931 he was assistant keeper at the Victoria and Albert Museum, devoting himself to literary criticism and aesthetics: *Reason and Romanticism* (1926); *English Stained Glass* (1926); *English Prose Style* (1928); *The Sense of Glory*

(1929); *Wordsworth* (1930); and *The Meaning of Art* (1931). His poems 1913-25, remarkable for their metaphysical power and imagery, were collected in 1926, and again in 1946. In 1930 he delivered the Clark Lectures at Cambridge, on Wordsworth. R. was also Watson Gordon prof. of fine art in the Univ. of Edinburgh, 1931-33; Sydney Jones lecturer in art, Liverpool Univ., 1935-36; and ed., *Burlington Magazine*, 1933-39. Other pubs. include *Form in Modern Poetry* (1932); *Art and Industry* (1934); *In Defence of Shelley* (1935); *Art and Society* (1936); *Poetry and Anarchism* (1938); *Annals of Innocence and Experience* (1940); *Thirty-five Poems* (1940); *The Politics of the Unpolitical* (1943); *Education through Art* (1943); *A World Within a War* (poems, 1944); *A Coat of Many Colours* (essays, 1946); *Collected Poems* (1946); and *The Innocent Eye* (1947). See studies by H. W. Hausermann, 1938, and H. Trecco, 1941.

Reade, Charles (1811-84), Eng. novelist and dramatist, b. at Ipsden, Oxfordshire, was in 1835 elected a fellow of Magdalen College, Oxford, but lived mostly in London, and moved in Bohemian circles to the great scandal of his academic confrères. In 1851, when he was serving as vice-president of Magdalen, he began his literary career with a tragedy, *Angelo*, which was produced at the Olympic in 1851. In the following year he wrote in collaboration with Tom Taylor the popular comedy *Masks and Faces*, which he turned into the novel, *Peg Woffington* (1853); but the play, though it has effective scenes, is tawdry. R.'s next novel, *Christie Johnstone* (1853), is one of his masterpieces, and the character of the poor old Scottish peasant and her blessing linger always in the memory. Then followed *It is Never Too Late to Mend* (1856), an exposure of the prison system, and many other novels and plays which do not call for detailed mention. R. stands or falls by *The Cloister and the Hearth* (1861), and there can be little doubt that he will stand by this for many generations to come. It is one of the greatest of historical novels. Its survey of the customs of Holland and Germany, of France and Italy, in the fifteenth century, just before the Renaissance, the knowledge it displays, its vast scope, its characterisation, its tenderness, and its pathos, above all its sincerity, make it a work to read and to re-read. It is a dashing tale of adventure, of fights with leopards, bloodhounds, bears, robbers; but its chief merit is the love story, so sad and exquisite. *Hard Cash* (1863) is an exposure of the private asylum. See lives by R. F. Littledale, 1884; W. C. Phillips, 1919; and M. Elwin, 1931, 1948.

Reading, Sir Rufus Daniel Isaacs, first Marquess of (1860-1935), of Jewish descent, Eng. judge and administrator, second son of Joseph Michael Isaacs, of London, fruit merchant. Educated at Univ. College School (London), Brussels, and Hanover, he went as a boy on a coal-ship running to Rio de Janeiro, for two years; later he was his father's agent at

Magdeburg, went on the Stock Exchange, and finally studied law, being called to the Bar in Middle Temple, 1887. His knowledge of the city brought him forward almost immediately in company actions, and within a few years he had one of the largest practices at the Bar; he took silk in 1898. Liberal M.P. for Reading, 1904-13, he became solicitor-general and was knighted on the elevation of Sir Samuel Evans to the bench, March 1910, becoming attorney-general the following Oct., in succession to Sir W. S. Robson (made lord of appeal). In 1912, somewhat in defiance of usage, he was admitted to the Cabinet while still holding the post of attorney-general. On Oct. 20, 1913, he became lord chief justice of England. He was made Baron R. of Erleigh on Jan. 9, 1914, and Viscount R., June 26, 1916. He was president of the Anglo-Fr. Loan Commission to U.S.A., 1915. The outstanding incident of his chief justiceship was his presiding over the trial of Roger Casement for treason, June 26-30, 1916. R. was special envoy to U.S.A., 1917, and was made earl of R., Dec. 20, 1917. Special ambas. to U.S.A., 1918-19, in 1921 he vacated the chief justiceship, and became viceroy of India. His period of office coincided with the rise of Gandhi (q.v.), with whom he had sev. interviews. His telegram of March 7, 1922, to the secretary of state gave, when pub. (see MONTAGU, E. S.), the finishing stroke to the pro-Gk. policy of the treaty of Sèvres. He was obliged in 1924 to use his special powers to carry the budget without consent of the assembly. He visited England in 1925 to confer with the home gov. as to reforms in India; and he brought about the abdication of the Maharaja of Indore, suspected of complicity in a murder. He strengthened Britain's moral claims to Indian support by combining a policy of benevolent patience with even-handed justice. His term expired early in 1926, and on May 7 he was made marquess. As a member of the Indian Round Table Conference, he put forward the outline of a scheme of All-India Federation, with responsibility at the centre, and due transitional safeguards (1931). In that year he was appointed foreign secretary in the National Gov. (q.v.), but relinquished the post in favour of Sir John Simon following the general election of that year. He was the first of Jewish race to fill the offices of lord chief justice of England, viceroy of India, and foreign secretary, and his career, full of romance, is unparalleled in our later legal and political annals. See life by his son, 1943-45.

Reading: 1. Cap. of Berkshire, England, 36 m. by rail W. of London, on the Kennet, at its confluence with the Thames. Here is the huge biscuit factory of Messrs. Huntley & Palmer. Palmer Park, second only to Prospect Park (120 ac.), was the gift of George Palmer; here also are Sutton's seed-testing grounds. There are also iron foundries, boat-building yards, and engineering works, R. being an important junction on the W. Region railway. The univ. (opened in 1892 as a univ.

college, and raised to univ. status in 1926), which accommodates its students in Wantage Hall, St. Andrew's Hall, and other buildings, provides an excellent training in agriculture, besides the usual courses for degrees. R. is the centre of instruction in dairying for the Brit. Isles. The grammar school (founded by Henry VII. in 1486) now ranks with the lesser public schools; among its pupils was Archbishop Laud, a native and benefactor of the tn. As many as nine Parliaments were at different times (1432, 1451, etc.) held in the wealthy Benedictine abbey (founded in 1211), whose consecration in 1164 was solemnised by Becket in the presence of Henry II. A Dan. encampment in 871, R., or rather 'Rad-ynges,' is credited with thirty houses at the time of the Domesday survey, whilst in the sixteenth century a writer explains that the tn. 'chiefly stonldith by clothing.' It sends two members to Parliament. Pop. 114,600. 2. Cap. of Berks co., Pennsylvania, U.S.A., on the Schuylkill R. 58 m. N.W. of Philadelphia by rail. In a coal- and iron-mining dist., it has steel and railway repair works, iron foundries, and rolling mills, and many manufs. Pop. 110,600. 3. Tn., in Middlesex co., Massachusetts, U.S.A., 12 m. by rail N.W. of Boston, manufacturing furniture and boots. Pop. 10,900.

Real, term used by lawyers with the primary significance of things permanent or immovable, as lands or tenements (see **REAL PROPERTY**, **PERSONALTY**, and **PROPERTY**). A R. right, or *jus in re* in Scots law, is a right of property in a thing in virtue of which the person vested with the right may sue for possession of the thing into whosever hands it may go. A R. composition is an agreement between the owner of lands and the parson or vicar, with the consent of the ordinary, that such lands shall be discharged from payment of tithes in consequence of other land being given to the parson in satisfaction thereof. In Scots law a R. burden as opposed to a personal burden denotes an imposition of money on the subject of a right in the deed by which the right is constituted, a personal burden being merely imposed on the receiver of the right. Bentham also used the term in connection with evidence, meaning by R. evidence that which is afforded in any particular case by material objects, as for example, by weapons, a jemmy, etc.

Real, Sp. silver coin worth a quarter of the 'peseta' which is still current in Mexico and other old Sp. possessions. The Portuguese R. is valued at forty reis.

Realgar, or **Ruby Sulphur**, sulphide of arsenic; formula As_2S_3 . It is found native as orange-red monoclinic crystals, of hardness 1½-2 and sp. gr. 3.5; it is also found as an incrustation in the neighbourhood of volcanic exhalations. The artificial di-sulphide (As_2S_2) is obtained by fusing together arsenic and sulphur. It is readily fusible, and can be made to sublime easily. It is used in pyrotechny and was used as a pigment until superseded by lead chromate. The name is of Arabic origin.

Realism (philosophy), an interpretation of life as opposed to idealism (*q.v.*). It involves the beliefs that time, space, and their attributes are real (transcendental R.), that phenomena exist apart from our consciousness or conception (empirical R.), and that our perception of them is governed by direct intuitive cognition, not by the mediate process of representative ideas. It has figured in philosophy from the beginning; *e.g.* Socrates, Plato, Aristotle. During the Middle Ages the term R. was used in scholastic philosophy to denote the teaching of the 'reality' of universal ideas; R. was thus contrasted with nominalism (*q.v.*). St. Thomas Aquinas (*d.* 1274), and Duns Scotus (*d.* 1308) were realists. Modern R. has important teachers in Sir W. Hamilton (natural and hypothetical R. or dualism), Herbert Spencer (transfigured R.), G. H. Lewis (reasoned R.), and others, and is chiefly a reaction against idealism. The term R. as used to signify certain types of art and literature is also the result of anti-idealistic reaction; its disciples claim to present life as it really is, both its joy and sorrow, its beauty and ugliness, the imperfections being generally emphasised (*e.g.* Zola, Dostoevsky, Thomas Hardy).

Reality. Consideration of R. is the primary difficulty in an philosophical discussion, since it involves the question of the existence and the nature of matter. Many philosophers have urged that matter does not actually exist apart from essential idea, *i.e.* that R. is relative, not absolute. What is commonly understood by R., they say, is nothing more than appearance. R. itself in its ultimate truth being the unknown object of all metaphysical inquiry. It is conceivable that between appearance and R. there is a qualitative change, *e.g.* science reduces matter to electric energy: Berkeley and other idealists regard it as an idea or group of ideas existing in the mind of God, and so on. On the other hand, realists and materialists assert that thought, mind, or consciousness apprehends but does not create matter. The term 'real,' therefore, implies the state of being or existence; thus any notion or concept has necessarily the quality of R. Yet R. is opposed to concepts which are neither true nor false and which fallaciously involve the element of existence. The term 'unreal' is, therefore, one of purely psychological relativity, expressing illusions and hallucinations as distinct from phenomena or sense-impressions. On broader grounds it is clear that when the term 'unreal' is employed, it denotes not a negation but a difference in order and degree of R. In logic R. is used as distinct from, and intermediate to, the extremes of (a) possibility, *i.e.* the fact that with certain conditions a thing may be affirmed as existing; and (b) necessity, *i.e.* the fact that with certain conditions a thing must be affirmed as existing.

Real Presence. In Rom. Catholic theology, the substantial presence of the body, blood, soul, and divinity of Jesus Christ in the bread and wine of the eucharist after consecration. According to the Rom. Catholic Church, this is

effected by transubstantiation, *i.e.* the 'substance' of the bread and wine is changed while the 'accidents' (appearance, weight, etc.) remain the same.

Real Property. Div. of property into real and personal is the cardinal div. in Eng. law (*see* PERSONAL PROPERTY). The old term for R. P. was 'lands, tenements, and hereditaments,' the later term 'real' being derived from the old remedy for dispossession (*see* under PERSONALTY, EJECTMENT). R. P. comprises (1) immovables (excluding leaseholds, which are personal property), which are further subdivided into (a) corporeal, *e.g.* lands, houses, hereditaments (*see* also HEREDITAMENTS), and (b) incorporeal, *e.g.* tithes, rents, advowsons, reversions; (2) incorporeal hereditaments, *e.g.* water-courses, rights of common (*see* INCORPORAAL 'HATTLES AND HEREDITAMENTS'); (3) personal property 'notionally' converted in equity into R. P. (*see* also CONVERSION); in other words, money or money's worth ordered by a testator or other person disposing of property to be laid out in the purchase of land; and (4) certain shares in joint-stock companies, *e.g.* in the former New River and the Avon Navigation Companies, though these shares have now been converted into port stock. R. P. chiefly differs from personal property in (1) its susceptibility from feudal times of being limited or marked out into estates (*see* ESTATE; LIMITATION OF ESTATES). In personality some may have the income for life and others the corpus in absolute ownership, but there are no estates. (2) R. P. on intestacy, prior to the Administration of Estates Act of 1925, devolved on the heir, personality on the next-of-kin (*see* further under HEIR; SUCCESSION; INTESTATE). (3) The beneficiary, under a will, of R. P. is called the devisee, of personality, the legatee; but since the Land Transfer Act, 1897, under which all property vests in the first instance, this distinction is of less importance. (4) Personal property is liable as assets in priority to R. P. for the liquidation of the deceased's debts, in the absence of provision by the testator to the contrary. (5) R. P. is said to be conveyed (*see* CONVEYANCING); personality only is said to be assignable (*see* also PROPERTY; LAND LAWS; and LAND).

Reaping. In the beginning of the nineteenth century cereal crops were harvested, as in prehistoric times, by means of the R. hook or sickle. This tool is still indispensable in dealing with badly lodged crops, but its use is very slow, half an acre being the utmost a man can cut in a long day. The scythe had long been used in cutting hay, but was not satisfactory for corn until a cradle of iron or wood, to lay the stalks in a swathe, was provided. It is still sometimes used to cut a roadway round each field for the machine to start. A R. machine was first introduced by the Rev. Patrick Bell in 1828. It only cut the corn and laid it in a swathe at the side. This was followed by manual delivery reapers, which required a man to remove the sheaf from the machine, and self-delivery reapers, which,

by means of revolving sails, discharged the sheaf to the ground. The sheaves were then generally tied with bands of corn by gangs of men stationed round the field. About 1885 the binder, which gathers the sheaf, ties it with string, and throws it off the machine, was introduced. This is a very complicated machine, and its employment, resulting in the cheapening of corn, has been of great importance to the human race. The binder, which may be tractor or horse drawn, can, depending on size, cut 6 or 8 ft. at a time and cover as much as 20 ac. in a day. When working, the sails of the binder gather the cut corn on to an endless canvas belt which feeds it to an incline where it is pushed or accumulated, until a sheaf large enough to depress a lever causes a curved arm, threaded with string, to rise and encircle the bundle with a cord, which is then knotted and cut, when a pair of arms discharge it. The sheaves must then be traved (stooked or shocked) to protect them from the weather and from premature germination which might occur on the ground. In some cases the corn, particularly oats and wheat, is cut early to prevent 'shelling,' and final ripening takes place in the trave. The corn is then carted and stacked, and the stack thatched, to await thrashing (*q.v.*).

This process is eliminated by the combine harvester, which cuts and thrashes in one operation. The combine can be one of three types: (1) tractor drawn and powered; (2) tractor drawn and self-powered; (3) self-propelled, of which the last is the most important and generally used, having its cutter bar, which is similar to that of a binder, in front, enabling a direct approach to the work. The thrashing mechanism is like that of a stationary thrasher. All grain must be dead ripe before being 'combined' to limit, as far as possible, the necessity of drying before storage.

Rear-Admiral, *see under* ADMIRAL.

Reason, term used in logic and philosophy with many different meanings. In ordinary usage it may be taken as equivalent to common sense and opposed to prejudice. *See* LOGIC; RATIONALISM; PHILOSOPHY; PSYCHOLOGY; KANT, etc.

Réaumur, René Antoine Ferchault de (1683-1757), Fr. scientist, b. at La Rochelle, nicknamed the 'Pliny of the eighteenth century.' An able and observant natural historian, he left behind him an exhaustive hist. of insects (1734-42). Besides discovering the white opaque glass and the famous thermometer which bears his name, he wrote monographs on subjects so different as turquoise mines and the silk of spiders, auriferous rivers, and the manuf. of tin. For his thermometer R. used a mixture of $\frac{1}{2}$ alcohol and $\frac{1}{2}$ water, and called the freezing point 0° and the boiling point 80°.

Réaumur Thermometer, *see under* THERMOMETER and THERMOMETRY.

Rebab, *see under* VIOLIN.

Rebate, allowance or reduction of price made for prompt payment, etc. **Rs.** of customs duties are granted on damaged goods, and gas and water companies often

distributed some of their profits in the form of a R. of the rates charged. **Deferred R.** is a commercial practice which has had a certain vogue, particularly with large trusts and their agents or distributors. As the term implies, it is a R. which does not appear on the invoice, but is deferred in some cases for six, in other cases for twelve months, provided certain conditions are fulfilled. Amongst those conditions, it may be stipulated that the trader shall enjoy such R. provided he (1) does not retail below a certain agreed figure the goods of the corporation granting the R.; (2) agrees not to sell or display similar wares of a rival organisation. Should such conditions be broken, the contract becomes void and the retailer may forfeit his claim to the deferred R., which in many cases represents a considerable percentage on the original invoice figure. By the advocates of the system it is maintained that the process keeps the trader on good terms with the larger corporations, on account of the reward which is offered after certain periods of 'good behaviour,' and helps in the suppression of rival concerns. The system was used by some of the larger shipping combines, particularly in respect of freight traffic, where for reasons of economy it is eminently desirable to maintain a regular flow of freightage on those lines of tramp steamers where short cargoes very often spell loss.

Rebec, or **Rebeck** (Arabic *rehbab*), musical instrument of Arab origin, popular in the Middle Ages, and the immediate forerunner of the viol family and the ancestor of the violin family, though its shape was more like that of the mandolin, which is probably one of its descendants. It was introduced into Europe from the R., and was either pear-shaped (tapering to the neck) with three strings, or boat-shaped with two strings, and was played with a bow. It survived in France until the eighteenth century, but only as a street instrument.

Rebekkah, wife of Isaac, who by craft secured for her younger son, Jacob, the blessing which Isaac intended for the elder, Esau (Gen. xxvii.).

Rebus, enigmatical representation of some phrase, name, or thing, by pictures or words.

Récamier, Jeanne Françoise Julie Adélaïde, Bernard, Madame (1777-1849), Fr. society leader, b. at Lyons, perhaps

REBEC

the finest representative of those women who swayed the *salon*, and thus became an unacknowledged legislator. In her teens she was married to M. Jacques R., a rich banker and about thrice her age. A record of the splendid social triumphs of Mme R. would involve notice of nearly all that was distinguished in Paris during a space of about fifty years. To the famous Madame de Staël she was bound by ties of extreme affection and intimacy, and the most distinguished *ami* of her later years was M. de Chateaubriand. She died of cholera, a disease of which her dread had always been great. Her *Souvenirs et correspondance*, ed. by Mme Lenormant, were pub. in 1857. See N. Williams, *Madame Recamier and her Friends*, 1901; E. Herriot, *Mme Recamier et ses amis*, 1904, 1934; and Margaret Trouncer, *Madame Recamier*, 1949.

Recanati, city in the Marches and S. m. N.N.E. of the tn. of Macerata, Italy. It has a fine fourteenth-century Gothic cathedral and monuments to Gregory XII. and Leopardi, a native. Pop. (com.) 17,700.

Recapitulation (biology), see BIOLOGY; HAECKEL, ERNST.

Receipt, written discharge of a debtor on payment of money, or an acknowledgment in writing of having received a sum of money or other valuable consideration (q.v.). A R. for part of a sum of money due will not operate to discharge the debtor of the residue even though it be expressed to be in full satisfaction, unless there be some consideration given to the creditor for so forgoing the rest of his legal demand. A R. is evidence of payment of a debt, but may be upset by counter-evidence to the effect that it was given under a misapprehension or obtained by violence, duress, or fraud. A R. for £2 and upwards must bear a twopenny stamp, which may be either adhesive or impressed. If unstamped it will be admissible in evidence only on payment of a penalty of £10. Again any person who gives a R. and refuses to stamp it or divides it with intent to evade the duty is liable to a similar penalty.

Receiver, a R. is an individual (usually an accountant, though sometimes the liquidator of a company) appointed in certain cases by a court of equity upon the application of creditors, or other interested parties, to receive income and pay debts. The court can appoint a R. whenever it appears to be just or convenient to do so. Rs. are usually applied for in debenture-holders', mortgagees', and partnership actions. When appointed the R. acts for the benefit of all the creditors, and not merely the creditor or creditors who applied for the appointment to be made. A R. may be appointed as R. and manager to carry on a business, but unless expressly appointed manager he has no powers of management. The court gives managerial powers over and above those of a mere R., only with a view to sale or realisation of the assets, for the simple reason that the court (a R. being deemed an officer of the court from the date of his appointment) will not under-

take the permanent management of any business. The main duties of a R. are to collect and receive rents, profits, or income, get in outstanding assets, pay and discharge ascertained debts or liabilities, and take proper receipts for such payments. Interference by third parties with the possession of a R. may be restrained by injunction, and may also render such parties liable to committal for contempt. The Dept. of the Official Rs. in Bankruptcy (High Court, Bankruptcy Buildings, Carey St., W.C.) consists under the Bankruptcy Acts of 1914 and 1926 of a senior official R. and official R. and assistants. Official Rs. are also appointed for co. court dists. A list will be found in the current law list. Under the Companies Act (1929) there exists a Dept. of Official Rs., Companies (Winding-up), High Court.

Receivers, Radio, see RADIO and RADIO RECEIVERS.

Receiving Order, order by a court for the protection of the estate of debtor who has committed an act of bankruptcy. It may be made either on the petition of a creditor or creditors to the amount of £50 and presented within three months of the act of bankruptcy, or on the petition of the debtor himself, alleging that he is unable to pay his debts.

Receiving Stolen Goods. A receiver of stolen goods is liable either as an accessory after the fact or as a prin. offender. It is essential to prove that the goods were stolen; but if the only witness to such original stealing be the thief himself, the judge ought to direct an acquittal of the alleged receiver. It must also be established that the goods were received by the accused into his actual possession, a joint possession with the thief being insufficient; the mere fact that stolen goods are found in the accused's possession is good presumptive evidence of his having received them. Lastly guilty knowledge must be proved; this may be effected either directly by the evidence of the thief, or circumstantially by showing, for example, that the receiver bought at a gross undervalue, denied that he had the goods in his possession, or (perhaps) that he was in possession quite recently after the theft. The punishment for R. S. (i. e. may extend to penal servitude for fourteen years, but if the theft were a misdemeanour (as, for example, if the thief obtained them by false pretences) the maximum sentence is seven years.

Rechabites, anct. Jewish religious order, founded by Jehonadab, the son of Rechab. The object of the founder was the perpetuation among his own posterity of his nomadic style of life, and with this view he prescribed various rules, the prin. of which were to refrain from building houses and to eschew wine. (2 Kings xv. 10; Jer. xxxv.).

Rechabites, Independent Order of. Friendly society for total abstainers, estab. at Salford, Lancashire, Aug. 25, 1835. It promotes temperance teaching and propaganda, and makes provision for sickness, death, endowment, and other similar benefits to members. It has over 4000

branches, called tents, in the Brit. Isles and dominions. The membership at Dec. 1948 was 500,000, and the total funds £1,000,000.

Recife, or **Pernambuco**, cap. of Pernambuco state, and seaport of N. Brazil, on the E. extremity of S. America. An opening in one of the reefs permitting access to the calm lagoon behind it provides a small natural harbour for the port of R. Sugar and cotton thrive in the area because of the hot and humid climate. The city exports sugar, rum, hides, cotton, fruit, and dyewoods. It comprises three quarters. Of these the oldest and most densely populated is São José do R. The more spacious Santo Antonio, on the ls. of Antonio Vaz, sprang up during the Dutch occupation (1630-54); it is a flourishing commercial port with customs house, exchange, warehouses, etc. Bon Vista is modern and mainly residential.

R. is one of the earliest Portuguese settlements in Brazil, a successful colony being founded at Olinda, near the site of R., in 1537. Pop. 384,400.

Reciprocal. If a quantity be represented by a/b , its R. is b/a . Tables of the Rs. of the common numbers are prepared for mathematical calculations; in this case the R. of n is $1/n$.

Reciprocating Motion, oscillation in a straight line of a portion of machinery, e.g. the piston in the cylinder of an engine; the reciprocating parts affect the balance of the engine, and the vibration and shock due to their motion have to be minimised. See STEAM ENGINE.

Reciprocity. Shortly expressed, the theory of R. of exchange in international trade means that a given country should decline to receive imports from another country except on condition that the latter accepts the commodities of the former in return. A modified form of R., adapted to the conditions of international trade, exists, and has existed for a century, in the shape of commercial treaties (q.v.). Such treaties cannot in the nature of things be consistent with Free Trade principles, because their very existence presupposes the existence of a tariff in both the contracting nations. England, for example, at the time of Cobden's treaty with France in 1860, was not a free-trade country; for in consideration of France substituting for its prohibitive (see PROTECTION) duties moderate protective duties not exceeding a maximum *ad valorem* charge of 30 per cent., England agreed to abolish all its outstanding duties on foreign manufactured goods. In modern politics commercial treaties have taken a prominent place, especially since the Imperial Economic Conference of 1932. (See also IMPERIAL CONFERENCE; MERCANTILE SYSTEM.)

Recitative. Declamation by singing, with fixed notes but without definite metre or time, comparable to prose inserted into verse drama. But although the notes are fixed by notation, they are not always, or should not always be, sung with full tone or even very definite intonation; on the other hand, although

the time is free, in musical notation R. is generally written down by convention in 4-4 time, with bar-lines. There are, broadly speaking, two kinds of R., as follows: (1) *Recitativo accompagnato* (or *stromentato*). A type of R. accompanied by the orchestra, as distinct from *recitativo secco*, which in the eighteenth century was accompanied by a harpsichord. *Recitativo accompagnato* served to modulate to or near the key of the set musical number, usually an aria, that followed it, and also to give the singer an opportunity for dramatic declamation. (2) *Recitativo secco*. A type of R. accompaniment by the harpsichord, mainly in eighteenth-century It. or Italianate opera. The composer's score showed only the voice-part and a figured or unfigured bass; the harmony was supplied by the player according to conventional rules and Rs. were never intended to be of musical interest, but merely to advance the action without letting the music drop out altogether and give place to spoken dialogue. It also served to modulate from the key of one set musical number to the next. R. owes a traditional origin to the dramatic recitation, whence is derived the medieval plain-song, the greatest examples of R. descended from the latter being Handel's oratorios and Bach's cantatas. The success of such works as Haydn's *Creation* and Weber's *Der Freischütz* owes much to the pictorial Rs.

Recklinghausen, tn. of Westphalia, Germany, 30 m. S.W. of Münster. It is a centre of the N. Ruhr coalfield and is noted for iron-works and manufs. of machinery, linen, and beer. Pop. 87,400.

Reclamation of Land, see LAND RECLAMATION.

Recluse, see ANCHORITE.

Recognition, in law, an obligation of record which a man enters into before some court of record or a magistrate, binding himself to do some particular act, e.g. to be of good behaviour for a specified period, to come up for sentence if called upon, to appear as witness, or to pay a debt (see BAIL). It resembles a bond, the form of it being, 'that A B doth acknowledge to owe to our lord the king, to the plaintiff, C D, or the like, the sum of £10 with condition to be void on performance of the thing stipulated.' If the condition of the R. is broken, the R. becomes forfeited, and is then *extrated* or *extructed* from the other records and sent up to the Exchequer. Then the party, and, if the R. was entered into with sureties, the sureties too, become the absolute debtors of the Crown for the sums for which they bound themselves. See also PREVENTION OF CRIME ACTS.

Reconnaissance (Fr. *reconnaitre*, from Lat. *recognoscere*, to recognise), military term denoting the examination of the enemy's position or movements, or of the ground to be occupied. Tactical and strategical Rs. are carried out by aircraft. When a large body of ground forces is employed, with the object of inducing the enemy to show his hand, the operation is termed a R. in force. This is also a favourite euphemism for an abortive

attack. Much R. is done by armoured cars in favourable terrain. In modern warfare the use of aircraft has, of course, vastly extended the possibilities of successful R. and indeed so revolutionised R. as to make secrecy of dispositions impossible without command of the air. Topographical Rs. have for their object the securing of information on the peculiarities and details of the position, hills, rivers, cover, etc., and are carried out by skilled officers and men. The term R. is also applied to the preliminary surveying operations preparatory to the building of a railway, canal, etc. See also PATROLS.

Record, or Court of Record. A court of R. is one 'where the acts and judicial proceedings are enrolled on parchment for a perpetual memorial and testimony (Blackstone). The distinguishing mark of a court of R. is the power to inflict fines and to attach a person for any contempt of court; while the practical effect of the distinction between courts of R. and those not of record is that the rolls and records of a court of R. are incontestable evidence of what purports therein to have been done, whereas the proceedings of courts not of record must be proved like any other question of fact. The description goes back to the records of royal authority, and originally the king's council or Curia Regis (*q.v.*) (see PRIVY COUNCIL; CABINET) was the only court of R. But gradually, as the different offshoots of that body developed, these, as being the king's courts, also became the courts of R. (see ROYAL COURTS OF JUSTICE), and their rolls absolutely authoritative save for inadvertent errors of an obvious kind. The courts of appeal (including the House of Lords) and the high court of justice constitute the superior courts of R., and the only inferior courts (*q.v.*) invested with the attributes of a court of R. are the co. courts. The House of Commons, though constitutionally a tribunal, is not generally regarded as a court of R., and, according to Sir Erskine May, the House has virtually abandoned its claim to the title. In a cognate sense the term R. means in judicial proceedings the written statement of the various steps in an action, from the issue of the writ down to the entry of final judgment, which is drawn up by an appropriate official. Where an action is settled out of court the R. is said to be 'with-drawn.'

Recorder. The presiding judge of a bor. court of quarter sessions is called the R. A R. is appointed by the home secretary during good behaviour, and to be eligible must be a barrister of not less than five years' standing. The same person may hold the recordership for two or more hors. jointly, and may also occupy the position of co. court judge for the same or another dist., be revising barrister for the bor., and mayor, councillor, or stipendiary magistrate. The R. is the sole judge of the sessions, and the mayor or other justices of the bor. have no judicial authority whatever in the R.'s court, except that if the R. or his deputy be absent they can open and adjourn the court and receive recognisances. The remuneration of a

R. is fixed by by-law or resolution of the bor. council.

Recorder, old musical instrument of the fipple flute family, ranging from 8 ft. to 1 ft., having a soft and sweet tone (whence known as *flûte douce*) similar to the song of a bird. Under this heading Dr. Scholes includes, for the sake of convenience, all flutes of the whistle-mouthpiece, end-blown type as opposed to those of the side-blown type. The family thus includes not only true Rs., but the flageolet (*q.v.*), tin-whistle, pipe (or tabor), or galoubet. Instruments of the true R. family had eight finger-holes and a compass of about two octaves. It was a very favourite instrument in Tudor times, and is referred to in Elizabethan literature, e.g. in *Hamlet* III. ii. and *Midsommer Night's Dream* V. i. It became known as the *flûte-à- bec* or Eng. flute, and was subsequently superseded by the stronger-toned transverse or Ger. flute, but is now in use again, having perhaps been helped in England by the movement for the revival of the folk-dance. See C. Welch, *Sir Lectures on the Recorder* 1911.

Recorder, Siphon, instrument invented by Lord Kelvin to replace his mirror galvanometer for recording the variations in the minute currents of submarine cables, which form the signals. The pen is a siphon of vaccination tubing, the short limb dipping into an ink reservoir, the end of the long limb supplying ink to a moving ribbon of paper. The horizontal limb is enclosed in a small coil of wire through which the current passes, and is placed between the poles of an electromagnet excited by a local battery. The ink bottle is electrified, and the paper ribbon carried on an insulated metal roller. The varying current moves the siphon and the electrified ink spurts upon the unelectrified paper, the tube not touching. The pen is not affected by the ordinary earth-currents passing through the cable.

Record Office. see PUBLIC RECORD OFFICE.

Records Association, British, see under HISTORICAL MANUSCRIPTS COMMISSION.

Recovery, Common, see FINES; RECOVERY OF FORT.

RECORDERS

Recovery of Land. The present method of recovering possession of land, whether from a tenant whose tenancy has been determined by notice to quit, or from any one else wrongfully in possession, is by issuing a specially endorsed writ in the high court and applying for leave to sign final and summary judgment by a summons under Order XIV. of the Rules of the Supreme Court. Formerly the legal machinery for recovering land was cumbersome in the extreme, and it was in the last degree essential to distinguish between the recovery of possession and an action to try title. So technical and uncertain in operation were the old real actions for the trial of title (see **REAL PROPERTY; PERSONALTY**) that they very soon in the hist. of Eng. legal procedure became replaced by the personal remedy of ejectment (see on this **EJECTMENT**). Originally ejectment was an action brought by a lessee to repair the injury done him by having been dispossessed, and the various fictions by which it became adapted to the trial of titles to freeholds are a lasting monument to the barbarous inelasticity of the technical rules of the old Eng. common law. It was long a standing rule that no plaintiff should proceed in ejectment against a casual ejector without giving notice to the tenant in possession, if any, and joining him as defendant at his option. Then he had to make good four points, viz. the title of his landlord, his lease, entry, and the ouster or eviction, and, if he succeeded herein, the sheriff put him into possession. Thus the title of the lessor came incidentally before the court and suggested ejectment as an appropriate remedy for trying titles to freeholds. But soon the trouble and formality of actually making lease, entry, and ouster suggested the concoction of a string of fictions, beginning with the entirely false statement of a lease for a term of years by him who claimed title to 'John Doe,' the latter being the plaintiff, and the no less false statement that Doe entered as lessee and that the equally celebrated 'Richard Roe,' the defendant, casually ejected or ousted him. (For a complete statement of this curious and archaic procedure see Blackstone's *Commentaries*.) It was not till 1852, when the superior courts of common law were reconstructed, that the old action of ejectment was abolished and the new action for the R. of L. created. Except by leave, no claim other than for mesne profits (see **MESNE**) and arrears of rent can be joined with a claim for R. of L. Ejectment proceedings may also be taken in the co. court where neither the ann. value nor the rent payable exceeds £100. Where the rent does not exceed £20 and the term is for not more than seven years, proceedings may be taken in the police court.

Recruit and Requiring, see AIR FORCE, ROYAL; ARMY, COMMISSIONS, RESERVE FORCES, EDUCATIONAL TRAINING, NAVY AND NAVIES.

Rectangle, quadrilateral plane figure of which the angles are all right angles and the opposite sides equal. The area of a R. is equal to the product of two adjacent sides.

Rectangular Projection, projection in which all the meridians are straight vertical parallel lines and the parallels of lat. are horizontal parallel lines perpendicular to the meridians. See **MAPS, Rectangular Projection.**

Rectification, in chem., the process of purifying volatile spirits by fractional distillation; they are then known as rectified spirits. In mathematics, the

process of finding the length of curves. In the figure P is the point (x, y) , Q, $(x + \Delta x, y + \Delta y)$. If s = the length of curve from some fixed point to P, $PQ = \Delta s$, then $(\Delta s)^2 = (\Delta x)^2 + (\Delta y)^2$. Hence $\frac{\Delta s}{\Delta x} = \sqrt{1 + \left(\frac{\Delta y}{\Delta x}\right)^2}$

i.e. in the limit $\frac{ds}{dx} = \sqrt{1 + \left(\frac{dy}{dx}\right)^2}$
 $\therefore s = \int \sqrt{1 + \left(\frac{dy}{dx}\right)^2} \cdot dx$, where $y = f(x)$, or if

polar co ordinates are used,
 $(ds)^2 = (dr)^2 + r^2(d\theta)^2$,

$$\therefore s = \int \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} \cdot d\theta,$$

or $\int \sqrt{1 + r^2 \left(\frac{d\theta}{dr}\right)^2} \cdot dr$,

where $r = f(\theta)$ and $\theta = f(r)$.

In the case of the catenary $y = \frac{c}{2}(e^x + e^{-x})$,

i.e. $y = c \cosh x/c$, and $\frac{dy}{dx} = \sinh \frac{x}{c}$,

$$\therefore \sqrt{1 + \left(\frac{dy}{dx}\right)^2} = \cosh \frac{x}{c}$$

$$s = \int_0^x \cosh \frac{x}{c} \cdot dx = c \sinh \frac{x}{c}$$

If the limits are taken from the origin to the point where $x = a$. In practice the length of curves is found by means of the opisometer (q.v.).

Rectified Spirit, alcohol which has been purified and strengthened by redistilla-

tion. In the Brit. Pharmacopœia, R. S. contains 16 per cent by weight of water.

Rectifiers are devices for converting an alternating or oscillatory current into a unidirectional current. The alternating current may be represented as a sine-wave

and the action of the rectifier may be that of inverting the negative half-waves, producing a unidirectional current of the form

(full-wave rectification), or that of blocking the negative half-wave, producing a current of the form

(half-wave rectification). R. may be classified according to their principle of action as mechanical, contact, and discharge R. Of the first, the rotating commutator is a full-wave rectifier and operates on the same principle as the commutator in the ordinary direct current generator, which is in fact a rectifier, since the electromotive force induced in the armature coils is alternating. In the vibrator rectifier, a vibrating spring closes the contact during one half-wave and interrupts connection during the next, the vibration of the spring being adjusted to exact synchronism with the alternating current, and the motion being maintained by a magnet, as the buzzer in an electric bell. The contact R. depend for their action on the curious phenomenon that a potential difference develops in the very thin layer or interface between two chemically different substances in contact. A zinc plate becomes positively charged in contact with a copper plate, the latter becoming negative. The theory of the electric double layer in the interface was developed by Helmholtz and provides an explanation of many phenomena such as frictional electricity, endosmosis, electric charging of capillary tubes in which water is flowing, electrification of air bubbles in water, and water drops and spray in waterfalls. The effect is made use of in the copper oxide rectifier, the selenium, and the crystal rectifier. Clearly if a potential difference is developed at a contact, current passes more easily in direction of the potential difference and the half-wave in the opposite direction is at least partially blocked. Contact R. are widely

used in connection with instruments and apparatus where only small power amounts are involved. The electrolytic rectifier is capable of handling considerable power and depends for its action on the unidirectional current in the cell (see ELECTROLYSIS). Of a different type are the various R. using electric discharges; these depend on the emission of electrons from the cathode, which is usually heated, either independently or by the current itself. In the thermionic valve the cathode is a filament heated by the current from a small battery and the electrons emitted are caught by the (plate) anode; the current thus passes in one direction only—opposite the flow of the (negative) electrons according to common parlance. Hence the name 'valve.' The thermionic valve is used as rectifier in wireless sets, cathode-ray oscillographs, and numerous other apparatus, and the modern type of 'thyatron' has been developed for high voltages and considerable power amounts. The discharge rectifier using a mercury pool as cathode and an iron or carbon anode is one of the most remarkable pieces of electrical engineering equipment developed in modern times. If operated in vacuum it is called a mercury vapour rectifier, if at atmospheric pressure it is known as a mercury arc rectifier. In either case the arc has to be ignited by some means and thereafter a luminous discharge continues to flow, keeping the mercury cathode hot, while the anode is usually cooled to prevent back-firing. The mercury vapour rectifier is extensively used for converting high voltage three-phase current into direct current in traction substations. In this application the rectifier usually has three, six, or twelve anodes placed in a ring with vertical axis, and the three-phase current is converted into current of a corresponding number of phases supplied to the anodes in turn. In this way the fluctuations in the direct current from the half-wave reversals are largely smoothed out. Mercury vapour R. are built for direct current voltages up to 3000 volts, the alternating current voltage being stepped down in transformers. The large-size R. are usually built in sealed steel tanks, the vacuum being kept up by pumps. The mercury vapour rectifier requires no attention; it can be automatically started and operated by remote control. The current is controlled by a grid, as in the thermionic valve. A modern type, the mutator, developed by Brown Boveri, may also be used for converting direct current into alternating current or three-phase alternating current into single-phase alternating current. As a direct current/alternating current converter it will become an essential link in the various projected high-voltage, long-distance, transmission schemes. A limit is set to alternating current transmission by the fact that for very long distance, the transmission of large power amounts required very high voltages, up to and above 400 kV, and the line becomes electrically unstable. This instability does not arise in direct current lines.

At the end of the transmission line conversion into alternating current is required for distribution at lower voltages, which is best carried out by alternating current owing to the facility of transformation of alternating current to a suitable voltage.

Rector, clerk in holy orders who has the cure of a par., and has also full possession of all the consequent rights and privileges. A vicar, on the contrary, receives only a certain portion of the eccles. income set apart to the vicarage. See **BENEFICE**.

Rectum, lower part of the large intestine. It commences at the end of the sigmoid flexure and extends to the anus. The term *R.* implies that this portion of the intestinal tract is straight, but in fact it has a distinct curve, bending backwards and again towards the front. The *R.* has four coats: the peritoneal, which is only present laterally and in front for some part of its course; the muscular, consisting of longitudinal and circular unstriped fibres; the submucous, consisting of aerolar tissue; and the mucous coat, which forms three folds called the *pliae recti*. The *R.* receives by peristaltic motion the residue of food material from the large intestine. An accumulation takes place until the mass produces a sensation which is interpreted as a desire to empty the *R.* This is accomplished by the relaxation of the interior and exterior sphincter muscles of the anus. The motion of defecation is partly voluntary and partly involuntary; the exterior sphincter is relaxed by an effort of the will, but the inner muscles act involuntarily on receipt of the accustomed stimuli. If from any cause these stimuli evoke no response, the faeces are retained, producing the condition known as constipation. Many of the disorders to which the *R.* is liable are due to constipation. The accumulation of impacted masses may lead to fissures, piles, and other local disorders, besides the general toxic effects. Obstruction of the *R.* is sometimes due to thickening of the mucous coat, foreign bodies, or strictures due to tumours, etc. In women the weakening of the tissues after parturition may lead to a hernia of the *R.* into the vagina.

Reculver, Kent, England, 3 m. E. of Herne Bay, on the S. shore of the Thames estuary. There are remains of the Roman Saxon shore fort of *Regulbium*. The medieval church was demolished in the last century, save for two towers, known as 'The sisters,' which were taken over by Trinity House to serve as a landmark. There are also remains of an interesting pre-Conquest church, columns and a carved stone cross from which are re-erected in Canterbury Cathedral.

Red, see **under** **PIGMENT**.

Red Admiral Butterfly, or *Vanessa atalanta*, Brit. butterfly with black wings crossed by scarlet bands and marked with white and blue spots. The spiny black caterpillar feeds on the nettle. The butterfly is not known to hibernates in Britain, immigrating in May and June.

Red Army, army of the Soviet Union. It had its origin as the army of the Rus-

slan Revolution of 1917, and it was called 'Red' Army because it bore the red flag of the revolution. The name was retained after the revolution, and the Soviet Russian Army is officially styled the *R. A.* of Workers and Peasants, or was so styled until late in the Second World War. In 1940 it numbered about 20,000,000 trained reserves, and soon became highly mechanised. Its air arm was estimated at 7000 first-line aircraft before the Second World War and the number of tanks at more than 10,000, but these totals were much increased as the war developed. It is to be doubted whether any army has adapted itself to modern war conditions as rapidly as did the *R. A.* during the two years 1942-43. Some developments were essential in order to offset the Ger. methods and to employ effectively new types of armament produced by factories, home and foreign; others were the outcome of a realistic policy of obtaining the means by which the human element provided by a quarter of a century of Soviet life could be harmonised with the old Russian military traditions. In the first group can be included measures determining in what conditions, and in the second in what state of mind, the soldier fights.

The Russian Army made a poor showing in the Finnish war of 1939-40. The result of that campaign was that Stalin and the high command undertook a reorganisation of the *R. A.*, including a revision of formations, tactics, and command. Their chief aims were to improve tactics and weapons, and to improve leadership by a careful sifting of army corps and divisional commanders. Two other factors also contributed to their success: simultaneously with the overhauling of the *R. A.* the Soviet Gov. began to put into effect a bold scheme to transfer machinery, and indeed whole industries, eastward from the Ukraine, and particularly from the Donetz basin, and also to accelerate the expansion of the inner industrial fortress beyond the Urals. Later came the delivery of Brit. and Amer. war materials, a flow, however, which became really important only about the time that the Russians had already demonstrated their tenacious grip on Stalingrad. In the Finnish war on the Karelian Isthmus the Russians relied upon massed artillery and steam-roller concentrations of tanks and infantry to break the Mannerheim line. In their long withdrawals from White Russia and across the Ukraine and the Don steppes they gradually perfected an elaborate method of defence in depth, and also anti-tank tactics to make use of their new anti-tank weapons. Eventually, in the winter of 1942-43, and in the summer campaign of 1943, they demonstrated that they could conceive and execute a well-timed offensive. One of the lessons learned in Finland concerned the amount of authority that should be delegated to the political commissars. In 1941 and 1942, for the first sixteen months of the Russo-Ger. campaigns, the *R. A.* operated with officers and commissars on

the dual-command basis, but this command authority was finally removed in Oct. 1942, at the moment when Stalin was preparing the first great Russian counter-offensive. This move was prompted by a Ger. Army order that all political commissars should be shot after interrogation when captured. The Oct. decree provided that the most capable commissars should be withdrawn for courses at officers' training schools. By the spring of 1943 they were back again in active service, under the title of ordinary regimental and staff officers, but with their experience at the front supplemented by new technical knowledge. Meanwhile the remaining commissars and other new ones continued their former work, but there was now a single military command in every unit. Following this reorganisation Stalin found himself confronted with the need of making changes in his high command. In Finland he had relied on his former comrade of civil war days, Marshal Voroshilov, with disappointing results. Similarly, Marshal Budyenny had failed disastrously in the Ukraine. Both were withdrawn to train new armies in the rear. Later he took the same stern line with Marshal Timoshenko. It was in Aug. 1942 that Gen. Zhukov was appointed vice-commissar of national defence directly under Stalin. Until then that important post had been held by Timoshenko. The change was due to the catastrophically swift Ger. break-through at Rostov on July 25, 1942. The disaster at Rostov revealed where fatal weakness still existed in the R. A. machine and paved the way for the great recovery between Nov. 1942 and Feb. 1943. The defence of Stalingrad was entrusted to younger generals, men of strong physique and greater competence, men like Chulikov, Rodimtzev, who became heroes of Stalingrad, Lelushenko, the hero of Rzhev, and Malinovsky, the leader on the S. front. After the Ger. and Ger. satellite armies had been flung back across the Donetz the veil of anonymity was lifted. Stalin had emerged as a marshal, a title which his leadership had merited, especially as much of the grand strategy of Stalingrad seems clearly to have been his work. Zhukov had also now become a marshal. Vasilevsky, promoted to marshal in Feb. 1942, was chief of staff. It was these three who planned the great counter-offensive. Now, like Napoleon, Stalin distributed the laurels after they had been won, to Marshal Nikolai Voronov, chief of artillery, and to a growing list of generals, men like Rokossovsky, Vatutin, Golikov, Tolbukhin. The significance of the victory at Stalingrad and the successful winter offensive which followed can scarcely be exaggerated. The R. A. had proved its ability at defence in depth. Now it revealed its mastery of great encircling movements and annihilation tactics. Coincident with its purely military evolution the R. A. had also undergone changes of psychological and political importance. It had much less than formerly the conformation and

appearance of a workers' and peasants' army.

The plan for post-war reconstruction contained provision for nine military schools to train boys between eight and seventeen years of age to become officers in the R. A. Named in honour of Alexander Suvorov, these schools recall, in some respects, the cadet boarding schools of pre-revolutionary days. The extent of the R. A.'s power outside the Soviet federation may depend in the end on whether it has served chiefly for the protection and security of the Soviet state or whether it has become an instrument for another imperialism. Heretofore its chief motivating force has been the flame and faith of Russian nationalism. The general wartime development of the R. A. was in the direction of greater centralisation and unity of command. By the end of the war major formations had become much more uniformly composed and rigidly organised than in other armies. The army groups (known as 'fronts') were commanded by marshals and divided into armies under colonel-generals; corps had been practically eliminated and armies almost all consisted of six divs., which by W. standards were deficient in artillery. The divisional field artillery (both guns and howitzers) was of light calibre, but there existed great quantities of G.H.Q. artillery of all calibres. This was organised in large bodies up to divisional size and together with the armoured troops could be handled in masses by G.H.Q. or fronts on almost strategic scale. This centralisation increased the importance of the General Staff Corps until it probably exceeded that of the Ger. general staff (see STAFF, MILITARY). For the campaigns of the R. A. in the Second World War see EASTERN FRONT, OR RUSSO-GERMAN CAMPAIGNS, IN SECOND WORLD WAR. See D. Fedotoff White, *The Growth of the Red Army*, 1943.

Redbank, tn. of Monmouth co., New Jersey, U.S.A., 26 m. S.W. of New York. Pop. 11,000.

Redbird, see CARDINAL-BIRD.

Red Bush Pig, see RIVER HOG.

Redoar, tn. in the N. Riding of Yorkshire, England, 8 m. N.E. of Middlesbrough. It is a popular seaside resort, with good sands and bathing and golf links. Race meetings are held. Pop. 27,100.

Red Cedar, see JUNIPERUS.

Redcliffe, tn. of Queensland, Australia, so named by Matthew Flinders in 1799 because of the red cliff which he discerned when entering Moreton Bay. It is a peninsula with bayside beaches, within 25 m. of Brisbane, and connected to the mainland by the Hornibrook highway. R. was the first white settlement in Queensland. Pop. 10,000.

Red Comyn, see under COMYN.

Red Cross, The, organisation for the relief of suffering, owes its inception to the Swiss banker, Jean Henri Dunant, who, moved by the sufferings of the wounded at the battle of Solferino (June 1859), pub. *Un Souvenir de Solferino* (1862), urging the formation of voluntary

aid societies, with a permanent existence, to succour the wounded in time of war. As a result an international conference was held in Geneva in 1863, attended by delegates from sixteen European countries, and followed in 1864 by a diplomatic conference which signed the first Geneva Convention. As an emblem of neutrality the convention adopted a R. C. on a white ground (the Swiss flag reversed) and the motto 'Inter Arma Caritas.' The use of the red crescent in Turkey, Egypt, Iraq, Jordan, Syria, and part of the U.S.S.R., and of the red lion and sun in Iran, have been approved. The supreme deliberative authority of the International R. C. is the International Conference, which meets every four years, and is attended by delegates of the R. C. and Red Crescent societies, the international R. C. committee, the league of R. C. societies, and representatives of the govts. signatory to the Geneva Convention. The International R. C. committee is composed of twenty-five Swiss citizens, and has its seat in Geneva. Its main functions are to promote the adherence of states to the Geneva Convention, to afford recognition to new societies, to create international agencies in wartime for the relief of victims of war, especially prisoners-of-war, and to maintain fundamental R. C. principles. The league of R. C. societies, founded in 1919, is best described as a 'parliament' of national societies linked for purposes of co-operation and mutual assistance in peace. Its present membership is sixty-eight R. C. and Red Crescent societies.

Civilian hardships in the Second World War and the ill-treatment of prisoners were among the urgent reasons for revising the protective conventions administered by the R. C. Amended texts of four conventions were adopted provisionally, at Stockholm, in Aug. 1948, by the representatives of fifty govts. and fifty-two R. C. societies; and a conference met at Geneva on April 21, 1949, to examine the new proposals. The conventions revised were: (1) the Geneva Convention of 1929 for the relief of the wounded and sick of the armies in the field; (2) the Hague Maritime Convention for the relief of the wounded, sick, and shipwrecked in the armed forces at sea; (3) the International Convention on the Treatment of Prisoners of War, 1929, all of which were in force when the Second World War broke out. A fourth convention, for the protection of civilians in time of war, was then only in draft, and the absence of any kind of protection was bitterly felt by the nationals of the countries overrun by the Gers. and the Jap. The revised conventions provide for control, inspection, sanctions, and embodiment in national legislation and for the trial of war crimes by national govts. Under the revised conventions, in no circumstances may persons of the local pop. be punished for giving help to the wounded, even to enemy parachutists. An important new chapter of the Geneva Convention of 1929 lays down rules for the protection of army medical personnel,

doctors, orderlies, chaplains, and administration. No prisoner of war may be submitted to physical mutilation or subjected to scientific experiment of any kind. Collective disciplinary measures, especially as regards prisoners' food, are prohibited. Prisoners may do work that is necessary to ensure the housing, clothing, transport, and health of human beings, provided that such work is not connected with military operations. Escaped prisoners who are recaptured can be subjected to disciplinary punishments only. The signatories undertake to apply the convention in the event of civil war, provided that the other side does likewise. Categories of persons to be treated as prisoners of war include civilian members of air crews, war correspondents, and the pop. of a non-occupied ter. who, at the approach of an enemy, fly to arms spontaneously, and persons belonging to a military organisation or an organised resistance movement constituted on occupied ter., provided that notice is given to the occupying power that its members are under the orders of a responsible chief and that they wear a distinctive badge or uniform. They must carry their arms openly and conform to the laws of war. The new convention for the protection of civilians prohibits physical injury, torture, and the taking of hostages, and there may be no execution without previous judgment by a regular court under judicial guarantees. Precise conditions are laid down regarding their employment or internment on grounds of security. Apart from this the substance of the convention is the obligation on the signatories to establish on their ter. neutral zones of security for the safety of the sick and wounded, whether civil or military, with facilities for free passage of medical supplies and provisioning.

In Aug. 1949 sixteen delegations signed the conventions unreservedly, and in Dec. of the same year some twenty-eight other nations, including the United Kingdom, signed with various reservations. The new conventions come into force the following year after the first ratifications had been received.

The Brit. R. C. Society was first active in 1870, and was granted a royal charter of incorporation in 1908. Voluntary Aid Detachments (V.A.D.) were first estab. in 1909. They comprised men trained in first aid, women in first aid and nursing, liable for service with the medical services of the Crown in the event of mobilisation. In the First World War the joint committee of the B.R.C.S. and Order of St. John was estab. Enormous expansion took place and outstanding service was performed; *The Times* fund raised £10,500,000. In 1919 the joint council of the Order of St. John and B.R.C.S. was formed to administer the balance of war funds mainly for benefit of disabled ex-service men. This included the emergency help scheme; after care, settlements, and homes; hospital library service; and home ambulance service. In 1939 was formed a joint war organisation of the B.R.C.S. and Order of St. John,

officially recognised and similar to that which carried out work in the First World War. While the care of sick and wounded servicemen and women, prisoners-of-war, and civilian victims of air raids was the primary work, members also undertook stretcher-bearing, ambulance driving, librarian and diversional therapy in service hospitals; assisted the wounded and missing dept. of the War Office by liaison and searcher work; the care of refugees from abroad, etc. They manned first-aid posts in London tube and other shelters; shared the work of casualty services in air raids, estab. rest centres for homeless and old people, and filled the appointments of over 1000 welfare officers attached to service hospitals at home and abroad. The war organisation opened many convalescent homes and provided equipment and staff commissions, fully equipped with stores, vehicles, and personnel, went out to all war zones as and when army advances made this possible. Personnel also undertook immediate post-war services in the Middle E., N. Africa, Italy, N. W. Europe, S.E. Asia, and Far E. commands. The duke of Gloucester's appeal fund raised £83,000,000. A joint committee of the Order of St. John and B.R.C.S. undertakes the maintenance of those services arising out of war, the relief of disabled ex-servicemen and women, replacing the joint council set up in 1919.

The peacetime work of the B.R.C.S. falls within the following categories: (1) First aid: road posts; ambulance duty; beach huts; air fields; sporting fixtures; camp sick-bays for cadets, scouts, guides; dispensaries in hopfields; industrial undertakings; cinemas and entertainments. (2) Nursing: in hospitals; homes and clinics; nursing aid service under the supervision of dist. nurse; blood transfusion service; medical loan depots. (3) Welfare: hospital welfare; escort duty; home visiting; diversional therapy; work for invalid and crippled children; picture library; care of children; old people's homes and clubs; meals-on-wheels; (4) Immediate relief in disaster: floods, fire, major accidents, etc. (5) Work carried out under the joint committee. In addition welfare work in service hospitals is carried out by the society and the Order of St. John jointly. The work of the R. C. is carried out by detachment members (men and women), V.A.D., associate members (those who support the society by giving part-time service other than as full detachment members), and the junior R. C., which was founded in 1915 and has two types: (a) Cadets: boys and girls between eleven years and school-leaving age, under the special charge of a cadet officer and attached to a senior dept.; (b) Links: formed in schools or juvenile organisations, between the age of five years and up to school-leaving. There is a special junior R. C. badge and a motto 'Serve One Another.' The objects of the junior R. C. are to keep themselves and others in good health, to give aid and comfort to sick and suffering; and to link together children of all countries in international friendship. A branch of

the B.R.C.S. exists in every co. throughout England and Wales. There are central council branches in Scotland, N. Ireland, and the Isle of Man. The national headquarters are at 14 Grosvenor Crescent, London, S.W.1.

The Brit. R. C. also has overseas branches in the colonies. The need for R. C. work is fully recognised in the Brit. Commonwealth, the most urgent being health education. Instruction in varied subjects is also carried out. Clinics, dispensaries, convalescent homes, and crèches have been estab. according to specific needs. Overseas branches are also undertaking pioneer work in lepro colonies, and in blood transfusion. The junior R. C. is active and is enthusiastically pursued. See H. St. George Saunders, *The Red Cross and the White*, 1949.

The Amer. National R. C. operates under a charter of the U.S. Congress, granted Jan. 5, 1905, and amended in 1947, to furnish volunteer aid to the sick and wounded of the armed forces in time of war, to act as a link between the people of the U.S.A. and their armed forces, and to carry on a programme of national or international relief when natural disaster strikes. The governing body of the organisation is a fifty-member board of governors, eight members of which are appointed by the President of the U.S.A.; thirty are elected by R. C. chapters, and the remaining twelve by their fellow board members. The President of the U.S.A. is honorary chairman of the organisation. National headquarters are in Washington, dist. of Columbia, and there are 3745 chapters in communities throughout the U.S.A. and insular territories. The accounts of the Amer. R. C. are audited by the dept. of the army and the organisation's ann. report is submitted to the Congress. Membership in 1948 was 18,098,000 adults, with 19,314,427 enrolled in the Amer. junior R. C. In addition to its services to the armed forces and veterans, which cost the organisation \$35,352,300 in the 1948-1949 fiscal year, and disaster relief, which cost \$7,869,400 in the same period, the Amer. R. C. also carries on a large variety of health and safety services, including a national blood programme inaugurated in 1943.

Red Cross, The Royal, decoration for nurses instituted by Queen Victoria in 1883. It consists of a crimson enamel cross, gilt-edged, fastened by a bow of dark blue ribbon, red-edged, of width 1 in. It is conferred on nurses or other persons, either Brit. or foreign, recommended by the secretary of state for war on account of services in nursing and providing for sick and wounded soldiers or sailors.

Red Currant, see CURRANT.

Red Deer, city of Alberta, Canada, 90 m. N. of Calgary, on the Canadian Pacific Railway and the Canadian National Railway, in the valley of the R. D. R. There are large numbers of beef cattle in the dist., where dairying, hog-raising, and the cultivation of wheat, oats, and barley are carried on. Coal is mined, there are lumber mills and condensed milk works,

and creosote is made. Pop. 6700. See *Annie Jaetz, The Park Lands*, 1917.

Red Deer, or *Cervus elaphus*, large deer widely distributed throughout Europe, Asia, and N. Africa. It is a native of Britain, occurring still in the Scottish Highlands and the W. of England, while it is preserved in a number of parks. A full-grown male (stag or hart) stands 4 ft. high at the withers, and typical antlers measure about 32 in. in length and 32 in. greatest width. When fully developed they have brow, bay, and tray tines. Remains of R. D. which have been dug up in Brit. peat beds show that they were much larger and the antlers finer than is now the case. This is due partly to lack of sufficient food, and to the injudicious practice of shooting the best animals, leaving inferior ones to perpetuate the race. The antlers are shed in April or May, and a few days afterwards the new growth shows. While the new antlers are developing they are covered with a thick velvet, and while in this condition are very sensitive. They are full grown in about twelve weeks, and the 'velvet' is then rubbed off. It is well known that cast horns are chewed and eaten by deer. Hornless stags sometimes occur. During the breeding season the colour is a rich brown, turning grey at the approach of winter. The young are spotted with white.

The hangul or Kashmiri R. D. is known to sportsmen as 'barsingh.' The prin. differences between this R. D. and others of their tribe is the possession of a yellow rump patch and the fact that the 'bez-tine' (secondary antler point) on each horn is bigger than the brow; also the R. D. is larger than his Brit. relative and equal to the deer of E. Europe, Asia Minor, and the Caucasus. The stag stands at about 52 in. at the shoulder. It sheds its horns in spring and begins growing them again so rapidly that by late May they have hardly more than 2 in. to add to the beam. Ten points is a normal number, and a good head should be over 40 in. from the burr to the tip of the largest tine. In a fight between a stag with hinds and another stag, the two fight furiously with heads low and horns locked, each trying to throw the other to one side downhill. The finest stags never quit the forest, 'calling' infrequently, and living with a single hind or a succession of them. Unfortunately, with the relaxation of all forms of game preservation in Kashmir, the R. D. will be the first of the hill game to be shot down, especially as their venison commands a high price in Srinagar.

Redditch, tn. of Worcestershire, England, 16 m. S. of Birmingham. Its chief manufs. are needles and fishing tackle and motor cars. Pop. 21,100.

Redemptionists, see TRINITARIANS.

Redemptorists, or *Liguorians*, congregation of missionary priests founded in 1732 by St. Alphonsus of Liguori. It spread rapidly through Europe, especially after the suppression of the Jesuit Society in 1773. It was founded especially for work in country dists.

Redesdale, John Freeman Mitford, first

Baron (1718-1830), Eng. lawyer, b. in Holborn, London, son of John Mitford. Called to Bar, 1777, in 1780 he pub. a famous treatise on chancery practice. He was successively M.P., Beer-Alston, 1788; a Welsh judge, 1789; solicitor-general and knight, 1794; attorney-general; M.P. for E. Loe, 1799; Speaker of the House of Commons, 1801; lord chancellor of Ireland and a peer, 1802-6. He opposed Catholic emancipation.

Red Eye, see RUND.

Redfern, suburb of Sydney, New S. Wales, Australia. Its chief industries are the manuf. of boots and tobacco; it has also railway works and iron works. Pop. 20,000.

Red-headed Poker, see POCHARD.

Red Indian Languages, see under NORTH AMERICAN NATIVE LANGUAGES.

Red Indians, see AMERICAN INDIANS.

Red Irish Setter, see under SETTER.

Redlands, city in San Bernardino co., California, U.S.A., 6 m. S.E. of San Bernardino. It is engaged chiefly in fruit-growing and canning. Pop. 14,300.

Red Lead, see under LEAD.

Red-letter Days, greater festivals of the Church's year, which in the old MSS. or early printed ecclies. calendars were written in red. The 'feasts to be observed' in the Church of England are R. D. The term has hence come to signify a very lucky day. See BLACK-LETTER DAYS.

Redmond, John Edward (1856-1918), Irish statesman and leader of the Irish Nationalist party. Of an Anglo-Norman family, long settled in Wexford, R. was b. at Ballytrent in that co., son of Wm. Archer R., M.P., a follower of Isaac Butt. Educated at Clongowes and Trinity College, Dublin, he entered the civil service, and was clerk in the Vote Office of the House of Commons. R. was elected as Nationalist member for New Ross, 1881; sat for N. Wexford, 1885-91. He was called to the Bar in England, 1886, and in Ireland, 1887. In 1891 he became M.P. for Waterford. He was Irish parl. whip at the time of the split in the Nationalist party after the Parnell-O'Shea divorce case, and remained with the Parnellite minority, in 1891 becoming their recognised leader. At the reconciliation in 1900 he was chosen chairman of the United party. In July 1914 he and John Dillon took part in the abortive conference at Buckingham Palace. He supported the Brit. Gov. when the First World War broke out, but the real Irish movement was now Sinn Féin, and the assurance it honestly gave to Birrell, chief secretary for Ireland, were (to some extent in consequence of the attitude of the War Office towards Irish volunteers) falsified by the Dublin revolt of Easter 1916, which took it by surprise. An agreement then made with Asquith and Lloyd George to bring Home Rule into instant operation with exclusion of the six N.E. cos. was repudiated by other members of the Cabinet, and R.'s prestige in Ireland sank. In the All-Ireland Convention of June 1917 his policy of acceptance of terms then offered was outvoted by the more thoroughgoing Nationalists

under Devlin. As a delegate from the convention, he went to London, Feb. 1918, but was immediately taken ill, and died March 6. His son, W. A. R., sat in the House of Commons for E. Tyrone, 1910-18, and for Waterford, 1918-22, and represented Waterford in Dail Eireann (1931). R.'s *Speeches* were pub. 1900. See also SINN FEIN. See S. Gwynn, *John Redmond's Last Years*, 1911; and lives by W. B. Wells, 1919, and D. Gwynn, 1932.

Red Oak, co. seat of Montgomery co., Iowa, U.S.A., 10 m. W.S.W. of Des Moines. Its chief manufs. are bricks and pottery. Pop. 5800.

Redon, tn. in the dept. Ille-et-Vilaine, France, on the R. Vilaine. In 820 a Benedictine abbey was founded, and was for long famous. R. has slate quarries, and manufs. machines. Pop. 6700.

Redonda, is. of the Lesser Antilles, Brit. W. Indies, N.W. of Montserrat.

Redoubt, name applied to military works entirely enclosed by earthworks. They were used principally for the purpose of resisting infantry attacks, and were seldom used as defensive works, since they offered so simple a target to the opposing artillery. They usually had a parapet of from 3 ft. to 6 ft. in height, deep trenches in the rear and specially constructed shelter pits. A R. could be easily constructed in less than 24 hrs., and would have a garrison of two to four companies of infantry. They were commonly used as supports for the second line of defence, or in order to keep the line of communication open. The word is still current in military parlance, but only metaphorically, e.g. 'Alpine R.', where certain elements of the Ger. high command intended to hold out in 1945.

Redpoll, or **Redpole** (*Linola rufescens*), smallest Brit. finch, characterised by the deep crimson crown of the head and vermillion breast. It is gregarious, and migrates to Britain in the autumn.

Red Poll Breed, see under CATTLE.

Red River, important W. trib. of the Mississippi, takes its rise in Staked Plateau, Texas, passing through a famous canyon, 100 m. long and 1000 ft. deep. It later forms the boundary between the states of Oklahoma and Texas, then flows through Arkansas and Louisiana, and enters the Mississippi about 300 m. above the gulf of Mexico. It forms, during its lower course, numerous lakes and bays which abound in fine fresh-water fish; it takes a curious winding course, and has a length of 1550 m., of which 1200 m. are navigable. It is called after the colour of the water, which is in some parts of a reddish shade owing to a sediment which forms in the basin of the riv.

Red River (China), see SONG-KOI.

Red River of the North. This riv. flows through the U.S.A. and Canada. It forms the boundary between Minnesota and N. Dakota, and has as tribs. the Goose, the Sheyenne, the Wild Rice, the Marsh, and the Red Lake Rs. Its total length is 660 m., of which 520 are in the U.S.A. At first it flows S.W., then makes a great curve, joining the Bois de Sioux R. It then joins the Assiniboine near Winnipeg,

and empties itself into that lake. The plain it traverses was once Lake Agassiz, and is now a fertile agric. dist. (see under MANITOBA).

Red River Settlement. This famous settlement is now part of the prov. of Manitoba. The settlement originated in a migration scheme planned by a young Scots nobleman, the earl of Selkirk (see SELKIRK, THOMAS DOUGLAS, fifth EARL OF) to help clansmen who were living in the Highlands in poverty and without land. He began by sending 800 men to Prince Edward Is. but, conceiving more ambitious dreams, he turned to the valley of the Red R. with the idea of starting a settlement in the heart of the fur-trading empire. He bought shares in the Hudson's Bay Company in 1811 and received from the company a grant of 116,000 sq. m. of land, covering parts of what to-day constitute Manitoba, N. Dakota, and Minnesota. In the same year Selkirk's first party sailed to Hudson Bay under the command of Miles Macdonell, a Glengarry highlander, and selected for the headquarters of their colony a spot which now lies within the modern city of Winnipeg, and named it Point Douglas in honour of Selkirk. Selkirk's grant of land, however, lay directly across the N.W. Company's (see under HUDSON'S BAY COMPANY for the hist. of the rivalry between the two fur-trading companies) main highway to the far W., and was, in effect, a gesture of defiance. The crisis came in 1814 when Governor Macdonell issued an order forbidding the exportation of pemmican from Selkirk's ter., claiming that it was needed for food. The Métis, or half-breeds, whose livelihood depended chiefly on making pemmican for the fur trade, and the N.W. Company construed this as a declaration of war, and in the ensuing two years the colony was twice destroyed. In 1815 crops were trampled down, houses burned, and Macdonell and most of his settlers were transported to the N.W. Company's headquarters at Fort William and to Upper Canada. In the same year more settlers arrived through Hudson Bay under Governor Semple, but he and a score of his men were massacred by the half-breeds at Seven Oaks (close to Winnipeg's Main Street). At this point, however, Selkirk had started out from Montreal with 100 Swiss soldiers of the De Meuron regiment, which had just been disbanded after serving in the war of 1812. With their help Selkirk seized the N.W. Company's headquarters at Fort William, and planted his colony for the third time. In 1817 he signed the first treaty in the N.W. for obtaining land from the Indians, the latter giving up their claim to a strip of land along the Red and Assiniboine Rs. In this period Selkirk did much to establish the settlement, planning roads and bridges, setting aside sites for schools and churches, and seems even to have entertained the idea of an experimental farm. After leaving the col. ny, however, he became involved in lawsuits on account of the seizure of Fort William, and died a broken man, having spent over \$500,000 and sacrificed his life in the struggle to establish

a permanent settlement; but at least he had laid the foundations of the eventual colonisation of W. Canada, and to-day his name is honoured among the founders of the prairie provs. The union of the rival fur-trading companies in 1821 brought peace, but for some years longer the pioneer settlers faced grim hardships from storm, floods, and frost. They persisted in the face of all difficulties, climatic and economic, and, by 1826, numbered about 1500 in all, including some Métis farmers. But they could buy or sell next to nothing in those days as the Hudson Bay route was too costly for anything but the fur trade, and wheat, even though the best in the world was to be grown in the prairie, could not be sold until the advent of the railway. For over fifty years the buffalo herds were a mainstay of the colony, for the animals supplied meat for settlers and fur traders, while buffalo robes were sold in great quantities in the U.S.A. See G. W. Brown, *Building the Canadian Nation*, 1942.

Redruth, tn. of Cornwall, England, 9 m. S.W. of Truro. This tn. lies in the centre of the mining dist. of Cornwall, and its trade is connected with the tin- and copper-mining industries; there is a school of mines near by. Near the tn. are Carn Brea, a hill with Druidical remains and castle ruins, and Gwennap Pit, where John Wesley preached. Pop. 11,000.

Red Sea, or **Arabian Gulf**, branch of the Indian Ocean, running N.N.W. from the gulf of Aden for about 1200 m., extending from 12° 40' to 30° N. lat. It has Arabia on the E.; Abyssinia, Nubia, and Egypt on the W.; and is connected with the Mediterranean on the N. by the Gulf Canal, where it divides into two branches or gulfs, those of Suez and Akaba. The prin. harbours are: on the Arabian coast, Jiddah (the port of Mecca), Hodeida, and Mocha; on the African coast, Suez, Kosseir, Suakin, and Massowa. The atmosphere is extremely hot in the warm season, and the winds which vary the current are alone responsible for the slight tidal phenomena. After the opening of the Suez Canal in 1869, which connected the R. S. with the Mediterranean, trade in European vessels increased.

Red Setter, see **SETTER**.

Redshank, see **SANDPiper**.

Red Spider (*Tetranychus telarius*), tiny reddish suctorial mite, not a true spider, which causes much damage to plants, especially those in dry greenhouses, by sucking the sap from the leaves, causing them to become yellow and die. It is prevented by keeping the atmosphere moist, and is killed by fumigating the structure with n'cotine or cyanide of potassium. Infested leaves can be cleaned by sponging with soft soap and water.

Redstart (*Ruticilla*), genus of warblers. The common R. (*R. phoenicurus*) is a summer visitor to Britain, nesting in hollow trees, where it lays about six greenish-blue eggs with red spots. Its upper parts are dark grey and the forehead pure white, the throat is black and the under parts rust red. The black-capped R. (*R. titys*) also visits Britain.

Its upper parts are deep bluish grey and under parts black. See J. Burton, *The Redstart*, 1950.

Reducing Agent, in chem., a substance which takes away oxygen; or, more generally, a substance which abstracts electro-negative elements or groups, as oxygen, sulphur, chlorine, bromine, iodine, and fluorine. Reduction is aimed at in the smelting of ores which contain oxides. If, for example, powdered litharge (lead oxide) be mixed with charcoal in the proportion of 10 to 1, and the mixture be heated in a crucible, the oxygen of the litharge will combine with the carbon to form carbon dioxide, leaving metallic lead. Carbon is in this instance the R. A., as it has abstracted the oxygen from the oxide. The chief R. As. are hydrogen, carbon, potassium, sodium, aluminium, magnesium, hydrides of iodine, sulphur, phosphorus, etc. A R. A. of wide application in organic chem. is hydrogen in the presence of finely divided nickel, the latter acting as a catalyst (q.v.). In commercial chem. this process is used in converting inedible oils (e.g. cotton-seed oil) into edible fats suitable for use as artificial lard and as constituents of margarine.

Reductio ad Absurdum, in formal logic, an indirect demonstration founded upon the impossibility of a contradictory supposition. Euclid constantly employed this mode of indirect reduction to the proof of his geometrical propositions. The process first supposes the conclusion of a syllogism to be false, and its contradictory true, and then constructs a new syllogism leading to a conclusion contradictory of one of the original premises. Most logicians now condemn this and analogous processes on the ground that in strict logic it is absurd to question the truth of one's own premises, inasmuch as the very purpose of all argument or syllogism is to deduce a conclusion which will be true when the premises are true, not when they are false.

Reduction. In Scots law the appropriate action for setting aside a document or writing is one of simple R., or, if actual forgery is alleged, of R.-improbation. The usual grounds are that the grantor was a minor, inhibited (see **INHIBITION**), interdicted (see **INTERDICT**), deceived, or otherwise improperly drawn into granting it, or that the requisite solemnities were not performed, or that it was granted in prejudice of the rights of creditors. The rights of innocent third parties are generally safeguarded by the court.

Redwald, king of the E. Angles, reigned in the early seventh century. All that is known of him is through notices in Bede and Nennius and other chroniclers collated by Palgrave, Skene, and others. He is chiefly notable for having defeated and slain Ethelfrid (q.v.), king of Northumbria, in A.D. 617, at a battle on the Idle R., and thereby restored to his throne Edwin (616-633), son of Ælla of Deira.

Red Wing, co. seat of Goodhue co., Minnesota, U.S.A., 41 m. S.E. of St. Paul. The chief manufs. are stoneware, boots, flour, and furniture. Pop. (1930) 10,000.

Redwing (*Turdus iliacus*), thrush some-

what smaller than the song thrush and with an inferior song. Its back is darker than that of the common thrush; the feathers beneath the wings are a bright rust colour, and there is a distinct white line over the eye. It is a winter visitor to Britain.

Redwood, see SEQUOIA.

Reed, John (1887-1920), Amer. journalist b. in Portland, Oregon, U.S.A., of wealthy parents. Educated at Harvard and travelled in Europe. He worked for the *American Magazine* and *The Masses*, and covered the Mexican revolt of 1914 for the *New York World*, accompanying 'Pancho' Villa (see VILLA, FRANCISCO),

REEDS

Above, two views of clarinet reeds and a clarinet mouthpiece; below, bassoon, oboe, and bagpipe.

and wrote his impressions of Villa and others in *Insurgent Mexico* (1914). In the First World War he was on the E. European front and was in Russia during the October Revolution, becoming associated with Lenin. His first-hand description of the Russian Revolution was contained in *Red Russia* (1919). Driven out of the National Socialist Convention (U.S.A.) in the same year, he organised the Communist Labor Party and founded and ed. its organ, the *Voice of Labor*. Being indicted for sedition, he took refuge in Russia, where he joined the Communist leaders. He died of typhus and was buried in the Kremlin. His most important work was *Ten Days that Shook the World* (1919), a graphic account of the revolution to which Lenin wrote an introduction for a later ed. Other pubs.: *Sanger* (in *Poetry*) (1912); *The Day in Bohemia* (1913); *The War in Eastern Europe* (with Boardman Robinson, 1918). See life by Granville Hicks.

Reed, name of various tall aquatic

grasses. The common R. (*Phragmites communis*), formerly regarded as a species of *Arundo*, but now separated from that genus, is a tall plant, with long leaves or grass, a dense, drooping, purple-brown panicle of spikelets, and a perennial root. It is found exclusively in places overflowed over during summer. In such situations it occurs all through Europe, and is common in Siberia, Japan, and N. America, forming thick coverts, and yielding an abundance of stout durable grass of great value for thatching, while its long creeping rootstock binds muddy riv. banks. The plant is remarkable in that its ash contains over 70 per cent of silica.

Reed Bird, see BOBOLINK.

Reedbuck, see ANTELOPE.

Reeds: 1. The vibrating tongues producing the tone of certain woodwind instruments (except, for example, flutes) and of organ pipes, though in the latter case they are often made of other materials than reed. These instruments use so-called 'beating R.', and these are single for clarinets, saxophones, and organ pipes and double for oboes, bassoons, and bagpipes. There are also 'free R.' used in harmoniums and instruments of the concertina and mouth-organ type. 2. In weaving, frames of parallel flat strips of wood for separating the warp threads.

Reed Warbler, see WARBLERS.

Reefing, operation of reducing the area which the sail of a ship presents to the wind. From the head of a sail to the first reef-band, a piece of canvas sewed across a sail to strengthen it in the part where the eyelet-holes come, is called the first reef; from the first to the second reef-band is the second reef, and so on. Courses and top-sails are made reducible, the former generally having two, the latter four reefs. They are fitted with spilling, slat, and reef-lines and becket, and toggles on the yard. Reef-points or reef-linos are flat pieces of cordage tapering towards each end, and passed through the holes in the reef-band of a sail, a knot being then made on each side. Patent R. gear is sometimes used, which allows as much as possible of the operation of R. to be done from the deck.

Reel, Scottish, Irish, and Scandinavian dance, either of Celtic or Scandinavian origin. It is performed with the dancers standing face to face and the music is in quick 2-4 or 4-4, occasionally 6-8, time and divided into regular eight-bar phrases. A musical characteristic of many Rs. is a drop into the triad of the subdominant unprepared by modulation.

Reeling, see under CORROV.

Ree, Lough, lake in the R. Shannon, Eire, forming a boundary between Co. Roscommon and Co. Westmeath and Longford. It is 17 m. long.

Reeve (O.E. *gercfa*), Eng. official who in early times was the chief magistrate of a tn. or dist., with the administration of which he was entrusted. There were many kinds of R., as the port R., the tn. R., the high R., the manor R., the shire R. ('sheriff'), etc. The word is now used in Canada for the president of a tn. council.

Reeve, see RUFF.

Referees, Court of, 'court' estab. in 1864, consisting of the chairman of ways and means, the deputy-chairman, and not fewer than seven other members of the House of Commons, whose duty it is to adjudicate on the preliminary question of the right of petitioners against private bills or provisional orders (*q.v.*) to be heard upon their petitions where an objection has been lodged against their *locus standi*.

Referendum. In politics a direct appeal by the gov. to the electorate on a single definite issue. Brit. political opinion is as much against the idea of a R. as it is against that of the initiative, the general theory of Eng. democracy or the principle of representation being that the parl. representatives are chosen not so much upon any definite issue or issues as upon a general policy the execution of which in detail is to be left to the representatives themselves (*see, in reference to the mandate theory, INITIATIVE*). Lord Balfour of Burleigh introduced a Bill into the House of Lords in 1911 for establishing the R. This was merely a belated effort at reform of the House of Lords made in the vain hope of defeating the Parliament Act, 1911 (*q.v.*).

The general principle of the R. as it is understood in many of the states of the U.S.A. is that no law or measure save those whose urgency is required by public safety, and which, as a rule, require a two-thirds or three-fourths majority, shall go into effect for a fixed period (say ninety days). If during this period 10 or more per cent of the people sign a petition for a R. on that law, it would not go into effect until the next election, when the whole people would vote on it. If rejected it would cease to be a law. Different states have, however, somewhat differing rules. There is, however, no provision for the R. in the Federal constitution of the U.S.A. In Switzerland the R. applies only to legislation affecting the constitution which has already passed the Federal Assembly by a specified majority. The more recent (pre-1939) constitutions in Europe made provision for the use of the R. The present (1937) Irish constitution provides that no amendment of the constitution can be effected except with the approval of the people given at a R. Also the president of Eire can, at the instance of a prescribed proportion of the members of the Parliament, refer certain Bills to the people for decision at a R. By the Ger. constitution of 1919 the president had the right to make use of the R. at his discretion.

Canada has used the R. particularly on the question of the liquor laws. Australia has used the R. on sev. occasions to introduce amendments to the constitution, and proposed laws for altering the constitution must be submitted to the electors and can be enacted only if approved not only by a majority of the states but also by a majority of all the electors voting.

Reflection and Refraction of Light. In travelling through space or any homogeneous medium the waves of light pursue a straight path; on reaching another

medium part of the energy is transmuted, i.e. part of the light is lost, the remainder being either thrown off as reflected light or penetrating and passing through the new medium. That the incident and reflected ray are in the same plane with the normal or vertical line at the point of reflection is

FIG. 1

proved by a simple experiment as in Fig. 1, where the reflection of X in the mirror Z is viewed through a small hole in Y. Further, on altering the position of the mirror and adjusting Y so that the image of X appears through the hole, it will be found that XH/XZ is always equal to

FIG. 2

YD/YZ ; i.e. the angle of incidence equals the angle of reflection. These two laws being entirely mathematical, the study of reflection becomes a branch of geometrical optics. Fig. 2 illustrates a simple development. N is the normal to the mirror MR, and an object at N will be reflected

FIG. 3

back upon itself; if now the mirror be rotated on P into the new position M_1R_1 , the normal will be n_1p and the reflection of N will appear at N_1 , that is, the reflected ray rotates at twice the speed of the mirror. The phenomenon of refraction is readily observed by immersing a piece of stick in water, as shown in Fig. 3, when

the eye is placed in the same plane as the stick. By arranging an experiment as shown in Fig. 4, where a strong beam of light is reflected by the prism P on to the milky water in the tank, and marking the angle of incidence and the angle of refraction (i.e. the angles made by the two bent portions of the beam with the normal) with strips of paper on the side of the tank, it can be shown that whatever the angle of the incident beam, it always bears a constant ratio to its angle of refraction. Denoting this ratio by its usual symbol μ , then $\mu = \sin \phi / \sin \theta$, and this is the index of refraction from the first to the second medium; for air and glass, $\mu = 3/2$; for air and water, $4/3$. The refractive index of a substance is the ratio, when the incident beam enters from a vacuum; for air, glass, and water the figures are 1.00029, 1.5, 1.34 respectively. This law, together with the law that the path of the bent beam and the normal are in the same plane, again gives the mathematical basis of the further

FIG. 4

study. In Fig. 4 the angle ψ is the deviation of the light. If in the same figure the light originated in the water at L, it would traverse the same path, but in the opposite direction; then, light travelling from a less (optically) dense to a denser medium is bent towards the normal; from dense to less dense, away from the normal. In this latter case there is an important consequence. The mirror M in Fig. 4 may be moved to reflect the light falling on it; as the beam emerges from the water it is bent towards the left. As now the beam is reflected more and more to the left in the water, the emergent beam will fall closer and closer towards the surface. A point is reached when it coincides with the surface. Beyond this refraction ceases and total reflection takes place, as shown in the figure, i.e. the beam enters the water and obeys the law of reflection. This is readily observed by holding a glass of water above the eye, when the upper surface appears as a mirror. The angle of incidence at the moment when the emergent ray disappears is known as the critical angle; it is easily calculated to be $\sin^{-1} 1/\mu$. For water to air it is $48^\circ 45'$. Newton discovered that the refractive index of a substance varies for the different coloured constituents of white light (see DISPERSION; SPECTRUM).

Double refraction.—On looking through a crystal of Iceland spar, there is a position when an object looks double. This is due to a second refracted ray, called the extraordinary ray, which does not lie in the plane of the incident ray (see POLARISATION). The phenomena of reflection and refraction give rise to such occurrences as

the mirage, rainbow, haloes, etc. Refraction is of extreme importance in astronomy, since the rays from heavenly bodies are refracted on entering the atmosphere. The twinkling of stars is due to refraction varying with the varying density of the air pierced by the ray. See T. Preston, *Theory of Light*, 1895, 1928; R. A. Houston, *A Treatise on Light*, 1927; W. H. Bragg, *Universe of Light*, 1933; R. G. Mitton, *Heat, Light, and Sound*, 1936; and R. W. Stewart and J. Satterby, *Text-book of Light*, 1941.

For refraction, in vision, see REFRACTION, ERRORS OF.

Reflex Action, see NERVOUS SYSTEM.

Reform, Political and Social. Political historians generally appropriate this term exclusively to one kind (albeit far-reaching in its results) of R. only, that of the franchise, which, gradually extended to the different classes of an overgrowing urb. pop., socially reformative legislation, with recurring periods of neglect, became a regular feature of political propaganda. The year 1906 saw a reversal of the electoral tide in favour of the Liberal party, which party had for long identified itself with schemes of social R. (see LIBERALISM). Much in the way of the amelioration of the conditions of life of the masses has been done during the last three or four decades. The Liberal govs. of 1906-14 had a long list of ameliorative social legislation to their credit. The years 1914-18 were naturally barren of legislation affecting the social conditions of the people. Legislation not immediately bearing on the prosecution of the war was postponed to a more convenient period. There is, however, an important statute of 1918, namely, the Representation of the People Act, 1918, which conferred the franchise on all men of full age, and on women who had attained the age of thirty, and married women. Ten years later another Act, entitled the Representation of the People (Equal Franchise) Act, 1928, was passed by the Baldwin Gov. It extended the franchise to men and women of full age on equal terms. Thus it may be said that the great political fights of the nineteenth century, having for their end the extension of the parl. franchise, culminated in the Act of 1928, passed by a Tory gov. and popularly known as the 'Flapper Vote Act,' which gave adult suffrage. It may be that future historians will look upon the nineteenth century politically as the century of the struggle for the vote. The rise to prominence and power of the Socialist party in Britain, a rise unparalleled in hist. for its rapidity, has already exercised a strong influence on the progress of social reform. See also SOCIAL SERVICE.

Reformation, name generally given to the great religious revolution which took place in the W. Church in the first half of the sixteenth century, and by which almost all the N. part of Europe threw off the supremacy of the bishop of Rome.

Causes.—The statement that it is impossible to study any period of hist. apart from the periods that precede and follow it, though true at all times, is especially

true of the period of the R. The roots of the movement are to be sought centuries before the outburst occurred. Its effects are with us now. The chief of these will be summed up at the end of this article; we are now concerned with the steps by which the discontent with the papal system gradually led to open revolt. To do this properly it would be necessary to give a full account of the social, political, and intellectual state of Europe during the fourteenth and fifteenth centuries. One point must be emphasised, the medieval polity was essentially centralising. Previous to the R. the see of Rome claimed by divine right and asserted (with the assistance of the lay power of the various states of Europe) an absolute authority over the whole Christian Church in all matters both spiritual and temporal. Though the exercise of this power in the temporal sphere, especially in matters of papal taxation, was resisted by various princes, it was freely taught that as the vicar of Christ, responsible to God alone, the pope had power to give and take away kingdoms. Again, since the clergy were the educated class of the Middle Ages, and since under feudalism they had been entrusted with the gov. of large areas in every country, it was inevitable that a preoccupation with secular affairs and a consequent worldly spirit should arise amongst them. To worldliness must be added two abuses of administration: that proceeding from the system of pluralities, by which many benefices and livings might be accumulated in the hands of one man, and that by which youths and even children were raised to the high offices of the Church. There was also much laxity in the lives of the clergy and prelates, laxity which was increased by the Renaissance movement.

The Renaissance contributed more directly in another way to cause the R. It was the outburst of individualism, and caused a growth of national consciousness in all the countries of Europe. Its seeds took root more firmly among the N. races, for the Teutons have ever stood for individualism in opposition to the unifying tendency of the Lat. races. The critical Renaissance attitude, coupled with the general spirit of anti-clericalism, led to a questioning of the doctrinal bases on which the unpopular vested interest of the clergy ultimately rested. Thus we find that Luther's protest, from being at first a voicing of the widespread feeling against clerical rapacity, as exemplified by the preaching of the indulgence of 1517, passed quickly to an attack on the doctrine of indulgences, and thence to a general attack on the doctrinal system of the Church. Finally, the greed of laymen played some part in the general overthrow of the Catholic system in N. Europe. The chance of enriching themselves at the expense of the Church tempted kings and nobles to throw in their lot with the reformers and thus to supply that condition of governmental support without which, in that age of centralised despotism, the movement from below would not have succeeded.

The Objects and Teaching of the Reformers.—As a general rule the R. succeeded in those countries where the civil gov. and the reformers acted in combination. The main object of both was the same, viz. the overthrow of the papal supremacy and the curtailment of clerical privileges. But, whereas civil govts. promoted this policy for their own aggrandisement, the reformers proper were actuated by religious zeal. The overthrow of the hierarchy was a necessary step to doctrinal changes, changes which they regarded as a revival of primitive Christianity. In the whole of the literature issued by the reformers we find this last point strongly emphasised: that the main body of the Church had fallen away from the primitive truth and the primitive discipline, that already appeals had been going up too long for a general council to reform the manifold abuses, and that it was therefore necessary that all those who could should set about the task of R. immediately. The appeal of the reformers, especially in England, was to the Bible and the Fathers. They disclaimed any desire to introduce new doctrines, and charged the Catholics with the introduction of novelties.

The Reformation in Germany.—It was one of these practical abuses that impelled Martin Luther to the act which has ever been considered the official beginning of the R. On Oct. 31, 1517, he nailed to the doors of the castle church of Wittenberg his famous theses in which he attacked the doctrine of indulgences. The move to doctrinal reform was rapid; and in 1519, in his disputation with Eck or Eckius, one of the ablest of the Catholic champions of that age, he questioned the supremacy of the pope and the doctrines of purgatory, auricular confession, and priestly absolution. In June 1520 Pope Leo X. issued a bull condemning as heretical forty-one propositions extracted from Luther's writings. Luther appealed from the pope to a general council, and publicly burnt the bull in Dec. In Jan. of the next year (1521) he was excommunicated. Three months later he appeared before the Diet of Worms to defend his opinions, and here he maintained that both popes and councils may err. He refused to retract his teachings, and placed himself under the protection of the Elector Frederick of Saxony, who steadily upheld the cause of the reformers. On his death in 1525 his successor, John, openly embraced the R., and during the next four years, with the assistance of Melancthon in Saxony and Bucer at Strasburg, Luther's opinions spread rapidly throughout the Ger. states and even as far as Sweden. This rapid diffusion of the R. in Germany was helped, however, not only by the popular feeling, but also by the self-interest of the various princes, who eagerly seized upon the wealth of the suppressed convents, collegiate churches, and other eccles. establs., a selfish motive which no one deplored or censured more bitterly than Luther himself. In 1529, at the Diet of Speyer, the Romp. Catholic princes were in the majority and proscribed many of the reformers'

chief tenets. It was from the protest which the other princes and their adherents then made that the name Protestant (*q.v.*) is derived. Following on this protest an unsuccessful attempt was made to reconcile the Lutherans and Zwinglians. In 1531 the Confession of Augsburg was pub., giving the doctrine of the reformers. Meanwhile the emperor had issued an edict forbidding any further action by the reformers until a general council should have been called. Alarmed at his action, the Protestant princes assembled at Schmalkald, with the elector of Saxony at their head, to form a religious and political defence league. War followed, and in 1546, through the defection of Maurice of Saxony, the Schmalkaldic League was utterly defeated. In 1555, after prolonged negotiations, a diet met at Augsburg to settle the religious condition of the Ger. states, and it was decided that each prince should choose his side, that the people should follow him in religion, and that there should be no attempt at compulsory conversion on either side. The peace thus made was broken in 1619 by the Thirty Years war, terminated in 1648 by the peace of Westphalia, which estab. a more tolerant and workable arrangement, based on compulsory religious conformity within each state and religious equality between the states.

In Switzerland.—While Luther had been working in Germany, a parallel movement had been progressing in Switzerland under the leadership of Ulrich Zwingli. Here again the proximate cause of the outburst was the doctrine of indulgences, and here again political events conspired to regulate the course of the R. Though Zwingli preached against indulgences in 1518, it was long before the Rom. Curia took action, its attention being concentrated on Germany. In 1528 the council of Basle arranged an elaborate disputation, and this was followed by the pub. by the council of Bern of a series of ten theses agreed on by the reformers. In 1531 Zwingli was killed. Henceforward the centre of reform moves from Zurich to Geneva, and the hist. of the movement gathers round the name of Jean Calvin (for the further progress of the R. in Switzerland see CALVIN). But the influence of this great Fr. reformer did not stop here. His system of church polity formed the model for the Presbyterian and Congregational systems, and the influence of his theological teaching spread as wide as the R. itself. His influence was especially great in France, Holland, Scotland, and England.

In the Northern Kingdoms, Denmark, Norway, and Sweden.—In all these three countries the Lutheran form of the reformed religion spread rapidly, and in each case the action was initiated by the sovereign. In Sweden the Lutheran doctrines were accepted by Olaus Petri and Archdeacon Andersson. The work was then taken up by Gustavus Vasa, who found in the new movement a powerful tool for the furtherance of his own projects. In 1527, at a council held at Westerås, the reformed doctrines were

unanimously adopted. The work of R. was completed by the Synod of Orebro (1529); though externally the change in Sweden and Denmark was less than in the other countries, most of the externals of Catholic worship being retained. The new teachings were introduced into Denmark, then united to Norway, by Christian II. about 1520, and after his deposition in 1523 the work was carried on by his successor, Frederick. He granted religious liberty to the reformers at the Diet of Odensee in 1527, and in 1546, at the Diet of Copenhagen, the new doctrines were finally imposed on the country. Their introduction into Norway was due to Christian III., and here again many of the externals of Catholic worship were retained.

In France.—This country had always been a great stronghold of Catholicism, and the new doctrines have never made any considerable progress within its bounds. The reformed doctrines were embraced by the upper classes, whereas the peasants and lower classes rejected them with the greatest obstinacy. The new doctrines had found their way into France as early as 1530 from Germany and Switzerland. There was a tradition of religious dissidence among the mts. of Dauphiné, bordering on the Waldenses. Pierre Robert d'Olivet, Michel Cop, rector of the univ. of Paris, Beza, and others adopted and spread this, and Margaret of Navarre, sister of Francis I., gave them her countenance. But Francis I. opposed them, and used the stake and the faggot freely to extinguish them. The persecutions, the civil and religious wars, the truces and other vicissitudes of the Fr. Calvinists, during the reigns of Francis I., Henry II., Francis II., Charles IX., and Henry III., are part of the hist. of France (see FRANCE, *History*). At last Henry VI. by the Edict of Nantes (1598) acknowledged the reformed faith as the lawful creed of a part of the Fr. pop., the Huguenots (*q.v.*).

In the Netherlands.—The doctrines of the R. had made many converts in the Netherlands during Luther's lifetime, and a fresh influx of Calvinists from France and Switzerland increased the number of dissidents from the Rom. Church. The wild outbreaks of the Anabaptists at Leyden, Munster, and other places at first threw discredit on the principles of the R., but these disturbances were soon put down. The reformers suffered terrible persecutions under Charles V. of Spain, and matters were made worse under his successor, Philip. Hence came the revolt of the Low Countries, which ended in the N. states adopting Calvinism. The Netherlandish Confession of Faith was pub. in 1562, and was later revised and republished at the Synod of Dort in 1618. Since then a majority of the Dutch have remained permanently attached to Calvinism.

In East-Central Europe.—Under the sway of Sigismund Augustus, the Lutherans and Calvinists became very numerous in Poland, and many of the high nobility embraced the reformed doctrines. Their

numbers were greatly reduced by the persecutions under Sigismund II. and some of his successors; but they were never annihilated, and Lutherans and Calvinist congregations have continued to exist in most tns. of Poland. Even before the R. actually commenced, the exertions of John Huss and his followers had converted almost the whole of Bohemia into a hot-bed of religious unrest, and in this dist. the R. was received immediately. After the Thirty Years war, however, Protestantism was entirely rooted out. In Hungary and Transylvania the R. was spread by Hungarians who had studied at Wittenberg, and in spite of strict laws against them there were soon followers of Luther and Calvin throughout the country.

In England and Scotland.—Though the divorce of Henry VIII. from Catherine of Aragon must be described rather as the occasion than the cause of the break with Rome, nevertheless that episode is important because it enlisted the Crown on the anti-papal side, and without governmental support the R. movement could hardly have succeeded. Though Henry claimed for himself the headship of the Church, yet he had no sympathy with the reformed doctrines, and the famous Act of Six Articles brought many of the reformers to death at the very time when Catholics were dying in support of the principle of the papal supremacy. Under Edward VI., the gov. allied itself with the Protestant minority and drastic changes were seen. The latter part of this short reign is indeed the worst part of the Eng. R. The zeal of the reformers far outran their discretion, and their acts were characterised by reckless cruelty and wanton vandalism. The reign of Mary saw a temporary return to the Rom. obedience, but on the accession of her sister in 1558 the work of reform was resumed. The mass of the clergy conformed, the Catholic gentry were crippled by fines, and during the reign some 180 Catholics, mostly priests, were butchered. The reformed religion gradually permeated the Eng. people. In Scotland the name of John Knox stands out above all the rest, though here also impetus was given to the movement by political causes. The nobility espoused the R. because it provided a powerful weapon against the obnoxious sovereign. (For a further account of the progress of the R. in this country see KNOX, JOHN.)

Effects of the Reformation.—The Renaissance, the invention of printing, the discovery of America, and the R. changed the face of Europe and still condition the civilisation and outlook of the modern world. The result was a moral and intellectual revolution on so vast and complicated a scale that it is impossible to say that any particular development was an effect of one only of these four causes, such as the R. Any interpretation of the effects of the R. is coloured by religious prepossessions. A Catholic regards the R. as disastrous because it broke up the unity of Christendom. A Protestant regards it as the birth of freedom of thought, the inauguration of a purer

religion, and the point of departure for all modern progress. A neutral observer might point out to the Catholics that the R. reacted beneficially on the Catholic Church by giving impetus to the movement which culminated in the doctrinal classification and disciplinary spring-cleaning of the council of Trent, while on the other hand he might remind the Protestant that the number of rival sects into which Protestantism has split has led in our own day to a desire among the reformed Churches for religious reunion.

See G. Mentz, *Handschriften der Reformationszeit in Tabula in usum Scholarum* (ed. by J. Lietzmann), 1910; G. Wolf, *Quellenkunde der deutschen Reformationsgeschichte* (3 vols.), 1915-23; P. Smith, *Age of the Reformation*, 1920; H. Belloc, *How the Reformation Happened*, 1929, *History of England*, 1931, and *Characters of the Reformation*, 1936; H. S. Lucas, *The Renaissance and the Reformation*, 1934; E. C. Messenger, *The Reformation, the Mass, and the Priesthood: a Documented History with Special Reference to the Question of Anglican Orders* (vol. i., *The Revolt from the Medieval Church*, 1936; vol. II., *Rome and the Revolted Church*, 1937); J. Mackinnon, *The Origins of the Reformation*, 1939; and F. M. Powicke, *The Reformation in England*, 1911.

Reformatory and Industrial Schools. A reformatory school is defined in the unamended Children Act, 1908, as a school 'for the industrial training of youthful offenders, in which youthful offenders are lodged, clothed, and fed as well as taught.' An industrial school is there defined as a similar estab. for children as distinct from youthful offenders. Reformatories were intended for persons under sixteen convicted of an offence punishable by imprisonment, and who were either between fourteen and sixteen or, if between twelve and fourteen, had been previously convicted. Detention might be for a period of from three to five years, but must have expired before the offender reached the age of nineteen. An industrial school was rather an institution for the salvation of children apparently under fourteen who were so circumstanced that they might be said to be on the path of crime. But this nomenclature has now entirely disappeared under the Acts of 1932-33, the desired objects being achieved through the machinery of 'approved schools' (see further under CHILDREN ACTS, 1908-33). One radical defect of the old system always vitiated the reformatory properties of these schools: the fact that all sorts of youthful offenders were herded together without discrimination of mental capacity. The result was that a large proportion were in reality mental defectives, until the Mental Deficiency Act, 1913, to provide certified institutions for the feeble-minded. A further development has been the institution of classifying approved schools which, after a period for observation, determine which school is the most appropriate to the individual. Experience shows an increase in juvenile delinquency in wartime. Thus in the year 1916 there were 10,897

boys and 3052 girls in industrial schools, and 3698 boys and 532 girls in reformatory schools. In 1924 there were 3871 boys and 1177 girls in industrial schools, and 1952 boys and 138 girls in reformatory schools. In 1948 there were 9207 boys and 2105 girls in approved schools; these numbered 145 in England and Wales, 111 still run by voluntary managers and local authorities. All of them are inspected by the Children's Dept. of the Home Office, who must approve the appointment of the head. See also **BORSTAL SYSTEM**; **MENTAL DEFICIENCY ACTS**. See Sir E. Ruggles-Brise, *The English Prison System*, 1921; Winifred A. Elkin, *English Juvenile Courts*, 1938; and M. M. Simmons, *Making Citizens*, 1948.

Reform Club, founded in 1837 and formerly the headquarters of the Whig party. Cobden, Bright, Gladstone, and all the notable Whigs or Liberals (see **PARTY GOVERNMENT**) were members in their day. The club premises are at 104 Pall Mall, London. It has a fine library, the roof of which is supported by marble columns. There is no collection of political works in the United Kingdom comparable to that of the R. C. Since the decline in the fortunes of Liberalism the R. C. no longer enjoys its former political prestige, having been superseded by the National Liberal Club, though it is still frequented by professional men, particularly journalists, lawyers, and economists.

Reformed Churches, term conventionally used to designate those Protestant churches which followed the teaching and eccles. organisation of Calvin and Zwingli rather than those of Luther. In Germany the Reformed and Lutheran churches co-exist. Of the other Protestant churches, those of Scotland, Holland, France, Poland, Switzerland, and most of those in America belong to the former group. The R. C. differ from the Lutheran in their total rejection of consubstantiation. They consider the Lord's Supper as nothing but a commemorative meal. They also reject the ceremonial and ornaments retained by the Lutherans, such as, for example, the crucifix, and have generally a Presbyterian organisation.

Reformed Presbyterians, see **CAMEROONIANS**.

Reform, Social, see **REFORM, POLITICAL AND SOCIAL**; **SOCIAL SERVICE**.

Refraction, see **REFLECTION AND REFRACTION OF LIGHT**.

Refraction, Errors of, in the case of vision, are due to constitutional or pathological abnormalities in the cornea, aqueous humour, crystalline lens, and vitreous humour, whereby the rays of light are abnormally refracted, or to muscular changes leading to deficient accommodation. Presbyopia (old sight) is due chiefly to loss of elasticity in the lens and contractile power of the ciliary muscles, with advancing age; near objects are indistinct. In hypermetropia (long sight) the eyeball is short and the focus of the rays lies behind the retina, producing a condition similar to presbyopia, but applying to objects at all distances; both are corrected by convex glasses. When the eyeball

is long so that the focus lies in front of the retina, Myopia or short-sightedness is found; distant objects are indistinct or near objects have to be brought too close to the eyes. Eye-strain with watering and headache often accompany myopia; concave glasses, by slightly diverging the rays before entering the eye, can be so chosen as to throw the focus on to the retina, producing correct vision. Astigmatism may be simple, compound, or mixed. It is due to the abnormal shape of the cornea or lens, whereby the rays of light in different planes are not refracted to the same focus. It exists in every degree of complexity, but is simple when one meridian has correct refraction but the other is myopic or hypermetropic;

A, NORMAL VISION; B, HYPERMETROPIA (LONG SIGHT); C, MYOPIA (SHORT SIGHT)

compound when both meridians show errors of the same kind but differing in degree; **mixed** when one gives myopic, the other hypermetropic vision. Cylindrical glasses, correcting the eyes' curvature, are used to correct astigmatism. Asthenopia is eye-fatigue, due to overstrain of the muscles of the eye, or to neuropathic condition, consequent on the various defects of refraction. Anisometropia is the condition found when one eye has a considerable difference in error of refraction from the other eye. Suspected eye defects should be investigated by an ophthalmic optician or ophthalmic medical practitioner in consultation with the patient's own doctor. In some cases spectacles may be prescribed for close work (reading, needlework, etc.), and in others constant use of spectacles will be found necessary.

Sight-testing is still the term used, mainly in everyday parlance, for describing eye examination. This is carried out by ophthalmic opticians and by ophthalmic medical practitioners and includes a detailed consideration of the patient's symptoms and hist. The external and internal parts of the eyes are examined carefully, its movements and reflexes observed, and the refraction of the eyes is

measured in order to detect any optical defects. In a straightforward case the procedure commences with a routine check on the health of the eyes by means of an ophthalmoscope (q.v.). The refraction of the eyes is then measured first by objective methods, which require no conscious assistance from the patient (retinoscopy). These results are then verified and possibly modified during a subjective examination in which the patient observes a series of graduated letters, and also answers questions about the relative clarity of groups of black lines (fans, squares, diamonds, etc.). All these tests together enable the practitioner to measure accurately the degrees of hypermetropia, myopia, astigmatism, presbyopia, that may be present. The patient's muscle balance, accommodation, and convergence are also considered, as these have an important bearing on visual comfort. Patients requiring more detailed examination may have their fields of vision measured and mapped for scotomata (blind areas), their colour vision tested, or further investigation of pupillary reflexes, ocular muscles, etc. Extended treatment known as orthoptics may be given to patients with muscle abnormalities or where the two eyes do not work together comfortably—e.g. children with a squint or a tendency to squint.

See W. S. Duke Elder, *The Practice of Refraction*, 1928; J. Thorington, *Refraction of the Human Eye*, 1930; Gibson, *Clinical Orthoptics*; H. Emsley, *Visual Optics*, 1939; and G. H. Giles, *The Practice of Orthoptics*, 1943.

Refrigerant, in medicine, an agent used for lowering the temp. or allaying thirst. The term is usually applied to those agents which give a feeling of coolness, the term *antipyretic* being reserved for remedies which actually lower the body temp. The most important antipyretics are cold, as in the wet pack, agents which produce perspiration, antipyrin, antifebrin, phenacetin, etc. Substances which afford relief to thirst without materially affecting body temp. are barley water, effervescent fruit drinks, potassium chlorate, potassium nitrate, etc.

Refrigeration, removal of heat from the substance which it is desired to cool, and its transference to a cooling medium, sometimes water, sometimes the atmosphere. R. depends on the two well-known facts that when a gas is compressed its temp. will rise, and that if its temp. is reduced whilst under this compression then the gas will liquefy. If the pressure is then reduced the liquid will boil (i.e. revert to gas), and in so doing draw heat from its surroundings. Only a restricted few gases may be used as refrigerants; those in most common use are ammonia, methyl chloride, sulphur dioxide, dichlorodifluoromethane (Freon 12), and monochlorodifluoromethane (Freon 22). Freon is almost the ideal refrigerant because it is neither poisonous nor explosive, has very little odour, is not inflammable, does not corrode metals, and condenses with only moderate pressure. The two prin. types

of refrigerators are the absorption type and the compressor type. The latter is in most common use, especially for industrial and marine purposes.

Absorption Refrigerator.—Ammonia is the refrigerant used in this type. A solution of ammonia and water is heated in a container and the ammonia gas driven off is condensed in an air or water-cooled condenser. The condense is then led into an evaporator where it boils or evaporates; therefore, as a liquid to boil must extract heat from its surroundings, refrigeration is achieved. The gases from this evaporating process are then dissolved in water and the liquid refrigerant flows back to its original container, the complete cycle being thus attained. The heater may be gas, electric, or even an oil-burner. There is thermostatic control on the heater. As there are no moving parts the obvious advantage lies in the fact that this type is completely silent; if the heater is electric it is suitable for either A.C. or D.C. use, and if a voltage is encountered different from that for which the refrigerator is constructed, then only the heating element has to be changed at a comparatively small cost. Hydrogen is introduced into the system to maintain a constant pressure throughout. In some plants a solid absorber is used in place of water, like silica gel or calcium chloride, but the principle remains the same.

Compressor Type. A compressor creates a low pressure on its suction side and a high pressure on its discharge side. The suction side is connected to an evaporator in which of course a low pressure is created. A liquid refrigerant in the evaporator boils because of this low pressure and so draws heat from its surroundings. The gas then passes through the compressor to the condenser, which in turn liquefies the gas which then passes on to the evaporator again. The compressor may be driven by electrical or mechanical means. An electric motor is usually thermostatically controlled from the evaporator, therefore if the temp. rises the motor will start and the compressor will reduce the pressure. The evaporator in a domestic refrigerator consists of coils, which are formed into a rectangle for the purpose of holding water trays. Water should be kept in the trays to assist refrigeration. Theoretically it is possible down to -458°F. , at which temp. all molecular motion stops. The thermostat usually used in domestic refrigerators is the bellows type (see THERMOSTATS). There is one other type of R. plant known as the cold-air machine, but this is now largely obsolete. See H. Williams, *Mechanical Refrigeration*, 1934.

Refuse, Disposal of. Public cleansing includes the collection of refuse from premises, the cleansing of streets and the disposal of refuse resulting therefrom. The degree of service rendered by the local authority varies considerably, depending on the nature of the locality and the types of refuse which the local authority has undertaken to collect. Under the Public Health Act, 1936, a local authority

may, and if required by the minister of health must, undertake the removal of house refuse and the cleansing of earth closets, privies, ashpits, and cesspools. Where local authorities have undertaken any such service, they are liable to penalty on failure to perform the service within seven days after notice by an occupier of premises. Where the local authority do not themselves render the services, they may require the occupier so to do. The local authority may require the owner or occupier of premises to provide approved dustbins, or else the authority may provide and maintain dustbins for which a charge of 2s. 6d. per annum per bin can be made. The local authority may undertake the removal of trade refuse and may make a reasonable charge for this service. A local authority may, and if required by the minister of health must, undertake the cleansing of streets in either the whole or any part of their dist. The above applies to authorities outside London. In London the metropolitan boroughs and the common council of the city of London must remove house refuse and cleanse and empty ashpits, etc.

At one time household refuse was stored and collected in ashpits. Now dustbins are employed for both trade and domestic premises, and most refuse collection consists of the removal of the contents of dustbins by special refuse-collecting vehicles. There are several types of vehicle, most of which can be classed as either side-loading or back-loading. The type selected depends on the locality: side-loading vehicles are perhaps the most popular, but rear-loading vehicles are particularly advantageous in windy districts, for they reduce the amount of dust and paper which is blown off the load. Many of the latter type involve special compressing mechanisms, to ensure full loads, and means of tipping or otherwise discharging. Special vehicles are provided for dealing with the refuse from blocks of flats, e.g. vehicles which deliver empty refuse trucks and take away full trucks for the disposal of their contents. Street cleansing vehicles include watering-carts or lorries, sweeping mechanisms, gully-flushing tank vehicles, etc. For the emptying of cesspools and septic tanks, special cesspool-emptying vehicles are available. Some of these can also be used for the removal of night soil.

The cost of refuse disposal, which is usually an appreciable charge on the rates, depends partly upon the service rendered; but the keynote of refuse collection is efficient organisation. Owing to the varied routes that have to be taken by vehicles, the planning of itineraries is of great importance; and because the amount of material to be removed varies seasonally, considerable thought has to be given to the labour problem, if overtime and waste of labour are to be avoided. Methods of disposal of refuse include tipping on land; dumping at sea; incineration (see *DESTRUCTORS*); conversion to fertiliser by composting with sewage sludge, or pulverisation and mixing with dried sludge; digestion either of the refuse

alone, or in combination with sewage sludge. By far the greater quantity of refuse is disposed by controlled tipping, i.e. tipping according to plan so as to avoid nuisance. Next are incineration and crude or uncontrolled tipping; other methods of disposal are rarely employed. At one time, when tips were not properly controlled and were very insanitary, incineration was considered greatly preferable to tipping. But in 1922 the Ministry of Health issued a 'list of precautionary measures for abating and preventing nuisances arising from refuse tips' which, with slight emendation, was reproduced in the ministry's report for 1931-32. This had the effect of making 'controlled tips' generally popular. In brief, the rules laid down by the ministry were that the deposit should be made in layers of limited depth and each layer covered on all exposed surfaces by 9 in. of earth or other suitable material, care being taken that only a limited surface of refuse should be exposed at any time during the process of tipping, and that no refuse should be left uncovered for more than twenty-four hours after the time of deposit. It was also required that screens or other suitable apparatus should be provided to prevent paper or other debris from being blown by the wind. In addition, it was required that deposit in water must be avoided as far as practicable if likely to cause nuisance, and reasonable precautions taken against the breeding of vermin or flies or the breaking out of fires. Refuse consisting mainly of organic material must be covered with not less than 2 ft. of earth; each layer of refuse must be allowed to settle before the next is added; care must be taken to avoid raising the surface of the tip above the general level of the adjoining ground; competent labour must be employed to enable the necessary measures to be taken for the prevention of nuisance; all refuse must be disposed of with such dispatch and be so protected during transit as to avoid risk of nuisance.

Considerable quantities of salvage are now separated during the processes of refuse collection and disposal. Early sorting—i.e. on the vehicle—is advantageous, for some materials greatly deteriorate in value if not segregated as soon as possible. At the tip or destructor site, sorting is effected partly by mechanical screening and partly by hand picking. In some plants iron is removed by magnets. The nature of refuse has changed in recent years, having now a lower calorific value than formerly, and this renders incineration more expensive. Digestion of refuse with sewage sludge, besides disposing of organic material without nuisance, provides additional quantities of methane which can be used for power for heating purposes. See also *DESTRUCTORS*; *PUBLIC HEALTH*; *SANITATION OF BUILDINGS*; *SEWERAGE*. See F. R. Matthews, *Refuse Disposal*, 1915; A. L. Thomson, *Modern Public Cleansing Practice*, 1930; Amer. Public Works Association, *Committee on Refuse Collection and Disposal, Refuse Collection Practice*, 1911.

Regal, small portable organ, said to have been invented about 1460 by Heinrich Traxdorff of Nuremberg, but existing in various forms much earlier as the portable or positive organ, which could be held by a band slung round the player's neck, one hand playing the keys and the other working the small bellows, or placed on a table, with the bellows worked by the feet or by another person.

Regaluto, *tn.* 25½ m. W.N.W. of Catania, in the prov. of Catania, Sicily. In the campaign of 1913 the churches Madre and S. Maria alla Croce sustained some damage. Pop. 11,900.

Regalia: 1 The ensigns or visible marks of royalty, or, in a more accurate and restricted sense, the ser. parts of the apparatus of a coronation. Though different countries have very different R., or crown jewels, varying greatly in value, a richly jewelled crown is commonly the chief of the insignia of sovereignty. In England the chief R. properly so called are the three crowns, the queen's crowns or diadems, the king's royal and other sceptres, the two orbs, the jewelled sword of state and four other state swords, the ampulla and spoon, the golden spurs of chivalry and coronation ring, the state trumpets, and the bracelets or armillas. The crown of England is the crown copied from St. Edward's crown in the time of Charles II., the original having been destroyed by the Protectorate. It is a circlet of gold embellished with rosettes of precious stones, ringed by diamonds. From the circlet rise four crosses-paté and fleur-de-lis, and from the former rise golden arches symbolising independent sovereignty. The imperial state crown is worn, after the coronation, by the reigning monarch on state occasions. The existing crown was made for Queen Victoria in 1838, and its constituent gems are of very anc. origin. They include a sapphire from Edward the Confessor's ring, the Black Prince's ruby, a sapphire from the crown of Charles II., pearl ear-drops of Queen Elizabeth, and in front is the second Star of Africa, weighing 309½ carats, cut from the Cullinan diamond. Altogether the crown, the most beautiful of all crowns, has 2783 diamonds, 277 pearls, seventeen sapphires, eleven emeralds, and five rubies. The imperial crown of India was made on the occasion of the Durbar held by George V., because neither of the above-mentioned crowns may be taken out of Britain. It has 6000 diamonds, four sapphires, four rubies, and six emeralds, all of unusual size and quality. It is designed on the pattern of the crown of England. The crown of Mary of Modena, consort of James II., is studded with diamonds and pearls, and her diadem of diamonds and pearls, which latter is reputed to be worth more than £100,000. Queen Mary's crown is the personal property of the Dowager Queen Mary, widow of George V. It is a beautiful light diamond crown, with detachable half-arches and bears in front the Kohinoor diamond. The Prince of Wales's crown resembles a peer's coronet, but has one

arch over it supporting a gold *monde* and cross. It was made specially for Edward VIII. when he was Prince of Wales. The royal sceptre, with the cross, is enriched with gems, including the larger Star of Africa, cut from the Cullinan. The other four sceptres in the R. are the king's and queen's sceptre with the dove, the queen's sceptre with the cross, and the queen's ivory rod. *The Orbs*: The orb and cross together are held to signify the domination of the Christian religion over the world. There are two orbs, the queen's being made on the occasion of the joint coronation of William and Mary. The king's orb is of polished gold, studded with large pearls, rubies, sapphires, and emeralds, and is larger than the queen's. The jewelled sword is made of Damascus steel, the scabbard being studded with precious stones. It originates from the coronation of George IV.; at the coronation ceremony the monarch hands it to the archbishop of Canterbury as a symbol that he puts his sword at the service of the Church. It is said to be the most valuable sword in the world. *The Four State Swords*: The sword of state is a two-handed sword, with a blade 32 in. long, gilt metal handle, and cross-pieces representing the lion and unicorn. The scabbard is adorned with precious stones in designs of the rose, the thistle, and the shamrock. At coronation ceremonies the peer who carries it hands it to the lord chamberlain, who gives him in exchange the jewelled sword; the second sword is the sword of justice to the spirituality; the third the sword of justice to the temporality; and the fourth is known as Curtana, and has the blade curtailed and squared to symbolise mercy. The ampulla or golden eagle and the anointing spoon are used at the coronation for anointing the monarch. They are very anc., appear to be of Byzantine origin, and luckily escaped the Puritanical hand of the Protectorate. *The Spurs and Coronation Ring*: Like the jewelled sword, the spurs of St. George are placed on the altar by the monarch at his coronation, with the same symbolical significance. The spurs are the emblem of knighthood and chivalry, and were made for the crowning of Charles II. The ring of rubies and one very fine sapphire circled with diamonds represents in design the cross of St. George. The state trumpets are of silver, with red and golden silk bannerets with royal arms and cipher; they are used for fanfares on great state occasions such as the reading of proclamations. From the earliest time, even in anc. Heb. days, a bracelet was one of the insignia of royalty. The bracelets in the Eng. R. are of gold, enamelled with rose, lily, thistle, and fleur-de-lis, but these are not used in modern coronation ceremonies. The R. of Scotland comprise the crown, sceptre, sword of state, and ugc. The Eng. R. are kept in the Tower of London, those of Scotland in Edinburgh Castle. The Irish crown jewels were stolen from Dublin Castle and have never been found, but they comprised nothing of any great intrinsic value. (See Sir G. and G.

Davenport, *The Crown Jewels of England*, 1919.)

Of European R. there is extant the crown, the sword (*La Joyeuse*), and spurs of Charlemagne. The crown is fashioned of gold plates, enamelled with representations of Solomon, David, Hezekiah, and Christ. The sword has a golden scabbard with cloisonné enamel and precious stones; Napoleon I. brought it from Vienna to the Louvre in Paris. The Bourbon crown, introduced by Louis XIV., was generally adorned lavishly with diamonds, surmounted by a double fleur-de-lis. The Fr. crown diamonds and gems were frequently reset for each succeeding monarch, but many famous jewels and stones were lost during the revolution. The leading example of It. R. is the iron crown of Lombardy, consisting of a broad band of gold with rosettes of enamel and precious stones, with an inner circlet of iron supposed to have been wrought from a nail of the true cross. The crown of the former Ger. empire, dating from the Franco-Ger. war of 1871, is fashioned on the model of that of Charlemagne. Most of the former Ger. states each had their own crowns and jewels. Austrian R. included the imperial crown made for Rudolph II., and the older crown of Hungary or St. Stephen of the tenth century. The imperial crown made for Catherine II. of Russia was one of the sumptuous items of the R. of the Romanoffs, which were formerly kept at the Winter Palace. Another is the imperial orb surmounted by a diamond cross, and especially the imperial sceptre with the famous Orloff diamond, a wonderful yellow stone, set atop. Tradition says that this gem was looted from an idol in a Hindu temple and sold to an Armenian trader, who in his turn sold it for £40,000 to Prince Orloff, who gave it to Catherine II. in 1772. The Soviet Gov. have valued it at £2,000,000. Spain possesses sev. fine emeralds among her crown jewels, and might have had more had Hernando Cortez acted on Queen Isabella's hint and handed over to her all he brought back from his conquest of Mexico. See Mary Abbott, *Jewels of Romance and Renown*, 1933.

2. The attributes or privileges of or belonging by virtue of his prerogative to the sovereign, which, according to writers on civil law (*q.v.*), comprise the power of life and death, war and peace, the administration of justice, monopoly of coinage, the power of assessment, and the ownership of waifs, estrays, royal fish, treasure trove, etc.

Regency Style, see GEORGIAN ARCHITECTURE.

Regeneration, in physiology, the repair or renewal of lost, or diseased structures, as, for example, the regrowth of a tail by a lizard. The phenomenon of R. must be considered in relation to ascertained facts about the growth and reproduction of cells. Every organism has developed from a single cell. The initial cell, there-

fore, must be considered as having within it the potentiality for completing the organism. This potentiality, however, is a highly complex thing, and, as the cell divides and still further subdivides, certain aspects of this potentiality tend to become prominent, and others are thrust into the background, even to the point of obliteration. In other words, cells are differentiated to perform more or less specialised functions, to form nerve, muscle, epithelium, etc. It should not be supposed that the specialisation is ever complete, for under certain circumstances the cell may modify its function to adapt itself to an abnormal condition. This adaptation may lead to the formation of a structure similar to one which has been lost by accident or disease. The extent of the adaptation appears to vary considerably in different organisms. Some structures can only be replaced by the action of cells of the same general form; thus, in man, lost epithelium is replaced from epithelium. Other organisms have the power of replacing homologous structures in a complex degree. In other cases the potentiality of the cells to reproduce quite a different structure seems to have persisted; thus certain insects have been known to produce a wing in place of a leg, and lobsters have produced a limb in place of an eye-stalk. The capacity for R. seems to be greater among the lower animals. Amphibia are able to replace the whole epidermis, salamanders replace their limbs, lizards their tails. Arthropods regenerate their limbs; molluscs are able to replace heads and feet, fishes can replace their fins. Among birds and mammals the capacity for R. is very restricted. Birds replace feathers in the process of moulting; mammals replace hair, skin, and horns. In man it may generally be said that lost parts can only be replaced by adjacent tissue of the same kind; broken bones reunite, and flesh wounds heal if the parts are put in juxtaposition. If epithelium is extensively destroyed, as in the case of a burn, it is replaced by scar-tissue. Plants have great powers of R. and use is made of those powers in the propagation of cultivated species from cuttings, grafts, etc. It is said that some weeds, such as the horse-radish, can be completely regenerated by any fragment containing a few intact cells.

Regeneration, theological term used to denote the change by which one becomes a member of the Church. All Christian Churches are agreed as to its necessity, and base the doctrine on the words of Christ to Nicodemus: 'Except a man be born again (or from above) he cannot see the kingdom of heaven.' In the Catholic Church R. is identified with the reception of sanctifying grace in baptism and the term is therefore equivalent to initial justification. Most Protestants, on the other hand, make it a sensible change of heart and life, not necessarily connected with any external rite. The doctrine of R. was the cause of a furious controversy in the Anglican Church during the nineteenth century, and the insistence on

baptismal R. was one of the main causes of the secession in America of the Reformed Episcopal Church.

Regensburg, see RATISBON.

Regent, one who exercises the power of sovereign during the absence of, or owing to the incapacity of, the sovereign. No provision had been made for a R. during the temporary absence of the sovereign since 1837—when it was provided that the gov. should be carried on by lords justices in the event of the queen's decease whilst the heir (the king of Hanover) was abroad—until 1937. The office of R. in early times usually fell to the justiciar (*q.v.*) in the event of the sovereign's absence, though William I., during his absence in Normandy in 1067, left as Rs. his half-brother Odo, earl of Kent, and Wm. FitzOsbern, earl of Hereford. The chief instances of Rs. in Eng. hist. between 1190 and 1837 are the following, and they illustrate the transition from the despotic and personal character of the kingship under the Norman and Angevin or Plantagenet kings to the struggle between the king and barons over the limitation of royal power and, thereafter, to the gradual development of parl. and constitutional control of the royal power and prerogative; in 1190 Richard I. on departing for the crusade appointed the chancellor, Wm. Longchamp, guardian of the kingdom. In 1216, owing to the minority of Henry III., the barons chose Wm. Marshall, earl of Pembroke, *rector regis et regni*. In 1272, Edward I. being abroad at the death of Henry III., the king's council assumed the functions of regency, the gov. being carried on by the archbishop of York, assisted by others. In 1297 Edward I., on joining his army in Flanders, left his son Prince Edward as R., together with an assisting council of regency. It was this regency that provisionally accepted the *Confirmatio Cartarum* and sent it to the king for ratification. In 1327, at the accession of Edward III., a minor, Parliament appointed a regency of bishops, earls, and barons. In 1377 in Richard II.'s minority no R. was appointed, but a council of twelve was named by the barons, though this council was frequently modified by Parliament which had the real control. In 1422 Henry V., at his death, named the duke of Gloucester R., but the peers, having searched for precedents, found that the late king could not, without the assent of the estates, dispose of the gov. after his death. Accordingly Parliament appointed the duke of Bedford or, in his absence, the duke of Gloucester 'to be the protector and defender of the kingdom and English Church, and the King's chief counsellor.' Sixteen counsellors were subsequently added by Parliament, and the peers declared that the protector's power was limited to defence of the realm against internal and external enemies. The following important principles may be deduced from this regency of 1422: (1) that the king cannot nominate a R. during the minority of his successor; (2) that neither the heir apparent, nor any other person, is

entitled to exercise the royal prerogative during the infancy of the king; (3) that Parliament alone has the right to nominate a R. and to determine his powers. In 1454, owing to Henry VI.'s insanity, the peers chose Richard, duke of York, protector, and Parliament confirmed the appointment. In 1483, on the accession of Edward V., Richard, duke of Gloucester, was appointed protector by the king's council. In 1547 sixteen executors were appointed as a regency during the minority of Edward VI.—this being in accordance with a statute of 1536; these executors chose the earl of Hertford as protector. In 1751 a Regency Act, passed on the death of Frederick, Prince of Wales, made the princess dowager of Wales R. in the event of a child of hers succeeding under eighteen, and also nominated a council or regency. In 1765 owing to the illness of George III. a Bill was passed appointing a council of regency and defined their duties; the king was empowered to nominate as R. either the queen, the princess dowager of Wales, or any descendant of George II. In 1788 George III. became insane, and Fox supported the right of the Prince of Wales to be R., but Pitt maintained the right of Parliament to make the appointment. It was decided to create a regency by statute, which of course required the royal assent, and eventually the two Houses of Parliament concurred in directing the chancellor to put the great seal to a commission for giving the royal assent; but the king recovered before the Bill was carried. In 1810 George III. again became insane and the Prince of Wales was appointed R., the Bill was passed (1811), and the royal assent given by commission. The R.'s power was limited; thus he could not, for twelve months, create peers nor grant offices and pensions, except during pleasure. The provision made in 1837 has been stated above. It was further provided (1840) that in the event of a child of the queen succeeding under eighteen, the prince consort was to be R.

Of these appointments those in the reign of George III. are of the greatest constitutional importance, it having been then settled that no one, not even the heir apparent, had the right to be R. without nomination. In case of a minority Parliament would pass a provisional Act to meet the requirements of the particular case. Thus in 1830 a Regency Bill provided for the administration of the gov. in case the Princess Victoria should succeed before her majority; and again, in 1910, Queen Mary was nominated R. in case of the death of George V. leaving a minor as heir. Further legislation was passed in 1937 and 1943; the Regency Act, 1937, provides that in the event of the illness of the sovereign or of his absence or intended absence from the United Kingdom, certain of the royal functions may be delegated to persons who are nominated counsellors of state *e.g.* the queen, the duke of Gloucester, the duke of Kent, (*d.* 1942), but from among the persons in the line of succession to the Crown

who may be nominated, the Act excludes any who are not of full age. The amending Act of 1943, however, provides for including the person who is heir apparent or heir presumptive if over the age at which the accession of the sovereign does not necessitate a regency, viz. eighteen. Under the Act of 1937 the heiress (Princess Elizabeth) while between the ages of eighteen and twenty-one could have succeeded the sovereign with full powers, but could not have been his deputy. The Act of 1943 therefore provides that 'the heir apparent or heir presumptive to the throne, if not under eighteen years, shall not be disqualified from being a Counsellor of State by reason only of his not being of full age.' The Act of 1937 further provides that the sovereign or the R. may in the event of illness not amounting to incapacitation, or absence from the United Kingdom, delegate to the counsellors certain of the royal functions, which would not include the power to dissolve Parliament or grant any title of peerage.

Reger, Max (1873-1916), Ger. composer, b. at Brand, Bavaria, studied with Riemann, and became teacher in 1895-96 at Wiesbaden Conservatoire, later prof. after 1907. His music is very original, of consummate technical skill with very great dexterity of contrapuntal part-writing, and usually of great difficulty. It has also transcribed compositions by Bach, Richard Strauss, and others, with success. His best work was for the organ, but he also composed many pieces for orchestra and piano. Variations on a theme proved the best mode for his ideas, and with Brahms he is the best exponent of this form in the nineteenth century. His work includes chamber and church music, tone-pieces, fugues, songs, etc. See lives and studies by K. Hassé, 1921; H. Unger, 1921, 1924; G. Bagier, 1923; S. Kallenberg, 1930; E. Reger, 1930; F. Stein, 1939, 1941; and L. Taube, 1941.

Reggio di Calabria: 1. Prov. of Italy. Pop. 659,400. See CALABRIA (2). 2. City and archiepiscopal see of Calabria, Italy, cap. of the prov. of Reggio, on the strait of Messina, 9 m. from Messina. It was founded in 720 B.C., and was one of the most flourishing ins. of Magna Græcia. It fell into the hands of the Romans in 281, and Caesar gave it the name of Ithegium Julii. It was entirely rebuilt in 1783. It has sev. times suffered from earthquake, and was totally destroyed in Dec. 1908, when about 35,000 persons perished. R. was taken by Brit. forces soon after the conquest of Sicily (1943). Pop. 144,300.

Reggio Emilia: 1. Prov. of Italy, bounded on the N. by Mantua. It is mountainous in the N., the highest point being Monte Cusna (6420 ft.), but in the N. it forms a fertile plain watered by the Secchia. It is rich in agriculture, producing rice, wheat, fruit, wine, chestnuts, and olives; and there are also some minerals, notably copper, sulphur, and iron. The chief manufs. are silk, leather, paper, glass, and porcelain. Area 884 sq. m. Pop. 396,100. 2. Or R. nell' Emilia, city of Italy, cap. of the above, 15 m. from Modena. It has a thirteenth-

century cathedral, a library with many valuable MSS., and the natural hist. collection of Spallanzani. Its theatre (1857) is one of the finest in Italy. The tn. is the centre of a rich agric. dist., and its industries include the rearing of silkworms, printing, and the manuf. of cloth and silk goods, cheese, matches, and brushes. Pop. 106,700.

Regiam Majestatem, title given to a collection of anct. laws, reputed to have been compiled by order of David I., king of Scotland (see Scott, *Border Antiquities*). The general assumption is that this compilation is a mere copy of the celebrated *Tractatus de Legibus Anglorum* of the justiciar Ranulf de Glanvill.

Regicides, term applied to people who bring about the death of a king, more particularly to the men who were appointed on the parl. committee to try King Charles I., and the members of the Fr. Convention who voted for the death of Louis XVI. Of the sixty-seven judges who sat in trial upon Charles I., fifty-nine signed the death warrant. After the Restoration the R. were brought to trial, some were executed and some sentenced to imprisonment for life, while, of those who were dead already, Cromwell, Ireton, and Bradshaw were condemned, and their bodies hanged at Tyburn.

Regillus, lake of anct. Italy, near the Tuscan Hills, in Latium. It was the scene of a battle in 496 B.C., between the Romans and the Latins.

Regiment (Late Lat. *regimentum*, from *rego*, I rule), largest permanent unit of the Brit. Army. The development of the R. may be dated from the sixteenth century, when armies were permanently organised in companies and Rts. The earliest form of organisation of cavalry was in troops (*q.v.*) and of infantry in companies, each of which carried its own banner long after they were organised into Rts. As warfare became more scientific, the battalion and the squadron were introduced as the fighting formations of infantry and cavalry respectively. At first battalions were composed of many Rts., and were gradually reduced till they formed only fractions of a R. Finally Rts. were made of uniform strength, and the battalion became a fixed fraction of a R., but in the Brit. Army most Rts. consisted of only one battalion until the army was reorganised in 1881, and now consist of two regular battalions, commanded by lieutenant-colonels. The different battalions which compose a R. have their own system of administration, and are, to all intents and purposes, separate, serving in different parts of the empire under the control of the United Kingdom Gov. A R. of infantry comprises the regular and territorial army battalions, and all are under the 'Colonel of the Regiment,' who is usually a distinguished general officer who has served in the R. The Rs. of Foot Guards, however, have no territorial battalions, and the number of their regular battalions varies—Grenadiers three, Coldstreamers three, Scots two, Irish one, and Welsh one. Corps like the Corps of R.E., Royal Corps of Signals, R.A.S.C.,

Regiment

Regiment

No.	Date Raised	Title in 1881
1*	1633	Royal Scots
2*	1661	Queen's Royal West Surrey
3*	1665	Buffs (East Kent)
4*	1680	Lancaster
5*	1685	Northumberland Fusiliers
6*	1673	Warwickshire
7	1685	Royal (English) Fusiliers
8	1685	King's Liverpool
9	1683	Norfolk
10	1685	Lincolnshire
11	1685	Devon
12	1685	Suffolk
13*	1685	Somerset Light Infantry
14*	1685	West Yorkshire
15	1685	East Yorkshire
16*	1688	Bedfordshire and Hertfordshire
17*	1688	Leicestershire
18*	1684	Royal Irish
19	1688	The Green Howards
20	1688	Lancashire Fusiliers
21*	1678	Royal Scots Fusiliers
22	1689	Cheshire
23*	1689	Royal Welch Fusiliers
24	1689	South Wales Borderers
25*	1689	King's Own Scottish Borderers
26	1689	1st Cameronians (Scottish Rifles) (see 90)
27	1690	1st Inniskilling Fusiliers (see 108)
28*	1694	1st Gloucestershire (see 61)
29	1694	1st Worcestershire (see 36)
30	1702	1st East Lancashire (see 59)
31	1702	1st East Surrey (see 70)
32	1702	1st Duke of Cornwall's Light Infantry (see 46)
33*	1702	1st West Riding (see 76)
34	1702	1st Border (see 55)
35	1701	1st Royal Sussex (see 107)
36	1701	2nd Worcestershire (see 29)
37	1702	1st Hampshire (see 67)
38	1702	1st South Staffordshire (see 80)
39	1702	1st Dorset (see 54)
40	1712	1st South Lancashire (Prince of Wales's Volunteers) (see 82)
41	1719	1st Welch (see 69)
42*	1743	1st Black Watch (see 73)
43	1741	1st Oxford and Buckinghamshire Light Infantry (see 52)
44	1741	1st Essex (see 56)
45*	1740	1st Sherwood Foresters (see 95)
46	1741	2nd Duke of Cornwall's Light Infantry (see 32)
47	1741	1st North Lancashire (see 81)
48	1741	1st Northamptonshire (see 58)
49	1741	1st Royal Berkshire (see 66)
50	1755	1st Queen's Own Royal West Kent (see 97)
51	1755	1st King's Own Yorkshire Light Infantry (see 105)
52	1741	2nd Oxford and Buckinghamshire Light Infantry (see 43)
53	1755	1st Shropshire Light Infantry (King's) (see 85)
54	1755	2nd Dorset (see 39)
55	1755	2nd Border (see 34)
56	1755	2nd Essex (see 44)
57	1755	1st Middlesex (see 77)
58	1750	2nd Northamptonshire (see 48)
59	1755	2nd East Lancashire (see 30)
60*	1755	King's Royal Rifle Corps (formerly Royal Americans)
61	1756	2nd Gloucestershire (see 28)

62*	1757	1st Wiltshire (see 99)
63	1756	1st Manchester (see 96)
64	1756	1st North Staffordshire (was 2nd/11th till 1758) (see 98)
65*	1756	1st York and Lancaster (see 84)
66	1756	2nd Royal Berkshire (see 49)
67	1756	2nd Hampshire (see 37)
68*	1756	1st Durham Light Infantry (see 106)
69*	1756	2nd Welch (see 41)
70	1758	2nd East Surrey (see 31)
71*	1766	1st Highland Light Infantry (see 74)
72*	1778	1st Seaforth Highlanders (see 78)
73*	1766	2nd Black Watch (see 42)
74	1787	2nd Highland Light Infantry (see 71)
75	1787	1st Gordon Highlanders (see 92)
76	1787	2nd West Riding (see 33)
77	1787	2nd Middlesex (see 57)
78*	1793	2nd Seaforth Highlanders (see 72)
79*	1793	Cameron Highlanders
80	1793	2nd South Staffordshire (see 38)
81	1793	2nd North Lancashire (see 47)
82	1793	2nd South Lancashire (see 40)
83*	1793	1st Royal Irish Rifles (see 86)
84	1793	2nd York and Lancaster (see 65)
85	1794	2nd Shropshire Light Infantry (King's) (see 53)
86	1799	2nd Royal Irish Rifles (see 83)
87*	1793	1st Royal Irish Fusiliers (see 89)
88*	1793	1st Connaught Rangers (see 94)
89	1794	2nd Royal Irish Fusiliers (see 87)
90	1794	2nd Cameronians (Scottish Rifles) (see 26)
91*	1794	1st Argyll and Sutherland Highlanders (see 93)
92	1794	2nd Gordon Highlanders (see 75)
93*	1800	2nd Argyll and Sutherland Highlanders (see 91)
94*	1800	2nd Connaught Rangers (see 88)
95*	1800	2nd Sherwood Foresters (see 45)
96	1800	2nd Manchester (see 63)
97	1798	2nd Queen's Own Royal West Kent (see 50)
98	1824	2nd North Staffordshire (see 64)
99	1824	2nd Wiltshire (see 62)
100*	1858	1st Leinster (see 109)
101*	1861	1st Munster Fusiliers (see 104)
102*	1861	1st Dublin Fusiliers (see 103)
103*	1861	2nd Dublin Fusiliers (see 102)
104*	1861	2nd Munster Fusiliers (see 101)
105*	1861	2nd King's Own Yorkshire Light Infantry (see 51)
106*	1861	2nd Durham Light Infantry (see 68)
107*	1861	2nd Royal Sussex (see 35)
108*	1861	2nd Inniskilling Fusiliers (see 27)
109*	1861	2nd Leinster (see 100)
	1800	1st Rifle Brigade
	1805	2nd Rifle Brigade
	1855	3rd Rifle Brigade
	1857	4th Rifle Brigade

etc., are Rs. to all intents and purposes, but there is no battalion organisation. In the U.S.A. an infantry R. consists of a headquarters, one H.Q. company, one service company, one cannon company, one anti-tank company, and three battalions. A U.S. cavalry R. consists of one regimental H.Q., one H.Q. troop, one service troop, and two squadrons. In most foreign armies a R. is commanded by a colonel, whilst the executive command of the battalions is held by majors (or commandants). The First World War brought into being tank Rs. and armoured-car Rs., while many of the police and pioneer Rs. have disappeared, particularly those of the Indian Army. In the Second World War there was also the Royal Air Force R. There exist two main methods of identification of Rs., viz. numbering and territorial names. For active service purposes Rs. are allotted distinctive abbreviated titles for correspondence and inter-communication, such as by telegraph and telephone.

INFANTRY.—On p. 86 will be found a list of Brit. infantry Rs. of the line, in order of seniority down to the absorption of the East India Company's army in 1861.

* *Notes.*—1. From 1633 to 1636 known as Hopburn's R. It was recalled from Dutch service by James II and named and numbered by him. 2. Under Charles II. called the Tangle Foot. 3. Under Charles II. called the Holland R., because it was formed from troops discharged from the Dutch service. 4. The King's Own Royal R. 5. Raised privately in Holland in 1674. 6. Until 1680 served the Dutch Gov. on contract. 13. Prince Albert's. Became Light Infantry in 1822. 14. The Prince of Wales's Own. 16. From 1792 to 1809 was the Buckinghamshire R. 17. Princess Alexandra's Yorkshire R. 18. Disbanded in 1922. 21. Raised on the Scottish Estab. as the Earl of Mar's R. 23. From independent companies raised in 1686. 25. Originally Leven's R. It received its present title in 1805. 28. Originally Bragg's R. 33. The Duke of Wellington's R. 42. From independent companies formed in the reign of William and Mary and amalgamated in 1729 as the Royal Highlanders. It reverted to the old title in 1751. 45. The Nottinghamshire and Derbyshire R. 60. As the Royal Americans had four battalions, of which the second after the revolution became the 60th Rifles of Canada and the 3rd became the 63rd R. of Nova Scotia. The first battalion was transferred to the United Kingdom estab. and also formed three new battalions which continued to exist until 1922. 62. Originally 2nd Lancaster R. 65. 2nd Suffolk until 1758. 68. 2nd Royal Welch Fusiliers until 1758. 69. 2nd South Wales Borderers until 1757. 71. City of Glasgow R. 72. Raised in 1756 as Fraser's Highlanders. 73. Until 1786 this number was borne by the 1st Highland Light Infantry (71). 78. Raised in 1757 as 2nd Highlanders. 79. Raised in 1757 as Drake's Highlanders. 83. Became Royal Ulster Rifles in 1922. 87. Princess Victoria's; became Royal Ulster Fusiliers in 1922. 88. Disbanded in 1922.

91. Formerly Argyll Foot. 93. Formerly Sutherland Foot. 94. Disbanded in 1922. 95. Two battalions of this R. were raised in 1800 and 1805. In 1816 they adopted the title Rifle Brigade and ceased to use the number, and a new 95th R. was formed which became the 2nd Sherwood Foresters. The 3rd and 4th regular battalions of the Rifle Brigade were disbanded in 1922. 100. Originally raised in Canada as the Prince of Wales's Royal Canadians; disbanded in 1922.

101–109. Transferred from East India Company's service. 101. Ex-Royal Bengal Fusiliers, raised in 1759. 102. Ex-Royal Madras Fusiliers, raised in 1746; later called Madras European R. 103. Ex-Bengal Fusiliers, raised in 1661 as the Bombay R., and later called Royal Bombay Fusiliers. 104. Raised in 1839 as 2nd Bengal European R. 105. Raised in 1839 as the 2nd Madras European Light Infantry. It became the Madras Light Infantry and transferred to the United Kingdom in 1861. 106. Ex-Bombay Light Infantry, raised in 1839 as 2nd Bombay European Light Infantry. 107. Raised in 1854 as 3rd Bengal European R. 108. Ex-3rd Madras Europeans, raised in 1854. 109. 3rd Bombay Europeans, raised in 1882.

Expansion of Infantry, 1642–1922.—The preceding list gives an impression of the expansion of regular land forces of the Brit. Crown since the Civil war. Apart from two Rs. of foot guards, Charles I. had only the Royal Scots when the Great Rebellion broke out. At the Restoration some veterans of the New Model Army enlisted in new Rs. under Charles II., who sent most of them abroad in the service either of the king of France or the states-general. A much greater expansion occurred under James II., who ruled ten Rs. of foot, mostly to put down Monmouth's rising. Despite the territorial titles these Rs. now bear their original rank and file were predominantly Irish Catholics. The next large group was that raised by William III. for the war in Ireland against James II. and the War of the League of Augsburg in the Low Countries, bringing the total of line Rs. to twenty-nine. The eleven Rs. next in seniority were raised at the instance of Marlborough for the wars of Queen Anne's reign.

George I. did little to increase the infantry estab. (but see *Cavalry*, p. 88). The War of the Austrian Succession and 'the 45' required, however, the creation of nine new Rs., while seventeen were raised for the long and wearing campaigns of the Seven Years war in N. America and India. Three years after this recruiting for Highland Rs. other than the Black Watch began. Eighteen new Rs. were formed during the wars of the Fr. Revolution and Empire, but this does not fully represent the expansion that took place at this time, for many second battalions were formed and later disbanded, besides regiments which no longer exist. But certain rifle and light infantry Rs. were expanded to four battalions and retained this strength until

	<i>Horse</i>	<i>Dragoon Guards</i>	<i>Dragoons</i>
1 1661	Tangler	-----	1 1693 Royals
2 1678	-----	1 1746 King's	2 1691 Scots Greys
3 1685	-----	2 1746 Queen's Bays	3 1685 King's Own-----
4 1685	-----	3 1746 Prince of Wales's (3/6)*	4 1685 Queen's Own-----
5 1685	-----	4 1788 (1/7)	5 1685 Disbanded 1799
6 1685	-----	5 1788 Inniskilling (5/6 Dragoon Guards)	6 1689 Inniskilling (5/6 Dragoon Guards)
7 1685	-----	6 1691 Carabiniers (3/6)	7 1690 Queen's Own-----
8 1688	-----	7 1788 (4/7)	8 1693 -----

* 3rd Carabiniers since 1920.

During the long peace following Waterloo the total remained at rather less than 100. Only the third battalion of the Rifle Brigade was raised for the Crimea, and the fourth of the same R. for the Indian Mutiny, which led to the last major addition to the list of infantry regiments. Besides native troops, the East India Company had maintained its own Brit. Rs. since the reign of Charles II. By 1857 there were nine of them, three for each presidency, and Palmerston's Act for the Better Government of India of 1858 transferred them to the service of the Crown but under their old E. India titles. In 1861 they were finally incorporated in the line and given serial numbers. Twenty years later occurred the reform of 1881, whereby the old system of numbers came to an end and local titles were found for both regular battalions of Rs. which sometimes had had little previous connection with the place of their 'adoption.' It was considered that the traditions of the most venerable Rts. (down to the 25th Foot) were strong enough to be shared between two battalions.

CAVALRY.—The table appearing above shows the evolution of Brit. cavalry Rs. The numbers in brackets show the amalgamations of cavalry Rs. brought about in 1922. Small numbers show the date of first raising and the date of conversion. The apparently chaotic numbering of cavalry Rs. at the present day arises from successive conversions, and comparatively few Rs. have disappeared without trace. At the time of the Civil war there were two kinds of mounted troops: dragoons, who were organised as infantry and armed with large-bore pistols, and horse, or cavalry proper. Charles II. raised two Rs. of horse, the 1st, or Tangier Horse, and the 2nd, and some troops of dragoons which became the Scots Greys. James II. inherited these and raised six more Rs. of horse and three Rs. of dragoons, mostly to suppress Monmouth's rebellion. William III. converted the Tangier Horse into dragoons and designated them '1st' because they had been the senior mounted R. He also raised three more Rs. of

dragoons. He named the old 7th Horse the Carabiniers and his own 6th Dragoons the Inniskilling R. Later all the remaining horse Rs. were renamed Dragoon Guards. In 1715 the 3rd, 4th, 7th, and 8th Dragoons were made light dragoons, and six new light dragoon Rs. were raised. Between then and 1781 nine light dragoon Rs. were raised, because the old dragoons had proved unsuited to the important cavalry role of reconnaissance and pursuit. By 1799 there remained only ten Rs. of 'heavy cavalry'—seven Rs. of dragoon guards and the 1st, 2nd, and 6th Dragoons. From 1806 onwards, following the Napoleonic example, the light cavalry was divided into hussars and lancers in the proportion of about three to two. In 1861 some European horse Rs. of the disbanded East India Company's army were transferred to the Crown establishment as hussars (cf. table of infantry line Rts., 101-109).

See ARMY, Organisation; DRAGOONS; GUARDS, DRAGON; GUARDS (HOUSEHOLD TROOPS); HOUSEHOLD CAVALRY; HUSSARS; LANCERS; SCOTTISH REGIMENTS; and separate articles on individual Rs. See also YEOMANRY.

Regimental Marches. In the Brit. army it is a long-standing custom of regiments to adopt, by authority, a marching tune, to which the regiment marches past at reviews, and concludes a band performance with a quick-step. In many cases the R. M. are old tunes associated with the co. from which the regiment takes its name, such as *The Lincolnshire Poacher*, of the Lincolnshire Regiment, or *D'ye*

ken John Peel, of the Border Regiment. Other marching tunes commemorate famous commanders of the past: the Royal Scots, for example, still march past to the old Scottish air *Dumbarton's Drums*, recalling the fact that the regiment was enrolled in 1678 as Dumbarton's Regiment; while the duke of Wellington's (W. Riding Regiment) marches to the tune of *The Wellesley*, commemorating the fact that they were led by Col. Wellesley (later the duke of Wellington) against Tippoo Sahib. One of the most famous of all marching tunes is *Ca Ira*, the Fr. revolutionary air (see CA 18A). The W. Yorkshire Regiment adopted their quickstep from this air at the time of the siege of Famars, in which they took part. Again, the Rifle Brigade's tune, *I'm Ninety-five*, commemorates the fact that before they were taken out of the line to be converted into riflemen they were

designated the 95th Foot. There is thus much army hist. in marchin' tunes, and the different regiments are naturally proud of the distinctive incidents with which they are associated. Among other R. Ms. are *The Young May Moon is beaming* (Notts and Derby Regiment); *Hielan' Laddie* (Black Watch and the Scots Guards), a very famous tune; *We'll gang nae mair to yon Toon* (Hampshire Regiment—which regiment has also a second march, called the *Hampshire*); *Altho' Highlanders and Buthin a Mile of Edinburgh Town* (both of the Cameronians); *Kynead Slashers and Highland Pipers* (both the Gloucestershire Regiment); *Windsor* (Worcestershire Regiment); *Lancashire Lads* (E. Lancashire Regiment); *Southerly Wind and a Cloudy Sky and Lass of Gowrie* (both of the E. Surrey Regiment); *One and All* (Duke of Cornwall's Light Infantry); *Men*

of *Harlech* (S. Wales Borderers); *Blue Bonnets over the Border* (King's Own Scottish Borderers), the words of which were written by Sir Walter Scott, the song itself being founded on *General Leslie's March to Longmarston Moor*; *We've Lived and Loved Together* (Devonshire Regiment); *Speed the Plough* (Suffolk Regiment); *Prince Albert's March* (Somerset Light Infantry, the full name of which regiment is Prince Albert's Somerset Light Infantry); *The Yorkshire Lass* (E. Yorkshire Regiment); *Mountain Rose and Mandolera* (both of the Bedfordshire Regiment); *Romaika* (Leicestershire Regiment). It is curious that while the Scots and Irish regiments adhere to their own national

Gaul, which properly belongs to the Royal Scots, while *The Duke of York's March* is played by sev. cavalry regiments; and since the amalgamation of cavalry regiments soon after the First World War, there has been a blending of the R. Ms. The R.A.F. march past was composed by Sir Henry Walford Davies. The marches are played mostly on special occasions, chiefly ceremonial, but some regiments play them on the dismissal of a parade, and the particular air is followed immediately by the National Anthem. See F. J. H. Darton, *Marches of Wessex*, 1922.

melodies, the Eng. regiments draw freely upon Scottish compositions for their R. Ms., e.g. (in addition to instances given above) the tune of the Royal Lancaster Regiment is *Corn Rips are Bonnie*; that of the Cheshire Regiment is *Wha wouldna' fecht for Charlie?*; that of the Royal W. Kent Regiment is *A Hundred Pipers*, and that of the Durham Light Infantry is *Whistle o'er the Lave o't*. The Durham Light Infantry and the Royal Ulster Rifles both march past to the same air; but whereas the Durham Light Infantry calls it *The Light Barque*, the Royal Ulster Regiment knows it as *Off, Off, said the Stranger*. *Lillibullero*, the Whig political ballad which originated in the army under James II. (perhaps in the 8th Liverpool Regiment), was revived during the Second World War, and adopted by commando units as a regimental march. Some tunes are common to a number of regiments: *The 'British Grenadiers* is played by all Fusilier regiments as well as by the Grenadier Guards. The cavalry regiments have, as a rule, rather stately compositions of their own. The Scots Greys, however, adopted *The Garb of Auld*

Early in 1883 it was declared the seat of government of the N.W. Tera., in place of Battleford, and so remained until 1905, when the ters were divided. In 1903 R. became a city and in 1905 the cap. of Saskatchewan. It is the headquarters of the famous Royal Canadian Mounted Police. R. has been called 'Queen City of the Plains.' A singularly handsome centre, with many striking buildings, e.g. those of the Prov. Legislature and the Dom. Gov., it stands surrounded by a vast plain of grain fields, with a climate of abundant sunshine, and has scenic beauty and natural charm. Yet R. offers all modern urb. amenities. It is a popular centre for conventions of national and international organisations of many kinds. A manufacturing tn., it has over a hundred production plants of almost every kind of industry, from artificial limbs to cars, jewellery, paints, varnishes, wagons, windows. It is an aviation centre served daily by the Trans-Pacific Airlines and Canadian Pacific Airlines main lines. There are more than 3000 ac. of parks and boulevards. There are five colleges, a normal school for teachers, six commercial

schools, a technical school, and twenty-four elementary schools. R. Symphony Orchestra and Saskatchewan Musical Festival draw music lovers to the cap. In July-Aug. the Prov. Exhibition (agric. and industrial) is the largest event of its kind in Canada next to Toronto National Exhibition. The sheep and swine show is in Nov., and the horse and cattle shows at the 'winter fair.' The pop. has increased since 1926 by 25,700. Pop. (1948) 64,100.

Regiomontanus (1436-76), Ger. astronomer, whose real name was Johann Müller, b. at Königsberg in Franconia. He studied at Vienna, where he met Purbach, and in 1461 accompanied Cardinal Bessarion to Italy. He left Rome in 1468, spending the next three years at the court of the king of Hungary, and afterwards settled at Nuremberg, where he pub. his *Tabulae Directionum* (1475). Bernhard Walther, a wealthy citizen, furnished him with means to start a book-printing business and to construct astronomical instruments, wherewith they demonstrated the inaccuracy of the Alphonsine Tables (*q.v.*).

Regional Commissioners. The Brit. Gov. in Feb. 1939, through the lord privy seal, announced its intention of designating twelve R. C., w^o in the event of war should assume supreme control in their respective regions for such time as communications with the central gov. might be interrupted. The names of the R. C. were announced soon afterwards; they were all lord-lieutenants or men of similar standing. The R. C. were provided with deputy commissioners and with a staff consisting of A.R.P. regional officers and representatives of all gov. depts. concerned with civil defence. Before assuming their responsibilities in Sept. 1939 they were supplied with full details of the war plans of all the depts. concerned with civil defence and kept in touch with their war staff.

Regionalism, term denoting local individualism in politics; also used in literary criticism to describe a type of fiction in which the scene is set in a particular locality, and a realistic presentation of the life and work of the area is given. In Eng. literature the regional novel developed rapidly in the nineteenth century. The Brontës laid the scene of their novels in Yorkshire and George Elliot in the E. Midlands. Other examples of R. are the 'Barnesshire' novels of Trollope, and the 'Wessex' novels of Hardy. The works of Mary Webb, Sheila Kaye-Smith, Eden Phillpotts, J. B. Priestley, etc., are often examples of literary R.

Regional Planning, method of planning in advance of development large areas of land, usually under the authority of regional committees estab. by local authorities. The object is to prepare outline plans for such public services as roads and drainage, and to indicate areas for open spaces, rural preservation, industrial and residential development, etc., to which the tn. plans adopted by individual local authorities may conform. Many such committees were set up in

England after 1920, and a number of reports were issued by them. The whole subject was subsequently examined in its various aspects by the Scott and Barlow Committees, and both before and since the setting up of these committees, there was legislation on the subject of tn. and country planning. At first the central departmental authority was the Tn. and Country Planning Advisory Committee which was appointed as a dept. of the Ministry of Health, but subsequently a separate Ministry of Tn. and Country Planning was created. *See further under TOWN AND COUNTRY PLANNING.*

Registered Stock, or Inscribed Stock. Stock is said to be inscribed or registered when the name of the stockholder is inscribed in the stock register of the state or corporation issuing it. The holder is entitled to an imaginary sum, usually £100 or multiples thereof, and the right to receive a fixed rate of interest in perpetuity. The registration is evidenced by a certificate which also gives him the right to obtain payments of interest. In contradistinction to R. S. is that stock which is issued in the form of bearer bonds with dividend coupons attached.

Register of Voice, see VOICE AND VOICE TRAINING.

Registers, Parish. Registers of a kind appear to have been kept by all civilised peoples in every age. In the Rom. provs. officials were appointed as public registrars to keep records of names for the settlement of disputes, proof of freedom, and certification of births and deaths. In France it appears that registers were kept with surprising regularity from about 1308. P. R. were not regularly kept in England before 1538. From that date, however, until 1837, they form an almost complete record of the manners, customs, and events of three centuries of Eng. social hist. They have often afforded the chief evidence of titles to peerage and property, and are an invaluable source of material for all manner of historical, and genealogical research. Although public attention has frequently been called to the importance of securing the safety of P. R., Parliament has never taken effective steps to ensure that this was done. It is on record that some have been sold as waste paper or made into book covers; some at Whimpole, Cambridgeshire, were destroyed by parliamentary troops; and those at Otterinton 'were devoted to the utilitarian employment of singeing a goose.' P. R. belong in law to the parochial clergy. They are usually kept in the par. churches. Since 1837, when the records of the registrar general begin, P. R. have become bare records of baptisms, marriages, and deaths, and have thus lost their character and interest. *See also REGISTRATION OF BIRTHS, MARRIAGES, AND DEATHS. See J. C. Cox, Parish Registers of England, 1910; and T. P. Taswell-Langmead, Preservation of Parish Registers.*

Registrar: Bankruptcy.—The Rs. in bankruptcy of the high court and co. courts are the officials who hear bankruptcy petitions, make receiving orders,

hold public examination of debtors, approve compositions or schemes of arrangement, and grant orders of discharge to bankrupts.

Probate.—The R. of a dist. registry grants probate (*q.v.*) of wills or letters of administration in cases where the deceased appears at the time of his death to have had a fixed place of abode within the dist. in which application for probate is made; but in opposed applications he may only grant probate when the contention is terminated by decree or otherwise. The R. of the Principal Probate Registry (Somerset House) is an official invested with all the authority of a judge in chambers in matters of probate and divorce, except in proceedings touching the liberty of the subject, service of writs out of jurisdiction, injunctions, appeals from dist. registrars, taxation of costs, and other minor matters. The duties of a co. court R. comprise the filling up of the usual papers required by the probate court to lead to a grant of letters of administration, and transmission of the same to the R. of the probate court.

Privy Council.—To the R. of the Privy Council have been assigned by order in council, 1904, all the duties of the old R. in eccles. and Admiralty causes. He has power to examine witnesses on oath in all actions pending before the Judicial Committee of the Privy Council, and to do the chamber work of that committee, such as issuing the committee's orders and calling on parties to enter an appearance.

Friendly Societies.—As to the R. of friendly societies, see under FRIENDLY SOCIETIES.

Consistory Court.—The R. of this court, who is appointed by the bishop of the diocese, prepares faculties, sends to the registrar-general of births, deaths, and marriages a list of all the Church of England chapels of his diocese within which a marriage may be celebrated, and has duties to perform in connection with the issue of marriage licences. See also ECCLESIASTICAL COURTS.

Joint-stock Companies.—The R. of joint-stock companies registers companies formed under the Companies (Consolidation) Act, 1908. He is an officer of the Board of Trade.

County Courts.—The R. of a co. court, who must be a solicitor of five years' standing, usually hears all cases in which the amount involved is not over £2. He issues summonses, warrants, precepts, and writs of execution; registers all orders and judgments of the co. court of which he is the R., and keeps an account of all court fees and fines. He generally performs the duties of a R. in bankruptcy, and in addition performs numerous duties in interlocutory proceedings before the co. court. He must reside within the dist. of his court.

High Court Registrars.—The duties of the Rs. of the chancery court are to take notes on the judgments and orders of the judges in that court, and the court of appeal in the case of chancery appeals, to make up lists of the causes for trial before the chancery judges and assist the

judges generally during the hearing of cases.

Solicitors' Registrar.—The official whose duty it is to issue certificates empowering solicitors to practise.

Registrar-General, central authority for the registration of births, marriages, and deaths and for the taking of the periodical census. The first R.-G. was appointed in 1836. Besides taking the census and preparing the census returns, he undertakes the verification of claims by applicants for old age, widows, etc., and war pensions. See next article.

Registration of Births, Marriages, and Deaths. The registration of births, marriages, and deaths is believed to have been inaugurated about 1528; but the statutes concerning registration are of a comparatively modern date. General registration was introduced by the Registration Act of 1837, extended to Scotland in 1855, and to Ireland in 1864. Other Acts were passed in 1837, 1856, and 1858. These Acts were consolidated in the Act of 1874, but other statutes have been passed since then. The work of the registrar-general was enormously increased by the consolidating Act of 1874, which made registration compulsory, and also by the Births and Deaths Registration Act, 1926, the Legitimacy Act, 1926, and the Adoption of Children Act, 1926. This legislation created a general registry office, situated at Somerset House, Strand, London, W.C., at the head of which is an official known as the registrar-general of births, marriages, and deaths. The whole kingdom is divided for purposes of registration into dists. controlled by superintendent registrars, each dist. being further subdivided into smaller dists. under local registrars. The object of the Registration Acts is primarily to furnish official proof of a birth, marriage, or death, but the utility of systematic registration is manifest in a number of different ways. The science of eugenics and the laws of public health alike derive much useful material from the returns of the registrar-general, while the severe penalties against wilful neglect to register births and deaths probably operate to some extent to diminish the evil of infanticide (*q.v.*). Prior to these Acts births were customarily proved by certificates of baptism, or, if none, by entries in family Bibles, while marriages were proved by certificates or by similar entries, and deaths by nothing more trustworthy than inscriptions on tombs. The dates of births prior to July 1837 can be ascertained from the registrar-general in cases where they have been recorded in church registers deposited since 1837 in the General Registry Office; if not so deposited reference must still be made to the church or chapel of the locality where the birth is believed to have been recorded. Similarly a certificate of a marriage solemnised before July 1837 is to be obtained either from the registrar-general or from the particular church where it was celebrated. Where the record of a particular birth, death, or marriage cannot be traced, a search should always be

made in the books kept by the superintendent-registrar where the event is believed to have taken place, especially in the case of a recent event, because the local officials may not have had time to transmit their records to Somerset House. Births must be registered within six weeks, including, of course, those of illegitimate children. The obligation to register the birth of a legitimate child is on the parents, or, in default, any one in charge of it. The putative father of an illegitimate child is not bound to register its birth, the obligation being on the mother, and the putative father's name can only appear on the register by joint consent of himself and the mother. A new form of birth certificate became available from 1947, showing only name, sex, date, and place of birth, but excluding details of parentage or adoption. A birth cannot, except by the written authority of the registrar-general, be registered after the lapse of twelve months from the event.

By the Notification of Births Act, 1907, the local authority, in various places where the Act has been adopted, must also be notified of a birth. It is to be noted that the notification to the medical officer of health under the Act of 1907 is in addition to the registration under the Registration Acts. It must be given in writing, subject to a penalty of 20s. for default, within thirty-six hours after the event. The birth of seven-months' children must be registered under this Act whether they be still-born or not. Deaths must be registered within five days of the event. The mode of registration is for the nearest relative of the deceased present at the death, or, if none, any other relative or inmate of the house in which the death took place, to send to the registrar a written notice of the death, accompanied by a medical certificate as to the cause of death. But, as in the case of a birth, a death may not, without consent, be registered after the expiry of twelve months. If an inquest is held it is for the coroner to send up to the registrar the necessary information for registration. The registrar delivers to the person registering a death a certificate, which document is the authorisation to any person to bury the body and perform the funeral service. Still-born children can be buried in any burial-ground only after the person controlling the ground has been supplied with certain particulars. Marriages are registered by the officials solemnising them with the registrar-general at Somerset House (or in Scotland the registrar-general's office, Edinburgh), where the register may be inspected on payment of 1s. fee (*see also* MARRIAGE; FEES). By the Local Gov. Act, 1929, the functions of boards of guardians under the various registration Acts are transferred to co. councils or co. bors. Registrars (paid by fees) have now been largely replaced by salaried officials appointed by councils. *See also* CENSUS; VITAL STATISTICS. *See* R. R. Kuczynski, *Measurement of Population Growth*, 1935, and H.M.S.O. (Ann. Report), *Registration of Births, Deaths, and Marriages*.

Registration of Deeds, or Enrolment, is necessary in certain cases and for certain purposes, e.g. in register cos. (*see* REGISTRATION OF TITLES); in the case of gifts to charities (*see* MORTMAIN and CHARITIES); barring all entail (*see* ENTAIL and ESTATE); bargain and sale of freeholds (i.e. under the Statute of Enrolments of 1535, which was aimed at secret conveyances); a mode of conveyance which was superseded by a simple release in 1841, which mode was in its turn replaced by a mere deed of grant (*see* GRANT); and in the case of certain rent-charges. A rent-charge created otherwise than by will or marriage-settlement must, since the passing of the Judgments Act, 1855, be registered; by that Act the registration was effected in the Central Office; but by the Land Charges Act, 1900, the registration must be in the Land Registry. Unless registered a rent-charge cannot prevail against subsequent purchasers or creditors without notice (*see* NOTICE, EQUITABLE AND JUDICIAL), though it will prevail against the trustee in bankruptcy of the owner of the rent-charge. *See also* LAND LAWS.

Registration of Title. The official Land Registry was estab., as the result of a recommendation of a royal commission, by an Act passed in 1862. The purpose of the Act was to simplify and lessen the cost of dealings in land by establishing a state register of landowners who voluntarily submitted the titles to their land for examination and approval by the registrar on behalf of the state. The registry was reformed by the Land Transfer Act, 1875, which, however, continued the voluntary basis of the system. The Land Transfer Act of 1897 introduced the principle of compulsory registration, and various orders in council under that Act between 1895 and 1902 made the system compulsory on sale in the administrative co. of London. By further orders of more recent years registration has been made compulsory in certain prov. tns., and in 1936 in the administrative co. of Middlesex. The Land Registration Act, 1925, consolidated the previous Acts, incorporating such changes as experience had shown to be necessary. The system shows that the machinery for the purchases and sale of land is assimilated to that for stocks and shares. Simple forms, analogous to those used on transfers of stocks and shares, are provided. The cost of buying, selling, or mortgaging registered land is much less than the cost in the case of unregistered land. It is open to any co. council or council of a co. bor. to apply to the Privy Council for an order making registration of title compulsory in its area.

Titles may be officially examined and registered as (1) absolute, (2) qualified, and (3) possessory. An absolute title is one that cannot be disputed, it being good against all the world, except register, encumbrancers and beneficiaries with trustees. An absolute title, granted by the Land Registry, is guaranteed by the state. A qualified title is one that is subject to other estates or interest actually

specified in the register. A possessory or 'holding' title is subject to all adverse or derogatory estates (if any), but it can be converted into an absolute title at any time if the registrar thinks fit. To so convert a possessory title, the registrar must investigate the title, and advertise for possible objectors to lodge their objections within two months. A possessory title six years old is comparatively easy of conversion into an absolute title. The 'register' at the Land Registry consists of three divs.: (1) the property register, in which are registered particulars and situation of land, and rights, etc., appertaining thereto; (2) proprietorship register, which specifies the nature of the title; and (3) the charges register, which states the encumbrances on registered lands. A registered proprietor may convey in the usual way (see CONVEYANCE; CONVEYANCING), or may make use of a short form prescribed by the Land Transfer Rules, the transfer being entered on the register, and a document called a land-certificate being delivered to the purchaser or transferee, and, on part-sale, to the transferor or vendor also. Apart from conveyances of freehold, which must, in a compulsory area, always be registered, all assignments of leaseholds for an unexpired residue of not less than forty years must be registered, as also all leases and under-leases granted for a like period. The fees payable for registration vary from 6d., where the value of the consideration for the sale does not exceed £5, to £1 13s., where the value exceeds £275 but does not exceed £300, an additional 5s. being payable for each £60 over £300. The Land Registry is in Lincoln's Inn Fields, London, W.C.

Registration of Voters, see under ELECTIONS.

Regium Donum, sum of £1200 per annum granted by William III. to the Presbyterian Church of Ireland in consideration of the active aid given him against James II. It was finally abolished in 1871, compensation being granted to those ministers who had a claim on the fund.

Regius Professor, holder of a univ. professorship founded by a king. In 1546 Henry VIII. founded chairs of Heb., Gk., divinity, medicine, and civil law at Oxford, and chairs of Gk., Heb., divinity, hist., civil law, and physics at Cambridge. The chair of modern hist. at Oxford was founded by George I. in 1724.

Regnal Year, Brit. method of dating Acts of Parliament. A sovereign's R. Y. begins on the anniversary of his accession, e.g. R. Y. 1. of King George VI. commenced on Dec. 12, 1936. Acts passed in a calendar year containing more than one R. Y. are dated by all, e.g. legislation of 1910 is dated 10 Edward VII. and 1 George V. See also under ACT (ACT OF PARLIAMENT).

Regnard, Jean François (1655-1709), Fr. dramatist, b. in Paris. In 1678, while on his way from Italy to France, he was captured by corsairs and kept as a slave in Algiers, an experience which he describes in his novel, *La Provençale* (1731). Later he travelled very widely, and it was

not until 1696 that he produced his first great comedy, *Le Joueur*, at the Théâtre Français, followed by *Le Distrait* (1697); *Démocrite* (1700); *Les Folies amoureuses* (1704); *Les Ménechmes* (1705); and his masterpiece, *Le Légataire universel* (1708), which gave him rank as second only to Molière, though his work lacked the depth which made Molière's so outstanding. An ed. of his works was pub. in 6 vols., 1819-1820. See F. Gaffio, *Le Drame en France au XVIII^{ème} siècle*, 1910.

Regnault, Henri (1843-71), Fr. painter, b. in Paris. He travelled in Italy, Spain, Morocco, and painted, besides portraits, scenes from oriental life, subjects inspired by episodes in Fr. hist., particularly of a martial character. See lives by H. Cuzalis, 1872, and R. Marx, 1886.

Regnault, Henri Victor (1810-78), Fr. chemist and physicist, b. at Aix-la-Chapelle. He studied chem. under Liebig, became a prof. at Lyons, and in 1841 prof. of physics at the Collège de France. His discoveries in organic chem. won him election to the Academy of Sciences, and he became director of the imperial porcelain manufactory of Sèvres. It is famed for his researches in connection with specific heat and expansion of gases. He wrote largely on chemical and physical subjects, chiefly for scientific periodicals. See A. Dumas, *Éloge historique de Henri Victor Regnault*, 1881.

Régnier, Henri François Joseph de (1864-1936), Fr. poet and novelist, b. at Honfleur (Calvados). He studied law in Paris. In the eighties R. appeared as a symbolist poet, beginning with *Les Lendemains* (1885). Other vols. were *Les Médailles d'argiles* (1900) and *Vestigia flammæ* (1921). His novels include *La Canne de Jaspe* (1895); *La Double Matresse* (1900); *Les Vacances d'un jeune homme sage* (1903); *La Peur de l'amour* (1907); *L'Amphibène* (1912); *L'illusion héroïque de Tito Russi* (1916); *La Pécheresse* (1920); *L'Escapade* (1926); and *L'Allana ou la vie renitienne* (1929). His collected works were pub. 1921-31. See study by R. Honnert, 1923.

Regnier, Mathurin (1573-1613), Fr. poet, b. at Chartres. He took holy orders, and eventually was made a canon of Chartres Cathedral. His works (1608-1612), which are chiefly satires, are characterised by the absence of personal reference, and by their easy style. They have been collected and ed. by E. Courbet (1875) and J. Plattard (1930). See study by J. Vianey, 1896.

Regnitz, riv. of Bavaria, Germany, which joins the Main at Bamberg. The Zenn, Aisch, Aurach, and Grudlach are among its tribs. Length 130 m. The lower course is navigable.

Regrating, old common law offence in England, consisting of buying 'corn and other victuals' and scheming to raise the price artificially. 'Forestalling' (q.v.) and 'engrossing' (q.v.) are very similar in nature. The old penalties were abolished in 1844 (7 and 8 Vict. c. 24).

Regular Canons, see CANON.

Regulation, form of delegated, subsidiary or secondary legislation, which

may be exercised by gov. depts. directly under the authority of a statute, or indirectly under like authority. There is little, if any, substantial difference between rules and Rs., special orders, and orders. There is a vague departmental understanding that rules and Rs. are intended to be of general application throughout the kingdom, whereas orders (prerogative orders and statutory orders) are of limited application to specific places, persons, or classes of persons, e.g. Housing Orders or Tn. Planning Orders. The distinction, however, is not uniform. Thus, under the Poor Law Acts and some of the earlier Housing Acts, the dept. concerned made 'orders' of universal application, and under the Public Health Act, 1875, power was given to make regulations regarding infectious diseases, but orders with regard to the qualifications and duties of medical officers of health. The inconvenience in practice is one of form rather than of substance. Both, however, are challengeable in the courts, though whether for a specified period or at all times is not clear. Both the Defence of the Realm Act, 1914, and the Emergency Powers Act, 1939, endowed the executive with the necessary authority to issue Rs. for the purpose, or better realisation of the purpose, of ordering the detention of dangerous persons in wartime. In the course of both world wars the action of the executive was unsuccessfully called in question before the House of Lords, in 1917 in the case of *Zadig*, and in 1941 in the case of *Liversidge v. Anderson*. See H. G. Hanbury, *English Courts of Law*, 1944, and C. K. Allen, *Law and Orders*, 1945.

Regulus, Marcus Atilius (d. c. 250 B.C.), Rom. consul 267 B.C. In 256 he was consul a second time with Lucius Manlius Vulso Longus. The two consuls defeated the Carthaginian fleet, and afterwards landed in Africa with a large force. They first met with great and striking success, but in 255 R. was defeated and taken prisoner. Five years later the Carthaginians sent an embassy to Rome to solicit peace. They allowed R. to accompany the ambas. on the promise that he would return to Carthage if their proposals were declined. He dissuaded the senate from assenting to a peace, and returning to Carthage he was put to death with torture.

Regulus, see GOLDEN-CRESTED WREN.

Regulus (metallurgical product), see under MATTE.

Regulus (star), see under LEO.

Rehoboam (Heb. *Rehobo* 'am, 1 Kings xiv. 21, 'the people is enlarged'), son and successor of Solomon (q.v.). His mother was Na'amah, an Ammonite princess. R. ascended the throne c. 930 B.C. at the age of forty-one, and reigned seventeen years. He was received as king by the whole nation, but his title, though recognised in the cap., Jerusalem, seemed insecure without the formal adhesion of the other tribes. An assembly was summoned at Shechem, the most revered site among the N. tribes, but instead of adopting the wise and conciliatory language

recommended by the older counsellors of Solomon, in order to placate the discontent which had been excited by the burdens (high taxation and forced labour) imposed during his father's reign, R. followed the advice of the young and violent. The N. tribes probably had resolved to break away whatever happened. They had already recalled Jerobo 'am to act as their leader (Jerobo 'am had rebelled against Solomon, but when summoned to Jerusalem, probably in order to be arrested and sentenced to death, he fled to Egypt, where he found asylum at the court of Sheshonk I., or Shishak). Jerobo 'am certainly would not have renounced his claims to the kingdom even if the demands had been accepted. However, R.'s most insolent and tyrannical reply to the representations of the N. tribes hastened the div. of the kingdom. The N. tribes drew off in resentment, stoned the officer, Adoram (Adonoram), who was sent to make terms with the ten tribes, and made Jerobo 'am their king. Thus the national union was dissolved; only the tribes of Judah and Benjamin remained loyal to the dynasty of David. Continual wars prevailed between the two petty kingdoms. This strife provided an opportunity for Shishak to invade Palestine in R.'s fifth year (1 Kings xvi. 25). He took Jerusalem and removed from the temple and the palace their golden treasures. This campaign was memorialised in an Egyptian inscribed relief on a wall at Karnak: the god Amon leads forward by cords rows of 156 Heb. captives, each of whom symbolises a different Palestinian tn. which Sheshonk I. claims to have taken. R. seems to have been an altogether strong character. He fortified the road from Jerusalem through Hebron to Gaza, and built or restored many fortresses (2 Chron. xi. 5-12). He was succeeded by his son Abijah or Abijam.

Rehoboth, dist. and tn. in the protectorate of S.W. Africa. The pop. of the dist., called the Bastards, are half-caste Hottentot-Europeans. Since 1924 the dist. has been governed by the Bastard Administration; previously it had native government. Cattle-breeding is carried on and gold is mined. Pop. (dist.) 5000.

Reichenau: 1. Vil. of Saxony, Germany, 7 m. E. of Zittau. Pop. 7100. 2. Vil. of Lower Austria, 46 m. N.N.E. of Graz, much frequented as a summer resort. Pop. 1700. 3. Is. on Lake Constance. Since 1803 it has been a part of Germany. R. contains three small vils., Oberzell, Mittelzell, and Unterzell. Its steep, rugged coastline made it an easy position to defend, and it became a Benedictine monastic settlement in Carolingian times. With Fulda and St. Gall, it was one of the most important centres of Ger. culture in the early Middle Ages. The minster of St. Mary and Mark, in Mittelzell, founded in 813, contains much tenth- and eleventh-century work, while the series of frescoes in St. George's Church, in Oberzell, which belong to the same period, are among the finest in Europe. The monks of R. were famous for their illuminated MSS., which

derived some of their inspiration from St. Gall but show, like the rest of R.'s art, distinctive traces of Byzantine influence. Pop. 2600. *See* K. Gröber, *Reichenauer Kunst*, 1922; W. Gernsheim, *Die Buchmalerei der Reichenau*, 1936; and K. Beyerle, *Bischof Perminius und die Gründung der Abtei Murbach und Reichenau*, 1947.

Reichenbach, Karl, Baron von (1788-1869), Ger. scientist, b. at Stuttgart. The first iron foundries and charcoal furnaces in Bavaria were estab. by R., who discovered paraffin in 1830 and creosote two years later. He also studied animal magnetism.

Reichenbach: 1. Tn. of Saxony, Germany, 11 m. S.W. of Zwickau. Its chief industries are the spinning of wool and dyeing; it has also machine works and factories for woollen goods. Pop. 32,000. 2. Tn. in Poland, since 1945 known as Dzierżonów. It was formerly in the Prussian prov. of Silesia. R. is 31 m. S.W. of Wrocław (Breslau). Its chief manufs. are carriages, textile goods, and beer. Pop. 16,500. 3. Riv. in the canton of Bern, Switzerland, having its source in the Great Scheldegg. Its confluence with the Aar is opposite Meringen. Its course is interrupted by waterfalls, in some cases hundreds of feet in descent.

Reichenberg (Czech *Liberice*), tn. of Bohemia, Czechoslovakia, 87 m. N.E. of Prague. Its chief buildings are an industrial museum and the palace of Count Clam-Gallas. Its chief manuf. is that of cloth. Pop. 52,700.

Reichenhall, tn. of Bavaria, Germany, 8 m. S.W. of Salzburg. It is picturesquely situated, and is much visited on account of its saline springs. The chief export is salt. Pop. 14,500.

Reichsbank, *see* BANKS AND BANKING, Germany.

Reichsrat, from 1919 to 1945 Ger. federal chamber, representing the states. It replaced Bismarck's *Bundesrat*, but held less power, its functions being largely advisory. The word has also been used, at different times, of various constitutional bodies in Denmark, Sweden, tsarist Russia, the Austrian Empire, and Bavaria.

Reichstadt, Napoleon Francis Joseph, *see* NAPOLEON II.

Reichstag (Ger. 'Day of the Empire'), former name for the Ger. legislature, derived from informal, intermittent meetings of nobles and estates, called for a specific day, first by Frankish rulers and then by Ger. emperors. In 1867 the R. was re-estab. as an elected parliament for the N. Ger. Confederation, and in 1871 for the Ger. Empire. It exercised legislative power with the Bundesrat (q.v.), under the emperor's prerogatives. In 1919 the R. gained supreme power. It was elected by universal suffrage under a system of proportional representation. The Bundesrat had disappeared, and its successor, the Reichsrat (q.v.), exercised only curtailed powers. The National-Socialist regime preserved the R. in name, but Hitler eliminated opposition from that elected in 1933, and for later elections

only names of National Socialists were submitted. Nominated members of the R. were added occasionally to represent annexed territories. By passing the Enabling Act (1933) the R. voted its own virtual elimination. After this it was convened only to hear declarations of national policy made from time to time by Hitler, though it was supposed to have advisory functions.

In 1919 representative government, under Brit., Amer., and Fr. supervision, was restored in W. Germany, and elections were held. This legislature, however, was called the Bundestag. *See also* under GERMANY, History.

Reichstag Fire, *see* under GERMANY, History; NATIONAL SOCIALISM.

Reid, Sir George (1841-1913), Scottish artist, b. at Aberdeen and studied under Yvon at Paris and Mollinger at Utrecht, and in 1872 worked with Josef Israels at The Hague. He painted landscapes, e.g. 'Whims in Bloom,' and flower-pieces, e.g. 'Roses,' and also executed studies in black and white; but his forte was portraits, his first success in this direction being his likeness of George MacDonald in 1867. Other portraits are: Sir John Millars, James Anthony Froude, the Marquess of Tweeddale, and Sir Wm. Henderson. He was president of the Royal Scottish Academy, 1891-1902.

Reid, Mayne, originally Thomas Mayne Reid (1818-83), Brit. novelist, b. at Ballyronney, N. Ireland. In 1840 he emigrated to the U.S.A. There he had an adventurous and varied career. He was at one time a journalist, but in 1846 he obtained a commission in the New York volunteers, and took an active and distinguished part in the Mexican war. He wrote in 1848 his first novel, *The Rifle Rangers*, which he pub. after his arrival in London two years later. He wrote a succession of tales of adventure which were long popular with boy readers, among them *The Scalp Hunters* (1851) and *The Headless Horseman* (1866).

Reid, Sir Robert Threshie, *see* LORE-BURN, EARL.

Reid, Thomas (1710-96), Scottish philosopher, b. at Strachan. He graduated from Marischal College, Aberdeen, in 1726, and in 1733-36 acted as college librarian. In 1737 he was presented to the living of New Machar, near Aberdeen, and having turned his attention to philosophy accepted the chair in that faculty at Marischal College in 1751. While here he pub. his *Inquiry into the Human Mind on the Principles of Common Sense* (1762) as an answer to Hume, and in 1761 was appointed prof. of moral philosophy at Glasgow, succeeding Adam Smith. Here he remained till his death, but he retired from the active duties of his professorship in 1780. His essays on the *Intellectual Powers of Man* appeared in 1785, and their ethical complement—the essays on the *Active Powers of the Human Mind*—in 1788. He also wrote an account of Aristotle's *Logic* for Kames's *Sketches of the History of Man*. R. is the leading representative of the school of common sense, by which phrase he meant the

beliefs common to rational beings as such, and not vulgar opinion. His most important doctrine is contained in his *Inquiry*, viz. that belief in an external world is intuitive or immediate. See *lives* by A. D. Fraser, 1898, and K. Peters, 1900, and ed. of the *Essays*, ed. by A. D. Woozley, 1911.

Reigate, municipal bor. and one-time mkt. tn. in Surrey, England, 22 m. S. of London. Its chief building of interest is the church, the burial-place of Lord Howard of Effingham. The grammar school was founded in 1675. It grew up round a castle, held first by the Warenne family and then by the earls of Arundel. This was destroyed in the Civil war. The old tn. hall, formerly on Market House, is now the public library. There are fuller's earth works, hearthstone mines, and an essence factory. Pop. 14,100.

Reign of Terror (1793), see FRANCE, *History*.

Reikiavik, or **Reikjavik**, see REYKJAVIK. **Relly**, Sir Charles Herbert (1874-1918), Brit. architect, b. in London, and educated at Merchant Taylors' School and Queen's College, Cambridge. He was prof. of architecture at Liverpool Univ. from 1904 to 1934. In 1909 he was elected to the council. F.R.B.A. and was architectural editor of *Country Life* from 1922. Among the buildings he designed were the Liverpool Students' Union and Devonshire House, Piccadilly. He was one of the early advocates of 'play-trees' for children. It was decided in 1947 that an ann. R. scholarship in architecture should be offered by Liverpool Univ. R. was knighted in 1911. His autobiography, *Scaffold in the Sky*, was pub. in 1938.

Reims, see RHEIMS.

Reimun, see RAMOTH-GILEAD.

Reinach, Joseph (1856-1921), Fr.-Jewish politician and historian; he was b. in Paris and became a barrister. He joined the *Republique française* and supported Gambetta, to whom he became secretary in 1881. In 1889 he became a member of the Chamber, in which he sat at intervals till 1914. R. was a champion of Dreyfus, being largely instrumental in securing justice for him. His account of the case (1901-11), in the *History of the Dreyfus Case* (7 vols.), is a careful and interesting work, though strongly partisan.

Reinacher, Eduard (b. 1892), Ger. poet, b. in Strasburg. Many of his subjects are taken from legend and myth, and his lyrics of Alsace show a deep knowledge and love of the old Alsatian customs, traditions, and folklore. R.'s poetry is mystical, pictorial, emotional; he belongs to the school of the late Ger. Romantic poets. His finest poems include *Elsasser Idyllen* and *Elegien* (1925) and *Silberspane* (1930).

Reincarnation, or **Metempsychosis**, doctrine according to which the soul of a human being enters at death into another body, whether of man or beast. It is impossible to determine among what people the idea of R. originated, but it certainly dates from the remotest antiquity, and seems to form part of all

primitive religions. It enters into all the religious and philosophical systems of the E., and is associated with the idea of retribution for good and evil. It probably arose in the attempt to find a cure for evil and to explain its existence. If the cure is to be found in a future immortality, the cause may be sought in previous existence whose sins are punished by present suffering. Thus, the goal of all systems which admit R. is the termination of the indefinite cycle of rebirth and absorption in the divine. In the W., although the belief was widespread among the ancients, R. appears to have had no spontaneous and popular origin, being rather a tenet of philosophical or mystical schools. It was a central belief of the Pythagoreans and Orphics, having been derived by them ultimately perhaps from Egypt or Chaldea. It passed into Platonism, and traces of it appear in the mixed eschatology of Virgil. R. is irreconcilable with Christian theology, nor has it any place in the mosaic scriptures. Some scholars, however, have detected the influence of R. (inherited from Babylonians) in the post-exilic literature of the Jews. See also BUDDHISM; ESCHATOLOGY; HINDUISM; NIRVANA. See E. Abel, *Fragmenta Orphica*, 1885; J. Harrison, *Prolegomena to the Study of Greek Religion*, 1908; and W. Iatostawski, *Pre-existence and Reincarnation*, 1924.

Reindeer, or *Rangifer tarandus*, species of deer, the only one which has been domesticated. The domesticated animal is much smaller than the wild. Antlers are produced in both sexes, being cast in

REINDEER

March or early April; those of the female are shorter and more slender. The hoofs are broad and rounded, and the 'petticoes', which in other deer except elk are small and evanescent, are well developed, being of great service to the animal in walking over snow and bare ground. The colour varies considerably, but is commonly a mouse grey tinged with brown, becoming lighter towards winter, with white on the belly, and in the bucks a thick fringe

under the throat and neck. The domestication of Re. dates from a remote period, and the Laplanders utilize them not only as beasts of burden, which will drag a sleigh weighing 300 lb. 100 m. a day over the snow, but also to produce milk, meat, clothing, and tents. In domestication they suffer a great deal from anthrax, and also from the attacks of flies, which often destroy the value of the skin. They are capable of great endurance, and can swim long distances in ice-cold water; their sense of smell is unusually acute. In summer they feed on coarse grasses, herbs, mosses, and lichens; in winter a special lichen known as *lit. moss* (*q.v.*) forms their prin. food. Their range was formerly very extensive, and in the Post-Glacial Pleistocene period they were abundant in S. France. They are now confined to the most northerly regions of Europe and Asia, in many parts of which, including Norway, the wild herds are stalked. It is still unsettled whether the N. Amer. and Newfoundland caribous are distinct species or only varieties of the R. The barren-ground caribou makes very extensive migrations in huge herds and penetrates far into the Arctic Circle. The woodland caribou occurs in some of the denser Canadian forests and in a few forests of the United States. The Newfoundland caribou has been much massacred in the past, but is now protected. See also under LAPLAND.

Reindeer, lake in Saskatchewan, Canada, 120 m. long by 25 m. broad; it has an outlet through the Reindeer R. to Churchill R.

Reindeer Moss, a finely branched lichen, *Cladonia rangiferina*, occurring on moors in America and N. Europe. It constitutes the prin. food of the reindeer.

Reineke Fuchs, or **Reinhart Vuhs**, or **Fuchs**, see REYNARD THE FOX; and also FABLE.

Reinforced Concrete was invented in France about the year 1850, and is now one of the most important materials used in building construction. It is a combination of cement concrete (which can resist very high compressive forces, but has little resistance to the tensile, shearing, twisting, and other forces to which the parts of a structure are subjected) and steel, which has a high resistance to tensile and other forces imposed on structures by their own weight, by the loads they carry, and by other forces, such as the wind. R. C. is designed so that, generally, all the compressive forces are resisted by the concrete and all the other forces by the steel reinforcement. The reinforcement is generally in the form of mild steel round bars up to 2 in. in diameter, but square, indented, and twisted bars, and also high-tensile steel bars, are used. An advantage of the steel reinforcement is that it also resists the tensile stresses induced in the concrete when the latter shrinks during the setting and hardening process, and when it expands and contracts with changes of temp. This is possible because concrete and steel expand and contract at the same rate with changes of temp. A further advantage of R. C. is its resist-

ance to fire. In the case of structural steel frames the steel has to be encased in concrete to protect it from fire, and this concrete casing serves no other purpose. The use of reinforcement has made possible the erection of large cantilevers, thin domes, long spans (the longest arch span so far built in R. C. is in a bridge in Sweden and is 865 ft. long), and other shapes that would be impossible or uneconomical in any other material. It has also made possible R. C. bonns, transmission-line poles, lamp and fence posts, and many other products which can be made in a factory away from the site of erection, with a consequent reduction of the amount of labour required on the site.

Prestressed Concrete.—A more recent development, which was first conceived on the Continent in the first decade of the present century, is known as prestressed concrete, the use of which has made rapid progress in the past ten years. It has been stated that concrete is weak in tension, that is in its resistance to forces that tend to stretch it; if a beam, say, is loaded at mid span tensile stresses will be induced in its underside because when a beam is bent its underside is lengthened, and its top shortened. If, however, pressure is applied to one or both ends of the beam so that it is in compression throughout its length it will have a greater resistance to bending, and a friable material, or even separate pieces arranged to form a beam, will then carry a load. This can be proved by arranging half-a-dozen bricks in a row and lifting them by pressing with the hands on the end bricks. Steel, on the other hand, can be stretched and lengthened within its elastic limit, and when the stretching force is removed it will return to its original length. These properties are taken advantage of in prestressed concrete by incorporating in the concrete steel wires (generally about one-fifth of an inch in diameter) which are stretched and kept in a state of tension throughout the life of the beam. One method is to place the wires in a mould and stretch them with a jack, fix the ends of the wires so that they remain in the stretched state when the jack is removed, and then place the concrete. In a week or so the bond between the hardened concrete and the steel is sufficient to prevent the wires from slipping, and when the fixings are removed the concrete remains in a state of compression because the wires are striving to regain their original shorter length. In another method longitudinal holes are formed in the concrete to take the wires, which are not in contact with the concrete. Instead they are, after stretching, wedged in steel plates covering the ends of the beam, so that the wires pull on the end plates, and so keep the concrete in compression. See G. Magnel, *Prestressed Concrete*, 1918; A. L. I. Baker, *Reinforced Concrete*, 1919; and Oscar Faber, *Reinforced Concrete Simply Explained*, 1930.

Reinhardt, Max (1873-1913), Austrian-born Amer. theatrical director, b. at Baden, near Vienna, of Jewish stock, his real name being Goldmann. He became a

bank clerk, but in 1894 appeared on the stage of the Deutsches Theater, Berlin, of which he became director—after a period (beginning 1903) of innovating management at the Neues Theater. His character acting was outstanding, but it was as a theatrical manager that he is remembered. He employed the 'apron stage' and devices even more striking to establish intimacy with the audience. His productions of Shakspeare and Shaw, Molière, Strindberg, Ibsen, Gorky, etc., occasioned his being invited to stage these authors in foreign cities. His purpose was to increase the resources of the stage and to widen its appeal by every possible means; but if he was a great showman, he was an erudite one. His theatre became a clearing-house for ideas and tendencies from every country, and its importance from that standpoint before the Second World War was undeniable. His most remarkable experiment, perhaps, was *The Miracle*, a medieval pageant enacted with a background which took in both audience and players—an experiment which was followed at Covent Garden in the presentation of *Edipus Rex*, in which frenzied torch-bearers ran through the auditorium to the great brazen door of the palace. In *Edipus Rex* a play without words, the plot was conveyed by music, costume, lighting, and decoration. R. left Germany in 1933, in which year he supervised an open-air production of *A Midsummer Night's Dream* at Oxford, where the honorary degree of D.C.L. was conferred upon him. He went to the U.S.A. in 1935 and became an American citizen in 1940.

Reinkens, Joseph Hubert (1821-96), first Old Catholic bishop, b. at Burtcheid, near Aachen. In 1870 he joined Dollinger in the Old Catholic movement and opposition to the doctrine of papal infallibility, and in 1873 was consecrated bishop of the Old Catholics in Germany, with headquarters at Bonn. See life by J. M. Reinkens, 1906.

Reinsurance. When an insurance broker, company, or corporation has accepted a risk, which in the interest of good business is much too heavy to be carried with safety, a way is found of spreading the risk by insuring part of it with others. This is known as R. It is principally of two kinds: (1) Facultative; (2) Treaty. Facultative R. differs from treaty R. in the fact that by the former method the party with whom the R. has been effected has the power to accept or decline each risk offered by the ceding company. Treaty R. is, on the other hand, carried out under a contract which stipulates that the ceding company is bound to cede and the reinsurer is bound to accept an agreed proportion of the risks undertaken by the ceding company. The amount of business done in R. is enormous, and it is to the credit of Brit. insurance companies in general that much of the risk taken by foreign insurance companies is reinsured with them.

Reith, John Charles Walshaw, first Baron Reith of Stonehaven (b. 1889), Brit. administrator, b. at Stonehaven, and

educated at Gresham's School, Holt, and at the Royal Technical College, Glasgow, later becoming an engineer. He became the first general manager of the B.B.C. in 1922, and was its director-general from 1927 to 1938. He rendered great service in developing Brit. broadcasting, and insisted upon a high intellectual and spiritual standard for programmes. In 1947 a series of ann. broadcast lectures was established, named after R. He left the B.B.C. to become chairman of Imperial Airways, and was the first chairman of the Brit. Overseas Airways Corporation. R. became M.P. for Southampton in 1940 and was successively minister of information, minister of transport, and minister of works and buildings (later works and planning). For a time he was director of combined operations, material dept., at the Admiralty. In 1945 he became chairman of the Commonwealth Telecommunications Conference. He was knighted in 1927 and created a peer in 1940. He pub. a book of memoirs in 1948 and an autobiography, *Into the Wind*, in 1950.

Reitz, Deney's (1882-1944), S. African soldier, politician, and author, b. in Bloemfontein, son of the president of the Orange Free State at the outbreak of the S. African war. He fought against Britain in that war and afterwards went into voluntary exile in Madagascar, but was induced by Gen. Smuts to go back to S. Africa, where he qualified in law. After his return he forsook his anti-Brit. attitude, and in the First World War he fought with the Union forces in Ger. E. and W. Africa; volunteered for service with the Brit. forces in 1917 and took a commission, being severely wounded and mentioned in dispatches. In 1920 he was elected to the Union Parliament as a member of the S. African party. He was minister of lands (when he was influential in promoting the estab. of the Kruger National Park), 1933; minister of agriculture and forestry, 1935; minister of mines, 1938; and in 1939, after the Smuts-Hertzog break on the war issue, became deputy Prime Minister (till 1943) and minister for native affairs. In 1942 he was appointed S. African high commissioner in London. He did much for Afrikaans as a literary language and wrote, among other books, *Commando: a Boer Journal of the Boer War* (1929); *Trekking On* (1933); and *No Outspan* (1943). His wife, a daughter of Dr. Claude Wright, of Wynberg, Cape Prov., became the first woman member of the Union Parliament.

Rejuvenation, see under CLAND.

Relapsing Fever, acute infectious disease occurring among famine-stricken people; other names applied to the same condition are famine fever, seven-day fever, and bilious R. F. It is caused by a specific micro-organism, *Spirillum obermueri*, which is found in large numbers in the spleen. The period of incubation is from five to seven days; the fever starts with severe pains in the back and limbs, rigors, and a high temp. (105°-107°). Delirium, jaundice, enlargement of the spleen, profuse sweating, and intense thirst are

characteristic of the acute stage. These symptoms continue for about a week, when they cease by crisis. There is an intermission for about a week, during which time no spirilla are found in the blood. Another paroxysm then commonly occurs, which may not be of such severity as the first. A third and fourth attack with similar intermissions may occur. Recovery is the general ending, the mortality being under 5 per cent. The disease only prevails among overcrowded and badly nourished communities, and occasionally occurs in the thickly populated dists. of E. Europe and of India and China. An epidemic occurred in Ireland in connection with the famine of 1826. The treatment is similar to that adopted in typhus; light but nourishing food must be given, and as the disease is caused by poor vitality the patient's strength must be built up. The disease is probably transmitted by lice, so that bodily cleanliness is important in the treatment and prevention.

Relations, Maintenance of, see under POOR LAWS; PARENT AND CHILD; HUSBAND AND WIFE.

Relativity. The theory of R. is the theory of the statement of the general laws of physics in a manner that is common to all observers under any conditions. An adult is likely to have a lively recollection of the intellectual difficulties of the schoolboy when confronted with the mixture of Euclidean geometry and Newtonian dynamics that forms the basis of pre-relativity physics, or the physics that is now taught in schools. Appeals to the everyday experience of the pupil and to practical experiences in the form of demonstrations are necessary in order to develop the imaginative ideas that are required for a proper appreciation of pre-relativity physics, which is solely concerned with the point of view of the everyday observer. The judgments formed by such an observer are to a large extent subjective, and it is the business of the theory of R. to eliminate the subjective element from physics and to substitute a science that is objective, in the sense that the laws shall be common to all observers. The difficulties that the theory of R. presents to an adult trained in the ways of pre-relativity physics are twofold. First he must be prepared for a fundamental change in his imagination; at the same time the necessary substitution of Riemannian geometry for Euclidean geometry and of Einstein's geometry for Newton's dynamics demands a specialised knowledge of higher mathematics. It is possible, however, to indicate in a non-mathematical article some of the oddities of pre-relativity physics and to show the general line of advance of the theory of R.

The Michelson-Morley Experiment (q.v.). The real importance of this experiment is that it indirectly led to the theory of R. The nineteenth-century physicist postulated the existence of an absolute and all-pervading ether as the medium through which light travels. The earth, like other bodies, was supposed to pass freely through this ether. In other words, the

motion of the earth relative to the ether created the effect of an 'ether wind.' Hence a terrestrial observer should find that light travels faster with this 'wind' than against it, and faster across the ether wind than against it. The details of this experimental test are given in the appropriate article and a diagram of the apparatus used is given in the article on SPECTRUM. It is sufficient to note that the test was sufficiently delicate to have measured this expected difference in the velocity of light relative to the terrestrial observer according as the light travelled in the direction of the earth's motion or at right angles to that direction. The result of the experiment was negative, i.e. no such difference was detected. The experiment was repeated in 1887 with improved apparatus, but the same result was obtained. Lorentz (q.v.) and Fitzgerald developed a hypothesis to account for the surprising result of the experiment. This hypothesis adopted as its fundamental assumption that a measuring rod or body in motion suffers a contraction in length in the direction of its motion, and that the amount of the contraction is just sufficient to account for the negative result of the Michelson-Morley experiment. This ingenious assumption renders all attempts such as were made by Michelson and Morley abortive, since the measuring rods themselves are contracted in the direction of the earth's motion. The arbitrary assumption of Lorentz and Fitzgerald was found to be justified when Einstein developed the Special Theory of R. in 1905, but the important conclusions that can be made directly from the Michelson-Morley experiment are (1) that no observer can detect his motion through the medium that is the vehicle for the transmission of light; (2) that the velocity of light through this medium is independent of the motion of its source and has the same value relative to every observer. Einstein's Special Theory of R. is really a theory based on these two statements. A few examples will show what curious results follow from these facts. The contraction that takes place in the direction of motion of a body is exceedingly small for the ordinary velocities to which we are accustomed. A man, however, who was travelling with a velocity of 161,000 m. per sec., for example, relative to an observer would appear to contract to one-half of his usual dimensions in the direction of motion. If he were travelling vertically relative to the observer his height would appear to be halved, if he were travelling in a magic train his height would appear normal but his width would be halved so that he would present a curious appearance similar to the image of a man reflected in a cylindrical mirror. At the same time if the traveller measured his height or breadth he would discover none of these changes, since his measuring rods would share the contraction. He would, however, comment on the strange appearance of the observer who, forgetting his Burns, might be congratulating himself on his own good fortune. This weird

appearance, presented by each of the men to one another, is no illusion. A photographic plate operating in a camera at the necessary speed for such a photograph would give a permanent confirmation of the contraction.

Another result of the theory is that no body can travel with a speed greater than that of light, and a man travelling in such a magic train moving with that speed relative to an observer would be a two-dimensional being as far as the observer is concerned, for his height or breadth (as the case may be) would appear to contract to nothing. That the velocity of light has the same value, namely, 186,000 m. per sec. (the most recent figures are 186,271 m. per sec.), relative to every observer, leads to further strange results. If a policeman flashes his torch in the faces of suspected burglars, some of whom take to their heels while the rest drive off in a high-powered car, the light-waves from the lamp will be 186,000 m. from the policeman and from each of the sev. burglars after one second measured by their individual watches. It is not surprising therefore to learn that the watches are affected by the motion of their owners—not through any derangement of their works, but simply by the motion of the owner relative to an observer. Eddington has given the interesting example of an aviator travelling at 161,000 m. per sec. relative to an observer. Both men are equipped with mechanically perfect chronometers. The aviator and observer each light a cigar the instant at which they pass each other. Making due allowances for the time required for light signals to pass between the two men, each would arrive at the considered judgment that his own cigar had only lasted half as long as the other's. Before leaving these strange facts, the effect of relative motion on mass must be stated, because the β -rays emitted from radioactive matter provide us with instances of bodies (i.e. electrons) moving relatively to us at speeds comparable with that of light. It is found that the mass of such an electron is considerably greater than that of an electron moving slowly relatively to the experimenter. This is a practical verification of the consequences of the special theory of R.; theoretical considerations show that the mass of a body, whose speed approached that of light relative to an observer, would tend to infinity, while at the same time an observer travelling with the electron would detect no change in its mass.

So far we have noted the unexpected results that arise because we judge phenomena from our own point of view. Similar surprises occur in other branches of science. As Bertrand Russell points out, what appears to be a solid stationary piece of rock to a human being is seen by a microscopic observer of electronic size to consist of an almighty array of electrons and protons whirling round each other at enormous speeds.

The theory also shows that if matter is converted into energy of a different kind (e.g. radiation, or the kinetic energy of

atoms and electrons produced during the disintegration of atoms of another type) the energy E released is given by the equation $E = mc^2$, where c is the velocity of light and m the mass that disappears. This equation has been confirmed in many experiments. Because c is so large the energy set free when even moderate amounts of matter are destroyed is enormous. Changes of this kind provide the energy radiated by the sun and stars and that generated in the atomic bomb (q.v.).

Pre-relativity physics serves us very well provided we shut our eyes to the possibilities of dealing with phenomena other than those we meet in everyday life. We may rest content with Euclidean geometry and Newtonian dynamics; knowing that they do serve a very useful purpose for our daily affairs and that they represent a close approximation to truth as ascertained by practical measurements. But Einstein's general theory of R. is something more than a closer approximation to truth; it demands a complete revolution in the fundamental ideas of the natural world.

Formerly space was divorced from time. The position of any object was determined by three co-ordinates and in this sense space was three-dimensional; e.g. the position of an aeroplane is given by its latitude, longitude and its height above sea level. It was believed that time was quite distinct from space in the sense that the determination of the position of the aeroplane was quite distinct from the determination of the instant at which it occupied that position. Yet, as many writers point out, if one event is simultaneous with another according to the reckoning of one observer, another observer will declare that simultaneity between the two events does not exist. Russell illustrates this fact by observing that if two brigands stationed on a railway line shoot the guard and the driver respectively of a passing train and if a man in the middle of the train hears the reports simultaneously he will judge that the two shots were simultaneous. A stationmaster, however, who is exactly half-way between the brigands will hear first the shot that killed the guard. Simultaneity, in other words, is in that case relative to the observer. The theory of R. avoids such subjective judgment by recognising that four quantities are involved in determining the position of an 'event', namely the time and the three dimensions of the place of the event. The system of geometry that is implicated in the development of the theory is four-dimensional in that sense. The position of an event is thereby determined in space-time, and space-time is non-Euclidean in its properties. The general theory of R. is concerned with the explanation of gravitation by means of the properties of a world of four-dimensional space-time. Newton's law of gravitation postulates 'action at a distance' according to the law of inverse squares in order to explain the motions of heavenly and terrestrial bodies. The very idea of 'force' is abandoned by the general theory of R. The

behaviour of the planets, stars, etc., is not due to forces emanating from other bodies in the universe, but to the special nature of the world of space-time in the neighbourhood of matter. Three verifications of Einstein's theory are well known. In the first place it accounted for a peculiarity in the behaviour of the perihelion of the orbit of the planet Mercury that could not be explained on Newton's theory, and in the second place it accounts for the observed deviation of light in its passage near a material body such as the sun. A third verification is found in the shift towards the red end in the spectra of the sun, and in particular of stars of great density—white dwarfs such as the companion of Sirius. No doubt remains that the Einstein effect is in evidence in these three cases.

At the time of writing this article it was announced that Einstein had just published his new theory on which he had been working for many years. It is called a unified field theory, and is one more step in uniting the different modes of action of the universe in a single system. The difficulty that Einstein found in linking together gravitation and electromagnetism now appears to have been surmounted, and his previous tentative efforts have attained their consummation in this latest theory, which is a set of mathematical relations describing the field set up in space and time by the action of gravitation and electromagnetism together. Of course it may be premature to speak with confidence of the new theory because at present it has not been submitted to actual physical experiment, and it will be some time before this can be done, just as his earlier theory had to wait until 1919 for the first actual verification through the solar eclipse of May 29. It is possible that Einstein will survive to see his latest theory verified, a theory which has not merely an academic interest but which is fraught with far-reaching practical results.

Lieber, *The Einstein Theory of Relativity*, 1949.

Relativity of Knowledge, doctrine which is denied in some schools of philosophy, while in others it is regarded almost as an axiom. In its higher form it is grounded upon the distinction between noumena and phenomena, between realities and things as we can perceive them. If all human knowledge is gathered from 'shadows' (to use Plato's image) it can but be relative and not absolute. Again, it is argued that since all knowledge implies a relation between the knower and the object known, the subjective element

in knowledge cannot be discounted. Every object undergoes a change in the very act of becoming an object of knowledge. On behalf of the doctrine, see Sir W. Hamilton, *Discussions* (3rd ed., 1866), and *Lectures on Metaphysics* (3rd ed., 1874); against it see H. Sidgwick, *Philosophy* (1902).

Relay (electricity). An electrical R. is simply an electro-magnetic switch which is closed or opened by an electrical current and so controls another electrical circuit. Rs. are used for many purposes, alarms of various kinds, pilot and emergency lighting of factories, offices, road traffic signals, etc. If the current to be controlled is a large one the switch part of the R. will probably be of the mercury type. This is simply a glass phial containing the switch contacts and a quantity of mercury, the mercury opening or closing the circuit as required. A typical example of an electro-magnetic R. is the emergency lighting R. in a factory. A series of lamps are distributed round the building, fed by batteries; the feeds from these batteries are controlled by a switch, this being held in the off position by a mains operated R., therefore in the event of a mains failure the battery switch is allowed to close and the emergency lights are switched on automatically without any loss of time. There is another type of R. known as the photo-electro type. The actual R. may be a thermionic tube or the photo-electro cell may actuate a valve type amplifier which in turn may operate an electro-magnetic R. This is done because the operation of this type of R. depends upon the amount of light falling on the photo-electro cell, which changes the light energy into electrical energy. The electrical current, however, is much too small to be of any practical use, and so therefore it is amplified. The sound track of a cinema is based on this type of R. The light is passed through the sound track, is received by the cell, and then amplified. The amplified currents in turn operate the loud speakers behind or below the screen.

Release, in law, valid discharge by one person of a legal right or claim against another. To be effectual a R. should be by deed (q.r.), especially where the person released gives no consideration (q.r.). The right of payment of a cheque may, however, be given up by mere surrender of the cheque itself to the drawer. Liability under a contract under seal (see CONTRACT) can only be discharged by a R. under seal. A R. given by an infant is invalid.

Relics (O.F. *relique*, Lat. *reliquia*, from *relinquere*, to leave behind), remains of the bodies or other objects connected with holy persons, to which a religious cultus is paid. The practice is both older and more widespread than Christianity, and is found in an extreme form among Buddhists. In the early Christian Church great esteem was shown for the bodies of the martyrs, and strenuous efforts were made to recover them, as is witnessed by the remarkable epistle of the Christians of Smyrna on the death of St. Polycarp, A.D. 156. Earlier still the Eucharist

appears to have been celebrated over the tombs of the martyrs (*cf.* Rev. vi. 9). The early fathers of the Church all take the practice for granted, though there is diversity of emphasis in their explanations of the nature of the cultus. This was later explained by the medieval scholastics as a 'relative cult of *dulia*,' *dulia* being the kind of honour due to a human being, and 'relative' implying that this honour was paid only on account of the relationship of the object to the person. The enormous popularity of relics and the entirely uncritical nature of these ages led to abuses, both in the deliberate and in the unconscious multiplication of such relics, and in over-emphasis on devotion to them. Against these abuses the Reformers reacted with energy, and swept away the whole doctrine. The Rom. Church preserves both doctrine and practice, but does not in every case guarantee the authenticity of individual objects as relics.

Relic Mountains, *see under* MOUNTAINS.

Relief, feudal incident originating when fiefs were not hereditary, being sums paid to the lord by the heir before he could enter upon possession of his lands. William I. fixed the sum at 100s. or, in lieu, so many arms for each knight's fee; William II. exacted military Rs., but, in his Charter of Liberties, Henry I. enacted that Rs. should be 'just and lawful.' In the time of Henry II. the regular Rs. were 100s. for a knight's fee and £100 for a barony; these Rs. were only payable if the heir was of age; if a minor he became a ward and paid no R. Articles 2 and 3 of Magna Carta confirmed the ancient R. (Stubbs, *Select Charters*, 74, 1884). For R. organisations, *see* CHARITIES; NATIONAL ASSISTANCE ACT (1918); UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION; and VAGRANTS.

Religion, derived by Cicero from *religare*, to treat carefully (*De Nat. Deorum* ii., 28) by Lactantius from *religare*, to bind together (*Justit. Div.* iv., 28), and by St. Augustine from *religare*, meaning to recover (*De Civitate Dei*, x. 3). Broadly speaking, R. may be defined as the acceptance of certain obligations towards powers higher than man himself. Thus it does not exist among those who deny the existence of anything above this material universe, nor among those who, whether they hold such beliefs or not, accept no voluntary obligations towards such powers. If the concept of R. is further analysed it will be found to contain the following. First, belief that these higher powers are of a personal nature, not merely blind forces. In the higher Rs. there is the recognition of one Divine Being, infinitely transcendent, but not uninterested in the conduct of human beings. In lower forms of R. numerous gods are admitted, though the tendency to recognise one as supreme is apparent as the scale of intelligence is improved. Second, the ascription to the Being or Beings of certain moral qualities, in virtue of which they are

pleased or displeased with the behaviour of man. The standards of moral qualities attributed to them vary enormously, but the general idea that they are the judges of right and wrong can usually be detected. Third, the idea that the deity is to be obeyed, or at least placated. If this is not done retribution follows. There is a need of assistance from the Divine Being which may be obtained on certain terms. Thus the having of good relations with the Divine is intimately bound up with man's happiness. In the lowest Rs. the favours sought and the evils avoided are only of the most material kind, *e.g.* good crops, victory in war, natural fecundity, etc., but in the higher Rs. it is the needs of the soul that occupy the most important place; and in the highest of all, the end of man is sought in his complete communion with the Divine Being. In Christianity this is not conceived so as to destroy personality; in Buddhism it presumes complete absorption with loss of separate identity. Fourth, in most Rs. the idea that the Divinity rewards and punishes after death. From this it will be seen that R. comprises certain ideas or beliefs, corresponding to what Christianity terms 'faith,' and that it demands certain actions, corresponding loosely to what Christianity terms 'morals.' One may also distinguish positive acts of 'worship' which embody something of the beliefs in ritual actions. Round each of these general ideas are built up a large number of practices, such as penances, prayer, healing, festivities, ritual observances, *e.g.* sacrifices, and a more or less developed teaching on morals and the life hereafter, comprised, when the standard of civilisation permits it, in a number of sacred books.

In antiquity and in the Middle Ages the universality of R. was taken for granted, though its forms were known to differ widely. With the discovery of the new continents, however, travellers and missionaries reported the existence of tribes who had apparently no R., *e.g.* the Jesuit, Baegert, gave such a report on one of the tribes in S. California in the early nineteenth century. Further investigation usually showed that such tribes had a R., but that it was a secret, not to be communicated to strangers. Moreover, some of the early travellers failed to recognise the R. of the tribes they visited because it did not correspond to their own more civilised ideas. Generally speaking it can be asserted that R. is found to be a normal constituent of human life, of which the absence is extremely rare. This is explained by the Christian hypothesis that God made man, and implanted in him the notion of his creator, and the innate tendency to worship him. Both knowledge and worship were largely corrupted in subsequent ages, and thus we find the extremely defective ideas common to primitive races. Modern research, on the other hand, has seen in the religious feeling of mankind rather an instinct of fear towards the unknown in nature which is credited with superhuman powers, and thus gradually erected into an object of worship. On this hypothesis man would

gradually outgrow R., as he mastered his fears, and, in particular, subdued the forces of nature, or at least understood the causes of natural phenomena. This theory takes no account of the permanent craving found in man for happiness in communion with the godhead—an instinct which has nothing to do with fear or the forces of nature, and is not outgrown with an increase of material welfare.

How far R. should be described as universal to-day is impossible to state, since vast areas, e.g. the U.S.S.R., are professedly atheistic, with results that are not fully known, and have not yet had time to reach their full evolution.

The origin of R. has been the subject of considerable discussion. The various theories are as follows: (1) The Christian thesis of a divine revelation of Monotheism (*q.v.*) is contained in the Bible in the book of Genesis. (2) Philosophically it is possible to reach the same conclusion by the use of reason, and Plato practically did so; but few have done this, and it cannot be held responsible for the notions of primitive tribes. (3) Nevertheless their deduction of a force behind the powers of nature, which is a personal nature, though crudely understood, is not totally false. To argue that behind the thunder was a thunderer, and behind the rain a person who sent it, though crude, is an application of the principle of causality. The primitive man asks: Who sent the rain? The philosopher asks: Who organised the universe of which the rain is a minor phenomenon? The instinctive application of the principle of causality may then be invoked as a cause of the origin of R. (4) The intuition theory supposes simply that man has an intuition of God, and of his dependence upon him. This, however, explains nothing, and leaves unexplained the fact that large numbers of individuals have little or no religious bent. Max Müller's perception theory postulated a mental faculty, which perceives the infinite, independently of either sense or reason (*Growth of Religion*, 1880). A perception of the infinite, even if granted, is hardly an adequate explanation of the origin of R., and would seem to be a philosophic notion of which primitive races are incapable. A sense of the 'numinous' is, however, an invariable part of R. (5) The animist theory (*Lat. anima*, a soul), propounded by E. B. Tylor, supposes that from dreams, etc., primitive people derived a notion of the soul; then by a confusion of ideas they transferred this soul-idea to things both living and inanimate. Thus there grew up the idea that the tremendous phenomena of nature were to be attributed to powerful spirits inhabiting the elements. (*see further under ANIMISM*). Herbert Spencer reduces R. in its origin to 'Shintoism,' or ancestor worship. He supposes that man began by worshipping his ancestors, some of whom had picturesque names, such as we find among the Red Indians, e.g. Rainbow, Mighty River, etc. Thus with the passage of time arose the worship of mighty nature spirits, whose connection with their ancestors was no

longer remembered. This change would be accelerated by the mingling of peoples with different sets of ancestors, and who would be loosely associated with their place of origin, viz. children of the valley, or of the sea. He points out that the original sacrificial offerings were things thought to be useful to the departed in their other-world existence. In exchange for them, the departed were expected to exercise their influence to help the living. Ancestor worship, however, is not R., and though extremely ancient, is a subject of its own, sometimes connected with R., sometimes not. There is no essential connection between the two (*see also ANCESTOR WORSHIP*). (6) The totem theory believes that the oldest form of R. is the totem or sacred animal or plant belonging to a tribe. The tribe is supposed to have derived its origin from this totem, and a spirit of the totem dwells in the different individuals of the species, which are therefore regarded as sacred, and deserving of veneration. By the process of war and conquest one clan would emerge as triumphant, and so its totem would be regarded as superior to all others. Thus by degrees grew up the idea of a supreme being. The totem theory, however, in addition to other defects, takes for granted the idea of superior spiritual forces, which it does not explain. In practice, too, it is found to be rather a component part of R. in primitive tribes, and would not explain their whole religious outlook (*see TOTEMISM*). (7) A theory well known to the ancients, based R. on fear of the unknown, particularly as encountered in the mysterious forces of nature. These forces are then personified, and an attempt is made to placate them by worship and sacrifices. Thus the Rom. and Gk. philosophers explained the crude polytheism of the masses. (8) Fetish worship (*see FETTERISM*) in essence supposes that it is possible to imprison a spirit or power inside a small object, which is then carried about for protection. When it fails to give protection it is assumed that the spirit has escaped, and the object is no longer of value. The fact that this fetish worship is a component part of the R. of certain primitive tribes in no way proves that it lies at the origin of all R. As with totemism fetish worship supposes but does not explain a belief in the existence of higher powers. Only if we suppose that a lower religious concept must precede a higher one is there any reason for placing this idea at the origin of R. The tendency to suppose that lower religious ideas necessarily precede higher ones was taken for granted among scholars of the last century, but has been largely disproved by W. Schmidt in his *Ursprung der Götteridee* (Eng. trans., *Origin and Growth of Religion*, 1931).

In the nineteenth century there began the independent research into all known forms of R. This was conducted on an entirely factual basis, and sought neither to prove nor deny the claims of various religious bodies; in practice it assumed that R. could not be other than the evolution of a certain part of man's

thought. In this way emerged the study of the hist. of R.: this treats of the positive facts that go to make up the story of each R.; it deals on the one hand with the evolution of various concepts, *e.g.* of God in each religion, and of the corresponding external evolution in rites, ceremonies, sacred books, priesthood, etc. An enormous amount of work of this kind has been done, and in particular the sacred books of the E. have been ed. and trans. Upon this basis arose the study of comparative R.: the different elements of each R. were compared, and attempts made to reach the common thought that had dictated them. The meanings of primitive rites were made clear by comparison, and such ideas as sacrifice were traced through various Rs. The question of dependence of one R. upon another was also illustrated by this method.

In itself the study of comparative R. neither proves nor disproves the truth of any one of them, nor does it seek to do so; it does, however, show that while some are higher or more intelligent than others, yet there is a certain universality of idea. There has been a considerable danger of assuming that every likeness proceeded from essentially the same idea, whereas such analogies may be superficial.

Another study, the psychology of R., proceeding also on a factual basis, examines the various states of man under religious influence. Without entering into the question of what influence the Divine may exercise, it examines the state as it is from a human point of view, and so studies such phenomena as ecstasy, frenzy, diabolic possession, sudden conversion, faith healing. Thus it will distinguish how far these things are explained by purely natural causes, and how far these causes do not explain what may be found. Many books have been written also on what is called the philosophy of R. This is a reasoned attempt to demonstrate the value of R. to man's moral nature; to a large extent this branch of study coincides with natural theology (*q.v.*).

It is not possible either to summarise the numerous forms of R., or even to classify them adequately, since the lower ones often contain elements preserved in the higher. Indeed, it is only by these elements that they may be distinguished from superstition. It may be pointed out, however, that there are three strata, *viz.* (1) the animist type, in which the forces of nature are identified with the higher powers; (2) polytheism, in which the gods exist separately and in their own right as persons above this universe, and this may be subdivided by the fact that higher Rs. here show a positive moral code, where lower ones are confused and meaningless; and (3) monotheism.

The state of R. in the world to-day may be summarised in broad outline as follows: (1) Heathen, taking this term to include animist forms of R., and generally the lowest forms: central regions of S. America; the native tribes of Canada, Siberia, and Australia; central Africa. Animism prevails among Negroes, Red Indians, Maoris, Javanese, Finns, and the

old Mexicans. (2) Judaism, the R. of the Jews (*q.v.*), is strictly monotheistic, and is the basis of Christianity (*q.v.*) and Mohammedanism (*q.v.*). The essential religious interpretation of Judaism is ethical monotheism, that is, the belief in a code of morals bound up inseparably with the belief in one spiritual force, called God. It is Israel's legacy to mankind to have been the first monotheistic people. By reason of the vicissitudes through which its adherents have passed, Judaism has assimilated much from different sources, but the doctrine of the unity of God has ever remained intact. Indeed Judaism insists on a unity without qualification and rejects entirely the Christian Trinity. The Heb. Bible (*q.v.*) is the most complete record of Judaism, and on its principles and laws is built the whole structure of this R. God's ethical qualities of righteousness, holiness, faithfulness, and grace come into particular prominence in the teaching of the prophets (see PROPHECY). The number of Jews is relatively small, *viz.*, about 12,000,000 (in 1939 there were about 17,000,000, but 6,000,000 were massacred by the Nazis), of whom 4,700,000 are in Europe, 5,250,000 in N. and S. America; 1,220,000 in Asia, including Israel; 625,000 in Africa; 38,000 in Australasia. These figures are approximate estimates. (3) Brahminism (*q.v.*), the anct. polytheistic R. of India, where it still holds the vast majority of the people. Hindus are computed at 230,000,000. (4) Buddhism (*q.v.*), in offshoot of Brahminism, founded at Benares about 500 B.C. by the monk-philosopher Buddha, who taught a system of ascetic philosophy aiming at self-annihilation and absorption into the impersonal god Brahma. It subsequently spread to the N., and is found in Tibet, China, Korea, and Japan, and to the S., where it is found in Ceylon, Burma, Java, and Siam. Both branches differ considerably from the original philosophy in their popular worship of a number of deities, including Buddha, but the S. branch is closer to it than the N. As practised by the masses Buddhism is a polytheistic R. Adherents are reckoned at 150,000,000, of whom 12,500,000 are in India. (5) Shintoism, the native R. of Japan. It is a mixture of nature worship and the veneration of ancestors. As a number of deities are worshipped it may be classed as polytheistic. Owing to the success of other Rs., *e.g.* Buddhism, etc., it claims only a minority of the people, *viz.* about 25,000,000. (6) Confucianism, dates from the philosopher Confucius (*q.v.*), who lived in the Shantung prov. of China 537-478 B.C. His teaching accepted the prevailing R. of his country, which it embodied, and reinforced with his own moral and social teaching. It is a mixture of monotheism with the worship of inferior nature-spirits. In popular Confucianism ancestor worship plays a large part. It became the State R. of China, and numbers 350,000,000, including in this number followers of Taoism (see LAO TSE), a gross form of idol worship. (7) Christianity, founded from Judaism at the

beginning of our era by Jesus Christ, is strictly monothelistic. It was originally mainly an E. R., but since the conquests of Mahomedanism its predominance has been mainly in the W. To-day the bodies professing the Christian name may be classified as the Rom. Church, the Protestant churches, and the Orthodox churches. In Europe Rom. Catholicism is the predominant R. of the Lat. countries, S. Germany, Ireland, Poland, and Belgium. Protestantism is the dominant R. of the other N. countries. Orthodoxy prevails in the countries of E. Europe, viz. Greece, Yugoslavia, Bulgaria, Rumania, and was the profession of Russia until the Soviet revolution. All three branches have missions in the three continents of the new world. Central and S. America is Rom. Catholic, as far as it is Christian; N. America has 26,000,000 Protestants and 24,000,000 Rom. Catholics. There is a fourth smaller body known as Coptic Christians in Abyssinia and Egypt. General figures for these bodies are as follows: Rom. Catholics, 330,000,000; Protestants, 137,000,000; Orthodox, 30,000,000, outside the U.S.S.R., of which there are no figures available (though there is to-day a body called the Soviet Christian Church); other minor bodies, especially Copts, 7,750,000. In England and Wales the main figures are: Anglican (the 'estab. R.'), 2,134,897 communicants; Rom. Catholics, 2,700,000 (approximate official figure); other major Protestant denominations, approximately 2,328,000. In the U.S.A. 49 per cent of the pop. belong to a religious denomination, mostly Christian, 51 per cent have no ascription. (8) Mohannedanism or Islam is a strictly monotheistic R., founded by Mohammed, inspired by Judaism (q.v.) and Christianity (q.v.). The *hejira* or 'flight' (of Mohammed from Mecca to Medina) took place in 622, the official starting-point of the Moslem era. Mohammed's early message, based on the Heb. Bible, was: God is one; He is all powerful; He is the creator of the universe; there is a judgment day; splendid rewards in paradise await those who carry out God's commands, and terrible punishment in hell those who disregard them. The Koran, the sacred book of Mohannedanism, is divided into 114 chapters, containing 6239 verses, 77,934 words, and 323,621 letters. Conquests of the seventh and eighth centuries made Mohannedanism the dominant R. in the lands between India and the Atlantic Ocean. It spread later to W., central, and S.E. Asia, a great part of Africa, the Balkans, and to what is now S. or S.E. Russia. There are 221,825,600 Moslems, including 7,500,000 in China, and about 80,000,000 in Pakistan and India. There are about 100 sects, including the Shi'ites (mainly in Persia), Kharijites, Qarmatians, Ismaelites, Assassins, and the Sunnites, who form the great majority of Moslems.

Remagen, tn. in Germany, on the l. b. of the Rhine, 25 m. N.W. of Coblenz. It is built on the site of Rom. and Frankish tns. In March 1945 the Allies first crossed the Rhine at R. Pop. 5500.

Remainder, see CONTINGENT REMAINDER.

Remand, Remand Homes, and Remand Centres. A court of summary jurisdiction is empowered to remand an accused person either in custody or on bail, with or without sureties. The remand may be for the purpose of obtaining further evidence necessary for the trial, or it may be ordered after conviction but before sentence to procure information that would shed light on the most suitable method of dealing with the offender. No single period of remand may exceed three weeks. Under the Criminal Justice Act, 1948, it can be made a condition of remand on bail that the accused should undergo a medical examination at a specified institution, or by a specified medical practitioner. Unless there are valid reasons to the contrary a court is expected to remand an accused person on bail. An adult person remanded in custody is sent to a prison. Prisoners on remand and those awaiting trial by the higher courts are kept separately from other prisoners. Though they have certain privileges as to food, etc., they are subject to the general discipline of the prison, but are not required to work unless they wish to.

Since juvenile offenders cannot nor-

mally be sent to a prison special remand homes have been set up for them. These homes also provide accommodation for those who are awaiting vacancies in approved schools, whether they are delinquents or care and protection cases. Moreover, a child or young person found guilty of an offence punishable in an adult with imprisonment may be sent to a remand home as a penalty for a period not exceeding one month. The remand homes are controlled by the local education authorities, but under the Criminal Justice Act, 1918, no premises may be used for this purpose unless previously approved by the secretary of state, who must also approve the appointment of the persons in charge.

Since one of the aims of the Criminal Justice Act was to keep young adults out of prison, state remand centres are to be set up for offenders aged seventeen to twenty-one. These must have facilities for the observation of offenders on whose physical or mental condition a medical report is required by the courts. They will also be empowered to take young persons, aged fourteen to seventeen, on whom such reports are required if no other facilities are available, and those of this age who are 'too depraved or unruly' for a remand home. Until the remand centres come into being this latter group can still be sent to prison.

There is still no state provision for the observation of children under fourteen. Under the Criminal Justice Bill, 1938 (dropped on the outbreak of war), it was proposed to set up state remand homes for this purpose. There was no corresponding clause in the 1949 Act, though local remand homes are not usually large enough to provide the technical facilities needed.

Remarque, Erich Maria (b. 1898), Ger. novelist, b. at Osnabruck, his real name being Krause. He fought in the army in the First World War. He made his name with the war novel *In Western Nights*, trans. into Eng. by A. W. Wheen, under the title *All Quiet on the Western Front*, and pub. in 1929. In Germany, over which country it swept like a gospel, 500,000 copies were sold in less than three months from pub. It went further than the frankness of Zola, being brutal and devoid of romanticism, but alive with a terrible realism and pathos. It followed a spate of books on the First World War, mostly of indifferent merit, but outvalued its predecessors in its universality and detachment and in its avoidance of both rhetoric and any attempt to propagate pacific socialism. His later novels, though not so outstanding, continued the theme of a world in which the individual was crushed by the irrationalism and blind cruelty of the world. These are *The Road Back* (1931); *Three Comrades* (1937); *Floresam* (1941); *The Arch of Triumph* (1946). After living in Switzerland for eleven years he went to the U.S.A. and became an Amer. citizen. In 1938 the National Socialists had deprived him of Ger. nationality.

Rembrandt, Harmens van Rijn (1606-1669), Dutch painter, b. in Leyden. His family recognised his artistic talent, and he was sent to study painting under Jan van Swanenburch. He then went to Lastman's studio in Amsterdam, and returned to Leyden to begin his career as a painter. His brilliant drawing and skilful use of oils estab. his reputation, and in 1631 he settled in Amsterdam. He married Saskia van Uylenborch in 1634, painting her many times. To this period belong his most light-hearted and gay pictures. He was extremely successful, but the fortune he amassed was soon dissipated by his extravagances. Saskia died in 1612, and R. married his housekeeper, Hendrickje Stoffels, a peasant. His last years were marred by financial

REMBRANDT

troubles; his prestige as an artist fell, and his eyesight began to fail. He died neglected, in poverty.

R. stands pre-eminent among the Dutch masters, and his work equals the skill and beauty of Velazquez or Titian, while in his expression of spirituality he has no rivals. He was a most prolific painter, and some 600 of his paintings, 2000 drawings, and 300 etchings are extant. He led the reaction against 17th-century naturalism in place of artificial classicism. In oils he painted portraits, landscapes, and religious subjects. His work can be grouped into three periods. At the time of his first marriage it already shows signs of his preoccupation with the effects given by using a full light upon the central point of interest, but he exercises the care in detail of a beginner, and frequently shows himself indebted to the teaching of his masters. In the second period it's entire treatment of a painting is bolder and more individual. The soft gold and brown shades, so characteristic of his greatest work, appear increasingly often, and his contrasts of light have become more forceful and dramatic. The final

period represents his work at its most mature, and, to this time, belong the majority of his masterpieces. He had learned to employ with great effect the power of chiaroscuro which he had discovered. A rich, deep red frequently appears among the browns and golds. The same three stages of development can be traced in R.'s etchings. In his earliest work of this kind, his paramount concern was accuracy of detail. Later he freed himself from this preoccupation, and, in his hands, the etching ceased to be predominantly a design, and became, like his portraits, a medium through which R. could express depths of spiritual feeling which even Durer, the other master of the art of etching, never attained. In his masterpiece, 'Christ healing the Sick,' as in other etchings of his most mature period, R. used the dry point to emphasise light and shadow effects; and he attained a broad majesty of conception, while not neglecting detail essential to his design and theme. His portraits are intensely lovely because of the depth and beauty of their characterisation. The character of R.'s painting is so unusual and so strong that his name has come to stand for certain marked features in art. He delighted in using strong contrasts in dark and light, and was an unsurpassed master in the use of shadows and half-tones. The strongest point of light in a picture expressed the crux of the subject. His portraits express intense humanity, and his studies of old people, peasants, and beggars are remarkably fine. R. excelled in minute detail, yet his works which contain large groups of people are wonderfully well composed. This skill of composition is admirably shown in 'The Syndics,' where, in spite of each study being strong as an individual portrait and apparently of equal importance, R. has made the picture a united whole, rendering as a complete study portraits of six distinguished gentlemen. His other works include 'Wedding Breakfast,' 'Portrait of Saskia,' 'Elizabeth Bath,' 'The Lesson in Anatomy,' 'The Night Watch,' 'Old Woman cutting her Nails,' 'Pilgrims at Emmaus,' 'Descent from the Cross,' 'Christ Healing the Sick.' The Brit. Museum contains a fine collection of his etchings and sev. of his pictures are in the National Gallery. See lives by G. B. Brown, 1907; J. Larn, 1925; O. Benesch, 1935; A. M. Hind, 1938; H. Dumont, 1948; and J. Rosenberg, 1949.

Remembrancer, King's, officer of the Exchequer dept. whose duties were to record certain documents and proceedings and issue processes. The officials so styled were formerly called clerks of the remembrance, and they were three in number, the K. R., the lord treasurer's R., and the R. of first fruits. The duties of the first and second of these offices were united by an Act of 1833. The style of R. is also applied to certain corporation officers, as, for example, the R. of the city of London.

Remigius, Saint (c. 440-533), apostle of the Franks, b. at Cerny or Laon; son of Emile, count of Laon. He probably

studied at Rheims, where, although a young man, on account of his learning and sanctity, he was elected archbishop in 459. He converted Clovis, king of the Franks, with the assistance of St. Vedast and Clovis's wife St. Clotilda. He erected bishoprics at Tournai, Cambrai, Terouanne, Arras, and Laon. He died at Rheims. His feast-day is Oct. 1.

Remington, Philo (1816-89), Amer. inventor, b. in Lithfield, New York. He superintended the mechanical dept. of his father's small-arms factory, and invented the breech-loading rifles and typewriter which bear his name.

Rémiremont, tn. in the dept. of Vosges, France, 16 m. S.E. of Epinal, on the Moselle. Its chief buildings of interest are the palace of the nuns and an old church originally belonging to them. The tn. manufs. cotton and leather goods. There was severe fighting near it in the Second World War, from Sept. to Nov. 1944. Pop. 10,300.

Remittent Fever, form of malaria in which the paroxysms are not separated by an apyretic interval, but proceed from a degree of great intensity to one of less intensity, and again to one of great intensity. The disease is caused by the malaria parasite carried by the *Anopheles* mosquito, and is characterised by the same general symptoms as other forms of malaria. The periodicity may take the form of quotidian or of double quotidian fever, except that the hot stage is prolonged and the cold stage shortened. When the patient nears recovery, and the paroxysms are diminished in intensity, the disease may take on the true intermittent form. The attack commences with chills and a feeling of weakness; but there is no shivering as in the cold fit of the intermittent, or, if there is, it is of very short duration. The hot stage sets in, the symptoms of thirst, delirium, quick pulse, enlarged spleen, and scanty urine common to malarial affections are intensified, with the addition of vomiting. The paroxysm may last six, twelve, or twenty-four hours, then a remission takes place; the pulse becomes slower, and the temp. falls, though it does not become normal. The remission continues for some hours, and then the symptoms begin to intensify. The treatment consists of systematic administration of quinine. See MALARIA.

Remizia (Remijia), genus of tropical trees of the order Rubiaceae, from which comes the caprea bark used in manufacturing quinine, especially from the species *R. villosa*. The bitter principle of the bark is 'vicine', or vicic acid.

Remonstrance, Grand, statement introduced into Parliament by Pym (q.v.) in 1611, which narrated in a series of clauses the alleged various unconstitutional acts and illegalities of Charles I., both in church and state matters, since the beginning of his reign. The debate on the G. R. was followed by a div. in which it was carried by eleven votes, and ordered to be printed as an appeal to the nation. The debate marked the emergence of a strong Royalist party in the Commons.

Remonstrants, Dutch Calvinist sect, founded by Arminius (q.v.). The name became attached to the group in 1610, after its members had sent a remonstrance to the states, denying that they wished to cause a conflict in the church. Prince Maurice secured their proscription in 1625, and they suffered bitter persecution until his death (1652). For doctrine see under ARMINIUS, JACOBUS.

Remora, see STUCKING FISH.

Remote Control, controlling of apparatus by electrical or mechanical means, usually by levers or switches, situated at a distance from the object being controlled. An example of R. C. is the pilotless aircraft known as the 'Queen Bee,' used by the artillery for target practice. This type of aircraft is controlled by radio, as also are pilotless boats. A further example of R. C. is the electrical equipment of large machines. By means of push buttons situated around the machine the electrical drive can be controlled by the operator even though the main control apparatus is some distance away. The photo-electric cell (see PHOTOC-ELECTRICITY) has sev. applications, for controlling street lamps, opening doors, etc. Automatic telephone exchanges and other systems utilize the relay (q.v.). There are also methods of R. C. for the guidance of aircraft (see RADIO DIRECTION FINDING).

Remscheid, city of Germany, 18 m. E.S.E. of Düsseldorf. It is an important centre for the manu. of small steel and iron goods. It is noted for some fine baroque buildings. Pop. 101,200.

Remsen, Ira (1816-1927), Amer. chemist, b. in New York city, and educated in New York and Tübingen, Germany. He did research in pure chem. and became prof. of chem. at John Hopkins Univ. in 1876, and president from 1901 to 1913. In 1879 he founded the *American Chemical Journal*. In the same year he described in this jour. a new compound which he had discovered (with Fahlberg). This became known as saccharin.

Remus, twin brother of Romulus (q.v.).

Rémusat, Charles François Marie (1797-1875), Fr. statesman and man of letters, b. in Paris. He took to journalism at an early age, and also studied law. From 1830 to 1848 he was a member of the Chamber of Deputies, and in 1840 minister of the interior. After the *coup d'état* he was exiled, but returned to Paris in 1871, and became minister of foreign affairs under Thiers. During his absence from public life he devoted himself to literary and philosophical studies. Amongst his works are *Essais de philosophie* (1842); *L'Angleterre au XVIII^{ème} siècle* (1856); *Histoire de la philosophie en Angleterre depuis Bacon jusqu'à Locke* (1875); two philosophical dramas, *Abelard* (1815) and *La Saint-Barthélemy* (1878); and studies on various noted men, including Bacon, Channing, Herbert, Wesley, etc. His letters were pub. 1883-86.

Remy de Gourmont, see GOURMONT.

Remy, St., see under RHIMES.

Renaissance, or **Revival of Learning** (Fr. *renaître*; Lat. *renascari*, to be born

again), name given to the important movement which marks the birth of modern Europe. The word was first applied to the revival of Gk. and Lat. forms in architecture and literature in Italy. But the R. was more than a pure return to aet. forms. Although it professed in some ways to despise the Middle Ages, it nevertheless emerged from the preceding centuries and owed much to them. Indeed, no definite line can be drawn between the R. and the period called medieval: R. tendencies existed alongside the medieval for centuries, and only gradually did society become wholly coloured and transformed by them; Dante was writing when the medieval world was apparently at its zenith. But the R. had qualities peculiarly its own. It represented an outburst of individualism, a new freedom of thought and action, a quickening of personality on every side of human life, from fashion in dress to speculation on this world and the next. It was intensely curious and intensely interested in humanity. With this interest in man came a new interest in the workings of nature and in science. There was a broadening and sharpening of a critical faculty which, though kept alive by the schoolmen, had not developed far in the atmosphere of ultimate reverence for authority which marked the Middle Ages. The R. began in Italy, which, though politically disunited and vulnerable to foreign invasion, possessed the standard of material well-being necessary for cultural development. Milan, Florence, and Venice especially had accumulated wealth by trade over a long period, and the growth of this middle-class urb. interest had broken the back of feudalism in N. and central Italy much earlier than elsewhere in Europe, except for similar areas of mercantile prosperity in Flanders and in some Ger. free cities. Italy, however, possessed other advantages which these areas lacked. She had a direct connection with the Rom. world; her geographical position and trade had kept her in constant and close touch with Greece and the E.; she had early developed a national language and literature, and was the home of a rich and intellectually enlightened papacy. Historical opinion is now generally inclined to the view that Europe was on the verge of discovering the impulses of the R. at the time when the R. percolating Italy from Byzantium, discovered Europe; Italy's geographical position was decisive in making her the centre of the new ideas. A new energy seemed to vitalise society. The R. ideal, unlike that of the medieval schools, was not of the specialist but of the all-round man, illustrated by the career of Leonardo da Vinci (q.v.), who was not only a painter, but a philosopher, metaphysician, athlete, inventor, and naturalist.

The medieval world had never entirely lost touch with the literature of classical times, but its knowledge was confined to a few writers, and was very fragmentary. In the days of Petrarch (1304-1374) it began to search more diligently for the lost treasures of Gk. and Rom. writers, to copy the style of the Romans,

and to learn Gk. Petrarch both sought classical learning himself and inspired others like Boccaccio to follow the same path. This movement grew in volume and vigour strengthened by successive discoveries of the writings of Gk and Lat authors. Long before the capture of Constantinople by the Turks (1453) teachers of Gk like Chrysoloras (c. 1400) found their way to Italy though the fall of Byzantium naturally accelerated the trend. The collection and copying of MSS became a considerable industry and libraries were established to house the precious texts, such as the Laurentian Library at Florence. Critical scholarship increased with the coming of printing.

Humanism was not confined to Italy. Reuchlin (1455-1522) (q.v.) furthered the knowledge of Gk in Germany though he

John H. Stone

RENAISSANCE ARCHITECTURE IN ENGLAND
Fan vaulting in the roof of the Henry VII
Chapel, Westminster Abbey

was more interested in Heb and the Bible than in Latin learning. This preoccupation with the spiritual characterises the N R. Through Reuchlin and von Hutten in Germany, Lefèvre d'Étaples in France, Linacre, Grocyn, Colet and More in England and above all through Erasmus of Rotterdam the humanism of the R in Italy was connected indirectly with the Reformation in religion. Many of these humanists never swerved from their adherence to the Catholic Church. More died rather than deny its sacraments, and it is now generally acknowledged that, but for other existing conditions, the R might have encouraged merely religious reform and not the break up of religious unity. As it was however the New Learning helped to dispose men's minds for the Reformation. In France the R gave a new stimulus to literature as may be seen in the lyric poetry of Ronsard and the Pléiade. In prose Rabelais's vast novels exhibit the freedom licence and immense vitality of the new humanism. In Montaigne can be found the intense interest in the individual and the clarity of expression to be typical of the greatest age of Fr prose. In England the beginnings of the R can be seen in the works

of Chaucer. In the early sixteenth century its beginnings appear in the centres of learning at Oxford and Cambridge and its earlier exponents include earnest and strenuous scholars like Roger Ascham, Nicholas Udall, and Sir John Cheke. The full flowering of R literary ideals is reached in the Elizabethan epoch. Sidney and Spenser have their continental counterparts but in the plays of Shakespeare literary skill is combined with a deep interest and understanding of human nature making Shakespearean drama among the highest expressions of the finest things for which the R stood.

But the revival was not merely literary. From the first the spirit as well as the letter of classical times appealed to the men of the new age. So to the humanists of the R neither the manner nor the matter of the scholastic education sufficed any longer. In this more secular age the classical writers were to be read and interpreted by and for themselves. That these writers were pagan did not prevent popes like Pius II or Leo X from fostering their study. In this art and literature the humanists found a new ideal of beauty and freedom. This led sometimes to corruption and licence though it would be inaccurate to attribute the moral decadence of the period in Italy to the classical revival. Guicciardini and Machiavelli the two greatest historians of the It R found their inspiration and model in the ancient political and historical writers, notably Livy. It was not however the arts, letters or philosophy of the Gks that attracted Machiavelli but the histories describing the statecraft and organisation of the Romans. Guicciardini's *Discorsi e Ordini* equally with Machiavelli's *Principe* represents the spirit of the It people in the last phase of the R. The great exponent of the spirit of classical literature in Italy in the same period was Ariosto. The new interest in the individual led to the development of biographical and autobiographical writing. The educationists of whom da Vinci's outstanding work *De hominis educatione* is a study largely on classical models and on the study of Lat and Gk.

Modern architecture is directly descended from that of the It R. Men had not lost touch with the ideas of Rome and Byzantium but now interest became more specialised. The definition of the various classical orders of architecture by Vitruvius the Roman architect and engineer of the Augustan age was revived and applied especially by Palladio (1518-80). But R builders did not copy slavishly. They adapted and combined classical and above all Roman forms with existing styles so that an altogether new type of architecture finally evolved. In Italy Florence led the way. Brunelleschi's dome for the cathedral (1436) serves as an outstanding example of the new trend. St Peter's Rome, which contains examples of the various stages of R architecture, is another. The It styles spread to France, partly through the Fr invaders of the country and there found its best expression in secular royal buildings, like Font-

tainbleau and the early Louvre. In Germany, Heidelberg Castle and many tn. halls (*Rathhäuser*) of the free cities show the transition from Gothic to the new ideas. Antwerp tn. hall (1565) illustrates their penetration to the Low Countries. In England the transition to classicism was slower, and unique in character. The last glories of Eng. Perpendicular owe part of their charm to R. touches of decoration: a fine example of the combination of Perpendicular and baroque can be found in the ceiling treatment in one of the smaller chapels of Ely Cathedral. The gracefulness of the Eng. architectural R. owes much to the interest of Henry VI. and Edward IV. in the arts, while the disturbed state of the country during the wars of the Roses, by making building operations more protracted, ensured that the transition should be slow, an adaptation rather than, as in Italy, complete rebuilding (except in necessary cases, like St. Paul's). Not till Inigo Jones returned from Italy in the seventeenth century did the change become rapid, to reach its zenith with Wren.

The genius of the R., its freedom, love of beauty, joy in nature and humanity, found its most complete expression in painting. The development was partly one of technique, marked by the increased knowledge of perspective, of light and shade, of the anatomy of the human body, the discovery and growing use of oil for painting. The growth of variety and luxury in dress at this period affected painting, as did the increased interest in secular life. Religious scenes were still painted, but artists dealt increasingly with the life around them. They concentrated more on portraits and painted scenes from pagan mythology. Da Vinci and Raphael achieved perfection of draughtsmanship and colour-work, but after them lt. painting declined, though its technical skill was retained. Outside Italy the rise of a new spirit in art is best seen in Germany and Flanders. Dürer and Holbein are the two outstanding Ger. artists. In Flanders, where there was an accumulation of wealth comparable to that of the N. It. tns. there was a native growth of painting independent of Italy, and of great importance. In the early fifteenth century the Van Eycks brought a new science of colour into painting. Bouts and Memling contributed an accuracy of perspective and a better knowledge of humanity. The Brueghels based their interpretation of Flem. secular life on these foundations.

The R. opened up new fields in every branch of science. Ptolemy's theory that the earth was the stationary centre of the universe was destroyed. Copernicus, Brahe, Kepler, and Galileo were the founders of the new school of inquiring astronomers whose ideas were too strong to be quelled by any opposition. Other sciences also developed. Astronomy depended on the parallel developments in mathematics and physics. Modern chem. was slower, but already the Swiss, von Hohenheim (1493-1541), had declared that the true work of chem. was not to make

gold but to prepare medicines. Medical knowledge was progressing. The new interest in man led to the closer study of anatomy. It has been seen how this influenced painting. It also led to further developments in the field of medicine itself, such as the discovery of the circulation of the blood by Wm. Harvey in the early seventeenth century. Printing, which was to make knowledge so much cheaper and widely accessible, has already

Anderson

'Beatrice D'Este' by Leonardo da Vinci.

been mentioned: the telescope, microscope, and the spiral spring, which provided the first watches, were among other inventions.

The development of navigation, with the use of the astrolabe, quadrant, and sextant, their use bound up with the growth of astronomy, and the revival of the classical interest in cartography both affected and were affected by the explorations which marked another side of the R. In Spain and Portugal the main energies of the new age were directed to this channel; and in England and France exploration and colonisation, though they came later, were also important. The significance of the discoveries can hardly be exaggerated. The widening of the physical horizon brought a corresponding extension of the intellectual horizon, which profoundly affected the political, philosophical, and religious ideas of the

next centuries. See also ARCHITECTURE; PAINTING; FRANOR, *Literature and Art*; ITALIAN ART; ITALY, *Literature*; ERASMUS; LEONARDO DA VINCI; RAPHAEL, etc.

Renal Calculus, see under CALCULUS.

Renan, Joseph Ernest (1823-92), Fr. philosopher, philologist, and historian, b. at Tréguier, Brittany; he studied originally for Rom. Catholic priesthood, but quickly abandoned this vocation. In 1840 he studied philosophy at Issy, and later at St. Sulpice, and in 1845 proceeded to the Oratorian lay college of Stavistas. He became deeply interested in the study of oriental languages, and in 1847 he won the Volney prize (Institut de France) by an essay on Semitic languages, and wrote also the *Future of Science*, pub. 1890. This is noteworthy as foreshadowing later developments; in it he anticipated a state in which philosophy and culture should supersede politics and religion. During 1849 he travelled in Italy, gathering material for his thesis on *Averroës* (pub. 1852). He became a member of the Académie des Inscriptions in 1856. His *Études d'histoire religieuse* (1857) and *Essais de morale et de critique* (1859), including the celebrated essays on *Celtic Poetry*, on *Critical Historians of Jesus*, and on *Feuerbach*, and his new trans. of the Book of Job and the Song of Songs (1859), appeared prior to his Syrian tour (1860). On his return from Syria, he succeeded Quatremère as prof. of Heb. at the Collège de France; but his rationalistic attitude caused his suspension until 1870, after the siege. Meanwhile he began his great 'History of the Origins of Christianity': *Vie de Jésus* (1863); *Les Apôtres* (1866); *St. Paul* (1867); *Antichrist* (1873); *Les Évangiles* (1877); *L'Église chrétienne* (1878); and *Marc Aurèle* (1880). The *Life of Jesus*, in which R., writing purely as critic, philologist, and historian, accepted Jesus simply as an inspired but human philosophic teacher, caused an immense uproar in orthodox circles; and no fewer than 1500 books and pamphlets appeared in controversy during the ensuing twelve months. The remaining years of his life were occupied chiefly with his philosophic dialogues and dramas (1878-88), his *Souvenirs* (1883), and the 5-vol. *Histoire du*

peuple d'Israël (1887, et seq.). In 1878 he became a member of the Fr. Academy, and two years later gave a course of Hibbert lectures in England on *The Influence of Rome on Christianity*. R. was a master of language; his prose is the finest produced in France during that epoch. His philosophy contains half-truths and superficialities caused by his habit of sliding over, rather than facing, difficulties. Yet his research caused a controversy which survived his death and affected the position of institutional Christianity to an extent hard to estimate. R. always denied that he was an atheist. See lives by H. Taine, 1891; G. Sorel, 1906; and M. Weller, 1945.

Rendsburg, tn. of Schleswig-Holstein, Germany, on the Kiel Canal, 16 m. S. of the port of Schleswig; it has manufs. of textiles, pianos, fertilisers, leather, and beer. During 1841-51 it was the seat of the provisional government of the insurgent Holsteiners. Pop. 19,500.

Renegade (Sp. *renegado*, a turn-coat), term used of Christians who became Muslims to escape persecution. It now denotes one deserting a faith, cause, or country for an opposing one, for reasons other than conscience.

René the Good (1409-80), duke of Anjou and Lorraine and count of Provence and Piedmont, second son of Louis II., king of Sicily and Naples, b. at Angers. He succeeded to the dukedom of Anjou on the death of his brother, Louis III., and to the kingdom of Naples through the death of his brother, and of Joanna, queen of Naples, the last heir of the earlier dynasty. Although he retained the title, he failed to establish an effective claim. In 1411 he negotiated with the Eng. at Tours, and he married his daughter Margaret to Henry VI. the following year. R. encouraged art and literature, and founded numerous charities, which earned for him his title. He himself wrote some verses and poems, his works being pub. at Paris and Angers in 1813-16. See J. Staley, *King René d'Anjou and his Seven Queens*, 1913, and E. Trenkler, *Das 'Livre du cuer d'amours esprais' des Herzogs René von Anjou*, 1916.

Renfrew: 1. Royal and municipal burgh, and co. tn. of Renfrewshire, Scotland, on the Clyde, 6 m. W.N.W. of Glasgow; it has shipbuilding and various engineering industries, and manufs. of iron goods and chemicals. In 1786 it was connected with the Clyde by a canal, and new docks and basins to accommodate the largest vessels have since been completed. There is an airport. It claims to be one of the oldest burghs in Scotland. It has lost some of its former importance; it was once a great Clyde port. Pop. 17,500. 2. Tn. of Renfrew co., Ontario, Canada, on the R. Bonaventure, 58 m. W. of Ottawa; it has manufs. of textiles and machinery. Pop. 5700.

Renfrewshire, S.W. co. of Scotland, bounded N. and W. by the frith of Clyde, E. by Lanarkshire, and S. by Ayrshire. It is 30 m. long and between 10 m. and 14 m. wide, with an area of 240 sq. m. The surface is diversified, but rises towards

its S. border, the highest peak being the Hill of Stake (1710 ft.). The co. is watered by the Clyde, the Gryfe, and the White and Black Cart. The grassy uplands afford pasture for large numbers of sheep and cattle, and dairy farming is extensively carried on. Agriculture is an important industry, and the minerals include coal, copper, ironstone, and barytes. Greenock, Port Glasgow, and Paisley are the prin. tns., the first two being important seaports; smaller tns. are Johnstone and Barrhead. The co. tn. is Renfrew, and Gourock is a popular holiday resort. There are manufs. of thread and cotton (chiefly at Paisley), bleaching works, pottery, chemical works, and sugar refineries. Engineering and shipbuilding are also engaged in. The co., which once formed part of the anct. prov. of Strathclyde, returns two members to the House of Commons. Pop. (1939) 321,200. R. was the heritage of the Stuarts, and it has given its name to one of the titles borne by the heir-apparent since the time when Robert III. made his son baron of Renfrew. William Wallace is said to have been born at Elderslie, near Paisley. The battle of Largs (1263) was fought within the co. Antiquities of interest include sculptural stones at Inchlunan.

Reni, Guido (1575-1642), see GUIDO.

Reni, tn. in Bessarabia, on the Danube, near its confluence with the Pruth, 110 m. S.W. of Odessa. Pop. 8300.

Renmark, port of S. Australia, on the R. Murray, 75 m. W. of Morgan, with which it is connected by a steamer service. It was one of the earliest irrigation colonies, being estab. as such in 1887. Fruit-growing is estab. on a co-operative basis. Many of the settlers are ex-soldiers, settled on land specially developed for them after the two world wars. Pop. 4300.

Renn, Ludwig (b. 1889). Ger. author, b. in Bresden, his real name being Arnold Vieth von Golschmann. His first novel, *Krieg*, a harsh and realistic treatment of the First World War, caused a sensation on pub., and in Germany almost equalled the popularity of Remarque's *In Western Nichts Neues*. Later R. became a Communist. His later novels include *Nachkrieg* (1930); he pub. his autobiography, *Adel im Untergang*, in 1941.

Rennell, James (1742-1830), Eng. geographer, b. at Chudleigh, Devon. His studies of oceanography and topography greatly influenced the development of Eng. geographical research. His pubs. include *Memoir of a Map of Hindostan* (1783) and *An Investigation of the Currents of the Atlantic Ocean* (1832).

Rennell of Rodd, James Rennell Rodd, first Baron (1858-1911). Brit. diplomatist and classical scholar. Educated at Haileybury and at Balliol College, Oxford. After leaving Oxford, where he won the Newdigate prize, his first diplomatic post was in Berlin in the last days of Emperor Wilhelm I., of whom he was a personal friend. He was in charge of the Brit. agency at Zanzibar in 1893, and in Abyssinia in 1897 led a Brit. mission to

Menelik. In Egypt he served under Lord Cromer. He remained in Africa until 1901, returning to Rome as secretary of legation (1901), and from 1904 to 1908 was Brit. minister at Stockholm. In 1908 he was appointed ambas. to Italy, where with the Fr. ambas., Camille Barrère, he was largely instrumental in divorcing Italy from the Triple Alliance. After the First World War he went to Egypt with Milner's mission; served as Brit. delegate to the League of Nations, 1921-23; entered the Commons as Conservative member for Marylebone, 1928; and was raised to the peerage in 1933. His 3-vol. *Social and Diplomatic Memories* covers his career between 1884 and 1919. Other works: *Customs and Lore of Modern Greece* (1892); biography of Sir Walter Raleigh (1904); *The Princes of Achaia and the Chronicles of Morra* (1907); *Love, Worship, and Death* (1919, a Gk. anthology); *Rome's Itiaka* (1927); *Rome of the Renaissance and To-day* (1932); and sev. vols. of poems, including *Poems in many Lands* (1886).

Renner, Karl (b. 1870), Austrian lawyer, socialist, and statesman, b. at Untertannowitz, Moravia, the son of a farmer, and educated at Vienna Univ. He entered the Austrian Parliament in 1907, and became leader of the Social-Democrats. On the dissolution of the empire he led the Austrian delegation to St. Germain-en-Laye, 1919, where the frontiers of the Austrian republic were settled. From 1919 to 1920 he was chancellor. After the coalition on which his gov. relied fell, he devoted his time to the study of social organisation, and to the foundation of a number of non-political workers' institutions. R. was imprisoned for a short time after Dollfuss's murder, and after his release lived in retirement at Gloggnitz. After the Second World War he headed the provisional gov. set up by the Allies, his appointment having special Russian approval. But R.'s policy soon emerged as independent and to-tally devoid of any leanings towards Communism, and at the end of 1945 he was elected president of the Austrian republic. R.'s consistent support of Socialist principles never prevented him from making every effort to co-operate with the Catholic political groups in Austria, and his example of combined idealism and conciliation undoubtedly played a large part in the estab. of a post-1945 Austrian republic on W. European lines.

Rennes, tn. of France, cap. of dept. Ille-et-Vilaine, 51 m. S.E. of St. Malo. It has a univ. (founded in 1735), and an agric. school, and is the seat of an arch-bishop. It is an important railway centre and essentially a modern tn.—in spite of having been the anct. cap. of Britanny—as the old tn. was destroyed by fire in 1720 and had to be practically rebuilt. The Palais de Justice, built in the early seventeenth century, was the seat of the parlement of Britanny. The cathedral was begun in 1787, on an anct. foundation. The chief manufs. are textiles, leather, agric. implements, and crockery, and there are foundries and printing works. In 1356

It was besieged by the Eng. and in 1899 Dreyfus was tried here for the second time. R. was occupied by the Gers. in June 1940, and liberated by Amer. forces in Aug. 1944. There was little war damage. Pop. 113,500.

Rennet, preparation obtained from the fourth or R. stomach of the calf, having the power of coagulating or clotting milk so that the fat is entangled in the curd. A standard of strength is that one part of R. should coagulate 10,000 parts of sweet milk in forty minutes at a temp. of 95° F. It is prepared and obtainable in solution and as tabloids and powder. See also KENNIN.

Rennie, John (1761-1821), Brit. civil engineer, b. at Phantassie, E. Lothian, Scotland, and educated at Edinburgh Univ. In 1784 he entered the service of Boulton & Watt, being commissioned by them to construct machinery for the Albion Flour Mills, Blackfriars Bridge, London. In 1790 he began constructing canals, and amongst his numerous works in England are the Avon and Kennet, Rochdale, and Lancaster canals; Waterloo (since demolished and replaced by a new bridge), Southwark, and London bridges; the London and East India Docks on the Thames; Sheerness and Chatham dockyards; and Holyhead and Kingstown harbours. In 1798 he was elected F.R.S., and was one of the leading civil engineers of his age.

Rennin, or Chymosin, digestive enzyme or ferment found in the gastric juice of man and other mammals. It is responsible for the clotting of milk in the stomach by the conversion of soluble caseinogen into insoluble casein. Whereas liquid milk would pass quickly into the intestine, the clot is retained in the stomach, where the casein, a protein, is digested by the ferment pepsin, also present in gastric juice. A commercial extract of R. known as rennet (*q.v.*) is used for preparing junket from milk by the same process as occurs naturally in the stomach.

Reno, city of Nevada, U.S.A., and co. seat of Washoe co. on the Truckee R. It has an airport, and is served by the S. Pacific and other railways. It is the financial and commercial centre of Nevada and of that portion of California near the Nevada line, and is the largest city in the state. The state univ. is in R. Machinery, plaster, etc., are manufactured, and it is the centre of an agric. and mining area. But it has achieved world-wide notoriety as the so-called cap. of divorce. Nevada laws require only six weeks' residence in order to qualify to sue for divorce in its courts, and the laws stipulate a very large number of grounds upon which divorce can be claimed.

Renoir, Pierre Auguste (1841-1919), Fr. artist, b. at Limoges. He was apprenticed to a Paris porcelain-maker, and later painted fans and blinds. In 1861 he studied painting under Gleyre; he met Cézanne, Sisley, Monet, and Bazille. He became an Impressionist, and first exhibited at the Salon in 1864. Ten years later he took part in an exhibition with

other Impressionists. His early work is remarkable for its colour and gaiety; later he specialised in rendering texture, and in achieving subtle half-tones of colour. 'Les Parapluies' is a study of greys, blues, and lavender, skillfully combined to give a vivid impression of movement and constant variety within the limited colour framework. His famous paintings of nudes include 'La Baigneuse.' R. was a prolific and spontaneous painter; he did over 150 lithographs and 6000 paintings. He is best remembered for his colourful studies of contemporary Paris life. See lives by G. Besson, 1930; M. Florissoon, 1938; and G. Bazin, 1940.

Rent, money or other payment made for the use of land, and also for the use of houses or other buildings; i.e. it may be for the right to cultivate a given area, to occupy buildings on it, or to work minerals under it. It is therefore only a form of interest on capital. The older economists, while accepting this popular meaning, endeavoured to give the term more precision. They regarded R. as the share of production which accrues to the owner of the land, as opposed to interest and wages that accrue to the capitalist and the worker respectively. Ricardo elaborated a doctrine of R. based on the definition that it was the price paid for the use of the 'original and indestructible powers of the soil.' This is often referred to as economic R. In theory R. is fixed by an economic law: it is the amount which one will pay for land that is of greater value than no-rent land, as it is called. The net value of the crop produced on such land over the value of that produced on no-rent land will be paid by a tenant for its use, because the land is worth that much and no more to him; and the same principle is true of site values. This theory, however, requires qualification: as regards agric. land capital has been put into it in the shape of clearing, drainage, reclamation, buildings, etc., so that the R. is for the greater part interest on capital. In practice it is impossible to differentiate between the original powers of the soil and those arising from capital investment in improvements; while proximity to a market and suitability for alternative uses may also enter into the question. R. may therefore be said to be simply a periodical payment made by the tenant or *de facto* user of immovable property to the landlord or owner of it. The origin and development of such a relation is a matter of hist.; its regulation is a matter of law. In the early Middle Ages rents were paid by services (ploughing the lord's soil; knight service, etc.) and payments in kind. When the money economy was introduced, the services, etc., were commuted (e.g. by scutage (*q.v.*)). In this way originated the customary Rs., which became competitive Rs. when agriculture was pursued for gain. Competitive Rs. may become excessively high when agric. prospects seem especially good, as, for example, during the Napoleonic wars or when there is little or no alternative means of employment, as happened in Ireland,

when as a consequence Rs. had to be adjusted by Act of Parliament. Hence, under the Land Act, 1881, the Irish tenant was given fixity of tenure (subject to eviction for default), free sale, and 'fair' rent assessed by the land court, thereby instituting what was in effect a system of dual ownership. State control of free competition was introduced on a large scale during the First World War. Rents were restricted by special legislation and, after the war, increases in R. were regulated, and this system of rent restriction is still in operation. *See also* HOUSING; LAND LAWS; LANDLORD AND TENANT; RENT RESTRICTION.

Renton, vil. of Dumbartonshire, Scotland, on the R. Leven, 2 in. N. of Dumbarton. It was formerly engaged in bleaching and printing calico, but these industries have now been superceded by light engineering works. R. was the bp. of Smollett. Pop. 3000.

Rent Restriction. In 1915, to deal with the changed conditions due to the First World War, it became necessary to restrict by law the power of landlords to raise rents, as the serious shortage of houses would have enabled them to do this to an excessive extent. At first such legislation was only temporary, but the restriction has been continued ever since, with modifications, by a series of statutes (*see under* LANDLORD AND TENANT). Rent tribunals were estab. under the Furnished Houses (Rent Control) Act, 1946, and returns issued by the Ministry of Health in 1949 showed that 41,106 cases had been referred to the seventy-nine rent tribunals in England and Wales since the Act came into force (June 1946).

Rent Tribunal, *see under* RENT RESTRICTION.

Renunciation, *see* REPUDIATION.

Renwick, James (1662-88), Scottish preacher and Covenanter. He studied at the univ. of Edinburgh and Groningen (Holland), was ordained, and went to Dublin. In 1683 he crossed over to Scotland and preached at Darnead. The privy council of Edinburgh denounced him as a traitor, and so he wandered about preaching and publishing manifestoes for some five years, concealing himself in caves. Through not having acknowledged James II. (1685), R. again had to conceal himself, but at last he was caught in Edinburgh and executed.

Repairs, *see under* LANDLORD AND TENANT.

Reparations, payments, in money or kind, by a defeated country in accordance with the demands of the victors, such payments particularly used as 'reparation' of damages caused by the war. The expression was used particularly for the payments to be made by Germany after the First World War. The amount was left for later computation in the treaty of Versailles. Demands made in 1920 and 1921 (the London Conference of 1921 fixing a total of £6,600,000,000) proved unrealistic, and after a first payment in Sept. 1921 a moratorium was granted. In 1924 a new scheme, known as the Dawes Plan (q.v.), was agreed to. This failed, and in 1929 it was replaced by the Young

Plan (q.v.), which fixed a total of 37,000,000,000 marks, payable in fifty-nine ann. instalments, beginning with 600,000,000 marks, increasing to 1,200,000,000, and then decreasing again. This scheme also failed, and in 1932 an international conference at Lausanne decided to cancel R.

The question of R. for war damage is a great and intricate one. After the war of 1870-71 France had to pay to Germany the relatively small sum of 5,000,000,000 gold francs. This very soon threw the Ger. economy into a state of disequilibrium, the after-effects of which were long felt. If R. cannot be paid out of the gold reserves of the country concerned they must be paid in kind, i.e. through exports of goods and services. This means that the debtor country must be able to make these exports and the creditor countries must be willing to receive these exports, which, in fact, may compete with their own production. This is the 'transfer' problem, widely discussed in the nineteen-twenties. In fact the larger part of the R. then actually paid by Germany was met out of the Dawes and Young loans raised in allied countries, which later also helped Germany to rearm. One of the first who saw the mistakes of the R. policy was Mr. (later Lord) Keynes, who gave a warning voice as early as 1919. Although in fact R. were only a small burden on the Ger. economy they were a welcome pretext for nationalistic political agitation which preceded the advent of the National Socialist regime.

The allies were determined not to repeat these mistakes after the Second World War. R. on this occasion were to be paid not out of *current production*, but by the transfer of technical productive *capital* equipment (industrial plant, installations, ships, etc.) to the war-devastated countries in order to accelerate their recovery. The principles to be applied were decided at the Moscow and Potsdam conferences, viz. that (1) first and foremost Germany must be disarmed; (2) Germany should be treated as an economic unit; (3) no foreign credit was to be given to Germany for reparation purposes; (4) R. were not to be taken from current production; (5) with certain exceptions no payments were to be made in cash; (6) the standard of life in Germany should not be higher than the average standard in Europe; (7) R. must not prevent Germany from paying for essential imports. The Potsdam conference (q.v.) applied these principles in detail. Russia was to receive all R. from the Russian zone in Germany; also 10 per cent without compensation from the other zones and 15 per cent in exchange for various deliveries (and also Ger. assets in E. European countries). Russia to pay Poland her R. share. The other allies were to receive all R. coming from the W. zones (less 25 per cent for Russia) and Ger. foreign assets not allocated to Russia. Reparation questions between the allies (apart from Russia and Poland) were settled at Paris in Dec. 1945, where also the Inter-Allied Reparation Agency (for the distribution of Ger. R.) was estab.

Policy, however, on such a subject cannot be final, but must be adapted to changing conditions. As economic unification of Germany was frustrated by Russia, the permitted level of industry in W. Germany was raised in 1917, and an additional number of factories was exempted from dismantling for R. in Nov. 1949. The Russians did not keep the Potsdam agreement in that they took R. out of current production. Italy has to pay \$100,000,000 R. to Russia, partly from current production; Britain renounced her claim to R. from Italy in 1945. Russia is also receiving R. from Finland, Bulgaria, Rumania, and Hungary.

See J. M. Keynes, *The Economic Consequences of the Peace*, 1919.

Repatriation, return to their countries of origin of persons displaced therefrom as refugees or prisoners-of-war.

Repeal, formal abrogation of an Act of Parliament. Acts, however anct., which remain unrepealed, are still law, and cannot, in strict theory, lapse by desuetude, however incongruous their provisions may be with modern conditions.

Repeating Rifle, see RIFLE.

Repertory Theatre, strictly a theatre with a permanent company and a repertoire of plays, such as the *Comédie-Française*; there is no such theatre in the United Kingdom. The term is used for a theatre maintaining a regular company, on a seasonal basis, performing a fresh play, weekly or fortnightly, though the Old Vic and the Stratford-on-Avon Shakespeare Festival Company make a repertoire of their plays for the season. The oldest surviving R. T. is the Playhouse, Liverpool, which was founded in 1911. The Birmingham R. T., under the direction of Sir Barry Jackson, the first specially built theatre for the purpose, was founded in 1913 after sev. years' experimentation with an amateur company.

The Cambridge Festival Theatre (1926-1934), estab. by Terence Gray, specialised in modernist productions. In 1923 the Oxford Playhouse was founded. It has been reconstituted and rebuilt since its foundation, and presents a range of plays varying from classic pieces to popular farce and comedy, and plays by new writers. James Bridie founded the Glasgow Citizen's Theatre in 1913, to present plays of artistic or didactic merit which would not otherwise be seen in Glasgow in order to encourage a school of Scottish playwrights. There are other R. Ts. at Bristol, Northampton, Sheffield, Nottingham, Bradford, and elsewhere. Many theatres have repertory seasons from time to time. The Old Vic has a stock company for the performance of Shakespeare's and other plays. The Shakespeare Memorial Festival Theatre at Stratford-on-Avon is conducted on R. T. lines during the Shakespeare birthday festival (spring), and is followed by a summer season, when the permanent company gives a different play each night. The Arts Council conducts the Royal Theatre, Bristol, and the Arts Theatre, Salisbury, on a repertory basis, and is interested in repertory companies in Coventry and

Swansea. In 1946 *The Stage* listed 220 repertory companies, mostly on a commercial basis, as compared with seventy-five in 1939.

See D. MacCarthy, *The Court Theatre*, 1907; P. P. Howe, *The Repertory Theatre*, 1910; Bache Matthews, *A History of the Birmingham Repertory Theatre*, 1921; St. J. Ervine, *The Organised Theatre*, 1924; A. Nicoll, *The English Theatre*, 1936; and N. Marshall, *The Other Theatre*, 1946.

Repin, Ilya Yefimovich (1844-1918). Russian painter, b. at Tschuguev. He studied at the Academy of Fine Arts, St. Petersburg, for six years, and then travelled in France and Italy. In 1894 he was appointed prof. of historical painting at the St. Petersburg Academy. His paintings are characterised by dramatic force and brilliant colouring: his portraits of Tolstoy and Rubinstein being considered among his best achievements.

Repington, Charles A. Court- (1858-1925). Eng. soldier and military critic, b. in London, and educated at Eton and Sandhurst. He served in Afghanistan, Burma, the Sudan, and S. Africa. R. was military correspondent of *The Times*, 1911-13, publishing the sensational message on the shell shortage which opened the way to a political crisis. In 1920 he pub. *The First World War*, which suggested that war policies had been worked out against a background of social manipulation and personal relationships, and caused a sensation upon pub.

Replevin (O.F. *re*, again; *plevine*, warranty), whereby a person distrained upon has the distress returned into his own possession, upon giving security to try the right of taking it in an action, on condition that if the action goes against him he will return the cattle or goods once more into the hands of the distrainer.

Reporters and Reporting, see JOURNALISM; NEWSPAPERS.

Repoussé (Fr. 'boaten back'), term generally employed in connection with metal work, by which a pattern or design is hammered from the inner side of the object to be decorated, the design being perfected on the outside by means of chasing tools. The early Egyptians and Etruscans largely practised this work, and the finest specimens were made in the sixteenth century by Benvenuto Cellini. Good examples have also been produced in France.

Representation. The germ and development of the representative idea in England has been treated in the articles ELECTIONS, PARLIAMENT, and JURY. In theory government by R. gives to the representatives chosen a wider mandate than that granted to ordinary delegates or to the holders of proxies. Since the end of the nineteenth century the representative system, as it had evolved from medieval times, has been frequently criticised, and in many countries it has been modified by the adoption of proportional R. (q.v.) in parl. and other elections, and the introduction of the machinery of the referendum (q.v.).

Parliamentary Representation in the United Kingdom since 1935—1935: Conservative vote, 10,488,626, seats, 387; National Labour, 339,811, seats, 8; National Liberal, 866,624, seats, 3; National, 97,271, seats, 3; Labour, 8,325,260, seats, 154; Independent Labour Party, 139,517, seats, 4; Liberal (Samuel), 1,377,962, seats, 17; Independent Liberal (Lloyd George), 65,150, seats, 4; Communist, 27,117, seats, 1; Republican, 56,833, seats, 2; and Independent, 217,666, seats, 2. Thus the Labour party secured one seat for every 54,000 electors, the Liberal (Samuel) one seat for every 81,000 electors, and the Conservative party one seat for every 27,000 electors. 1945: Labour vote, 11,992,292, seats, 393; Conservative and supporters, 9,960,809, seats, 213; Liberal, 2,230,668, seats, 12; Communists, 102,780, seats, 2; i.e. the Labour party had one seat for every 30,515 (approx.) electors; the Conservative party one seat for every 46,764 electors; the Liberal party one seat for every 186,639 electors. The remaining 20 seats were divided among six other parties and Independents. Feb. 1950: Labour, 13,295,736, seats, 315; Conservative and supporters (Ulster Unionists, Liberal Conservatives, etc.), 12,501,983, seats, 298; Liberal, 2,621,489, seats, 9. The Labour party had one seat for every 42,208 electors; the Conservative party and supporters one seat for every 41,952 electors; and Liberal, one seat for every 291,276 electors. The remaining 3 seats belonged to the Irish Nationalists (2) and the Speaker.

Representatives, House of, lower house of the congress of the U.S.A. and, later, applied to the lower house of other bicameral legislatures. The membership of the Amer. H. of R. varies in number from time to time, being determined by the decennial census. In the absence of specific congressional legislation affecting the basis (see further under UNITED STATES OF AMERICA). The elected chamber in the Parliament of the commonwealth of Australia (*q.v.*) is also called the H. of R., the numbers of members chosen being in proportion to pop. as shown by the latest statistics, but not less than five for an original state. Similarly there is a H. of R. in New Zealand, the members of which are elected for three years. Other countries with a bicameral legislature whose constitutions provide for a H. of R. include Colombia, Cuba, the Philippines, and Uruguay. The title H. of R. is synonymous with Chamber of Deputies, the name given to the lower houses of Bolivia, Chile, the Dominican Republic, Ecuador, Egypt, Peru, and Venezuela. The former Chamber of Deputies of France is now replaced by the National Assembly.

Repression, see under **PSYCHOLOGY**.

Reprieve, withdrawing of a sentence for an interval of time whereby the execution of a criminal is suspended, and may be granted either (a) by the Crown through the Home Office, or (b) by the court either before or after verdict. The grant of a R. is an entirely discretionary matter, but in two cases the court has no option,

and must grant a R., viz. (1) when a woman sentenced to death is pregnant; (2) when a prisoner becomes insane after judgment. See also **PARDON**.

Reprisals, internationally illegal acts to which by a rule of convenience of international law (*q.v.*) a state may resort in order to secure justice when it is otherwise not obtainable. If, for example (to argue from an actual case), one state has granted a monopoly in violation of a commercial treaty (*q.v.*) with another state, the latter may retaliate by seizing the vessels of the former and laying an embargo upon them. The moral justification for R. against a state is that the difference which is settled by such a quasi-belligerent mode of proceeding is a difference created by that state's own international delinquency, and, according to the better opinion, R. are admissible solely for international delinquencies (Oppenheim). Like pacific blockade (see on this, Westlake, *Collected Papers*, 1914) and retorsions, they fall short of actual war, though it is doubtful whether they would not inevitably be followed by a declaration of war from the state against which they were directed, if that state were a modern civilised power. But, as a rule, R. and analogous retaliatory acts have been committed only against minor states. Retorsion is distinguishable from R. in that it consists in retaliation in kind for unfriendly or inequitable acts which are not at the same time illegal in international law. It is an express provision of the Hague Convention that any compulsion of the pop. of occupied ter. to give information about the army of the other belligerent or about his means of defence is forbidden (Article 44, Hague Convention IV., 1907). This rule is an extension of Article 23, which prohibits the compulsion of enemy subjects to participate in the 'operations of war' against their own country. The prohibition is vague, but it was a harsh extension of its meaning which the Gers. claimed when they deported thousands of Belgian and Fr. men and women to Germany and compelled them to work there. In the Second World War the Gers. carried R. beyond all laws, moral and international.

Reproduction, in biology, process by which individuals generate new individuals of the same species. All organisms are made up of cells, and all cells are produced by the division of pre-existent cells; this is the ordinary phenomenon of growth. Many organisms have the power of developing new structures to replace parts which have been lost (see **REGENERATION**). Again, most organisms possess special cells which, in certain circumstances, may develop into complete individuals. It is this latter process which is specifically called R. R. may be *asexual* or *sexual*. Asexual R. may be by fission, i.e. the division of an organism into two parts, or by budding, in which a portion of the organism is constricted and grows into a new organism,

which may separate or remain attached to the parent. Sexual R. involves the production of a cell called a zygote by the conjugation of two cells called gametes. The gametes may be sexually indistinguishable, in which case the conjugation is said to be *isogamous*. In heterogamous conjugation, which is far commoner, a male gamete, called a spermatozoon, fuses with a female gamete, called an ovum. Reproductive organs are differentiated for the production of the gametes, and when these are possessed by different individuals, there occur male and female sex. The conjugation of male and female elements is called fertilisation (*q.v.*). When the ovum develops without fertilisation, the phenomenon is known as parthenogenesis; this occurs in bees and in many plants. Many plants have an asexual mode of R. by the formation of spores. See BIOLOGY; CELL; EMBRYOLOGY; PENIS; PLANTS; SEXUAL SELECTION; VARIATION.

Reptiles (*Reptilia*), class of vertebrates which has much in common with birds, and included with them by Huxley in the primary group, Sauropsida, reptile-like animals. R. are cold-blooded, and have the skin covered with scales or scutes, whence they are classed as *reptilia squamata* in contradistinction to the smooth-skinned *batrachia* (*q.v.*). They are oviparous or ovoviparous, and are all air-breathers, which distinguishes them from the Amphibia. According to herpetologists, the five chief groups or orders of existing R. are: Chelonina, tortoises, and turtles; Lacertilia, lizards; Ophidia, snakes; Rhynchocephala, represented by a single New Zealand lizard (*Hatteria*); and the Crocodilia. R. reached their maximum development in an earlier geological period, and the Mesozoic era is sometimes called the Reptilian Age, hence fossil forms are very numerous.

Repton, par. and vil., Derbyshire, England, on the Trent, 5 in. E.N.E. of Burton; it has a public school, founded as a grammar school in 1557 and reorganised in 1874. The kings of Mercia had a palace at R., and three kings were buried at the monastery there. The par. church contains a Saxon crypt. Pop. 2300.

Republic (Lat. *res publica*, the state; from *res*, affair, and *publica*, public), state in which the sovereignty does not reside in an hereditary ruler, but in the people themselves, or a section of them. Thus a R. may be aristocratic, oligarchic, or democratic. The earliest Rs., those of Greece and Rome, were in their essence oligarchic, as were the medieval Rs. of Venice, Florence, Genoa, and other It. tns. The United Prov. of the Netherlands formed for a short period in the sixteenth century a R., and in the seventeenth century Great Britain was from 1649 to 1660 a R. in name. France has been a R. from 1793 to 1895, from 1848 to 1853, and from 1870 to the present time. Mexico has been a R. from 1824 to 1863, and from 1867 to the present time. Spain has been a R. from 1873 to 1874, and again from 1931; Portugal from 1910, present Poland from 1916, Russia from

1917, and China from 1912. With the exception of the three Guianas, all the S. Amer. states are Rs. San Marino and Andorra are the smallest Rs. Switzerland and the U.S.A. are federal Rs., that is, separate Rs. bound together by a treaty, and having a central authority with the power of issuing laws, etc. The W. Ger. It. (1949) is a federal R. Practically all modern Rs. have a written constitution, an extensive franchise, and choose the executive indirectly, as by some form of electoral college; or by the legislature, as in France and Switzerland. Legislation is vested in two co-ordinate Houses, while the judiciary forms a separate branch of gov., invested with power to pronounce on the constitutionality of laws and of executive Acts. See also under CONSTITUTION.

Republican Party, one of the two major political parties of the U.S.A. The name was originally used as a second name for the Democratic party (*q.v.*), founded by Jefferson. In 1828 a group under John Quincy Adams and Henry Clay seceded, styling themselves 'National Republicans' or 'Whigs.' The modern R. P. was founded in 1851 by a union of N. Whigs, Democrats, and Independents, all of whom were opposed to slavery. In 1856 it held its first national convention at Philadelphia, and nominated John C. Fremont for the presidency. James Buchanan, Democrat, was elected, securing 174 votes, but the R. P. received 114 for its nominee. In 1860 the R. P. succeeded in securing the election of Abraham Lincoln (*q.v.*). After the civil war the R. P. was the dominant party in the country. It controlled the presidency and Congress till 1874, when a Democratic House of Representatives was returned, but retained the presidency until Cleveland's election in 1884. The R. P. was again in power from 1888 to 1892. In 1896 the party controlled Congress and the presidency once more. It was only the Roosevelt secession of 1912 (see under BULL MOOSE) which enabled the Democrats to gain control of Congress and secure the election of Woodrow Wilson; but a Republican Congress elected during his presidency effectively blocked many of his measures. In 1920 the R. P. regained the presidency and kept it until 1932. In 1932, 1936, 1940, and 1944 a Democrat was returned to the presidency (Franklin D. Roosevelt, (*q.v.*)), and in 1949 another Democrat was elected (Harry S. Truman, (*q.v.*)).

For years after the civil war the R. P. profited by the claim that it had saved the union, though many N. Democrats had fought beside N. Republicans during the struggle. Later the two parties appeared to be distinguished chiefly by their attitudes on currency and tariff reform. Cleveland stressed a tariff for revenue only, while the R. P. generally wanted a high protective tariff to aid Amer. manufs. Following the civil war, the R. P. also tended to support the strengthening of the central gov. as against the local spirit of the separate states, since the S. states naturally took every

advantage of federalism to salvage something from their defeat in the war.

After the initiation of Roosevelt's New Deal (q.v.), the Republicans, while continuing their campaign against 'state rights' emerged as a party opposed to the centralisation implicit in the 'welfare state'; in this view, however, they were followed by a considerable section of the Democrats.

At the end of the First World War, the R. P. opposed the entry of the U.S.A. to the League of Nations. Since the Second, its more right-wing elements have been more eager than the main body of the Democrats to participate in specific spheres of international politics where the paramount objective has been the prevention of Communism, e.g. China. Therefore, even on foreign policy, the two parties have no rigid dividing line, though possibly more elements of isolationism survive within the R. P. than within the Democratic. As the opposition, the R. P. since 1945 has been more anxious to criticise lavish gov. expenditure than the Democratic, and some Republicans have frequently objected to the granting of large-scale loans to Socialist countries, though their more moderate leaders, e.g. Vandenberg (q.v.), have generally approved presidential policy on these matters.

It is indeed hard to distinguish between the R. P. and the Democratic, even on the broadest political questions. The R. P. has gained much support from big business in the past because of its tariff policy; the Democrats have won many industrial workers' votes since the Roosevelt administration's New Deal. But voting in America is based to a large extent upon locality, historical association, and (particularly in presidential elections) on personal appeal, and both parties contain 'left' and 'right' groups, and rarely vote as a body, except when in opposition. In addition, large groups within the U.S.A., e.g. Prohibitionists, Unions, Baptists, Rom. Catholics, have frequently played off one party against the other in order to obtain as large a part of their own sectional programme from both, regardless of national or international issues.

Republican River, The, formed by two branches rising in E. Colorado, U.S.A., and flowing E. and S.E. to Junction city, Kansas, where they unite with other streams to form the Kansas R. Length 520 m.

Reputation, or Renunciation. In the law of contract a party who repudiates the contract before the time for performing it has come thereby commits a breach which entitles the other not only to consider himself discharged from doing anything under the contract, but at once to sue for damages or specific performances (see EQUITY).

Requena, tn. of Spain, in the prov. of Valencia, 48 m. by rail from Valencia city. The spas of Fuente Podrida are near by. Much of the medieval tn. remains. Vines, fruit, silkworms, and saffron are cultivated. Pop. 21,100.

Requiem (Lat. *requiem* (acc.), rest), celebration of the Mass for a person or

persons departed. The name is derived from the first words of the introit, *Requiem eternam dona eis, Domine*.

Requisition, Military, see under LAND FOR MILITARY PURPOSES.

Reredos, in churches, ornamented wall or screen at the back of the high altar. It usually consists of a screen detached from the wall, and is elaborately adorned

REREDOS

with sculpture and tracery. Originally the R. was a hanging of tapestry or silk; later it became more substantial, but could still be moved, and was only used at certain festivals.

Reremouse, see BAT.

Reschenschkeideck, Alpine pass in the It. Tyrol, at an altitude of 4900 ft. It is near Reschen vil., on the borders of Italy and Switzerland, and the route was known in pre-Rom. times.

Rescripts (Lat. *rescriptum*, answer), in Rom. jurisprudence, answers of the emperors and popes to questions officially put to them. During the early empire they constituted one of the most important sources of Rom. law. During the third century they rapidly increased and superseded the responses of the jurists, the privilege of giving such no longer being conferred on the latter. See also DECRETAL.

Rescue: 1. In law, forcibly and knowingly freeing another from arrest or imprisonment. If the original offenders be convicted, the rescuer will be punishable as for the same offence; if not convicted, the rescuer may still be punished as for a misdemeanour. To R. or attempt to R. a convicted murderer renders the offender liable to penal servitude to the extent of life. For *Pound Breach*, see under BREACH. 2. Deliverance from danger or death. R. work is carried out by a number of organisations specially equipped for certain types of emergency (see below). Organisations such as the various vigilance societies, church groups, and the Salvation Army conduct 'moral R. work,' campaigning against prostitution (q.v.), drunkenness (q.v.), etc.

Fire Rescue.—The primary duty and

purpose of every fireman is to save life: the saving of property is a secondary consideration. Each item in the varied equipment, from a small hand axe to a 150-ft. turntable ladder, may play an important part in the saving of life from fire. The methods of effecting a rescue vary according to circumstances. It may be necessary only for a fireman to enter a building, calm distracted occupants, and lead them to safety by a safe route. Generally, however, lives are saved by firemen using ladders (see under FIRE BRIGADES AND FIRE FIGHTING) to gain entry above the ground floor when staircases are obstructed by fire or, more commonly, smoke. In order to enter a building which is filled with smoke or toxic fumes, a fireman may use breathing apparatus (see OXYGEN APPARATUS).

Mines Rescue.—Under various Coal Mines (Rescue) Regulations, it is necessary for central rescue stations to be provided and maintained. A central rescue station is situated in a central position in a coalfield so that it can operate at collieries within a radius of 15–20 m. It must be fully equipped ready for immediate operation with a sufficient number of fully trained rescue workers. One of the principal pieces of equipment for this work is the breathing apparatus (see OXYGEN APPARATUS) provided with oxygen for two hours because of the distances often to be travelled underground before actual rescue work can begin.

Civil Defence Rescue.—The air attacks on civilian pops. during the Second World War necessitated the opening of new fields in R. work. No highly complicated or technical apparatus was required, except a sound knowledge of the use of shoring, damaged buildings, tunnelling under debris, etc., in order to reach and give aid to the victim.

For maritime R. work, see LIFE-SAVING AND RESCUE APPARATUS; for rescue from drowning, see HUMANE SOCIETY, THE ROYAL, and SWIMMING; for moral R. work, see under VIOLANCE SOCIETIES.

Research, see AGRICULTURAL RESEARCH; MEDICAL RESEARCH; NATIONAL PHYSICAL LABORATORY, THE; NATIONAL DEVELOPMENT RESEARCH CORPORATION; NAVAL SCIENTIFIC SERVICE, ROYAL; PHYSICAL SOCIETY; RESEARCH ASSOCIATIONS, INDUSTRIAL; ROYAL SOCIETY, SCIENTIFIC AND INDUSTRIAL RESEARCH, DEPARTMENT OF.

Research Associations, Industrial. The growth in importance and numbers of these associations and their increasing influence on the scientific and economic life of the country are a landmark in modern industry. The total expenditure of these associations in 1917 was nearly £2,000,000, of which £800,000 was provided by the Dept. of Scientific and Industrial Research. The gov. scheme for co-operative industrial research was initiated by that dept. in 1918, its purpose being to stimulate the industries of the United Kingdom to undertake co-operative research as a means of increasing their efficiency. R. A. under this scheme are registered companies,

limited by guarantee of a nominal sum and working without the div. of profits in the form of dividends; their income is from subscriptions of individual members, supplemented by gov. grants. There are now thirty-eight R. A. covering most of the prin. industries of the country. They are autonomous bodies free to decide their own policy for the development of their research programmes and the use to be made of the results of their research. Membership is open to any Brit. firms in the particular industry, subject to the approval of the Council of the Research Associations.

Reseda, genus of dicotyledonous plants, typical of the order Rosales, and found in Europe and round the Mediterranean. Two species occur in Britain: *R. lutea*, the base rocket or dyer's weld, and *R. luteola*, the wild mignonette. *R. odorata* is the common garden mignonette cultivated for its sweet-scented flowers.

Reservation of the Blessed Sacrament, practice of preserving the consecrated elements after the eucharistic ceremony, for administration to the sick and for purposes of devotion. It goes back to the earliest Christian times, when portions of the eucharistic bread were sent or taken by the deacons to the sick and absent (Justin Martyr, *Apol.* i. 87). Tertullian uses the word *reservare* in the sense of retaining the Blessed Sacrament (*De Orat.* xix.). On the other hand the practice of keeping the Blessed Sacrament in churches that the devout might pray before it cannot be traced with certainty further back than A.D. 1000. After the tenth century the common practice in England and France was to suspend the Blessed Sacrament over the high altar in a dove-shaped vessel. The tabernacle of modern times was known, but not by any means universal before the Reformation. Since the Reformation R. was not practised outside the Rom. Catholic Church until fairly recent times. The revision in 1928 of the rules concerning R. in the Anglican Book of Common Prayer and intended to permit it, was one of the reasons for its rejection by Parliament. See H. Thurston in *The Month* (1907), 377 and 617.

Reserve, Army. The principle upon which modern military systems are based is that, for financial reasons mainly, states cannot maintain in peace the number of troops they would require in war. They therefore give soldiers the training they consider necessary to fit them for war, and then pass them to a reserve force, where they complete their service. Whilst in this reserve they perform arm. training to keep them up to standard. In countries where military service is compulsory and practically universal, the constitution and personnel of such reserve troops are susceptible of more exact treatment than in other countries. In the Brit. service, according to the regulations in force in 1939, a man enlisted on a twelve-year engagement, seven of which were normally spent with the colours and five with section B of the A. R. During his reserve service he was paid a small retaining fee.

A limited number of section B reservists formed section A, and were liable for service at shorter notice than those of section B. At the end of twelve years all reservists were discharged, but many might re-engage for section D, which had other liabilities for service. Such men might serve up to forty-two to forty-five years of age, according to whether they were skilled or unskilled. In 1908 a special reserve was formed from the previous militia, but in 1921 the title militia was reintroduced and special reserves disappeared. This militia was not, however, maintained in Great Britain or N. Ireland between the two world wars. In 1924 a new force was formed—the supplementary reserve. It formed part of the A. R. as is law militia. It was organised in three categories: A, personnel of transportation units of R.M. required to undergo training in peace; B consisted of other personnel required to undergo training in peace; C consisted of personnel not required to undergo training in peace. Category B was mainly raised and administered by the T.A. and was affiliated to T.A. units for training, etc. Personnel of A and B enlisted for four years and those of C for two, three, or four years in accordance with requirements. Men between nineteen and forty-one were eligible. When called for service they became in all respects soldiers of the regular forces. See MILITIA.

Reserved Occupation, in relation to military service. At the beginning of the Second World War, as also under the Derby scheme of recruiting (see under CONSCRIPTION) and later in the First World War, there was a schedule of R. Os., which provided for a wide variety of men in different occupations whose call up for military service was deferred according to their particular age group. In the Second World War that plan operated until about the end of 1941, when the gov. gradually dropped the system of 'block reservations' or deferments and introduced a system of individual deferments according to the importance of the man concerned to industry. The system provided for exchanging men; thus an elderly worker would be put into the place of a key worker of younger age. After 1946 coal-mining, agriculture, and certain occupations connected with the building industry were the only R. Os.; and after Jan. 1, 1947, deferment, broadly speaking, was according to the circumstances of particular cases and not on the grounds of their importance to industry. In March 1950 all control of engagements was ended. See *Report of the Ministry of Labour and National Service for 1939-46*.

Reserve (Reservation), areas reserved for occupation by natives, especially Africans and Amer. Indians. In Africa the R. policy has been adopted in the Union of S. Africa, the Rhodesias, and Kenya (notably the Masai and Kikuyu Rs.), and it is a consequence of the alienation of lands to Europeans. In Brit. African territories, other than those mentioned alienation has had relatively less effect on

native life, as, for example, Nyasaland, though Rs. may also be seen there. There are none in W. Africa where conditions demographically are entirely different. The principle of segregation has two purposes: the reservation of land for European occupation and the eventual exclusion of the native from European-owned lands, save for his employment as wage-earner or tenant labour. Segregation here may be said to be in full operation in the sense that the limits of European and native areas respectively have now for some years just been fixed; but there is not complete territorial separation, for the holdings of the two communities are in most cases intermingled. In the Union of S. Africa the Transkei Territory and a part of Zululand may be said to constitute homogeneous native blocks; in S. Rhodesia there are some large blocks of native land, but a number of Rs. are interspersed in European areas; but the highlands of Kenya constitute a more or less homogeneous European block. From the employers' point of view the native reserve is useful as a 'shock absorber' in that it provides for the unemployed, the aged, or infirm without any charge on the gov.

Opinion in S. Africa tends to lay emphasis on the existence of the Rs. as a factor in the policy of social segregation (or *apartheid*) rather than on the influence it may have on the supply of labour. The policy which regards the reserves as the suitable field within which the native is to work out his social and economic advancement is in some quarters merely a doctrine of expediency, but in others it represents a genuine belief that the native can in this way secure for himself the best position available to him under the conditions introduced by a dominant and competitive white civilisation; but against this it seems evident that the R. can offer only limited possibilities for any substantial improvement in the conditions of those who live in it; and in some of the Rs. there is marked congestion. See further under SOUTH AFRICA, UNION OF.

On the Rs. in Kenya see KENYA, *White Settlement*. On Indian reservations in America see AMERICAN INDIANS, *Conditions on Reservations*. For reservations for animals, etc., see GAME RESERVES; NATIONAL PARKS.

Reservoirs for storage of water are classed as 'storage' or 'impounding' R. when they are intended to store up water during wet weather for use during drought, and as 'service' R. in the case of comparatively small covered R. supplying purified water by gravity to towns.

Storage or Impounding Reservoirs.—Wherever possible natural lakes are adapted, but where they do not exist artificial lakes may be created in a natural drainage area by constructing a dam across some portion of a valley; in more level plains advantage is taken of depressions as sites. The main consideration of cost of constructive work is naturally a great factor in the choice, and the geology, as well as the configuration of the land, must be carefully surveyed, as

it affects not only the retention of the water, but also determines largely the cost of labour. A synclinal valley is a favourable site, as water would percolate through the strata into the reservoir; an anticlinal valley would allow leakage. Again, sand, gravel, or limestone forms a leaky substratum unless artificially covered, while a clay bed, naturally, is excellent. The supply of water must be carefully calculated; a natural 'catchment basin' is mapped out; its rainfall noted both as to quantity and period; the quantity of water carried by the streams and its fluctuation measured. In hilly country the height of the reservoir site needs careful selection; too high a position not only requires greater strength in all delivery pipes owing to increased pressure, but the supply of water is more sensitive to rainfall, thus giving a precarious supply at one time, while flooding, necessitating expensive construction work, will occur at another; a lower site, avoiding periodic scanty supply, may yet allow flooding, and be still open also to the disadvantage of the great eroding force of supply water. The lower the site the better, so long as sufficient pressure can be maintained. The purity of water depends on many factors, but it is greater as a rule the higher the site and the more remote from populous districts. The supply may, however, be brought from a region by aqueduct to a reservoir in an economically selected site. On plains R. may be constructed alongside rivers, from which the water is pumped. The retaining walls or dams are built of earth, masonry, mass concrete, reinforced concrete, and other building materials. Earth forms a most substantial dam, is economical, and decidedly better than masonry in countries subject to earthquakes; it is not used on solid rock foundation or in dry climates. In America the wider variety of climate has led to many devices. Loose rock is piled up with careful filling of interstices; it may contain a vertical steel diaphragm or one of reinforced concrete. The whole is then sheathed with tarred planking or covered with earth or masonry. Crib dams, formed of a framework of logs, bolted or wired, filled with loose rock, are used, but are naturally not permanent.

Earth Dams.—This type may be built in layers of homogeneous material, with a core of puddled clay. The inner slope is usually 3 to 1, the outer 2 to 1, the latter often with one or more benches or berms as extra security against slipping. The core is founded on an impervious foundation and reaches to the top of the dam. The core is embanked on either side with selected earth carefully laid and worked. The inner face of the dam is carefully pitched with cobblestones, paving, or concrete slabs, to protect it against erosion—the pitching being stronger in the upper portion, where wave action is strong. Here the bank is usually steeper, so that spray recoils instead of topping the parapet and falling on the outer slope. The outer slope is usually covered with grass to bind the surface and protect it against weathering and spray.

Masonry and Mass-concrete Dams.—These must be on absolutely firm foundations, or future settling may lead to cracks or fissures. Their stability and the form for resisting water pressure are a matter of calculation. The weight of material itself must be considered, and extra pressure due to wind action as well as for varying level of water. The limits of pressure are found for the full and empty reservoir. In cross section the wall is so arranged that the centre of pressure at any level shall be within the middle third of the thickness of the wall.

Reinforced Concrete Gravity Dams.—These consist of a slab of reinforced concrete inclined at 45° to the horizontal and supported from a raft foundation by reinforced concrete wing walls. The downward thrust of the water holds the dam in position and prevents the comparatively light structure from overturning, but precautions against sliding of the dam are essential.

Arched Dams.—Such dams are made of mass concrete or other material and are constructed between the vertical or steeply sloping rock sides of a valley against which the ends of the dam abut.

Waste-weirs.—These are provided to carry off surplus water. They are constructed in solid ground at the side of the earth dam, or may be solid masonry structures at the end. In any case, it is usual to arrange both ends of the waste-way, escape, or spill-way well clear of the dam; with masonry dams the parapet may be so constructed as to allow of waste along the whole length; or any portion may be so constructed. The ogee shape is sometimes used, or a stepped fall, or a wide-crested fall. It is not usual to have any obstruction whatever, though various forms of sluice-gates are used to regulate the height where seasonal fluctuation is great. By-wash channels are used when for any reason it is desirable to divert water from streams entering the reservoir. Regulation is supplied by means of sluice-gates, or sometimes, when flood-water is to be excluded, automatically by a gap leading into the supply tunnel; beyond the gap the stream course is continued at a lower level, and the flood waters leap to this.

Outlet.—The sluices may be laid through the dam or through the ground outside—a safer plan; or, best of all, through the solid foundation below the dam. The pipes are usually laid in culverts to allow frequent inspection, and lead from a suitable depth in the reservoir, say two-thirds up the embankment. From this level a separate siphon-pipe may lead to the bottom for use if necessary. The valve or lower chamber, where the water may be admitted from the reservoir, leads to the upright pipe leading to the outlet sluice; these control devices are built away from the dam, a small bridge leading across. The lower may contain screens for straining the water.

See also WATER SUPPLY and under HYDRO-ELECTRIC POWER.

See W. P. Creager, *Engineering for Masonry Dams*, 1929; E. J. Taylor,

Modern Waterworks Practice, 1929; Institute of Civil Engineers, *Interim Report of the Committee on Floods in Relation to Reservoir Practice*, 1933; G. Bransby-Williams, *Storage Reservoirs*, 1937; Institute of Civil Engineers, *Code of Practice for the Design and Construction of Reinforced Concrete Structures for the Storage of Liquids*, 1938.

Resht, or **Rasht**, tn. of Persia, cap. of the prov. of Ghilan, 150 m. N.W. of Teheran. It is the centre of a military area, and has a regular air service with Teheran and Bushire. Silk, shawls, and carpets are made, and rice, fruit, tobacco, cattle, and sheep are exported. Pop. 122,000. Enzeli, its port, is 14 m. to the N.W. on the Caspian Sea.

Residence, *see* DOMICILE.

Residual Mountains, *see* under MOUNTAINS.

Residuary Legatee, *see* LEGACY.

Resilience, term used mainly in engineering to describe the work done by a body, after it has been subjected to stress, in returning to its original shape, or the work done to produce this stress in a body within its elastic capacity.

Resin, one of a class of substances obtained as exudations from certain plants. The secretions are in globules, which harden on exposure to air. The resins are soluble in alcohol, ether, and the volatile oils, but are insoluble in water. They are translucent and brittle, showing a conchoidal fracture; they are readily fusible and inflammable, and are bad conductors of electricity. The hard resins are chiefly used as varnishes; such are copal, mastic, dammar, lac, and sandarach. The soft resins contain essential oils, are odorous, and can be moulded by hand. They are chiefly used in medicine in the form of ointments, etc.; such are turpentine, copaiba, storax, and frankincense. Some Rs. are obtained as fossils, e.g. amber, fossil copal, kauri gum. *See also* PLASTICS.

Resina, tn. in the prov. of Naples, Italy, 4½ m. S.E. of Naples, on the W. slope of Vesuvius and on the bay of Naples; it is famous for its *Lacrima Christi* wine. The electric railway up Mt. Vesuvius starts from here. Pop. 37,600.

Resistance, in electricity, the property of an electrical conductor by reason of which energy is expended in it when a current flows or a transfer of electricity occurs; or, in other words, the extent to which an electric conductor resists the passage of an electric current. The resistance is constant under constant physical conditions and varies according to the material of which the conductor is made.

Resistance Furnaces, *see* under METALLURGY, *Electro-smelting*.

Resistance Movements, term which came into use in the Second World War to denote the underground organised resistance of the peoples of European countries occupied by the Gers. Such resistance took the form of irregular fighting forces, such as the *maquis* or *milice patriotiques* of France or the *partisans* of Russia or Yugoslavia; but the term

may also be said to embrace purely civilian activities, such as in Belgium, where an underground press was estab. to place on record the robbery and pillage practised by the Ger. occupation authorities. Politically most R. M. became associated with the left. *See further* under BELGIUM, *History*; GUERRILLAS; EUROPE (HISTORY), *Allied Invasion of Normandy*; FRANCE, *History*; MIHAILOVICH, DRAŽA; TITO, BROZ; YUGOSLAVIA, *History*.

Resistencia, tn. of Argentina, cap. of Chaco ter., on the Paraná R., opposite Corrientes. Its port, Barranqueras, is 1 m. distant. It is linked by rail with Santa Fé. There are large European settlements of colonists who are chiefly engaged in cotton growing, and the production of quebracho and other forest products, and in stock-raising. Pop. about 50,000.

Res Judicata, in law a question which, having been settled by a final judgment, is disposed of for all time. No question of fact that has once been finally determined in a legal tribunal can ever be reopened in a court of law. But a final recorded judgment is evidence only of the actual state of facts it purports to settle, and not of every piece of evidence that might or might not have guided the court in its decision, though it is conclusive evidence of facts which are necessarily imported in the judgment; and again, a final judgment is only final as between the original parties to it or their successors, no stranger to the suit being barred from getting the same issue set down for trial.

Resolution: 1. Formal decision of a legislative or corporate body; or of a meeting or any association of individuals; or a formal proposition brought before a public body or meeting for discussion and adoption. In the House of Commons taxes and duties are introduced as 'resolutions' before being included in the Finance Act; and money bills are debated in the form of Rs. before coming on for second reading (*see* PARLIAMENT, *Bill*). A 'special resolution,' confirmed by the court, is the statutory preliminary to the extension of the powers of a company. 2. Term used in harmony for the process by which a discord is made to pass into a concord.

Resolution of Forces, *see* COMPOSITION (in mechanics).

Resonance, in physics, the setting up of vibrations in a system by an applied periodic force having a frequency equal to one of the natural frequencies of the system. If there is little damping of the vibrations their amplitude may become very large even if the inertia of the system is great and the applied force small. This may be illustrated by the board of a child's swing. If the angle through which it swings is not too large each to-and-fro movement occupies nearly the same period of time; so the apparatus has its own natural frequency of vibration; that is to say, if left to itself it will always make the same number of to-and-fro movements per min. By applying a series of

gentle taps to the swing at regular intervals it can be put into forced vibration, and made to swing in time with the applied pushes. Suppose, for example, that its natural frequency is $\frac{1}{2}$ per sec., so that each to-and-fro movement requires 2 sec. If the taps are applied at intervals of $\frac{1}{2}$ sec. (say), the first few blows will drive it somewhat to one side, and it will then rebound from each successive one, moving with a frequency of 3 per sec. In general, unless the taps are heavy, the forced vibration will be only of small amplitude, or angle of swing; but if the frequency of tapping is reduced until it is approximately equal to the natural frequency, each blow will fall at such a time that it reinforces the motion of the board. In consequence, even if the blows are light, a movement of considerable amplitude can be built up, and the swing, under these circumstances is said to show R. This example is chosen by way of illustration because the reader can easily verify for himself what happens when the period is low, as in the example; but in many cases that are of importance the frequencies are too high for direct observation without special aids. R. may occur as the result of the impact of sound waves, as it does when a key of a piano is held down to release the damper on one of the wires and the same note is sounded or sung in the vicinity; after the sound from the source has died away, the piano wire can be heard emitting the note. By using hollow vessels designed to respond to notes of particular frequencies, Helmholtz applied the principles of R. for the analysis of complex musical sounds. R., however, is frequently troublesome because of the engineering problems it presents. Bridges and other structures, for example, may be endangered if they are subjected to periodic forces of frequency close to the natural frequency of some part of their structure. Such forces may result from vibrations due to traffic, from the regular step of soldiers marching (hence the order to break step in crossing a bridge), or from gusts of wind. To avoid R., engineering structures must be designed in such a way that their natural frequencies are far removed from those of any forces that are likely to be applied to them, and so that any vibrations set up are quickly damped out.

A phenomenon that is very similar to mechanical R., and to which the name R. is also applied, occurs in some types of electrical circuits. Suppose, for example, that a circuit consists of an inductance L and a condenser of capacity C , and that, at a certain instant, the plate A of the condenser is at a higher potential than B. Current will then begin to flow from A via L to B. Owing to the inductance, however, the current grows relatively slowly from its initial value of zero, and further, when the plates A and B have reached the same potential, the current does not immediately drop to zero, but continues to flow for a time, raising the potential of B above that of A. When, therefore, the current ceases momentarily, it begins to flow again in the reverse

direction, and again raises the potential of A above that of B, after which the whole cycle of changes may occur again and again. Such a circuit has thus a natural frequency, whose value depends upon the magnitudes of the inductance and the capacity, and if a current is induced in it the current will oscillate with this natural frequency until its energy is used up in generating heat in the conducting wires of the circuit. If a coil carrying an alternating current is placed close to L , an alternating current will be induced in the circuit, and, if the frequency of the current in the coil is close to the natural frequency, it will occur, and the current in the circuit may become

RESONANCE IN AN ELECTRICAL CIRCUIT

considerable. If the capacity of the condenser is deliberately adjusted to give R., the circuit is said to be tuned to the frequency of the other current. Such tuned circuits find numerous applications in work involving high-frequency currents (e.g. in radio), and are used in most stages of radio and television receivers to select and respond to the wanted frequency. It occurs not only in tuned circuits where the inductance L and capacity C are concentrated in a small space, but also in aerials (q.v.). A length of wire has both inductance and capacity distributed along it, and thus will resonate to a frequency determined by these factors. When suspended well clear of the ground this frequency is substantially related to the wire length (approximately $\frac{\lambda}{2}$),

which resonates electrically in the same way as does a violin string mechanically. Resorcinol, or Resorcinol (*meta*-di-hydroxybenzene), $C_6H_4(OH)_2$, obtained by fusing benzene-meta-di-sulphonic acid with potash. It is a colourless solid, crystallising in needles which melt at $119^\circ C$. It dissolves readily in water, alcohol, and ether. When heated with phthalic anhydride and the product dissolved in caustic soda, a solution is obtained which exhibits a green fluorescence when diluted. It is used in preparing fluorescein, eosin, and various azo-dyes; it is used for preparing ointments for chronic skin diseases, and, fused with an equal quantity of iodoform, as a dusting-powder employed in surgery. It has also been used as a constituent of hair-restorers, and as a cure for 'blackheads.' It stains may be removed with citric acid.

Respighi, Ottorino (1879-1936), It. composer, b. at Bologna. He studied com-

position and orchestration with Rimsky-Korsakov at St. Petersburg in 1901. In 1902 he took an additional composition course with Bruch in Berlin. His first opera was produced in 1908. In 1913 he was appointed prof. of composition at the Accademia di Santa Cecilia in Rome and toured Italy as conductor of his own works. In 1919 he married his pupil Elsa Olivieri-Sangiuliano, a composer and singer, and from about that time he began to take a keen interest in old It. music and the church modes. He was appointed principal of the Accademia in 1923, but resigned in 1925, though retaining the composition professorship. His operas include *Belfagor* and *La Flamma*. He wrote the music for the ballet *The Birds*, and wrote symphonic tone-music on Rome. His impressionist music and his stark clarity of expression greatly influenced It. music.

Respiration, act of breathing with the lungs; more generally, the interchange of gases within and without the living organism, oxygen being absorbed into the body and some of the products of combustion, viz. carbonic acid and water, being removed. In unicellular organisms oxygen is absorbed over the general surface, but in the more complex animal types special respiratory organs are present. In man the air enters the nose or mouth, passes to the pharynx, and, the epiglottis being open, through the larynx (*q.v.*) into the trachea or windpipe. The air, now being warmed to some extent, divides right and left into the bronchi, then into the secondary and tertiary bronchi and into the bronchioles, or small divs. of the bronchi. At the end of the smallest, bronchi sacs called alveoli occur. Each of these sacs is lined with epithelium, and between the epithelium and the elastic wall of the sac is a network of small blood-vessels. Across the epithelial layer of the air-sac and the endothelial layer of the capillary wall the interchange of gases takes place between air and blood. The collection of alveoli at the end of each bronchus is called a lobule, and the lobules, with the connective tissue in between, make up the lung. The movement of breathing is initiated by involuntary stimuli, which cause the diaphragm to contract and other muscles to raise the ribs. The space occupied by the lungs is therefore extended, the elastic walls of the air-sacs expand, the contained air is rarefied, and a current is set up from the mouth and nostrils inward. When the inspiratory muscles have ceased contracting, they return to their relaxed condition, the pulmonary cavity becomes decreased in size, and the result is an expiration of air.

Respirators, appliances for purifying or warming inhaled air, inhaling medicated vapours, or supplying air when deficient. For industrial use the prevalence of dust or steel particles is countered by the use of a mask in which the air is filtered through a fine gauze, magnetised if necessary. In smoke-laden or gas-filled atmospheres an oxygen apparatus (*q.v.*) is used. When the respiratory muscles are

inactive, for example, through infantile paralysis, use is made of the 'iron lung' (*see* AEROTHERAPEUTICS). Oxygen is supplied from a cylinder to the crews of high-altitude aircraft. The development of chemical warfare (*q.v.*) in the First World War led to the introduction of military R., and 'gas masks' were supplied to the civilian pop., as well as to the armed forces, in the Second World War. In all types filters were devised containing materials to absorb the gases, and with the introduction of new gases new filters were required. The civilian R. was basically the same as the military R., except that in the former the filter was part of the mask, whereas in the latter it was a separate component linked by a flexible tube.

Respite: 1. In civil law, postponement by creditors of their claims in consideration of the debtor's proposals for a compromise. 2. Suspension of the execution of a criminal sentence (synonymous with reprieve, *q.v.*).

Responsentia, loan raised by the master of a ship upon the security of the cargo; the mortgage on the ship itself is known as *Bottomry* (*q.v.*).

Responsibility. It is the general rule in criminal law that every man must be presumed to be responsible for his acts until the contrary is clearly shown. (As to the exemptions, either total or partial, from criminal R., *see* under CRIMINAL LAW.) In civil actions for tort, or, in Scots law, delict (*i.e.* actionable wrongs, such as negligence, assault, libel), the general rule as to R. is rendered simpler by reason of the principle that tortious or delictual liability is absolute, and only in a few exceptional cases can be said to import any particular state of mind; hence coverture, insanity, infancy, etc., are not grounds for exempting a person from liability to pay damages. As to a husband's liability for his wife's wrongs, *see* under HUSBAND AND WIFE. As to liability in contract, *see* under CONTRACT. *See* also EVIDENCE.

Rest: 1. In music, interval of silence between notes; the signs of rest-duration are:

= π = For 1 2 3

corresponding signs of note-duration:

o o p r c e f

2. Term used by the Bank of England and other banks for reserves.

Restaurants (Fr. *restaurant*, 'to restore'). Inns, taverns, hostleries, and 'eating-houses' have existed in most countries for a long time. But R. are a modern Fr. innovation, and are by no means, at least in the country of their origin, a development of any of the above establishments. France was, before the 1920s, pre-eminently the home of R. No other country could have supplied either the utilitarian basis of their existence, or the vivacious clientele to fill them. Many a pretentious

refreshment house in London, which for Englishmen is a restaurant, would be classed as a mere *traiteur* 'eating-house (keeper)') by a Frenchman. The true restaurant must have individuality in cuisine—e.g. the Café Riche was renowned for its sauce and soles, the Café Anglais for its *crêpes bordelaise*, the Noël for its turtle soup—and a speciality in wines—e.g. the Café Riche surpassed other R. for its *bourgeois rouge*, the Café Anglais for its *château-lafite* (modern spelling, *château Lafite*), the Noël for its *fleurie* (now *fleurie*). Historical associations may not be essential, though many Parisian R. owe their international reputation as much to such associations as to their cuisines, while nearly all the older ones can boast an 'atmosphere' of their own. The first estab. actually called a restaurant, according to Legrand, was the house of one Boulanger in the Rue des Poules, Paris, 1765, where customers, including ladies unaccompanied by gentlemen, could get *bouillons* or *consommés* and *volailles au gros sel avec des œufs frais* served on marble tables as in *cafés*. The refreshments obtainable at this and the other 'R.' which quickly succeeded it were strictly regulated by law. At first they were all in the nature of invalid food—chicken, eggs, soups, thick and clear. Other more substantial viands were the right of the caterer, and it was not long before the multiplicity of R. ruined their own trade, and the proprietors were forced to enter into catering and increase their range of edibles. Prices charged were comparatively high, yet during the revolution R. multiplied rapidly, among the most celebrated of the earlier being those of Legarque in the Jardin des Tuileries, in a room on the ground floor of which Marat, Couthon, and others are said to have continually met in secret conclave, and the Palais Royal estab. in 1808 near the renowned Frères-Provençaux (1786). A chance stimulus to the rapid rise of R. at this time was the fact that the very men to titillate the palates of the gastronomes of France were at large in the shape of *chefs de cuisine* of the great families ruined by the revolution. A host of R. were founded by these ex-chefs, among the most renowned being those of Beauvilliers, chef of the prince de Condé, and Robert, the chef of a farmer-general. The prin. Parisian R. early acquired a cosmopolitan fame, and it is only since the beginning of the twentieth century that the restaurant of even the foremost European and American cities have rivalled them.

The hist. of the restaurant in England is of much more recent date and few were known in London before the 1860s. Though the conception of the restaurant is Fr., it was the Ita. who first made their mark in London. But the true restaurant *quartier* of London has always been Soho, where between the two world wars It. monopoly was giving way to Czech, Swiss, Fr., Sp., and particularly Chinese *restaurants*, who in turn in the late 1940s were partially ousted by Uks. and Cypriots.

With the growth of democracy, the levelling upwards of incomes, and the consequent shortage of servants, the years between the two great wars saw a much greater demand for more R. But the type wanted had changed, for the emphasis was laid not so much on the personality of the *restaurateur* and his chef, nor on his *recherché* menus, but on the speed and efficiency of the service, while in the U.S.A. the cheap car and motor touring created still greater demand. Catering on such a large scale has produced the chain restaurant, such as Lyons (q.v.) and the Child's restaurant in the U.S.A., where a large portion of the food is pre-cooked at a central depot and then delivered in vans to the sub-branches. The introduction of rationing during the first years of the Second World War, coupled with a strict maximum price control of meals served, caused a great drop in the quality of meals served, and yet a remarkable increase in the attendance at R., so greatly were the earnings of the populace increased, and so occupied were women on war work in factories. The most lasting and salutary effect of Ministry of Food regulations was their right to withhold the granting of new catering licences to premises which had not taken adequate steps to enable them to cook food under hygienic conditions.

Other restaurant developments of the twentieth century are: (1) *On the Continent*. The huge popular-priced restaurant seating hundreds of people, and offering music and variety acts while the evening meal is in progress. (2) *In England*. The works canteen, legally obligatory to firms employing a certain number of staff, and often heavily subsidised by the employers for reasons of higher policy and because of the resulting increased output; the fully self-service restaurant; the coin in the slot machine automatic service; and finally, and most important, the semi-self-service, neon-lit, chromium-equipped milk bar, offering hot toasted sandwiches, sandwiches, waffles, soups, fruit juice, ices, and milk shakes.

See G. de la Reynière, *Almanach des Gourmands*, c. 1800; N. Newnham-Davis, *Dinners and Dinners*, 1893; G. Richards, *The Gourmet's Guide to Europe*, 1903; T. Burke, *Dinner is Served*, 1937; B. Capper, *Dining Out*, 1938; and T. A. Laxton, *Dining Round London*, 1948.

Rest Harrow, perennial shrub, *Ononis spinosa*, of the leguminous family. Of creeping growth or, sometimes, more erect, the taller is spiky, the lower covered with viscid hairs. The toughness of the rootstock is so great that it is said to arrest the harrow when clearing the ground—whence the popular name.

Restigouche, riv. of N.W. New Brunswick, Canada, forming the boundary between Quebec and New Brunswick for 50 m., and famous for its salmon. It rises in Victoria co., and flows 200 m. to Chaleurs Bay in the gulf of St. Lawrence. On it stand Dalhousie, the cap. of Restigouche co., with a trade in timber and tinned salmon, and Campbelltown with a similar trade. Its name is Indian for

'riv. in the shape of a hand,' since the riv. has five arms.

Restitution of Conjugal Rights. A husband or wife who without sufficient reason deprives the other spouse of his or her society, or neglects to perform his or her matrimonial obligations, may be sued for R. of C. R., and the court will grant a decree accordingly. In practice the decree is usually no more than a step in the direction of divorce, because if, as generally happens, the respondent refuses to obey the order, his or her disobedience is tantamount to desertion, and a petition for judicial separation may at once be presented, or, if the offending party has been guilty of adultery, the other may immediately sue for a dissolution. See HUSBAND AND WIFE; JUDICIAL SEPARATION; MARRIAGE; DIVORCE.

Restoration. In England and Scotland, re-estab. of the monarchy in the person of Charles II., May 29, 1660. In France the term is sometimes used to describe the reinstatement of the Bourbons in 1814.

Most historians consider that Cromwell's death in 1658 made the Eng. R. inevitable. Only the strength of his personality could hold together the widely divergent forces that had made the revolution, the 'godly' and the 'parliamentarians.' But it was the skilful handling of personalities and events by Monck (*q.v.*) and Hyde, later Lord Clarendon (*q.v.*), which brought about such a peaceful, speedy, and apparently complete R. Nevertheless, though the Stuarts were restored, the word R. does not really adequately describe the situation which existed in England after 1660. For it was not in fact a complete R. The events and ideas of the interregnum had ensured that the spirit of the age of Charles I., its manners, social groupings, and constitutional alignments, could never be restored in full. Gardiner's sentence gives the key to the constitutional position after 1660: 'It was a restoration of parliament rather than of the king.' Though episcopacy was restored, and Anglicanism retained its official monopoly, Dissent was too well estab. to be eradicated. A large class of Royalists had been forced to sell most of their land in order to survive, with a fraction of their property, the burdens of sequestration, forcible composition, and the decimation tax; others had sold early in the war, to help Royalist funds. For these people, whose selling had been legally voluntary, the expected redress never came. After 1660 many names among the squirearchy were those of men who had skilfully changed sides in time to safeguard their accumulations, of speculators in army debentures who had been able to buy up Royalists with their fortunes, in the days of the Commonwealth, when land had been exceedingly cheap. The part played by the City of London in the R. has yet to be fully examined, but it seems clear that its attitude was of vital importance. After the R. the moral and financial power of the city is a visible major factor in political life. The literature of the R. period, especially that

of the theatre, shows a reaction against the austerity of the interregnum, when theatres had been closed. R. literature owes much of its form, its cynicism, and its extravagances of situation to Fr. influence, a direct consequence of the Stuart exile. The works of Dryden, Congreve, Wycherley, and Vanbrugh possess variously a charm, skill, beauty, and zest which has made them literary masterpieces; but they are very different from the simple, fresh, less sophisticated lyricism of Herbert, Lovelace, and Herrick. The reaction against Puritanism showed itself also in a licence which appeared not only in some of the literature, but outstandingly in society manners, such as had never been permitted at the court of Charles I.

In a number of ways an advance on the early Caroline epoch, the R. certainly differed from it considerably, and, as such, was bound to be a bitter disappointment to many. Clarendon's hist. gives a vivid picture of Royalist disillusionment at court. A comparison of the debates in the House of Commons during the reigns of the two Charles's, if it shows, after 1660, the beginnings of the modern party system, shows there also a distinct deterioration in moral principle since the days of Pym, Hampden, and Eliot. Politics had become a field for the ambitious money-maker. The *Verney Memoirs*, which cover both reigns, demonstrate the change in attitude of a co. family over the period. A striking imaginary reconstruction of the disillusionment and decay of the small Royalist squirearchy is given in the novel *None so Pretty*, by Margaret Irwin (1930). See also CHARLES II.; CLARENDON, EDWARD HYDE; ENGLISH HISTORY; MONCK, GEORGE; ROYALISTS; WAR, CIVIL. Bryant, *King Charles II.*, 1931; and D. Ogg, *England in the Reign of Charles II.*, 1934.

Restoration, in architecture, repairing and rebuilding of portions of buildings in imitation of that which remains so as to make the new harmonise with the old. During the seventeenth century there is seen a gradual disappearance of all sympathy with and appreciation of medieval art. Horace Walpole with his 'Carpenter's Gothic' shows the beginnings of a revived interest in the next century. With the nineteenth century the movement became strong and well directed, as is shown by such societies as the Camden Society (1840), later the Ecclesiological Society. At this time the R. of a.c.t. (Gothic church) became almost a mania, and with this work the name of Sir Gilbert Scott is especially associated. It is now felt, however, that such R. can never be really successful, and it is attempted to

conserve rather than restore. See PROTECTION OF ANCIENT BUILDINGS AND PROTECTION OF ANCIENT MONUMENTS.

Restoration (of paintings), name given to various highly skilled processes applied to old paintings that have been lost or neglected for many years. Such paintings are invariably covered with varnish to protect the paint; often the only R. needed is the cleaning of this varnish, which turns yellow or brown with age and collects dust which would otherwise ruin the actual pigments. Microscopic examination of the varnish reveals a pattern in the cracks which identifies its consistency and the correct solvent to remove it. The solvent is usually 95 per cent turpentine, 5 per cent alcohol. X-rays and the polarised microscope are then used to distinguish the ages of different pigments and media, and it is in this stage that many hidden masterpieces have been discovered; the old painting may have been substantially altered or even covered with a different picture. Holbein's portrait of Sir Wm. Butts was altered to show Sir Wm. as an old man. Recently the tintometer has been used in restoring paintings. By reflecting light from small areas of the picture and from magnesium carbonate ('standard white') the colours of the painting may be matched and measured, to tell exactly how much the R. has altered them.

Restraint of Marriage. Contracts and conditions in wills or settlements *inter vivos* are void and against public policy. But where the restraint is only partial, it may be valid, e.g. the testator or sutor cannot validly provide that A shall forfeit all benefit under the will or settlement if she marry; but he may well deprive her of all benefits if she marry a particular person or class of person. A husband, however, is perfectly entitled to direct that his widow's interest in his property shall go over to someone else as soon as she marries again.

Restraint of Trade. The general rule of law is that agreements in R. of T. are void. It was this general principle of the law of contract, aided by the vaguer law of conspiracy (q.v.), that operated for some time against the development of trade unions (see INDUSTRIAL RELATIONS). At the present day no clause will be set aside by the court as being in R. of T. unless obviously unreasonable. The construction of such clauses very frequently arises in cases where an assistant in a profession or apprentice to a trade, being desirous of setting up either in opposition to or in the same neighbourhood or part of the country as his former partner or master, finds himself restricted by an agreement not to encroach. If the radius of prohibition be unreasonable, the court will not issue an injunction against him for encroachment, and will often invite the plaintiff to submit to more reasonable terms.

Restraint upon Anticipation, device of the courts of equity, intended to mitigate the hardships of the old common law, by which a married woman's property was protected from the husband's influence.

In medieval days under the common law of England all the property of a wife belonged to her husband. The first inroad the Chancery courts made upon the husband's position was the invention of a device whereby property might be vested in trustees for the 'separate use' of the wife (see on this HUSBAND AND WIFE). While under this device married women were enabled to dispose of their property as they thought fit, there was a danger that the husband might induce her to dispose of property and hand over the proceeds. The ingenuity of Chancery lawyers was therefore directed to protecting a wife against her husband's importunities, and Lord Thurlow (q.v.) is said to have been the first judge to discover the protection and to get it adopted by the Chancery courts. At the end of the eighteenth century it was well established that property could be settled upon a woman subject to a R. upon A., as it was called. By this device a woman was prevented, if she married, and so long as she remained married, from disposing of the corpus or capital of the property or from charging the income in any way before it was received. So the law remained until 1882, when the Married Women's Property Act provided that the property of a married woman should no longer go to her husband but form part of her separate estate. By that time, however, the clause providing a R. upon A. had become a settled precedent and continued to be used as a matter of common form, but in 1936 the legislature had come to the conclusion that the device of the R. upon A. was so prejudicial to the public interest that they passed an Act forbidding recourse being made to it in deeds, instruments, or wills executed after 1935. In 1949, owing to the introduction in the House of Lords of a personal Bill dealing with the estate of Lady Mountbatten, the gov. decided that the time was opportune for further legislation. In their view the experience since 1936 had shown that the device of the R. upon A. had become an anomalous and unjust anachronism, and they therefore introduced the Married Women (Restraint upon Anticipation) Bill with the object of preventing the further application of a legal device which, by a perversion of the old equitable doctrine, which was intended to protect married women, now operated almost invariably to their disadvantage by preventing them, so long as they remained married, from dealing with their property as their own. The Bill put an end to the R. upon A., so that all married women are in exactly the same position as each other and as spinsters and widows.

Resultant Tones, secondary sounds produced by certain intervals of two notes struck at the same time, in the nature of inverted harmonics, since they sound (all but inaudibly) below instead of above the generating notes. There are two kinds of R. T.: Differential, produced by the difference between the two generating notes, and Summational, produced by the sum of these two notes, i.e. in both cases the vibrations of these notes.

Resurrection, rising again of the body and its reunion with the soul. In its widest sense the belief in the R. is not peculiar to Christianity, and anticipations of it are found in Zoroastrianism and later Judaism. The doctrine of the R. developed after the Babylonian captivity. A few biblical references showing the development are Isa. xvi. 19; Ezek. xxxvii.; Baruch ii. 17, iii. 11, 19; Wis. iii.; 2 Macc. vii. 9, etc. In apostolic times the belief in the R. was one of the lines of demarcation between the Pharisees and the Sadducees (Matt. xxii. 23 ff., and cf. John xi. 24), and of this controversy St. Paul took advantage when brought before the Sanhedrin. Christian belief in the R. is founded on the rising of Jesus and His subsequent appearances to the disciples. The preaching of the R. seems, indeed, to have formed a large part of the apostolic mission. The fullest N.T. expositions of the belief occur in 1 Cor. xv. and 1 Thess. iv., where the apostle lays stress upon the spiritual nature of the R. of the body. The doctrine was taught generally by the Church fathers, notably Athenagoras (*De resurr. carnis*) and Ephrem (*De resurr. mortuorum*), but Augustine speaks of it as 'vehemently and obstinately opposed.' This was largely due to the widespread conviction among Gk. philosophers, following Plato, that matter was intrinsically evil. It is not claimed that the Christian doctrine of general R. can be proved from reason alone, but that its probability is seen from the fact that man's complete personality involves the life of both soul and body. See *Alger's History of the Doctrine of Future Life*, 1894; W. J. Sparrow Simpson, *The Resurrection and Modern Thought*, 1911; F. E. Marsh, *The Resurrection of Christ*, 1923; H. Wace, *The Story of the Resurrection*, 1923.

Resurrectionists, or **Resurrection-men**, familiar if blasphemous name given to the ruffians who between 1826 and 1830 gained a livelihood by opening graves and selling dead bodies to the teachers of anatomy. Though detection meant punishment and popular fury, some sections of the community favoured their practices, and from the evidence given before the Select Committee of Anatomy, 1828, it is clear the R. regarded themselves as persons pursuing a legitimate calling, and far removed from the stigma of 'thieves.' The sordid case of Burke and Hare (see BURKE, WILLIAM, 1792-1829) showed that the flourishing nature of the trade of the R., coupled with the lack of legislative control of the practice, was a temptation to murder. In 1832 an Act was passed regulating the dissection of bodies and providing for the necessity of obtaining licences. In spite of this Act the practices of the R. continued, though covertly, for some years afterwards.

Resurrection Plant, see ROSE OF SHARON.

Resuscitation, name given to various methods of restoring respiration, and through it the action of the heart. It is required sometimes for the new-born baby, when the action of the lungs needs

starting, no air having entered; a smack or two with the hand or a damp cloth is generally sufficient, but in any case the mouth should be cleared, and the tongue may be brought forward. In obstinate cases respiration may be started by breathing into the lungs with great gentleness, the abdomen being pressed slightly over the stomach to prevent the air entering the oesophagus, and after commencement of respiration it may be aided by rhythmic compression of the abdomen, the infant lying between the palms of the hands; alternate reversal, with decision, of position from prone to supine may help further. Respiration may be interfered with in fainting, in unconsciousness resulting from accident or shock, in fits, in choking, in asphyxiation produced by inhalation of gases, or by 'drowning,' in some cases of poisoning, as by narcotic drugs such as opium or alcohol, or anaesthetics such as chloroform. In all cases there is an accompanying lessening of the heart action, which may be the cause or effect of the lessened respiration; if the cause, the vasomotor nerves may be affected by poisoning, or by injury or shock to the brain or upper spinal cord, and the fact must be judged from the nature of the accident; if the effect, it may be judged by the forcible attempt on the part of the heart to restore the normal condition. The distinction is of importance, as the methods of R. must be much more cautious in the former than in the latter, when they may be fairly vigorous. But in every case certain preliminaries are essential: the patient should be laid in a recumbent position, the chin raised from the chest, and all hindrances to full respiration removed or lessened, e.g. collar, tie, corset, waistcoat, etc.; he should be placed in such a position that plenty of fresh air is available; windows should be opened, or onlookers kept at a distance. In an ordinary case of fainting this will be enough, but it is useful to bend the head forward and downward to the knees, following by application of cold water or eau-de-Cologne to the face, the administration of smelling-salts, and a drink of water, sal volatile, or brandy. In most cases of poisoning other remedies come first (see POISON), and mere walking is best, but artificial respiration may be resorted to as a last resort. The administration of oxygen is one form of this, and succeeds in cases where vigorous methods cannot be applied, e.g. following surgical operations. For cases of *apparent drowning* see DROWNING. Any of the methods is useful in some cases of collapse due to electric shock. They are also applied in cases of poisoning by gas. These cases, however, are better treated by combining the artificial respiration with an aspirator fixed to the mouth and supplying oxygenated air, particularly in the case of poisoning by carbon monoxide, which is more readily absorbed by hæmoglobin. See also under AEROTHERAPEUTICS; ARTIFICIAL RESPIRATION; DROWNING. See the Life-Saving Society, *Handbook of Instruction*, and St. John's Ambulance Association, *First Aid to the Injured*.

Retail Prices, Interim Index of, see under STANDARD OF LIVING.

Retainer. The object of a R. is to secure the services of a particular barrister and to bind him not to appear on behalf of the opponent of the litigant who proffers the R. The whole practice or 'etiquette' as to Rs. is settled by the Bar Committee in conjunction with the Incorporated Law Society (q.v.), and the courts have no jurisdiction to decide questions relative to Rs. A *general R.* is the fee paid for retaining counsel before an action has commenced; a *special R.* is one given after commencement and is usually lower than a *general R.*

Retention. Scots equivalent for the right of lien (q.v.). A *special R.* of a thing may be exercised for repairs to it: by a carrier for the expensers of carriage, by a salvor for salvage charges, by an unpaid vendor for the price, or in any similar case. The right of *general R.* in respect of any debt which may happen to be due or against the discharge of a general balance of account arising out of a course of employment is given either by trade custom, express contract, or tacit acceptance of advertised conditions. Law agents, factors, bankers, and policy-brokers, among others, enjoy the right of general R.

Retford, East, municipal bor. and mrkt. tn. of Nottinghamshire, England, on the Idle, 20 m. N.N.W. of Newark; it has corn- and paper-mills, dyeworks, iron foundries, engineering, and indiarubber works. The tn. has also a large agric. trade. E. R. became a bor. in the Middle Ages, and was famous for its markets and fairs. The grammar school was founded in 1552. Pop. 16,100.

Rethel, Alfred (1816-59), Ger. painter, b. at Diepenbeud, near Aachen. He began his training at Düsseldorf under Schadow, and achieved fame with his striking, simple frescoes of episodes in the life of Charlemagne for the Aachen City Hall (1844-52). Among his other works are 'Nemesis' (1837), six water-colours depicting the 'Expedition of Hannibal Crossing the Alps' (1844-45), and the illustrations to Reinick's poetical text *The Dance of Death* (1848). See lives by Müller von Königswinter, 1861, and H. Franck, 1937.

Rethel, tn. in the dept. of Ardennes, France, 24 m. N.E. of Rheims; it manufs. fine merino cloth. It was important in the Middle Ages, when it had a famous priory, and was the cap. of a co. Pop. 5400.

Rethrahythe, see ROTHERHYTHE.

Reticle. The time of transit of a star, that is, the time when it crosses the meridian, is determined from the instant the star crosses the middle line of a series of fibres stretched across the field of view in the telescope. The middle line is on the meridian, but for high accuracy the time when the star crosses each of the five or seven lines of the arrangement is taken, and the average is used for the time when the star crossed the middle fibre of the R., as the apparatus is called.

Retief, Piet, see under SOUTH AFRICA, History.

Retina, see EYE.

Retinoscopy, see VISION, DEFECTS OF, Sight-testing.

Retired Pay, see PENSIONS (NAVAL, MILITARY, AND AIR FORCE RETIRED PAY AND PENSIONS).

Retorsion. In international law, R. is the return in kind of acts which fall short of hostility but are marked by unfriendliness. Thus differentiation of tariff may be met by acts of R. on the part of the state injuriously affected. The so-called 'cold war' with Russia after the termination of the Second World War offers many instances of acts of R. See under EUROPE (HISTORY), *The 'Cold War' between the Western Powers and Russia.*

Retort, in chem., vessel in whose chamber an object is subjected to distillation (q.v.) or decomposition by heat, a neck conducting off the volatile products. The R. of the laboratory is made of glass, porcelain, or platinum, is flask-shaped, and has a long neck attached in which the products of distillation are condensed and from which they pass into the receiver. The R. of the gas-works is a cylinder made of iron or clay.

Retreat, military operation, either forced or strategical, by which troops retire before an enemy. It differs from a flight in being orderly and under control.

Retriever, valuable all-round sporting dog. Of the three varieties the Labrador (see also under LABRADOR RETRIEVER), which had a common origin with the Newfoundland dog, is the oldest, though not recognised by the Kennel Club till 1903; since, it has competed with great success at field trials. From it and the setter and the collie, the flat- or wavy-coated R. was

T. Fall
FLAT-COATED RETRIEVER

derived. This is a beautiful dog with wonderful 'nose' and great fondness for retrieving. The head is long and fine, the muzzle square, eyes dark, neck long, ears small and carried close to the head, body short and square, stern short and straight, and coat dense black or liver. The golden R. probably derives from the flat-coated R., but is a rich golden colour. The curly-coated R. is traceable to poodle cross-breeding, from which it derives its excellence as a water dog. The coat should have a tight close-fitting curl, and the colour is usually dull black, though

sometimes liver. There are also interbred and cross-bred varieties. The R. should have a 'tender mouth' and should be able to handle game without mangling it. The R. is a strong, well-made sporting dog of unusual intelligence, obedient, easily trained, affectionate, good-tempered, and hardy.

Retrograde Motion. The planets share with the stars an apparent motion westward, due to the rotation of the earth on its axis, but in addition each planet has its own orbital movement round the sun

RETROGRADE MOTION
OF A PLANET

DIRECT MOTION OF
A PLANET

from W. to E. For this reason the planets change their positions amongst the stars, appearing further eastward night by night, but not always. At times a planet appears to remain for a few nights almost in the same position with reference to the stars and then seems to move westwards—a phenomenon which proved puzzling to the anc. astronomers. The explanation of this is very simple, and will be easily understood by referring to the diagram (left) which represents the planet Jupiter moving in its orbit round the sun and also the earth moving in its orbit. If E and J represent the positions of the earth and Jupiter when the latter is in opposition, that is, in a line with the sun and the earth, then when the earth has moved to E' Jupiter will have moved to J', the orbital motion of the earth being much faster than that of Jupiter, so that the arc EE' is larger than JJ'. An observer on the earth judges the motion of Jupiter by projecting the planet on the background of stars, and when the earth is at E Jupiter will be seen in the direction EJ. When the earth is at E' Jupiter will appear projected on the background of the distant stars in the direction E'J', and an observer on the earth will describe its motion as retrograde, that is, in a direction opposite to that of the earth and the planets in general. In the diagram (right) E and J represent positions of the earth and Jupiter, respectively, at some other time. The earth is now moving straight away from Jupiter for a short period, and Jupiter itself will have moved in the time to J', so that an observer on the earth will see its motion as direct, because the line EJ rotated round E to J' is in the sense of 'direct' in the solar system. It is easy to make a number of diagrams to show when the apparent motion will be direct and when retrograde. The case of

a superior planet only has been considered, but the explanation is similar for an inferior planet such as Venus or Mercury.

Returning Officer. see under ELECTIONS.

Reitz, Rais, or Raiz, Gilles de Laval, Seigneur de (c. 1396–1440), Fr. baron and soldier. He became marshal of France and was famous for his great bravery in war but notorious for his diabolical cruelties, for which he was burnt alive at Nantes (1440). He is said to have murdered nearly 200 women and children. He is supposed to be the original 'Bluebeard.' See Abbé Bossard, *Gilles de Rais dit Barbe-Bleue*, 1886, and F. Winwar, *The Saint and the Devil*, 1948.

Reublin, Wilhelm (c. 1480–1559), Ger. Anabaptist, b. at Rothenburg am Neckar. He was the missionary of Anabaptism to the Swiss, and in 1531 founded a community run on Communist principles. See E. Egli, *Die Zürcher Wiedertäufer*, 1878, and L. Müller, *Der Kommunismus der mährischen Wiedertäufer*, 1927.

Reuchlin, Johannes (1455–1522), Ger. humanist, b. at Pforzheim, Baden, a cousin of Melancthon (q.v.). He was appointed travelling companion to Frederick, son of the margrave, and accompanied him to the univ. of Paris. Here he studied Gk. and applied himself to Lat. composition and Heb. In 1474 he went to Basle, where he took his degree and began to lecture on the classics. In 1478 he returned to France and studied law at Orleans, later teaching this subject at Tübingen. In 1496 he went to Heidelberg, where he trans. many Gk. works, and about 1500 he was made a judge of the Swabian League at Stuttgart. He came into conflict with Pfefferkorn, a Jewish renegade, in 1510 for defending Jewish books other than the Bible, Pfefferkorn having urged the emperor to have all, with the exception of the O.T., burnt. R. maintained that only those of a definite anti-Christian character should be condemned. R. pub. *Brerilquis, id est Dictionarium singulas voces latinas breviter explicans; Epistolæ Obscurorum Virorum*, and treatises on Heb., Gk., etc. See life by L. Geiger, 1871; also J. Haller, *Die Anfänge der Universität Tübingen*, 1927–29.

Reunion, Ile de la, formerly known as **Ile de Bourbon**, is. of the Mascarene group, Indian Ocean, forming, till 1946, a Fr. colony. It is 420 m. E. of Madagascar. It is of volcanic origin, and is divided into two portions, E. and W., by a chain of mts. and a tableland. The highest point, Piton des Neiges, reaches an altitude of 10,070 ft., and is surrounded by extinct craters. The climate is temperate, but hot on the coast. R. is well watered by numerous streams, most of them navigable, and the soil is fertile. Hot mineral springs exist on the slopes, and sanatoria have been estab. at Salazie and Hellbourg. The chief products are sugar, rum, manioc, vanilla, tapioca, starch, etc. In 1946 112,990 tons of sugar and 2890 tons of rum were exported. St. Denis is the cap. (pop. 36,000), and St. Louis, St. Pierre, St. Benoit, and

St. Paul are other prin. tns. Point-des-Galets on the N.W. coast is the chief port; a coastal railway connects it with St. Benoît and St. Pierre. R. was discovered by Pedro de Mascarenhas in 1513. France annexed it in 1638. England held it from 1810 to 1815, and on its restoration to France it was renamed R. In 1946 the status of R. was changed to that of a dept. of France. It is administered by a governor assisted by a privy council, and an elected council-general. It is represented in the National Assembly by three deputies, in the Council of the Republic by two senators, and in the Assembly of the Fr. Union by one delegate. It was controlled by Vichy in the early part of the Second World War; but Fighting Fr. troops landed on Nov. 29, 1942. Area 970 sq. m. Pop. 221,000 (Fr. 211,400).

Reus, city in the prov. and 5 m. N.W. of the tn. of Tarragona, Catalonia, Spain; it is an important commercial centre and has cotton spinning, manufs. of silk, soap, and leather. Flour, brandy, and fruit are exported. Pop. 36,000.

Reuss, riv. of Switzerland, trib. of the Aar. It rises in the canton of Uri and flows in a general northerly direction over a course of about 30 m. into Lake Lucerne. Issuing from the lake, it flows N.W. and joins the Aar. Length, including Lake Lucerne, 100 m.

Reuss, name of two former Ger. principalities, both founded in 1647; the elder covered an area of 122 sq. m. Cap., Greiz. The younger principality covered an area of 319 sq. m. Cap., Gera, on the Elster. After the First World War the two principalities became republics, and in 1919 became part of the republic of Thuringia. The ter. is for the most part mountainous or hilly, and the surface is largely covered with forest. The chief industries are grazing, printing, and the manuf. of woollens, soap, porcelain, paper, etc. The inhab. are nearly all Evangelical Protestants. Pop. about 230,000.

Reuter, Christian (c. 1665-1712), Ger. satirist, b. probably at Kuttun bei Halle. His satires on the *haute-bourgeoisie* of the late seventeenth century have something of the wit and penetration of Molière. They include *L'Honnête Femme* oder *die ehrliche Frau zu Plissine* (1695) and *La Maladie et Mort de l'honnête femme, das ist: Der ehrlichen Frau Schlammpanne, Krankheit und Tod* (1696). See lives by E. Gehmlich, 1891; O. Doneke, 1929; and F. G. Schneider, 1936.

Reuter, Heinrich Ludwig Christian, known as Fritz (1810-74), Ger. dialect poet and story-writer, b. at Stavenhagen, Mecklenburg-Schwerin, and studied law at the univ. of Rostock and Jena. At Jena he took part in a students' political club, with the result that he spent five years in prison for treason. Later he took up farming and then private teaching. In 1843 he pub. *Läuschen un Riemels*, a collection of humorous poems which became extremely popular. Next appeared *De Reis' na Bellingen*; *Kein Husung*; *Hanne Nüte un de hulle Pudel*; *Schurr-Murr*; *Dörchläuchling*; *Urgeschicht von Mecklenborg*; *Ole Kamellen*, his prin.

prose work; *Ut mine Stromtid*, his masterpiece; *Lustspiele und Pöllerabendgedichte*, etc. R's stories (written in 'plattdeutsch' or peasants' dialect) are marked by fresh humour and skilful character-drawing, though the plots are somewhat weak. See lives by A. Römer, 1895; A. Wilbrandt, 1902; and K. Gædertz, 1906.

Reuter, Paul Julius de, Baron (1818-99), Ger. telegraph promoter and the founder of Reuter's Agency, b. at Kassol and became a bank clerk at Gottingen. He formed an organisation at Aachen in 1849 for transmitting commercial news by pigeon post and then by telegraph, and in 1851 came to England and opened an office in London for the transmission of intelligence between England and the Continent. His enterprise rapidly grew in importance, and is now in operation over all parts of the world. His business was converted into a limited liability company in 1865, and in 1871 he was created a baron.

Reuters, leading Brit. and international news agency, founded by Baron Julius Reuter (q.v.). R. have a world-wide service covering all kinds of foreign news. After the First World War the business was converted from a public company into a private trusteeship, the shareholders being paid out for over £500,000. Later the concern became closely associated with the Press Association, which agency previously had transmitted Reuter messages to the newspapers of Great Britain. This arrangement thus involved the proprietorship of the famous agency passing to the newspapers of Great Britain, a policy dictated by national considerations. In 1947 the final steps were taken to convert R. into a world news agency under the ownership and control of the newspapers of the United Kingdom, Australia, and New Zealand. New articles of association were adopted by the Press Association's and the Newspaper Proprietors' Association's representatives, and the Australian Associated Press and the New Zealand Press Association have taken up new shares in R., while both these dominion agencies have become parties to the Reuter Trust. In 1949 the Press Trust of India took shares in the Reuter Trust. The independent chairman of the Reuter Trust is appointed by the lord chief justice. The trust deeds stipulated that R. shall never pass under the control of one interest or group. See also under PRESS ASSOCIATION.

Reutlingen, tn. of Württemberg, Germany, on the Eschach, 19 m. S. of Stuttgart. There are manufs. of cotton and woollen goods, leather, and paper. The church of St. Mary, built in the thirteenth century, is extremely fine. Pop. 38,800.

Revel, tn. of Haute-Garonne, France, 31 m. N.E. of Toulouse. Pop. 5200.

Revel, or **Reval**, see TALLINN.

Revelation, in theology denotes the unveiling of some truth by God to man. The term is used in a more restricted sense for the manifestation of truths, given through the sacred Scriptures. If the existence of a personal God be once granted the possibility of R. cannot be

denied, though the fact and the nature of R. remain to be investigated. For the Modernist School (Loisy, Tyrrell) the so-called truths of R. were but the expressions of the highest desires of man in his efforts to attain to a transcendent God, and so these so-called dogmas were liable to change and reinterpretation. The traditional doctrine supposes a 'deposit of faith,' i.e. a number of truths revealed or manifested by God to man of permanent value for all time. For a truth to be revealed it is not required that it should be otherwise unattainable, but that it should in point of fact have been revealed. Thus the existence of God may be demonstrated from reason, but it appears in the Bible without such demonstration (Exod. iii. 14). Frequently, however, revealed truths are distinguished from natural religion, the content of which is demonstrable by the processes of reason.

Revelation, Book of, otherwise known by its Gk. title *Apocalypse*, the last book of the Bible. It belongs to a class of literature which is treated generally under the heading *Apocalypse*. Its ascription to St. John the Apostle depends rather on the early tradition mentioned by Justin Martyr (A.D. 140), than on the MS. authority. By some it has been attributed, after Eusebius, to John the Presbyter, but the separate existence of this person has never been proved. We have the statement of Irenaeus for the vision having been seen not long since, 'almost in our own generation, at the close of the reign of Domitian' (A.D. 98), and he attributes it expressly to 'John the disciple of the Lord' (*Adv. Haer. V., xxvi.*). The difference of style between the Fourth Gospel and the *Apocalypse*, however, constitutes a difficulty. The meaning of the book has been a constant subject of dispute. It has repeatedly served as a foundation for Chilian views. The first part (chapters i.-iii.) consists of letters of encouragement or warning to the bishops, called 'angels,' of the Asiatic churches. The body of the prophecy (chapters iv.-xxii.) undoubtedly deals with the end of the world, though there are allusions to contemporary events and to the Christian liturgy of the first century. In reading the visions it is important to realise that they are not arranged in chronological order, but are like a series of separate flashes each describing the end of the world under a separate set of symbols. See H. B. Swete, *The Apocalypse* (3rd ed.), 1911; J. Chapman, *John the Presbyter*, 1911; and R. H. Charles, *The Apocalypse*, 1920; also the very detailed work of Allo, *St. Jean: L'Apocalypse*, 1921.

Revels, Master of, the name of an Eng. official formerly attached to royal and noble families. He was also known as the 'Lord of Misrule,' and his chief function was to preside over plays and performances of mountebanks, ballad singers, etc., and generally supervise and arrange the amusements of the court or great house as the case might be. The office fell into disuse early in the eighteenth century.

Revelstoke, tn. in Brit. Columbia, Canada, on the Canadian Pacific Railway, 360 m. N.E. of Vancouver. It is the centre of a mining and lumber dist. Pop. 3200.

Reventlow, Count Christian Ditlev (1748-1827), Dan. statesman and reformer, b. in Copenhagen. He was an able administrator, and while in office entirely reorganised Dan. agric. economy. In 1786 he initiated the appointment of the commission which abolished serfdom.

Reventlow, Count Ernst Christian Einar Ludwig Ditlev (1869-1943), Ger. politician, b. in Linsum, Schleswig-Holstein, at that time a part of Prussia. He was a writer on political subjects and on naval strategy, and in the decade before the First World War was a leading member of the 'Pan-Ger.' group of politicians. He became a member of the Reichstag in 1924 and joined the National Socialist party three years later.

Revenue, Public, see PUBLIC REVENUE.

Reverberatory Furnace, see under FURNACES.

Revere, Paul (1735-1818), Amer. patriot, b. in Boston, Massachusetts. He served as a soldier, became a gold- and silver-smith in Boston, where he printed the paper money ordered by Congress in 1775 and estab. a powder-mill, took part in the 'Boston Tea Party' (1773), and became a member of the Boston 'Anti-Brit. Society.' His midnight ride to Lexington and Concord (April 1775) to warn the people of the approach of the Brit. troops was rendered famous by Longfellow's poem, *The Midnight Ride of Paul Revere*. In 1801 he founded the R. Copper Company at Canton, Massachusetts. See lives by C. F. Gettemy, 1903, and H. O'Brien, 1929.

Revere, tn. and holiday resort of Suffolk co., Massachusetts, U.S.A., 5 m. N.N.E. of Boston. Pop. 34,400.

Reverend, title of respect generally accorded to all clergy and ministers of religion, though it has on some occasions been repudiated by certain dissenting ministers. In the Anglican Church deans are spoken of as 'Very Reverend,' bishops as 'Right Reverend,' archbishops as 'Most Reverend.' In Scotland the title 'Right Reverend' is applied to the Moderator of the General Assembly. In Rom. Catholic countries priests are addressed 'Reverend Father' and mother superiors 'Reverend Mother.' R. is not a substitute for Mr. in either writing or speech.

Reversed Trades, see under TRADE WINDS.

Reversing Layer, in astronomy, stratum of the sun's atmosphere whose absorption of the light from the photosphere produces some of the dark lines of the spectrum. The layer, which was discovered by Young in 1870, is at a lower temp. than the photosphere upon which it lies, but is itself incandescent. The white light of the photosphere passes through the stratum, with the result that light of those qualities characteristic of the stratum itself is absorbed, so that dark lines are produced in the spectrum. If, however, the photosphere is itself

eclipsed, the spectrum of the layer shows reversed or bright lines.

Reversion, in law, returning of an estate to the grantor or his heirs, after a particular estate is ended; e.g. if A gives a life estate to B out of his fee simple estate of Blackacre, the R. will be in A's heirs, and similarly the R. of the fee simple will be in the grantor and his heirs of a fee tail by mere implication of law and without any express reservation (see ESTATE, FEE). The interest of a landlord after the expiration of a lease is also called the R. In Scots law, R. as applied to heritage is a right of redemption, and is either legal, i.e. that which the law provides of its own motion, or conventional, i.e. that of a wadset or heritable bond entitling the debtor to 'disencumber' the estate.

Reversion, in heredity, name given to the biological fact that the species revert in some of their peculiarities to ancestral forms. Children, for example, often revert in certain particulars, both physical and moral, to their grandparents, or even more remote ancestry; again, Darwin considered that the slaty-blue pigeons which occasionally appear in all breeds are an instance of R., and that the inference of such fact may be drawn from the number of the markings correlated with the blue tint, because of the improbability that all the markings would appear together from a simple variation (see DARWINISM). The appearance of a certain characteristic in an organism may depend upon the presence of sev. different genes (see MENDELISM) in the fertilised egg from which the organism developed. In succeeding generations these genes may become separated, and their subsequent accidental recombination will cause the reappearance, or R., of the characteristic. In contrast to the views of Darwin the tendency at the present time is to regard the occasional appearance of a tail, or supernumerary nipples, in humans as being mere accidents of development, rather than as examples of R. to the ancestral condition. Similarly the simple brain and low mental capacity of a microcephalous idiot are more probably caused by a defect in development than by a R. to an ape-like ancestor. In medicine the term R. is used to denote the recurrence of a disease which has not revealed itself during intermediate generations. See also ATAVISM; HEREDITY.

Reversion Duty, see LAND TAXES.

'Review of Reviews,' former review of the monthly literature of all contemporary periodicals, together with a general commentary on the leading topics of the day. It was founded in 1890 by W. T. Stead (q.v.), whose characteristic political views dominated the R. of R. up to the time of his death. A notable feature of the R. of R. was the reproduction of the most striking Eng. and Amer. political cartoons of the day. Later it was owned and ed. by H. W. Stead (q.v.). The R. of R. became the *World Review* (q.v.) when Edward Hulton assumed control in 1940.

Revillagigedo Islands, group of uninhabited rocky is. in the Pacific Ocean,

off the W. coast of Mexico, about 19° N. and 111° W., belonging to the Mexican state of Colima. Total area is 320 sq. m., including the is. of Socorro, San Benedicto, Roca Partida, and Clarion.

Revival (of religion), name now used for various religious movements which caused a renewal of zeal and fervour in the cause of religion, e.g. the crusades, the Franciscan movement of the thirteenth century, and the early work of the Jesuits. The term, however, is a modern one, and is perhaps best used only in its modern connection. In this case its. are a feature of Protestant church life by which, under the influence of vigorous and fervid preaching, conversion of heart is felt by the unconverted and additional zeal is stimulated in church members. The 'Great Awakening' was the great R. of America, and is specially connected with the name of Jonathan Edwards. In England the names of Wesley, Whitefield, Moody and Sankey, Evan Roberts, Torrey and Alexander are well known in connection with religious R.s.

Revival of Learning, see RENAISSANCE.

Revocation. In the law of contract an offer may be revoked at any time before acceptance, for it is acceptance that binds the parties contractually. An offer is accepted when the acceptance is communicated; this means more than a tacit formation of intention; there must be some overt act or speech to give evidence of that intention; but in any case acceptance is 'communicated' when it is made in a manner prescribed or indicated by the offeror and therefore acceptance may be held to be communicated and the contract made though the acceptance has not come within the knowledge of the offeror. But an exception to this general rule as to the revocability of an offer must be made in the case of offers under seal. Such an offer cannot be revoked: even though it is not communicated to the offeree it remains open for his acceptance when he becomes aware of its existence. A R. (as distinct from lapse for want of acceptance) is inoperative until communicated, and the withdrawal of an offer is not 'communicated' by the mere posting of a letter. Consequently an acceptance made by post is not affected by the fact that a letter of R. is on its way. The above is the general rule, though there have been precedents which suggest a modification when the offer is one to sell property and the R. takes the form of a sale of the property to a third person. In business there must be many offers which do not contemplate an immediate acceptance; a reasonable time is here allowed during which the offer is continuing, and a mental R. would not avail against an acceptance made within such time.

In the law of principal and agent, the relation of principal and agent is founded on mutual consent, and therefore may be terminated by the same process which originated it, the agreement of the parties. Where the authority of an agent is determined by R., such R. is a 'condition subsequent' of the contract of agency;

i.e. it is a term in the original contract of employment. The principal's right, however, to revoke is affected by the interests of (1) third parties; (2) the agent. (1) A principal may not privately limit or revoke an authority which he has allowed his agent publicly to assume. He will be bound by the acts of the agent which he has given other persons reason to suppose are done by his authority. (2) If the employment is in its nature such that the authority cannot be revoked without loss to the agent, the principal may not revoke. This rule may be regarded as identical with a rule of a more limited significance, that an authority coupled with an interest is irrevocable. Authorities given to an agent to pay to a third party a debt which he owes to his principal, or to sell lands and pay himself a debt due to him out of the proceeds, are instances in which an authority has been held to be irrevocable by reason of interest. For it. of will see WILLS, and for R. of patents see PATENTS, *Revocation*. See Bowstead's *Digest of the Law of Agency*, 1944, and Anson's *Contracts*, 1945.

Revolution, name given to a change in the internal constitution and government of a country, when brought about by the concerted and more or less violent action of the inhab. Among the more important Rs. in the world's hist. are the R. in England in 1688, when William of Orange came to rule over England; the Amer. R. of 1776, when England was obliged to give America her independence; the Fr. R. of 1789; and the Russian R. of 1917. The change of Britain from an agric. into an industrial country is known as the Industrial R. (q.v.). For details of Rs. see hist. section of FRANCE, U.S.A., etc.

Revolvers and Revolver Shooting. Pistols have been superseded by R., except occasionally for target practice. A revolver is a single-barrelled pistol having a revolving breech, which contains sev. chambers for cartridges. The breech was originally revolved by hand, but in 1835 the first practical revolver was produced by S. Colt, an Amer. In the Eng. revolver the pull of the trigger, in the Amer. type the cocking of the hammer, revolved the cylinder; the first double-action revolver, in which either of these principles could be employed was produced in 1855. Rim-fire, pin-fire, and central-fire cartridges were successfully invented, the last being in general use save for small-calibre R. The revolver is designed for quick use at close quarters and is mainly a weapon of defence. Although capable of being used with precision, it is normally used instinctively, on the spur of the moment, as when taking a shot at game with a shot-gun. Modern R. are so constructed that when the arm is extended naturally to take a shot, the barrel of the revolver is pointing at the 'target,' so that even in moments of excitement shots will be effective. Both Colt and Adams R. were used in the Crimean war and later were adopted by the navy. The U.S.A. is regarded as the home of the revolver, and during the civil war whole corps were armed with four R. each man. The

action of reloading being comparatively slow, they were no match against corps armed with repeating carbines. There are sev. makes of modern R., and in the Brit. Army the Webley is used. Other makes are the Smith & Wesson, Webley-Wilkinson, Webley-Scott, and Colt. Revolver-shooting competitions are held under the auspices of the National Rifle Association at Bisley: Revolver Gold Badge, open to all comers; revolver medals, all comers ten to fifty yards range shoots; and revolver prizes, all comers, divided into four series. See also FIRE-ARMS; PISTOL.

'Revue des Deux Mondes,' Fr. review, most outstanding of all the bi-monthly periodicals which appeared until the Second World War. It was founded in 1829 by Ségur-Dupeyron and Mounroy, and later taken over by Buloz, under whose direction (which continued for over forty years) it acquired an enormous vogue. Apparently it owed its revived fortunes to the vicissitudes of the revolution of 1848, when it took up a constitutional and monarchist attitude, and thereby gained both the favour and patronage of the wealthy. In its origin the *R. des D. M.* was purely literary, but afterwards opened its columns to scientific discussion, political hist., and current politics. Balzac wrote in the *R. des D. M.* for a time, and so did Gustave Planche, who incurred the hostility of Victor Hugo by his criticisms of the latter's masterpieces. Between the two world wars the jour. was moderately Conservative and Nationalist in attitude.

Rewa, or Rewah: 1. State of Vindhya Pradesh, India. It has coal and iron mines, and produces rice and grain. Area 13,000 sq. m. Pop. 1,820,200. 2. Tn., cap. of the above, 75 m. S.W. of Allahabad. Pop. 30,000.

Rewa Kantha, former agency, consisting of sixty native states, in the Gujerat div. of Bombay. After the transfer of power in 1947 they were absorbed into Bombay Prov., India.

Reward, return for some voluntary act, but the corrupt taking or advertising Rs. may bring the offender within the criminal law. Advertising a R. for the return of stolen or lost articles is lawful, but to add words to the effect that no questions will be asked or inquiries made renders the person so advertising liable to a penalty of £50. No action for this offence can be brought against the printer or publisher of a newspaper containing such an advertisement, except with the leave of the attorney- or solicitor-general, and not at all after the expiration of six months from the pub. A person may be punished as for larceny who corruptly takes a R., i.e. takes the R. under pretence of helping to recover stolen property, but does not 'use all due diligence to cause the thief to be brought to trial.' Apparently keeping property back, like a cheque, the ownership of which is clear, in the expectation of the offer of a R., is not criminally punishable, but would certainly render the person doing so liable to damages for detention.

Rewari, tn. of E. Punjab, India, 43 m.

S.W. of Delhi; there is trade in grain, sugar, iron, and salt. Pop. 30,000.

Reykjavik, or **Reikjavik**, tn. and cap. of Iceland, on the S.W. coast at the head of the Faxa Fjord. It is of Viking foundation, estab. by Ingolf in 874 (see under ICELAND, *History*), but the present tn. is largely modern. It has a cathedral, a univ. (inaugurated in 1911), and theological and medical schools, the 'Althing,' or Parliament house, with a library and museum of Icelandic antiquities attached, and governor's house. In 1945 the heating of R. by piped water from the hot springs and geysers was completed. The exports consist of skins, butter, and fish

thrown by the Pétain regime and made the scapegoat for France's unreadiness for war, though he can hardly be blamed fairly for being unable in two months as Premier to remedy defects in defence which were the result of many years of ill conceived policy. He fought against the capitulation at Bordeaux to the last, and later suffered for his personal resistance by being first imprisoned by Pétain and later deported to Germany, where he endured a period of solitary confinement. In Aug. 1948 he took office for the first time since 1940 as minister of finance under André Marie, and proposed far-reaching fiscal reforms involving

R.A.

REYKJAVIK THE HARBOUR

L N 1

R was the headquarters of the allied occupation force during the Second World War. Pop. 48,900.

Reynard the Fox, see under FABLE

Reynaud, Paul (b. 1878), Fr. statesman, b. at Barcelonnette, Basses-Alpes. He became a successful advocate at the Paris Bar, and entered politics in 1919, joining Flandin's right-wing Democratic Alliance. He was fifty-two before he held his first ministerial office, and was minister of colonies, justice, and finance in various Flandin and Tardieu govs. after 1930 and minister of finance under Daladier (q.v.) from 1938 to 1940. He improved the nation's financial situation by decrees increasing taxation and by economies in public works expenditure. He was critical of the appeasement policy, and, after the Munich Pact (q.v.), broke away from Flandin's pro-appeasement party and remained an independent thereafter. He won a considerable reputation by his speeches calling for a vigorous conduct of the war, becoming Prime Minister, March 23, 1940, in succession to Daladier, who had signed the Munich Pact. On the collapse of France, however, he was over-

thrown by the Pétain regime and made the scapegoat for France's unreadiness for war, though he can hardly be blamed fairly for being unable in two months as Premier to remedy defects in defence which were the result of many years of ill conceived policy. He fought against the capitulation at Bordeaux to the last, and later suffered for his personal resistance by being first imprisoned by Pétain and later deported to Germany, where he endured a period of solitary confinement. In Aug. 1948 he took office for the first time since 1940 as minister of finance under André Marie, and proposed far-reaching fiscal reforms involving

Reynolds, Sir Joshua (1723-92), Eng. portrait painter, b. at Plympton, Devon. His father was headmaster of the local grammar school. While very young he showed great artistic talent, and in 1740 his family sent him to study under Hudson, a leading contemporary portrait painter. He returned to Devon, where he painted over twenty portraits, and later visited Italy and the Mediterranean, where he studied the It. old masters and became a lifelong admirer of Raphael, from whom he derived much of his skill in design and treatment of skins and materials. R. then settled in London. He lived in Great Newport Street until 1760, and then took a house in Leicester Fields. He was soon acknowledged as the finest portrait painter in England; he executed portraits of persons so diverse as George III, Laurence Sterne, Dr. Johnson, Garrick, Lady Sarah Bunbury, and Kitty Fisher.

In 1768 R. was appointed president of the Royal Academy, and was knighted in the following year. For the remainder of his life he exhibited many of his most famous paintings in the Royal Academy's gallery. R.'s encouragement of new talent was constant and generous; he founded the Royal Academy Schools, giving his first lecture to students there in 1769. He also suggested the foundation of the Royal Academy banquet, and the appointment, as honorary profs. of the Academy, of leading figures of the day. Of his many works, the *Discourses* (pub. in Everyman's Library) contain advice which is still valuable to students of painting. R.'s literary interests were wide. He was the founder of the Literary Club.

R. painted many historical scenes, but he is remembered chiefly for his portraits. His draughtsmanship was superb, and he possessed a wonderful sense of colour. He followed da Vinci in never ceasing to experiment for new colour combinations and effects, and, like da Vinci, his efforts have resulted in some of his pictures becoming faded, though in others the rich tones remain to justify his inventiveness. R. also possessed, though to a lesser degree, Rembrandt's gift of chiaroscuro, and, in the Eng. portraiture tradition, he is the successor of Van Dyck in his graceful studies of the Eng. aristocracy, though in detail of style he is not so close to Van Dyck as Gainsborough.

R. exercised great influence, not only on Eng. portraiture, but in every field of Eng. art. There are paintings by R. in many Eng. galleries, including the Royal Academy, the National Portrait Gallery, the National Gallery, and in many private collections in Britain and N. America.

See ed. of R.'s work with life by E. Malone, 1798. See also lives by J. Northcote, 1819; Sir C. Phillips, 1894; Sir W. Armstrong, 1900; M. Osborn, 1908; F. Rutter, 1923; A. Dayot, 1931; and J. Steegman, 1933.

'Reynolds News,' Brit. Sunday newspaper, founded May 5, 1850, by George Win. McArthur Reynolds, eminent Chartist politician and prolific Victorian novelist, who ed. the paper from 1850 until his death in 1879. Estab. to 'defend the rights of the masses' R. N. was a powerful champion of trade unionism, and was particularly noted for its support of the successful dockers' strike of 1889. For a period in the early part of this century the paper came under the Liberal ownership of Lord Dalziel. The paper was purchased by the Co-operative movement in 1929, and reverted fully to its Socialist background. It is now the only Sunday Labour and Co-operative newspaper.

Rha, see VOLGA.

Rhabanus Magnentius, see RABANUS.

Rhabdomancy, see DIVINATION and DIVINING ROD.

Rhadamanthus, in the mythological stories of the Gks., son of Zeus and Europa. He is said to have been made a judge of the departed souls on account of his own justice.

Rhætia, or Rætia, prov. of the Rom. Empire, lying in the Alps, S. of the

Danube, now occupied by the canton of Grisons, Switzerland, and part of the Tyrol. It was subdued by Tiberius and Drusus (15 B.C.). Its cap. was Tridentinum (Trent); Augusta Vindelicorum (Augsburg) was in its N. part, Vindelicia.

Rhætian Alps, div. of the Alps, lying to the N. of Lombardy, Italy, and between the R. Adia on the W. and the Inn on the E. The chief heights are the Piz Bernina (13,304 ft.), the Piz Roseg (12,936 ft.), and the Ortler Spitze (12,804 ft.).

SIR JOSHUA REYNOLDS
Engraving after a self-portrait.

Rhætic Beds, uppermost formations of the Triassic system. They are composed of red, green, and grey marls, black shales, sandstones, bone-beds, and exhibit thin coal seams in Germany. They are also known as the *Aricula contorta* beds from one of the characteristic fossils, and also as White Lias; other fossils are *Cardium Rh.*, *Pecten valon.*, *Pullastra arenicola*, *Saurians*, *Microlestes*, etc. In England they extend from Devonshire, through Bristol, to the coast of N. Yorkshire; on the Continent they are found in Germany, France, Italy, and the Rhætian Alps.

Rhæto-Romanee Languages, see under ROMANESCH.

Rhagæ, or Rhages, see RHÉ.

Rhamnaceæ, see BUCKTHORN.

Rhamnus ('Ραμνός; modern *Obrus Kastro*), scapeart of the tribe *Eantis* in N.E. Attica, anct. Greece, 25 m. from Athens, on the road from Marathon to Oropus. It derived its name from a kind of prickly shrub (ραμνός or ραμνός). It was famed for its temple and colossal statue of Nemesis, the 'Rhamnusia virgo' or 'dea' of Ovid and Catullus. In 1891 ruins of a small temple to Dionysus and a theatre were discovered. A statue of Themis was found in another temple near. See W. M. Leake, *Dem of Attica*, 1840, and C. Wordsworth, *Athens and Attica*, 1888. Rhamphastidae, see TOUCANS.

Rhampsinitus, classical form of the Egyptian Rameses, probably to be identified with Rameses III., king of Egypt (twelfth century B.C.). Herodotus (II. 121) tells the story of the theft by two brothers of the treasure stored in the king's treasury (at Medinet Abu in Thebes). Most collections of European folk-tales contain similar stories of *The Master Thief*. Some consider the tale to be of Egyptian origin. See Köhler, *Orient und Occident*, 1864; W. A. Clouston, *Popular Tales and Fictions*, 1887; G. Maspero, *Contes populaires de l'Égypte ancienne*, 1889; *Gesta Romanorum*.

Rhapsodists (Gk. *ῥαψωδός*, bard), originally epic poets of ant. Greece who recited their own verses in public; but by the sixth century B.C. the term was generally used of the professional reciters of other people's poems, especially those who declaimed the poems of Homer at various festivals, without instrumental accompaniment, merely holding a branch of bay in the hand.

Rhapsody, originally a recited or chanted poem, especially an epic one; but the term became adapted to music of a declamatory character and later, by derivation therefrom, to compositions of an eloquent kind cast in no definite form. The temptation thus arose to call any shapeless work, or any work whose form could not be classified, a R., but good compositions of that kind have, like all good works of art, a satisfactory form of their own, though it may not lend itself to classification.

Rhatany, or *Krameria triandra*, half-shrubby leguminous plant found on the dry gravelly soil of Peru. The root is excessively astringent, and is exported to Europe on that account; its powder, mixed with charcoal, forms excellent tooth-powder.

Rhayader, mrlkt. tn. of Radnorshire, Wales, on the Wye, about 40 m. N.W. of Hereford. It is a centre for the sale of sheep and farm produce generally. Some 4 m. away, among the hills, are the great reservoirs which constitute Birmingham's water supply. Pop. 900.

Rhé, Île de, see **RÉ, ÎLE DE**.

Rhé, Rai, or **Shah Abdul Azim** (ant. **Rhages Rhages**), ruins in Persia, 6 m. S. of Teheran. For many centuries the city was the cap. of Persia. The tomb of Shah Abdul Azim in the S.W. is much frequented by pilgrims. R. was the bp. of the famous Caliph Harun-al-Rashid (eighth century). It was destroyed by the Mongols in the thirteenth century, and Teheran became the home of its inhab.

Rhea, or South American Ostrich, genus of struthious birds, with three toes to the foot, a feathered head and neck, well-feathered wings, and rudimentary tail. Two species are identified: *R. americana*, which has been slaughtered in enormous numbers in recent years, though attempts have been made with considerable success to domesticate it. The other species is Darwin's R. (*R. darwini*), which is smaller in size, has shorter legs, feathered to a tarsus, and has the plumage mottled or less uniform in colour. It occurs in

Patagonia. See Darwin, *Naturalist's Voyage*.

Rhea ('Péa, 'Pén), in Gk. mythology, daughter of Uranus and Gaea, wife of Cronus (Saturn), and mother of Zeus, Poseidon, Hades, Hera, Demeter, and Hestia (Vesta). Her worship probably originated in Crete. She was regarded as an earth-goddess and type of the fruitfulness of nature. Often called the 'mother of the gods,' she was identified with the Asiatic Cybèle (q.v.) or Cybèle, 'the Great Mother.'

Rhea Fibre, see **BOEHMERIA**.

Rhea Sylvia, or **Ilia**, in Rom. legend, daughter of Numitor and mother by Mars of Romulus and Remus. King Amulius had forced her to become a vestal virgin, and after the birth of her sons had her drowned. The poets taught that she was changed into a goddess and became the wife of the Anio.

Rhegium, see **REGGIO DI CALABRIA**.

Rheims, or **Reims**, city of France, in the dept. of Marne, 81 m. E.N.E. of Paris, on the r. b. of the Vesle, a trib. of the Aisne. The chief industries are the manuf. of flannels, cloth, cotton goods, chemical products, candles, soap, stained glass, paper, and machinery. It is famed for its wines, particularly champagne. The most interesting architectural feature of the tn. is the cathedral of Notre Dame, where the kings of France used to be crowned. Founded in 1211, on the site of earlier churches, it has undergone many changes, and its façade is one of the most perfect masterpieces of the Middle Ages. Bombardments during the First World War severely damaged, though did not destroy it. Other beautiful old buildings, including the archiepiscopal palace, tn. hall, and Hôtel Dieu, were, however, destroyed. The cathedral was restored and reconsecrated in 1937, and reopened the following year, although in 1950 replacement of statues damaged thirty years before was still going on. R. was an important tn. during the time of Cæsar. Christianity was introduced in the fourth century, and Clovis, after his victory at Soissons (486), was baptised at R. in 496 by St. Rémy, or Remigius (q.v.). Historical meetings of Pope Stephen III. with Pepin the Short, and of Leo III. with Charlemagne, took place at R. In the tenth century R. became the centre of intellectual culture, and in 1139 Louis VII. granted the tn. a communal charter. The treaty of Troyes ceded it to the Eng., but on the approach of Joan of Arc they were expelled. It was held by the Gers. during the war of 1870-71, and was captured by them in 1914, but soon evacuated, and was under continuous bombardment, 1914-18. It was again occupied by the Gers. in June 1940, and evacuated by them, almost undamaged, in face of the rapid advance of the Allies after crossing the Seine, at the end of Aug. 1944. In May 1945 R. was the headquarters of Gen. Eisenhower (q.v.), where he received the unconditional surrender of the Gers. by Jodl, acting on behalf of the Ger. high command (May 7). Pop. 110,700.

Rhein, or Rhenus, see RHINE.

Rheinberger, Joseph Gabriel (1839-1901), Ger. musical composer, b. at Vaduz, studied at Munich, becoming prof. there (1859). He was considered one of the finest theory and organ teachers of his day, and after succeeding Wüllner as Hofkapellmeister (1877) devoted much time to sacred music. His compositions include organ sonatas, the oratorio *Christophorus*, operas, overtures, cantatas, and chamber music. See life by T. Kroyer, 1916.

Rheine, tn. in Westphalia, Germany, on the Ems, 30 m. N.W. of Osnabrück. Its industries include tobacco preparation, engineering, and cotton-spinning. It was the cap. of a small principality in medieval times, and has some Gothic and baroque buildings. Founded in 838, it became a tn. in 1327. Pop. 35,200.

Rheingau, dist. of Hesse, Germany, on the r. b. of the Rhine; Rüdeshelm is at one extremity of this region, which is very fertile, and produces excellent wine. Eltville is the chief tn.

Rheinhausen, tn. of Germany, on the Rhine opposite Duisburg. There are important iron and steel works. Pop. 40,300.

Rhein-Kreis, see RHEIN-PROVINCE.

Rhemes, see under SEMANTICS.

Rhenanus, Beatus (1485-1547), Ger. humanist, b. at Reims. He studied at Paris and then at Basle, where he entered on a lifelong friendship with Erasmus. He wrote *Rerum Germanicarum*, libri iii. (1531), and ed. the works of Erasmus (1540-41), besides those of Pliny, Tacitus, etc.

Rhenish Architecture, see ARCHITECTURE.

Rhenish Prussia, see RHINE PROVINCE.

Rhenish Wine, somewhat antiquated term for all wines which are made in the vineyards bordering on the banks of the Rhine, Moselle, and Main. All the wines so made are white, but a minute quantity of red is made in the dist. around Aynhausen and Ingelheim, which is poor and not regarded as important even in Germany.

Rhenium, metallic chemical element, symbol Re, atomic number 75, atomic weight 186.3. It was discovered by Noddack and Tacke in 1925, in certain platinum ores. R. is a gray metal, sp. gr. 20, with a very high melting point. It has so far found no industrial application, but potassium perrhenate, $KReO_4$, can now be obtained with comparative ease, so that commercial uses may follow. Chemically R. is an analogue of manganese.

Rhenus, see RHINE.

Rheology, study of the deformation and flow of matter. If forces are applied to many kinds of solids in such a way as to change their shapes, and the changes are not too large, practically complete recovery occurs when the forces are removed. Examples of such solids are metals, most crystals, wood, etc. Other materials such as putty, butter, pitch, clay, etc., may be deformed by even small forces, and afterwards show incomplete recovery of shape. Moreover, although they resemble liquids in that they can flow under the continued

action of forces, these materials do not behave merely as ordinary viscous liquids, for which the laws of flow are simpler and have long been known. The more complex behaviour of materials such as those mentioned is the subject investigated by the rheologist.

Rheostat, electrical instrument devised for varying an electrical resistance (q.v.) in a circuit and used in different forms for controlling direct-current motors, as motor starters, and in wireless apparatus. In one type the circuit is connected with a movable arm, the free end of which is moved over a series of brass studs, each connected with a resistance coil and the end ones with the circuit.

Rhesus (Rh) Factor, substance (agglutinin) first discovered in 1940 in the red blood cells of the Rhesus monkey, whence the name R. F. is derived; it is present also in 85 per cent of humans, who are said to be Rh +, the remaining 15 per cent being Rh -. The R. F. is inherited, and the offspring of an Rh + father and Rh - mother may itself be Rh +. The Rh - mother reacts to the presence of the Rh + foetus by producing an agglutinin in her blood plasma. This agglutinin causes agglutination and destruction of Rh + red cells in a subsequent foetus, with results which are frequently fatal for the child. A similar undesirable reaction occurs if an Rh - person, previously sensitised by a transfusion of Rh + blood, is subsequently given a further transfusion of Rh - blood. See *The Rh Blood Group* (Medical Research Council memorandum), 1948.

Rhesus Monkey, or Boonder (*Macacus rhesus*), macaque or catarrhine monkey common to N. India, in some parts of which it is attached to temples and regarded as sacred. It is from 18 in. to 2 ft. long, with a tail of 7 or 8 in. The hair is straight and fairly long, and is greyish or greenish brown. The face is flesh-coloured and the callosities bright red. This species is commonly kept as a pet, and is much used for research work in physiology. See RHEUS FACTOR.

Rheticus (real name, George Joachim) (1514-76), Ger. mathematician and astronomer, gave up his professorship of mathematics at Wittenberg for a time in order to supervise for Copernicus at Frauenberg the printing of *De Orbium Revolutionibus*, whose principles he enthusiastically endorsed. He is noted for the comprehensive and accurate tables of sines, cosines, and tangents, etc., calculated for every ten seconds and to ten places in his *Opus Palatinum de Triangulis*, pub. in 1596.

Rhetoric (Gk. *ῥητορικὴ*), originally the art of speaking effectively in public, but afterwards the meaning was extended so as to comprehend the theory of eloquence, whether spoken or written. It was first arranged and developed by the Gks. of Sicily, and Corax of Syracuse (c. 500 B.C.) is said to have been its originator. The earliest of the famous ten Attic orators was Antiphon. The earliest, however, really to make R. a methodical study was Isocrates, who defined his subject as 'the science of persuasion.' The greatest work on the subject either of ant. or modern

times is a treatise of Aristotle. He defines R. as the faculty of perceiving on any given subject what is best adapted to persuade. He then divides it into three parts: Persuasion, Language, or Expression, and Arrangement. Of persuasion there are three kinds, the deliberative, the demonstrative, and the judicial; with reference to each of which persuasion may be either general or special. In the second book he shows how, in certain cases, special persuasion depends upon the character of the speaker, and on the character and passions of the hearers. The third book deals with expression, and lastly arrangement is discussed. The peripatetic school followed Aristotle's method; but about 300 B.C. it was superseded by the Asiatic method, which in its turn was displaced by that of the school of Rhodes. Finally, the centre of rhetorical study shifted to Rome. See also ORATORY. See R. Volkmann, *Die Rhetorik der Griechen und Römer*, 1874; J. Bascom, *Philosophy of Rhetoric* (new ed.), 1885; R. C. Jebb, *Attic Orators*, 1893; I. A. Richards, *The Philosophy of Rhetoric*, 1936.

Rheumatism, general term for a number of diseases characterised by pain in the joints and muscles, and usually initiated by exposure to cold or wet. The following disorders may be grouped under the name R.: rheumatic fever; subacute R.; muscular R., including lumbago; sciatica; rheumatoid arthritis; osteoarthritis; and gout. *Acute rheumatism*, or *rheumatic fever*, bears several characteristics which point to an infective origin. Poynton and Paine have given the name *Diplococcus rheumaticus* to a micro-organism which has been found in lesions of the joints in rheumatic persons; but, although the probability of a microbic origin is generally admitted, there is considerable diversity of opinion as to whether the causative organism has been isolated. The immediate cause of acute R. is almost invariably exposure to cold or wet, particularly when the subject is in a debilitated or fatigued state. Heredity seems to be a predisposing cause, and the possession of a rheumatic constitution, whatever form it takes, renders a person peculiarly liable to an attack. It is a fairly common sequel of scarlet fever. It is more common in temperate climates than in extreme, but alternations of high and low temp. are favourable to the development of the disease. It seldom attacks children under ten or adults over forty, and apparently affects more males than females. The symptoms vary to some extent with respect to children and adults. In adults there are moderate febrile symptoms; the pulse is quickened, and the temp. is raised, though seldom above 102°. There is a peculiarly acid perspiration and the urine is acid and scanty. The tongue is furred and the appetite diminished. The most painful symptom is the inflammation of the joints, which usually begins with one joint and then spreads to others, often symmetrically. In children the joint inflammation is not so pronounced, and the pains may be localised in certain muscles. There are no

acid sweats, and the other symptoms are less intense than in adults. The most usual complications, which form the most serious feature of the disease, are chorea, or St. Vitus's dance, in children, and endocarditis, more rarely pericarditis, pleurisy, and peritonitis in both adults and children. The iris and conjunctiva may also be affected, and, in adults particularly, a sudden hyperpyrexia may cause alarm. The attack may be over in a few days, or it may be prolonged for some weeks; there is also possibility of a relapse, and one of the commonest after-effects in children is a chronic cardiac weakness. As regards treatment, the patient should be kept between blankets, though lightly covered. The diet should be light and nourishing. The joints should be comfortably disposed and wrapped in cotton wool or gauze; but relief from very acute pain is obtained by fixing the joint by means of splints. The drug found to have most effect on the arthritic symptoms is salicin or salicylate of soda. Antacids are also of value. If hyperpyrexia occurs recourse should be had at once to the cold pack of a similar measure. Methyl salicylate and a mixture of chloral menthol and camphor are useful applications to joints. Oil of wintergreen (which contains methyl salicylate) is a well-established household remedy. These remedies are effective in reducing temp. and relieving pain, but are probably of no effect in diminishing the risk of heart complications. Endocarditis, accompanied by such bacteria as *Streptococcus viridans*, can be treated with penicillin. Aspirin has been found to be of considerable value in cases of chorea. Tonics are required in convalescence when there is anaemia or debility.

Sub-acute rheumatism is usually the effect of the persistence of the joint lesions produced in an acute attack. The joints become stiff, with more or less pain, and the condition often resists treatment over a protracted period. *Muscular rheumatism* (or *fibrositis*) is not necessarily preceded by an acute or sub-acute attack. Certain muscles are affected, the commonest being those of the small of the back (*lumbago*), the ribs (*intercostal rheumatism*), and one side of the neck (*stiff neck*). Aspirin and general tonics are recommended for chronic R., and good effects often follow a course of spa treatment. Septic foci, such as decayed teeth or infected tonsils, are a common cause and rapid improvement often follows their removal. *Sciatica* is R. or neuralgia (*q.v.*) of the sciatic nerve in the thigh. *Rheumatoid arthritis*, or rheumatic gout, has probably little connection with R. It is characterised by an inflammatory overgrowth of the cartilages of the joints, leading to the formation of nodular masses and immobility of the joints. Treatment is unsatisfactory, consisting chiefly of attention to the general health and careful nursing. Recent work by Mrs. E. C. Kendall and P. S. Hench in the U.S.A. has indicated that rheumatoid arthritis (and possibly other diseases also) may be caused by a shortage of the hormone cortisone (compound E),

normally secreted by the cortex of the adrenal (suprarenal) bodies. In 1949 apparently successful trials of cortisone in the treatment of rheumatoid arthritis were reported by the Mayo Clinic, Rochester, Minnesota, but supplies are at present very limited, though attempts to synthesise it from bile acids, and also from certain plants, are being made. The plant now being investigated as a possible source of cortisone is *Strophanthus sarmentosus*. It is known that the adrenal bodies are controlled by the pituitary gland of the brain, and it may be possible to isolate a pituitary hormone which will stimulate the production of cortisone by the patient himself. *Osteoarthritis* is chronic R. of the joints; it may follow an attack of rheumatoid arthritis, or result from some injury or inflammation of the joints. The various forms of treatment are aimed chiefly at preventing an exacerbation of the condition. *Gonorrheal rheumatism* is an inflammation which occurs in association with gonorrheal urethritis. Usually one joint only is affected, and the disease runs a chronic course with considerable pain. See also ARTHRITIS; HIP-JOINT. See H. W. Crowe, *Rheumatism*, 1934, and C. Jeffery, *Rheumatism: its Causes, Prevention, and Treatment*, 1940.

Rheydt, tn. of Rhineland, Germany, 2½ m. S.S.E. of Munchen-Gladbach. It manufs. cotton goods and machinery, and has printing and electrical works. From 1929 to 1933 it was amalgamated with Gladbach, but was re-established as a separate tn. after pressure by Goebbels (q.v.), who was born there. Pop. 77,300.

Rhin, Bas-, dept. of France, in Alsace-Lorraine, formed during the Fr. Revolution. It was incorporated into the Ger. Empire after the Franco-Prussian war in 1870, and restored to France after the First World War. It contains eight arrons., these being Erstein, Haguenau, Molsheim, Saverno, Sélestat, Strassburg, Strassburg-Campagne, and Wissembourg. Strassburg (q.v.) is the cap. The Rhine runs along its E. boundary in a N.E. direction. There was severe fighting in the dept. late in 1944. The dept. contains the Haguenau Forest. Area 1848 sq. m. Pop. 673,300.

Rhine (Lat. *Rhenus*, Ger. *Rhein*, Fr. *Rhin*, Dutch *Rijn*), chief riv. of Germany and one of the most important in Europe. It is about 820 m. in length, of which 280 m. are in Switzerland, 430 m. in Germany, and 110 m. in Holland; it drains an area of 86,500 sq. m. Rising in Switzerland and flowing W.N.W. across Europe, it separates that country from Germany, flowing through Germany and the Netherlands to the North Sea. It proceeds N. from its source to Mt. St. Gothard to Lake Constance, then W. over the falls of Schaffhausen to Basle, where, on its l. b., it receives the Aar. Turning N. it flows through the Vosges and the Black Forest, and receives on its r. b. the Neckar and Main. At Mainz it turns W., and N. at Bingen, where, on its l. b., it receives the Moselle. From Koblenz it becomes a slow winding stream, and on

entering the low plains of Holland below Emmerich it proceeds W. It then divides itself into a number of separate branches, forming a great delta, and flowing into the sea by sev. mouths, the chief of which are the Waal and Lek, both of which unite with the Maas, the Yssel, and Vecht, which diverges to the (IJsselmeer) Zuider Zee and the true R., which enters the North Sea below Leyden. The R. was the natural defence of the Rom. Empire against the Teutonic hordes, who, however, in the fourth century, swept away the elaborate fortifications which the Romans had raised. With the partition of the Frankish Empire of Charlemagne (843), the R. became a Germanic riv. France, however, through the peace of Westphalia, obtained a footing on the l. b. In 1801 the l. b. of the riv. was formally ceded to France, but not till the war of 1870-71 did Germany regain full possession of both banks of the R., and she ceded back her r. b. conquests, Alsace and Lorraine, after the First World War.

The R. was never the scene of any offensive, nor was it even approached by the Allies in the First World War, though after hostilities had ended bridgeheads on the riv. were occupied for some years by Fr., Brit., and Amer. armies (see also under COLOGNE). In the land operations under the command of Gen. Eisenhower on the W. front in the Second World War the R. was the main objective of the Allies. The allied campaign W. of the R. (Feb.-March 1945) was so well planned and fought that the operation of crossing the riv. proved easy, while the advance beyond into the heart of Germany was completed in five weeks. See further under RHINE PROVINCE; WESTERN FRONT in SECOND WORLD WAR. See L. Febvre, *Le Problème historique du Rhin*, 1931; F. O. Rave, *Der deutsche Rhein, Wanderungen und Fahrten der Romantik*, 1938; and H.M.S.O., *Report by the Supreme Commander to the Combined Chiefs of Staff on the Operations in Europe of the Allied Expeditionary Force*, 6 June 1944-8 May 1945, 1946.

Rhine and Marne Canal, system connecting the Rhine and Marne, cut between 1838 and 1853. It is 225 m. long and runs from the Ill at Strassburg to Vitry-le-François, crossing the Meuse, Moselle, and Meurthe Rs.

Rhine and Rhone Canal, unites the two rivs. after which it is named. It was cut between 1783 and 1831, is nearly 220 m. long, and runs from the Saône, an affluent of the Rhone, to the Ill, near Strassburg.

Rhine, Confederation of the, see CONFEDERATION OF THE RHINE.

Rhinelanders, co. seat of Ononda co., Wisconsin, U.S.A., 96 m. S.S.E. of Ashland. It has lumber works, paper mills, and manufs. refrigerators. Pop. 8500.

Rhineland-Palatinate, Land, see under RHINE PROVINCE.

Rhine Province, Rhineland, or Rhenish Prussia, former prov. of Prussia, bordering W. on the Netherlands, Belgium, and Luxembourg, with Westphalia and Hesse-Nassau on its E. frontier. The area was 9478 sq. m. and the pop. 7,690,000. After

the Second World War, when the state of Prussia was liquidated (*see under PRUSSIA*) and a number of territorial redivisions took its place, portions of the Rhineland were assigned to the Brit., Amer., and Fr. zones of Germany: to the Brit. zone was assigned the N. Rhine area, including the governmental dists. (*Regierungs-bezirke*) of Cologne, Aachen, and Düsseldorf (in 1946 included in North-Rhine Westphalia); to the U.S. zone, the ter. of the former Land or state of Hesse on the r. b. of the Rhine, and the Prussian prov. of Hesse-Nassau, including the city of Wiesbaden (in 1946 Land Hessen); to the Fr. zone, the Rhineland-Palatinate, including the former Land Hessen on the l. b. of the Rhine and the governmental dists. of Koblenz and Trier (Trèves) of the former Prussian Rhine Prov. (in 1946 Land Rhineland-Palatinate); and the Saar Dist., including the Saar Ter. as defined by the treaty of Versailles, enlarged in Oct. 1946 by a number of adjacent rural dists. of the former Prussian Rhine Prov. The area of the pre-1946 Rhineland was 9178 sq. m. and the pop. (estimated for 1939) 8,000,000. According to the census of the Ger. pop. held on Oct. 29, 1946, the area and pop. of governmental dists. and of the *K. P. Länder*, etc., were: Aachen, Cologne, and Düsseldorf, 12,640 sq. km. (4879 sq. m.), pop. 5,895,000; Hesse, 21,100 sq. km. (8144 sq. m.), pop. 4,064,000; Rhineland-Palatinate, 19,900 sq. km. (7681 sq. m.), pop. 2,761,100; Saarland, 2500 sq. km. (965 sq. m.), pop. 874,000. In April 1949 small frontier areas were ceded to Holland, Belgium, and Luxembourg.

The surface is mountainous in the E., W., and S., but in the N. of the prov. the land is fairly level. The highest peak is Walderbeskopf (2670 ft.) in the Hochwald Range, which trends from S.W. to N.E. in the S. of the prov. The Rhine and the Moselle are the prin. rvs., and these, with their numerous tribs., drain the country. Forests occupy 30 per cent of the total area, but there are fertile tracts and valleys, where the decayed volcanic rocks afford excellent soil for the vine, which is extensively cultivated. It contains the rich coalfields of the Ruhr, and other minerals include iron, silver, lead, zinc, copper, lignite, basalt, and manganese. The chief crops are cereals, hops, sugar, flax, and tobacco. Mineral springs occur in various parts of the prov., notably at Aachen and Bad Kreuznach. Manufs. are numerous and varied: cloth, woollens, velvet, silk, seaut, muslin, linen, leather, wines, malt liquors, spirits, chemicals, pottery, and glass being the most important. There were also, before the Second World War, extensive iron works at Essen (including the famous Krupp foundries), Düsseldorf, Aachen, and Oberhausen, while R-mischel and Solingen are seats of the cutlery manuf. The former cap., Koblenz, is superseded by Düsseldorf as cap. of Land North Rhine-Westphalia, other important tns. being Cologne, Wuppertal (Kilberfeld-Barmen), Trier, Aachen, and Bonn, chosen as the cap. of the W. Ger. Federal Republic

after the Second World War. The tn. of Bonn has a noted univ.

The retention of the Rhineland by Germany after her defeat in the First World War was a sore blow to France, and the resurgence of Ger. militarism and aggression between 1932 and 1939 inevitably suggests that unconditional retention was a blunder on the part of the Allies. Lloyd George, however, devoted his efforts, after the war, to a policy of conciliation designed to give the new Weimar Republic the best possible chance of converting Germany into a pacific and truly democratic country, a problem that again confronted the Allies after 1945. Poincaré from the beginning was completely sceptical of any such policy and he resented bitterly the fact that the article of the treaty of Versailles which secured the Rhineland for Germany remained indefeasible, although the consideration which had induced France to accept the position, viz. the promise of a pact of guarantee by the U.S.A. and Great Britain, was never fulfilled. Poincaré therefore tried, but in vain, to secure by an externally provoked movement of separation from within the Rhineland a reversal of the treaty decision and his occupation of the Ruhr on the pretext of a failure of coal deliveries, was, in the long run, equally fruitless, for his policy, which was really to reduce the potential strength of Germany, was reversed in the Fr. election in 1924. Thus was the stage set for a renewal of the war in 1939.

The Industrial tns. of the Rhineland suffered heavy raid attacks in the Second World War. In March 1943 Essen, with its Krupp's works, was first badly hit, and the Möhne, Eder, and Sorpe dams breached. 'Blockbusters' (g.v.) were used with much effect on Essen, Cologne, Düsseldorf, and other places. In the 1945 battle of the Rhine the first of these, and Dortmund, were again especially singled out (*see further under the various tns.*, and *RUHR*).

In the land fighting the Rhineland first figured in the campaigns of the W. front in Sept. 1944, Amer. First Army troops entering Germany in the Trier region on Sept. 11, and in the Aachen area on the 12th, reaching the city of Aachen on Oct. 13. After the fall of Aachen, which was largely ruined, the First Army's offensive operations were curtailed until the Nov. offensives, which were mounted along the entire front. There was fierce fighting to overcome the dams which controlled the flooding of the Roer valley, and while these remained in Ger. hands progress was retarded; but the Amer. attack on the dams was launched on Dec. 13. Plans for the 1945 campaign envisaged an envelopment of the Ruhr, with the main thrust in the N., the unexpected capture of the Remagen bridge causing some modifications in the overall plan. Cologne was entered on March 5, Bonn fell on March 9, and by the 11th the l. b. of the Rhine was cleared from Koblenz to Andernach, and the stage set for the joint offensive of the Third and Seventh Armies. The Ruhr was enveloped from

the bridgeheads at Wesel and Frankfurt (see further under WESTERN FRONT IN SECOND WORLD WAR; WORLD WAR, SECOND).

Rhin, Haut-, dept. of France, in Alsace-Lorraine, formed during the Fr. revolution. Like Bas Rhin, it was incorporated in the Ger. Empire between 1870 and 1918. The six arrons. are Colmar (cap.), Altkirch, Guebwiller, Mulhouse, Ribeauvillé, and Thann. The Rhine forms the W. boundary of the dept. The dept. is fertile and densely wooded. It produces cereals, fruits, flax, etc. There are potash factories at Mulhouse. Area 1354 sq. m. Pop 471,700.

Rhinitis, see under NOSE.

Rhinoceros, genus of perissodactyle ungulates, of which five species still exist, three in Asia and two in Africa. A number of extinct forms have been

RHINOCEROS

identified, including four which inhabited Britain. Specimens of the woolly R. have been found imbedded in ice, the skin was without folds, and covered with hair and wool. The anterior horn was of remarkable size. The living Rs are, with the exception of the elephant the largest and most powerful terrestrial mammals. The head is large and the skull elongated, the brain cavity is relatively very small, and they are of low intelligence, the senses of smell and hearing are highly developed. The limbs are moderately long and stout, with three toes on each foot. The hide is scantily covered with hair, the face bears one or two median conical and recurved horns, which are composed of a mass of epidermal cells. The two African Rs. are the 'Black' or prehensile-lipped species (*R. bicornis*), found mainly in the forests of the mts. and the arid bush, and the 'White' or square mouthed species (*R. sinensis*), which is a dull brown black in colour, and, though once common in S. Africa, is now confined to the Sudan, N.E. Belgian Congo, Fr. equatorial Africa, W. Uganda, and Natal. These species differ from the Asiatic R. in the absence of folds in the skin and in the lack of incisor teeth in the front of their jaws, fighting when roused solely with

their horns, whereas the Asiatic kind attack with their lower tusks. The Asiatic species are *R. unicornis* and *R. sondaicus*, both of which are one-horned, and *R. sumatrensis*, which is two-horned and has a smooth skin and ears fringed with long hairs.

Rhinoplasty, plastic operation to replace lost tissue in the nose by tissue from some other part of the patient's body. In the Indian method, long known in the E., and introduced into Europe in 1814, a flap of skin is cut on the forehead, remaining attached to it by a small portion. It is then twisted round, so as to keep the external part outside, and moulded over pieces of oiled lint. The lower part of the septum is usually formed from the skin of the upper lip. When adhesion has taken place the attachment to the forehead is cut through or trimmed so as to reproduce the shape of a normal nose. In the It. method, devised by Pagliacozzi of Bologna in the middle of the sixteenth century, a flap is cut in the patient's arm and the skin moulded to form a nose. The arm must be bound to the face while adhesion is taking place, after which the tissue connecting arm and nose is severed.

Rhinoscopy, visual examination of the interior of the nose. It may be done by concentrating a ray of light from a frontal mirror through the nostrils, or by introducing a small mirror fitted with a long handle by way of the mouth into the naso-pharynx. Lennick's methroscope may also be adapted to R. Examination of the anterior nares is called anterior R., that of the posterior nares, posterior R.

Rhipael Montes, see URAL MOUNTAINS.

Rhizomes, see under ROOT.

Rhizopoda, form of Protozoa, between Infusoria and Sporozoa, being neither very active nor very sluggish. They have outflowing processes in the form of threads or blunt lobes, which are used in locomotion and capturing food. R. include Amöba, Foraminifera (q.v.), Radiolaria, and sun animalcules.

Rhodanthe, genus of Helychryseae. The one known species, *R. manglessii*, has flowers of the dry and unfading kind called everlasting, roseate or purple in the upper part and silvery below. It is found in W. Australia and has been introduced into Brit. greenhouses as a charming half hardy annual 9 to 12 in. high, with white or pink daisy like flowers. The R. will grow in the open air in a temp. between 60° and 80° F.

Rhodanus, see RHONE.

Rhode Island (Little Rhody), smallest of the United States of N. America, and one of the six New England states which formed part of the original thirteen states of the Amer. Union. It lies between Massachusetts on the E. and N., and Connecticut on the W., while its S. shores are washed by the Atlantic. The climate is mild and agreeable. There are no mts. in R. I., the N. and E. portions of the state are hilly and the land slopes to the S.; the highest point is Burpee Hill near Gloucester, other hills are Woodcock Hill, Mt. Hope, Diamond Hill, and Hopkings Hill. The three largest rvs. are the

Blackstone, Pawtuxet, and Pawcatuck. Black Is., a favourite resort, is 10 m. S.W. of Point Judith. R. I. has 45 m. of Atlantic Coast, and Narragansett Bay affords 350 m. more coastline. It is the most densely populated state, and exceeds all others in its industrial output *per capita* and in its *tn. pop.* It is over 97 per cent urb. Brown Univ., founded in 1764, has some 5000 students; there are two state colleges, and Providence College, founded by the Dominicans, with 2500 students. Manufs., which form the staple industry of the country, consist of cotton, woollen, worsted, and mixed textiles, silk, jewellery, and machinery for the textile trade. There are also dye works. Manufactured goods were valued at over \$516,000,000 a year. Providence, Woonsocket, and Pawtucket are the chief seats of the textile trade, which was introduced in the seventeenth century. Some farming is carried on. There are some 213 m. of railway and eleven airports.

R. I. was first settled in 1636 by Roger Williams and others who were expelled from Massachusetts because of their religious opinions. Settlers of every creed were admitted. In 1647 a patent was granted for the government of the settlement, and a charter in 1663. In 1790 the state accepted the federal constitution and entered the union as the thirteenth original state. The General Assembly consists of a Senate of forty-four members and a House of Representatives of a hundred members, both elected for two years, as are also the governor and lieutenant-governor. The state is represented in the national congress by two senators and two representatives.

The state cap. is Providence (1910, 253,500); other prin. tns. are Pawtucket (75,800), Woonsocket (49,300), Cranston (47,000), E. Providence (32,100), Newport, a watering-place (30,500), Warwick (28,700), Central Falls (25,200), W. Warwick (18,100), N. Providence (12,100). The pop. of R. I. is 761,000. The foreign-born whites in 1940 numbered 137,500 (19.3 per cent of the total). The Negro pop. was 1.5 per cent. There were over 28,000 Its., 23,000 Fr. Canadians, 19,000 Eng., and 11,000 Irish, who are a powerful influence in the politics of the little state. See *Book of Rhode Island* (issued by State Bureau of Information, Providence), 1930; C. Carroll, *Rhode Island: Three Centuries of Democracy*, 1932; and Federal Writers' Project, *Rhode Island: a Guide to the Smallest State*, 1937.

Rhoden, or Rhodes, Inner and Outer, see APPENZELL.

Rhode - Saint - Genève, see SINT - GENESIS-RHODE.

Rhodes, Cecil John (1853-1902), Eng. statesman. b. at Bishop's Stortford and educated at Bishop's Stortford Grammar School. In 1869 his health broke down, and he went to Natal to join his brother Herbert on a cotton plantation. In 1873 R. returned to England and went to Oriel College, Oxford, but he came down in a few months, his heart and lungs being affected. He did not take his name off the books, but kept terms whenever he

could, and took his degree in 1881. He had a love for the classics, and in S. Africa usually had with him a vol. of one of his favourite authors. In Kimberley in 1874 he, with a partner, Rudd, had a big holding in the goldfields, where his prin. rival was Barney Barnato (q.v.). In 1880 R. amalgamated sev. smaller companies into the De Beers Mining Company, and Barnato, working on the same lines. There was an homeric struggle between these corporations, but in 1888 they were amalgamated under the style of De Beers Consolidated Mines, with R. as chairman. R. was as anxious as Barnato to make money, but his endeavours to possess a vast fortune were deflected not only by commercial motives. He was a man of dreams, which, however, were based upon

CECIL JOHN RHODES

concrete ideas, and his prin. objective was a federated S. Africa under the Brit. flag. He entered public life in S. Africa in 1881 when he took his seat in the Cape legislature. He gradually obtained the respect and admiration of his colleagues, and in a few years became, by sheer force of character, one of the dominant spirits. All his efforts were directed towards the extension of Brit. rule and influence, and he was largely responsible for the annexation of Bechuanaland in 1884. In his efforts to secure N. expansion, R. was favoured by the fact that he was virtual dictator, with large powers, of the chartered company, in whose interest in 1890 Dr. Jameson estab. himself at Salisbury. In the same year R. became Prime Minister of the Cape, and the occupancy of those dual positions made him the most influential man in the continent. He held office until the famous 'Jameson Raid' compelled his retirement. The select committee of the House of Commons appointed to examine the matter found R. guilty of grave breaches of duty both as Prime Minister of the Cape and

as managing director of the chartered company. When the S. African war broke out in 1899, R. at once went to Kimberley, which, shortly after his arrival in Oct., was besieged until the middle of Feb. He died on March 26, 1902, and was buried, according to his instructions, in the Matopo Hills. In 1912 a monument to his memory was erected on the Grootte Schuur slopes of Table Mt. R. left a fortune of 6,000,000 sterling. By his will his house Grootte Schuur was bequeathed as a residence for ever for the Prime Minister of a federated S. Africa. He instituted scholarships at Oxford of the value of £300 each (the total endowment being over £50,000 a year—for students of the U.S.A. and the colonies, such students to be elected, not merely for academic attainments, but for general all-round fitness. In his life R. had his detractors, but now his great qualities are almost universally admitted. R. was an imperialist of the full post-Franco-Ger. war of 1870 type, when the period of liberal advance in Europe had given place to power politics. He was bent on carving up Africa for England's gain and the outwitting of rivals, especially Germany, but he sincerely believed that 'his rule was best for Africans. In political opinions he was more Radical than Conservative. Thus he supported Irish home rule, and wished to see S. Africa become a dominion with the maximum degree of self-government, but a Brit. dominion nevertheless. His career had moulded him. In the struggle for the survival of the fittest at Kimberley he had been engaged in big business; and S. African big business, which made millionaires from nothing in a few years, was not conducted on principles approved by the fastidious. 'Rhodes had no moral recoil from methods which would certainly not have been entertained by a man with a background of official or service life and its standards of conduct' (J. A. Williamson, *Great Britain and the Empire*, 1944). He was, undoubtedly, a visionary, and, by the provisions of his will, he made manifest his hope that one day there would be a union, not necessarily official, between all Eng.-speaking races. See lives by Sir T. E. Fuller, 1910; Sir L. Michell, 1910; A. F. B. Williams, 1921; Sarah G. Millin, 1933; J. G. McDonald, 1934; and H. Baker, 1934.

Rhodes, James Ford (1818-1927), Amer. historian, b. at Cleveland, Ohio, and educated at New York Univ., univ. of Chicago, Collège de France, 1867, and the School of Mines, Berlin. He was engaged in his father's ironworks at Cleveland, 1870-85. He then devoted himself to hist., and among his works are *History of the United States from the Compromise of 1850* (1893-1906); *History of the Civil War* (1917); *History of the United States from Hayes to McKinley* (1919, 1920); *The McKinley and Roosevelt Administration* (1922).

Rhodes, Gk. Is. of the Levant, lying 12 m. off the coast of Izmir (Smyrna), Asiatic Turkey. It is 46 m. in length, with a maximum breadth of 24 m. Its surface is mountainous, diversified with fertile valleys, producing fruit, especially

fine grapes, olives, tobacco, vegetables, and wine. Other products are oil, leather, sesame seed, and sponges. It is a beautiful Is., and has been called the Is. of Roses, even though roses scarcely figure among the fine tropical flowers, like the hibiscus and the purple bougainvillea. The Is. enjoys the most beautiful climate in the Mediterranean; but its once famous harbours have been allowed to decay, and its commercial importance has dwindled. It was, however, improving in the late 1920s, trade being then chiefly with Egypt, Italy, and Turkey. Its cap. is R., an archbishop's see and formerly a strong fortress, encircled by triple walls and moats. At the time of Alexander the Great it was 9 m. in circuit, and was considered one of the finest cities in the world. Its walls are now in a ruinous condition, and it occupies only a fourth of its former area. At the mouth of its harbours stood the celebrated 100-ft. high Colossus of R., one of the 'seven wonders', an enormous statue of bronze, which was thrown down by an earthquake in 224 B.C. The old city of R. was built by the crusader knights; Mussolini added most of the modern parts. The famous castle of the city of R., which was built by the Knights of St. John in the fourteenth century, was rebuilt by the Is. in 1937-40. Notable, too, are the ruins of the medieval castle at Lindus, with remains of the anct. acropolis. Of the fifty vils. on R. one is Turkish and the other forty-nine are Gk. The antiquity of the Gk. civilisation in R. is evident. The ruins of three Bronze Age cities remain, each with its mt. citadel overlooking the sea. Area of Is. 550 sq. m. Pop. of Is. 36,500; pop. of tn. 16,000.

R. has had an eventful hist. It was founded by Gk. settlers from Argos. It steadily increased in importance, and as early as the seventh century B.C. it was carrying on a prosperous trade with Spain, Sicily, and Italy. It came under the sway of the Persians in the fifth century B.C., but was wrested from them by Alexander the Great in 331 B.C. It was plundered by Cassius in 43 B.C. for siding with Cæsar, and was devastated by an earthquake in A.D. 157. In 665 the Saracens occupied the Is., continuing in possession until 1309, when they were driven out by the Knights of St. John of Jerusalem, who resisted many sieges by the Turks, to whom it ultimately fell in 1523. In 1912, during the Tripoli war, it was occupied by Italy, and in 1921 it was ceded to that country with other Aegean Is. The Gks. took over the Dodecanese, including R., in April 1947. See C. Torr, *Rhodes in Ancient Times*, 1885, and *Rhodes in Modern Times*, 1887, and Baron de Bulaire, *Rhodes of the Knights*, 1909.

Rhodesia, N. Southern Brit. protectorate, separated from S. Rhodesia by the Zambezi R., and bounded on the E. by Bechuanaland and Portuguese E. Africa. Nyasaland bounds it on the E., Tanganyika Ter. and the Belgian Congo on the N., and Portuguese W. Africa on the

W. It is watered by the Zambesi, Kafue, Luangwa, Chambesi, and other rivs. Mostly consisting of high tableland, thinly forested, only the valleys of the Kafue, Luangwa, and lower Zambesi are below 4000 ft. in altitude; while the Tanganyika plateau in the N.E. is 5000 ft. in height, and in the N. part of Kasempa in the N.W. 6000 ft. is reached. Lake Bangweolo is entirely in the ter. and Lakes Mweru and Tanganyika lie on its N. boundary. There are wide areas of good arable and pasture land, though the tsetse fly makes farming almost impossible in large areas of Kasempa, and makes transport a problem in the N.E. The Kafue valley is the best farming area, with centres at Mayabuka and Lusaka. Maize, tobacco, coffee, wheat, cotton, oil-seeds, and citrus and other fruits are grown, and cattle and pigs are reared. Mining is carried on at Broken Hill, Ndola, Kansanshi, and other centres. Copper, zinc, cobalt, vanadium, gold, and silver are the chief minerals produced, and the total value in 1947 was £23,521,000, of which copper was the most valuable, followed by zinc and lead. Mineral exploitation has brought labour problems in its train and led to unrest in the 'copper belt,' but welfare measures, education, and improved wage conditions, together with the development of trade unions, are bringing about a more settled state of affairs. The chief exports are copper, cobalt, vanadium, wood, zinc, tobacco, hides and skins, and gold. The Rhodesian Railway traverses the ter. from Livingstone on the Zambesi in the S. to the Belgian Congo in the N., passing through the tns. of Kalomo, Mayabuka, Lusaka, and Broken Hill; Fort Jameson, near the E. frontier, Abercorn, on Lake Tanganyika, Fort Rosebery, W. of Lake Bangweolo, and Lealui, on the upper Zambesi, are other important tns. Livingstone was the cap. until 1935, when the administration was transferred to Lusaka, 30 m. N. of the Kafue R. The most important centres are Broken Hill, Fort Jameson, Livingstone, Lusaka, Mayabuka, Abercorn, Kasama, Ndola, Luanshya, Mufulira, Kitwe, and Chingola.

The ter., until 1911 two provs., N.E. and N.W. Rhodesia, was governed by an administrator under the Brit. S. Africa Company until 1924, when it was taken over by the Crown and a protectorate estab. A governor was then appointed, assisted by executive and legislative councils. For administrative purposes the ter. was formerly divided into nine provs., each of which was under a prov. commissioner responsible for his prov. to the governor. The provs. were grouped together under five prov. commissioners in 1933 and the number of provs. reduced to five, but the number has since been increased to six. The provs. are divided into dists. under the charge of dist. commissioners responsible to the prov. commissioners. Barotseland in the W. is a native reserve. Area 287,640 sq. m. The European pop. at the 1946 census was 21,800, and the estimated African pop. 1,641,700. The legislature has wide

powers, but provision regarding natives is in the hands of the governor. The large native pop. is given special protection, and local administration is, as far as possible, in the hands of their own chiefs and headmen, who function as native authorities in the courts.

On the early hist. or even late hist. of N. R. there exists little but travellers' tales and these less than a century and a half old. The first authentic hist. of what is now N.E. Rhodesia is taken from the diaries of Dr. Lacerda, Portuguese governor of Sena, who led an abortive expedition to Lake Mweru (1798) where he died, but leaving his diaries to be brought back by Father Pinto. In the early nineteenth century Portuguese traders brought back stories of a great interior kingdom of the Lunda people, extending from Lake Mweru to Barotseland (q.v.) and including all the country drained by the upper Congo. Very few historical facts are known concerning it. The first expedition of any geographical value was that of Livingstone's famous missionary journey of 1851 and his discovery of the Victoria Falls. Later explorers, who retailed stories of native barbarism and large herds of game, were Serpa Pinto, Cameron, Selous, and Arnot. The great majority of the present native pop. is of Bantu origin and descended from invaders who swept over the country about A.D. 1700 or somewhat latter. The story of these invasions is lost in tradition but their traces remain in the great number and diversity of races and languages in N. R. The pop. of N. R. has been classified into some seventy or more different tribes, the most important being the Bemba and the Ngoni in the N.E. dists., and there are about thirty different dialects in use, but many of these vary very slightly. Nyanja is in use as the official language of the police. The chief invaders of the early nineteenth century were the Arabs from the N., the Ngoni Zulus fleeing from Chaka and the Kololo, who fought their way from the S across the Zambesi and founded a kingdom which was distinguished by a comparatively high degree of social organisation. One of the more successful of the invading tribes was the Lozi under Lewanika (q.v.), who asked for and obtained the protection of the Brit. Gov. in 1891. In 1900 the chartered company acquired certain trading and mining rights over Lewanika's dominion in consideration of an ann. subsidy and other advantages. During this time the slave trade estab. by the Arabs continued unchecked and its influence spread from Lakes Nyasa and Tanganyika over the whole of N. R., but with the final estab. of the administration of the Brit. S. Africa Company the slave traders quickly disappeared from the country. The status of the conquered tribes under Lewanika's dominion was that of a mild form of slavery; this social serfdom was ended by Lewanika himself, who in 1906 agreed to the emancipation of the slave tribes.

Before 1890-1900 the whole ter. had been vaguely included in the charter

granted to the Brit. S. Africa Company, but in 1899 and 1900 orders in council put the company's administration of the W. and the N.E. portions of the country, respectively, on a firm basis. These two ters. were amalgamated in 1911 under the designation of N. R. In recent years there has arisen a movement for the amalgamation of N. and S. Rhodesia (and Nyasaland), but the report of the commission under Lord Bledisloe (1938-39) was opposed to early amalgamation, and the general view is that there is need for much further progress in the native policy and in the native development of both ters. before amalgamation could be approved in principle. The native pop. in both N. and S. Rhodesia does not favour union, and the different policies towards natives in the different ters. make an obstacle to amalgamation. See also under RHODESIA, SOUTHERN.

Defence.—The forerunner of the present N. R. Regiment was an Indian police force raised and equipped on behalf of the Brit. S. Africa Company, in 1891, and for some time afterwards the mainstay of the force were Sikhs. Later still native recruits were enlisted from the Batoka, Bulala, and Barotseland with N.C.Os. and officers from the Brit. S. Africa police, the official force of the chartered company. During the First World War the military section of the police were mobilised and took part in campaigns until 1919. In 1933 the military section of the N. R. police became the N. R. Regiment. Despite this re-organisation the force remained under the N. R. Police Ordinance, and the appointments of personnel remained the responsibility of the Colonial Office. In 1937, however, it was decided to model the N. R. Regiment on the pattern of other African forces, and as a result the N. R. Regiment Ordinance was passed with the prin. result that European personnel were seconded to the regiment from the regular army. In 1938 the N. R. Regiment European Reserve was formed, and later an African Reserve was formed. On the outbreak of the Second World War the 1st Battalion served in Brit. Somaliland and later in the Far E.; the 3rd Battalion served in E. Africa, Madagascar, and Burma.

Rhodesian Regiments, see under *Defence in RHODESIA, NORTHERN, and RHODESIA, SOUTHERN*.

Rhodesia, Southern, Brit. self-governing colony in S. Africa. It lies between the Limpopo R., separating it from the Transvaal on the E., and the Zambesi, separating it from N. Rhodesia, on the N.; Portu-

guese E. Africa and Bechuanaland bound it on the E. and W. It is composed of the two provs. of Matabeleland and Mashonaland. Of its total area of 150,333 sq. m., nearly 100,000 sq. m. have an altitude of over 3000 ft., and about 26,000 sq. m. of over 4000 ft., the highest land stretching from the N.E. to the S.W. The lowest areas are in the valleys of the Sabi, Lundi, and Limpopo Rrs. near the S.E. frontier. These three rivers, with their numerous tribs., water the S. part of the country, the N. being watered by the Zambesi and its tribs. There is much excellent pasture land, cattle, sheep, and pigs being reared, and dairy-farming carried on; wide areas are under crops, of which the chief are maize, tobacco, ground-nuts, fodders and fruit of all kinds, citrus fruit predominating. The mineral resources of S. R. are extensive, gold being of first importance, the output being valued at over £4,500,000 in 1947; asbestos, chrome ore, coal, silver, mica, diamonds, lead, and copper are also mined. The mineral rights of the Brit. S. Africa Company in S. R. were purchased by the gov. in 1933 for £2,000,000. Other industries include brick and tile works, iron and brass foundries, factories for making cigarettes and tobacco, soap and candles, bacon, mineral waters, creameries, cotton ginneries, cement works, etc., and electric light and power works. The chief exports of local origin (in addition to gold) are asbestos, tobacco (twice the value of gold exports), chrome ore, coal, maize, fresh and preserved meat, hides, and citrus fruit. Communications are good, the total railway mileage being 2700. The Rhodesia Railway connects Bulawayo with Cape Town, and runs from Bulawayo in a N.W. direction to Livingstone in N. Rhodesia, crossing the Zambesi at the famous Victoria Falls. Bulawayo is also connected with Salisbury, 300 m. to the N.E., and branch lines run to West Nicholson, Shabani, Selukwe, Victoria, Sinola, and Shamva. The Mashonaland Railway connects Salisbury with Beira in Portuguese E. Africa. Umfali being the frontier tn. The Brit. S. Africa Company has a controlling interest in the Rhodesian railway system. There are also road motor services over 1960 m. of road. Salisbury is the cap. and Bulawayo comes next in importance; other centres are Umfali, Gwelo (a railroad junction), Gatooma, Que Que, Wankie (a coal-mining tn. in the N.), Fort Victoria, Selukwe, Shabani, and Bindura.

S. R. stands politically in a position intermediate between that of a dominion subject to no external control and a crown colony in which the legislature is responsible to the imperial gov. The aim of Cecil Rhodes was the early estab. of responsible gov., but the constitution granted by order in council of 1894 provided for a legislature with only a minority of elected members, and expressly reserved control over native affairs to the imperial gov. On the expiry of the charter of the Brit. S. Africa Company in 1914 the only alternative to renewal seemed to be incorporation in the Union

of S. Africa, but in 1922 a referendum resulted in a majority for independence, and since then it has been accepted that the future of S. Rhodesia is more appropriately bound up with that of the areas to the N. of it. S. R. was formally annexed to the Brit. Crown in 1923 and the new constitution of that year creating responsible government came into force in 1924. The difference between S. R. and those ters. which can claim to have full dominion status (*q.r.*) lies in this: that while the former has an executive gov. responsible to its elected legislature (formerly the Legislative Assembly but since 1933 called Parliament), certain

the chief justice, and the chief native commissioner. In 1934 the Parliament of S. R. passed a resolution urging the grant of full responsible government to the colony, though it was agreed that the demand for full dominion status, involving control of foreign relations, was premature. In the result a draft constitution embodying certain amendments (such as those relating to native affairs, noticed above) received the royal assent as an act of the S. Rhodesian Parliament in Oct. 1937. Under the constitution a native council may be estab. in any native reserve representative of the local chiefs, and native residents, to advise the governor

High Commissioner for Southern Rhodesia

A NATIVE KRAAL IN SOUTHERN RHODESIA

specified classes of its legislative acts are still subject, under the instructions issued to the governor, to reservation for the pleasure of the Crown and to disallowance by it. Further, certain executive acts, relating chiefly to the conduct of native affairs, are subject to the assent of the Crown. The Crown in this case acts on the advice, not of the S. Rhodesian Cabinet, but on that of ministers in the United Kingdom. A peculiarity of the constitution was that the supervision of the imperial gov. over native affairs was exercised through the high commissioner for S. Africa and native lands were vested in him; but by an amendment of 1937 the high commissioner relinquished these supervisory powers and the trusteeship of the native reserves. Of these powers the more important are now exercised by the secretary of state, while the trusteeship of these reserves is vested in a board of trustees composed of a chairman nominated by the secretary of state,

and manage such local affairs as may be entrusted to it, and in 1937 an Act was passed for the estab. of such councils. The legislature may amend by a two-thirds vote the letters patent setting up the constitution, with certain exceptions (relating to reservation of Bills by the governor and native administration). Under the electoral law of 1937 the franchise was extended to all Brit. subjects not under twenty-one years of age, subject to certain qualifications of occupancy or ownership of property which, in effect, exclude most of the native pop. S. R., having achieved responsible government, has its own cabinet of ministers, who are responsible to a freely elected legislature. Its Parliament is in control of almost all internal matters, but external affairs remain the responsibility of the gov. in the United Kingdom. Legislation affecting the enormous native pop. is also subject, as we have seen, to some measure of supervision by the home gov.,

but in practice this control is conditioned by the fact that the financial implementation lies with the local legislature. It is of interest to recall that in 1947 King George, on his return from S. Africa, opened the S. Rhodesian Parliament (April 7), when he announced that a defence council was to be estab., to enable the colony to co-ordinate plans with the United Kingdom and adjoining Brit. ter. Since the grant of responsible government, S. R. has made great progress. Considerable expansion has taken place in agric. and mining production, a large volume of immigration has been absorbed, and the railway system has been widely extended.

There is a high court composed of a chief justice and three judges, with criminal and civil jurisdiction. Single judges are stationed at Salisbury and Bulawayo, and twice a year sessions are held at sev. of the other prin. tns. There are also a number of prin. courts of magistrates, assistant magistrates' courts, and sev. periodical courts. Native commissioners have jurisdiction in civil and criminal matters in which natives only are concerned. A joint court of appeal for S. and N. Rhodesia was estab. in 1939. Education in 1917 was provided for in 100 schools for European children, 15 for coloured, and 2028 for native. The pop. in 1916 was estimated at 1,764,000, comprising 82,400 Europeans, 7500 Asiatic and coloured, and 1,674,000 native. Immigration increased greatly after the end of the Second World War.

The early hist. of the country has given rise to much conjecture, for ruins of at least 500 anct. buildings of unknown origin have been found. The earliest are the most skilfully constructed, but by whom they were built and when (except that it was before the sixth century A.D.) is unknown. The finest ruin is at Zimbabwe, and it and others at Mumbo, Tati, and elsewhere are believed to have been strongholds erected by Bantu people about four centuries ago, to protect gold washings, of which there are traces extant. During succeeding centuries Arabian traders kept up communication with Mashonaland, but the country was little known to Europeans until the late nineteenth century, though the Portuguese, ever since their occupation of the coast, had exported gold from its mines. In 1837 the pastoral Mashona tribe was conquered by the disciplined armies of the Matabele, a branch of the Zulu Kaffirs, who estab. here a military despotism. In 1889 the Brit. S. Africa Company obtained a charter and, largely owing to the energy of Cecil Rhodes, annexed Mashonaland; the turbulent Matabele were conquered in 1893, and in 1896 the country was formally given its name of Rhodesia, after Rhodes. (For the hist. see also under MASHONALAND; MATABELELAND; RHODESIA, NORTHERN.)

It was in 1911, as stated in the article on N. Rhodesia, that the ter. under the Brit. S. Africa Company's rule was divided into N. and S. Rhodesia. But in recent years there has been a growing

movement for the amalgamation of the Rhodesias and Nyasaland into a Rhodesian or Central African dominion. The Bledisloe Commission, however, which reported in 1939, did not favour amalgamation within any definite period, though it recommended closer collaboration through an interterritorial council, and suggested that the imperial gov. might accept the principle that identity of interests would lead ultimately to political union. In the meantime the report recommended amalgamation of N. Rhodesia and Nyasaland, and contemplated the eventual inclusion within S. R. of the N. portion of Bechuanaland. (For the movement for amalgamation of S. R. and N. R. as a dominion of the Commonwealth, see under NORTHERN RHODESIA.)

Defence.—S. R. has produced many units during the various wars over the past half-century. In 1899 with the outbreak of the S. African war and the departure from the ter. of most of the male pop. to enlist in the home forces it was decided to raise a Rhodesian Field Force for the protection of the ter. The chartered company (Brit. S. Africa Company) organised the enlistment of the force, and the home government paid for its cost. More than 2000 of the 6000 men enlisted were recruited from Australia, New Zealand, and Tasmania. This force played a notable part in the relief of Mafeking. At the outbreak of the First World War the 1st Rhodesia Regiment was formed. It took an effective part in the S.W. African campaign against the Gers. In the following year the 2nd Rhodesia Regiment was formed, and fought in the E. African campaigns. In 1916 the 1st Rhodesia Native Regiment was formed: many of the askari were Matabele, the officers and N.C.Os. being recruited from the Native Affairs Dept. and from the Brit. S. African Police. The S. R. Column also came into being and operated in the ter. to the N. of the present N. Rhodesia. S. R. had 11,000 males between fifteen and forty-four, and of these 6329 served in the armed forces during the period 1914-19. On the outbreak of the Second World War a large number of men from S. R. were enlisted for service with the King's African Rifles (q.v.) and the Royal W. African Frontier Force. They served as officers and N.C.Os. in these forces, and saw action in the E. African, Madagascar, and Burma campaigns. More than 1000 S. Rhodesians served in artillery units, forming first the S. R. Light Battery, and later the S. R. Anti-Tank Battery, and in these and other units they saw service in N. Africa, Sicily, and Italy.

Moffat, *Matabele Journals*, 1943; G. S. and E. Moffat, *Matabele Mission*, 1945; and Bishop Knight-Bruce's diary, *Gold and the Gospel in Mashonaland*, 1888 (ed. by Constance E. Fripp and V. W. Miller), 1949. See also *Annual Departmental Reports of the Government of Southern*

Rhodesia; Annual Year Book and Guide of the Rhodesias and Nyasaland; Official Year Book of the South Rhodesian Government.

Rhodium (symbol Rh, atomic number 45, atomic weight 102.9), metal of the platinum group, in whose ores it is found. It was discovered by Wollaston in 1803, and is a very hard white metal, ductile and malleable (sp. gr. 12.1; melting-point 1907° C.). It is insoluble in acids, but alloyed with platinum and some other metals it dissolves in *aqua regia*. Its name is derived from the red colour of its salt solutions, which are prepared from Rh_2O_3 . Three oxides, a chloride, and two sulphides have been isolated. It is used, alloyed with platinum, for thermoelectric functions of some pyrometers, and electro-deposited R. has a high reflective power.

Rhododendron (Gk. $\rho\acute{o}\delta\omicron\nu$, rose; $\delta\epsilon\upsilon\delta\rho\omicron\nu$, tree), genus of evergreen and deciduous shrubs or low trees (family Ericaceae) with leathery leaves and racemose corymbs of fragrant flowers, which are of a great variety of delicate tints, and are borne in late spring. A large proportion are hardy, thriving best in a deep fibrous sandy peat. The presence of lime in soils is always harmful to Rs. A mulch of decayed manure is desirable in May, and the seed-pods should be removed as the flowers fade. Rs. are increased from cuttings, by grafting in March, and by layering in Sept. The R. is allied to the *Azalea*, and the cultural requirements of these two genera are similar. The earliest record of the cultivation of Rs. in Britain is 1629, and they became popular after the discoveries made in the E. Himalayas by Sir Joseph Hooker in the mid-nineteenth century. The genus evolved in the N. hemisphere, but its place of origin is uncertain.

Rhodope, prov. of Greece in W. Thrace on the E. foothills of the R. Mts. The cap. is Komotini. Area 155 sq. m. Pop. 201,800.

Rhodope Mountains (called by the Turks *Dospad Dag* and by the Bulgarians *Despoto Dag*), mt. chain dividing Macedonia and Thrace, and so called from its numerous Gk. monasteries. The chief peaks are *Muse Alla* (9015 ft.) and *Rila Dag* (8790 ft.).

Rhonda, David Alfred Thomas (1856-1918), Brit. merchant and politician, b. at Aberdare, Glamorganshire. Became head of the Cambrian combine and other S. Welsh colliery companies. Elected Liberal M.P. for Merthyr, 1888-1910, and for Cardiff, 1910. President of the Local Gov. Board, 1916-17, and food controller in 1917. Raised to the peerage 1916; viscount, 1918. His title passed to his daughter, Margaret Haig (b. 1883), who occupied some of his positions, and became known as an advocate of women's rights.

Rhonda, Margaret Haig, second Viscountess of Llanwrne (b. 1883), Brit. feminist and editor, b. in London, and educated at St. Leonard's School and Somerville College, Oxford. She founded and became editor of the non-party weekly review *Time and Tide* (q.v.). Lady R. was a leading figure in the campaign

for women's rights. She succeeded to her father's peerage in 1918 by special remainder. Her publs. include *Leisured Women* (1928); *This was My World* (autobiographical, 1933); and *Notes on the Way* (1937).

Rhondda: 1. Urb. dist. of Glamorganshire, on the S. Wales coalfield, 16 m. from Cardiff. The chief industry is coal-mining, but there is also a variety of manufs. such as electrical accessories, light engineering, etc. It sends two members to Parliament. Pop. 112,000. 2. Riv. of S. Wales, joining the r. b. of the Taff near Pontypridd. Its valley is an important coal-mining area.

Rhône, dept. of E. France, with an area of 1104 sq. m., drained by the Rhone (a boundary eastward) and its affluents, the Saône, Azergues, and Gier. There are two arrons., Lyons (cap.) and Villefranches. The chief highlands are the Beaujolais (St. Rigaud, 3320 ft.), Tarare, and Lyonnais Mts. Moderate crops of wheat and rye, etc., grow on the rocky soil, and the vine is cultivated in the S. Mulberry-trees are grown to feed the silkworms, silk-weaving being the chief industry. There is some metal and coal-mining. Pop. 918,900.

Rhône (Lat. Rhodanus), great riv. of Europe (505 m. long), with a drainage area of 38,000 sq. m. The valley is highly cultivated; vegetables, vines, and mulberry-trees and olives in the S. are grown. Rising at an elevation of close on 6000 ft. from the R. Glacier (q.v.) in the Swiss canton of the Valais, it is a turbulent mt. torrent until it reaches Brieg. At Martigny it changes its course from S.W. to N.W., and finally reaches Geneva, after traversing the whole length of the lake (45 m.), from Villeneuve, the E. extremity. So far the riv. has fallen 4679 ft. (in 106 m.); from Geneva to Lyons (124 m.) the fall is only 689 ft. This second section is marked by numerous narrow gorges as the waters wind about the S. spurs of the Jura Mts. Above Lyons the chief trib. is the Ain, whilst just below is the confluence with the Saône, through which there is a communication with the Rhine, Moselle, Seine, and Loire. The third section (southward from Lyons to the Mediterranean, near Marseilles), with its tribs. the Isère, Drôme, and Durance (on the left), and the Ardèche (on the right), drains valleys where flourished famous centres of Gk. and Rom. culture. Here along the r. b. stand to-day the cities of Vienne and Avignon, Tarascon and Arles. The R. is navigable as far as Lyons. The Genesiat dam on the Upper R. was completed in 1948, the first of a project for twenty-one dams for hydro-electric power. In 1944 the Amer. Seventh Army under Gens. Devers and Patch advanced rapidly up the R. valley, routing the Gers. and eventually joined hands with the Third Army near the Ger. frontier.

Rhone Glacier, lies 10 m. from Münster and 31 m. from Brieg, in Switzerland. It is the source of the Rhone, and ascends with magnificent ice terraces for 6 m. between the Galenstock, Rhonestock, and

Damnamstock to the E., and the Gerstenhörn and Gelmehörn to the W.

Rhubarb (*Rheum hybridum* or *rhaponticum*), perennial herbaceous plant (family Polygonaceae) is cultivated for its edible leaf stalks, which are utilised as a spring fruit. It will grow in most kinds of soil that have been deeply dug and manured, but is most productive in a rich deep loam which is cool, moist, and well drained. It can be raised from seeds, but stalks should not be gathered until the stools are three years old. It is more commonly propagated by div. of the roots. R. is easily forced by covering the 'stools' with inverted tubs, surrounded with litter, or by planting the roots in heat. The R. of pharmacy is derived from *R. palmatum*, and is prepared as an extract, infusion, tincture, or pill.

Rhuddlan, or **Rhyddlan**, tn. of Flintshire, Wales, 3 m. S. of Rhyl. The ruined castle was an eleventh-century structure. R.'s prosperity as a seaport was destroyed by the encroachment of sand. Pop. 1500.

Rhussen, see **SEICHE**.

Rhyl, seaside resort, 30 m. by rail N.W. of Chester, near the mouth of the Clwyd, in Flintshire, N. Wales. Pop. 18,500.

Rhyme. Johnson derives this word from the Gk. *rhythmus* (*poësis*). Others derive it from the Swedish and Dan. *ryn*, the Dutch *ryn*, and the Ger. *Reim*. All the prin. European nations use the same word to signify the same thing. Thus, the Fr. have *rime*, the It. *rima*, and the Spaniards *rima*. The Gk. and Rom. poets did not use R., and the word *rhythmus* was applied by both, in its poetical meaning, to the metrical arrangement of syllables, and not to the correspondence of sound in their terminations. R. was not used either by the Celtic or by the early Scandinavian nations. R., as an accompaniment of verse, cannot be traced further back among European nations than to the *rymours* of Normandy, the troubadours of Provence, the minnesingers of Germany, and the monks, who, after the fall of the Rom. Empire, added rhyming terminations to the Lat. metres which were chanted or sung in the church service. It was early employed by the It. poets. The *Divina Commedia* of Dante, the oldest of the great It. poems, is in alternate R., but it is sometimes used in the latter. Many of the Middle Eng. poems have Rs.

Rhyme Song (or **Riming Poem**), A -S. poem of eighty-seven lines, preserved in the Exeter Book, notable for its metrical form, which is probably imitated from the *Hofuthlausn* of Egil Skallagrimsson, composed in Northumberland at the court of Athelstan. It exhibits a complicated system of internal consonance, frequently repeated, at the ends of lines and half lines. Alliteration is also used. It is evidently rather a metrical exercise than a poem, and has been attributed to Cynewulf, the subject recalling the epilogue to *Elene*, but the resemblance is not very striking.

Rhymney: 1. Tn. of Monmouthshire, England, 2½ m. W. of Tredegar, is the

centre of a coal-mining dist., and has iron-works and a clothing factory. Pop. 9300. 2. Rumney, riv. forming the boundary between Monmouthshire and Glamorganshire, Wales, and flowing S. into the Bristol Channel, 2 m. E. of Cardiff. Length 30 m.

Rhynchops, see **SKIMMER**.

Rhyncephora, see **WFLVILS**.

Rhynchaeus, see **LASCARIS**, **ANDREAS** **JOHANNES**.

Rhyolite, general term for a group of volcanic rocks characterised by acid composition an unusually large proportion of silica, and, in many cases, a vitreous structure. Its are often called *laparites*, from their frequent occurrence in the lavas of the Lipari Is.

Rhys Davids, see **DAVIDS**, **THOMAS** **WILLIAM** **RHYS**.

Rhys, **Ernest** (1859-1916), editor of *Everyman's Library* (*qv*), b. in London. Educated at Carmarthen, Newcastle-on-Tyne, and Durham, he began his career

ERNEST RHYS

as a mining engineer, but abandoned it for literature. From 1886 onwards he edited the *Camelot* series. He wrote poetry, novels, and lyrical drama. The title of *Everyman's Library* was suggested by R. to J. M. Dent, and the series was planned from the first to reach a total of 1000 vols. Beginning with *Boswell's Life of Johnson*, R. and Dent produced no fewer than 100 vols. in the first year. Besides his work as publisher's editor, he ed. also *Modern English Essays* (1922); *Everyman Remembers* (1931); and *Letters from Llandovery* (1936). His stories include *The Man at Odds* (1905) and *White Horse Pit* (1925). See R.'s reminiscences, *Everyman*

Remembers (1931) and *Wales England Wed* (1940).

Rhys, Sir John (1840-1915), Brit. Celtic scholar and educationist, b. in Cardigan-shire, Wales, son of a yeoman farmer. He was educated at the Brit. school of Penllwyn, near Aberystwyth, and at Bangor Normal College. He matriculated at Leipzig, and then devoted himself to linguistic research. His *Lectures on Welsh Philology* (1877) estab. his reputation as a Celtic scholar, and when the Jesus College professorship of Celtic was founded in 1877 he was elected the first prof. He was principal of the college from 1895 to 1915. His other philological works include *Outlines of the Phonology of Manx Gaelic* (1894) and various monographs on Celtic inscriptions. His historical works include *Celtic Britain* (1879); 'Studies in Early Irish History' (pub. in the *Proceedings of the British Academy*, 1903); and *The Welsh People* (with D. Brynmor-Jones, 1900).

Rhythm (Gk. *ῥυθμός*, flow), regular and measured beat or movement in language, music, or action. Both verse and prose may be rhythmical, but the R. of the former is more regular and obvious, and in Eng. prosody is marked by stress or accent. True poetical R. is modified by the emotion it conveys, and is never mechanical or lifeless, while its nature varies with the subject of the verse. R. in verse is marked by feet, analogous to bars in music, and the 'time' of these is indicated by various distinctive names, trochaic, dactylic, etc., which may be studied in any work of prosody.

Rhytina Stelleri, see *SEA-COW*, NORTHERN.

Riazan, or Ryzan: 1. Region of the R.S.F.S.R., to the S.E. of Moscow; it exports corn, and has also coalfields and limestone quarries, etc. Area, 16,190 sq. m. Pop. 2,500,000. 2. Cap. of the above region, on the Trubozh, near its confluence with the Oka, 120 m. by rail S.E. of Moscow. There is an Orthodox Gk. cathedral. The tn. is a railway centre, and produces machinery, alcohol, and footwear. Pop. 93,400.

Ribbentrop, Joachim von (1899-1946), Ger. politician and diplomat, b. at Wesel. After serving in the First World War he became a sales agent in wines and married the daughter of Henckell, proprietor of a champagne firm of Cologne. He joined the National Socialist party in 1932, becoming Hitler's plenipotentiary for foreign affairs while Baron von Neurath was still foreign minister. He was appointed Ger. ambas. in London, where later his intense unpopularity merely provoked hostile demonstrations in Downing Street (1936-37). In 1937 R. replaced von Neurath, the substitution being indicative of the beginning of Hitler's expansionist undertakings, and signed the Ger.-Soviet Pact of Aug. 23, 1939. He assured Hitler before the outbreak of the Second World War that Great Britain would not fight. He was tried at Nuremberg (Nov. 1945-Oct. 1946) and sentenced to death. For a character sketch of R. see Sumner Welles, *Time for Decision*, 1947.

Ribble, riv. of Engand, 75 m. long, rises in the Pennine Chain, W. Yorkshire, and flowing S.S.E. and S.W. through Lancashire, passes Preston, and enters the Irish Sea at Southport.

Ribbon, Riband, or Ribband, silk with a narrow web, varying from fractions of an inch to a foot in width, used for tying, binding, and all kinds of trimmings. A modern power loom can weave as many as forty Rs. at a time; in Jacquard looms, which turn out patterned fabrics, every warp thread is under mechanical control so that the web or 'shute' may be made to catch it up or not according to the design. The chief centres of manuf. are St. Etienne (France), Basle (Switzerland), Coventry (England), Krefeld (Germany), Paterson (New Jersey), and Moscow (Russia).

Ribbon Development, building along the sides of new arterial roads regardless of amenities or safety, or making new means of access to such roads, so as thereby to impair the effectiveness of such roads as arterial through-roads for motor traffic. The Ribbon Development Act, 1935, directed towards preserving the amenities of roads by checking 'ribbon' building development and securing greater road safety, empowered local authorities to 'sterilise' areas by the sides of roads, their width varying with local conditions, so that it was thereafter unlawful, without the consent of the local authority, to build along or to make new means of access to such roads. For all practical purposes highway authorities (co., bor., and urb. dist. councils) were given power to refuse to allow development within 220 ft. of the middle of roads classified in 1935 or otherwise brought under the Act. The Town and Country Planning Act, 1936, permits the purchase of land on either side of arterial roads to prevent R. D. But it does not compel the power to be used, and R. D. with a few exceptions continued in spite of both these Acts. Further difficulties were created by the need for factories for war purposes, with the result that the Restriction of Ribbon Development Temporary Development Act was passed in 1943, allowing local authorities to give a temporary consent if required in the interests of war production.

Ribbon-fish, term applied to any species of the family Trachypteridae. They are pelagic fishes, with elongated and compressed bodies which have a ribbon-like appearance. There is no anal fin, but the dorsal fin is as long as the body, and the ventral fins have from one long ray to nine smaller ones. They are seldom found alive, and are usually seen floating dead on the surface of the ocean. *Trachyp-terus arcticus*, the N. R. or deal-fish, occurs near Scandinavia. R. may have been mistaken on various occasions for marine 'monsters.'

Ribbonism, see under WHITEBOYS, and as to tenant-right, under LAND LAWS.

Ribbon Microphone, see under MICROPHONE.

Ribchester, vil. in Lancashire, England, on the Ribble, 5 m. from Blackburn.

Remains have been found of a Roman station called Brenntonacum. There is a museum containing many valuable Roman remains. Pop. 1600.

Ribeauvillé, or Rappoltsweller, tn. in the dept. of Haut-Rhin, France, 8 m. N.N.W. of Colmar. It is walled, and known as the 'Pipers' tn.'; there are three famous castles near by, Girsberg, Hohrappoltstein, and Ulrichsburg. The prin. industries are spinning, weaving, dyeing, printing, tanning, etc., and there is an extensive wine trade. Pop. 5000.

Ribeira, or Riviera, seaport in the prov. and 67 m. S.S.W. of Corunna, Spain. Pop. 14,000.

Ribeirao Preto, tn. of Brazil in São Paulo State, 260 m. by rail from São Paulo city. It is a distributing centre for the state and for Minas Geraes and Matto Grosso and produces coffee, cotton, sugar, and rice. Pop. 90,800.

Ribot, Alexandre Félix Joseph (1842-1923), Fr. statesman, b. at St. Omer, studied at the univ. of Paris and adopted the legal profession. He succeeded Loubet as Prime Minister, 1892-93, and headed a short-lived ministry, 1895. In 1909 he left the Chamber of Deputies for the Senate, in 1913 was a candidate for the presidency of the Republic, and became Prime Minister in the spring of 1914. He was minister of finance in Viviani's second Cabinet, 1914-15, and under Briand till March 1917, when he became Prime Minister for the last time. See his letters (Eng. trans., 1925).

Ribs, arched bones which form the wall of the thorax. In the human subject they are twenty-four in number. The upper seven on each side are termed *true* or *vertebro-sternal*, as they articulate with the thoracic vertebrae and are joined to the sternum or breast-bone by cartilages; the next three on each side are called *false* or *vertebro-costal*, as their anterior extremities are joined to each other, not to the sternum; the two lowest are known as *floating* or *vertebral*, as their anterior extremities are free. The ribs, together with the sternum and backbone, form a bony framework, appropriately known in Ger. as the *Brustkorb*, or 'basket,' of the chest, protecting the organs of the thoracic cavity, and are capable by their arched form of resisting considerable pressure. If any ribs are fractured, the whole part should be rendered immovable by a broad and tight roller bandage. The R. and diaphragm are responsible for the respiratory movements which fill the lungs (see BREATHING).

Ricard, Louis Gustave (1823-72), Fr. painter, b. at Marseilles. He studied art in Marseilles and from 1844 at Paris. He first exhibited in the Salon of that year with his portrait of Mme de Sabatier, a sensational picture of the time. It is on the realism and skill of his portraits that his fame chiefly rests.

Ricardo, David (1772-1823), Eng. political economist, b. in London, son of a Dutch Jew, educated in Holland, and then joined his father on the Stock Exchange. R. devoted much spare time to study and scientific pursuits, and was one

of the original promoters of the Geological Society of London. Later in life he wrote on political economy from a mercantile standpoint, particularly on currency and taxation, and was the first to enunciate clearly the quantity theory of money. But he is chiefly remembered for his theory of rent, as to which, see under ECONOMICS. R. first appeared as an author during the discussions that led to the famous Bullion Committee in 1810, and his pamphlet *The High Price of Bullion* passed through four eds. R.'s next pub. was *A Reply to Mr. Bosanquet's Practical Observations on the Report of the Bullion Committee* (1811), which was followed by *An Essay on the Influence of a Low Price of Corn on the Profits of Stock* (1815). His great work, *On the Principles of Political Economy and Taxation*, appeared in 1817, and was pronounced the most valuable contribution made to economic science since the days of Adam Smith. R. was M.P. for Portarlington (1819-23). His collected works were ed. by J. R. McCulloch in 1846. See life by J. H. Hollander, 1910.

Ricasoli, Bettino, Baron (1809-80), It. statesman, b. at Florence, tried, as Gonfaloniere of Florence (1848), to thwart the reactionary policy of the grand duke of Tuscany. Having assisted in the union of Tuscany with Piedmont (1860), he accepted, on Cavour's death (1861), the premiership, recalled Mazzini, and on his reaccession to office (1866) made conciliatory but ineffectual overtures to the Vatican. See M. Niels, *Helsu*, 1943.

Ricci, or Rizzi, Sebastiano (1659-1734), It. painter, b. at Belluno, in the Venetian ter. He was invited to the court of Vienna, to decorate the palace of Schönbrunn, whence he went, at the invitation of the duke of Tuscany, to Florence, and afterwards visited England, where he remained ten years. See study by J. von Derschau, 1922.

Riccio, called Brusasorci, Domenico (1494-1567), It. historical painter, b. at Verona, was a disciple of Giovanni Francesco Caroto; he also went to Venice to study Giorgione and Titian. Cardinal Gonzaga invited him to Mantua, where he painted in competition with Paolo Veronese and Farinato.

Riccio, Andrea (1470-1532), It. engraver and goldsmith, b. at Padua. He was influenced by Mantegna and the ideas of Venetian renaissance artists. His statuettes, both in idea and skill of execution, had a beauty not seen since the classical age. See study by L. Planiscig, 1927.

Riccio, or Rizzio, David (1533-66), son of an It. musician, b. at Pinallo. Coming in 1561 to Scotland in the train of the ambas. of the duke of Savoy, he became known to Mary Queen of Scots, who in 1564 appointed him her Fr. secretary. He soon acquired great influence with Mary and to some degree directed her policy, which greatly angered her husband Darnley and the nobles. On suspicion of being the queen's lover, he was seized in her presence, and killed in an adjacent room.

Riccioli, Giovanni Battista (1598-1671), Ferrarese philosopher and mathematician. A member of the Society of Jesus, he lectured on philosophy and rhetoric in the univs. of Bologna and Parma. It is, however, upon his proficiency in astronomy that his reputation principally rests, on which subject he pub. some valuable works, viz. *Astronomia Reformata*; *Chronologia Reformata*; and the *New Almagest*; besides twelve books on geography, printed in 1672.

Rice, Elmer (b. 1892), Amer. playwright and novelist, b. in New York, his real name being Elmer Reizenstein. He graduated from New York Law School, and became a solicitor's clerk, but quickly abandoned this for writing. In 1914 his first play, *On Trial*, was produced. This was remarkable for his use of 'flash-backs' to portray episodes described by the witnesses in the play, a technique more common to the cinema than to the stage. After the First World War he became a leading supporter of Expressionism, and his second great success, *The Adding Machine* (1923), was a satirical fantasy embodying expressionist ideas. He showed a deep interest in the problems of ordinary Amer. society, and *Street Scene* won him the Pulitzer prize in 1929. In *Judgment Day* (1934) he dealt with the issues raised by the Reichstag fire trials, and it is on this compelling, thoughtful drama that his European reputation rests. A master of dramatic technique, R. is able, with a few characters, in an apparently slight and narrow setting, to raise problems of universal importance and urgency. He has also written a number of novels, including *Imperial City* (1937), a realistic study of life in New York. In 1945 R. was made president of the Authors' League of America.

RICE CULTIVATION

Rice (*Oryza sativa*), marsh plant (family Gramineae), cultivated in nearly all hot countries where capable of artificial irrigation. The grain is rich in starch, and

probably supports a greater number of human beings than any other cereal. It is the removal by 'polishing' or milling of the cortical and sub-cortical layer, the cells of which contain aleurone and vitamin B, that causes beri-beri (g.v.) amongst those with whom R. is a staple diet. R. in the husk is known as 'paddy' or 'padi.' The granules of R. starch are angular and minute. It is grown throughout the Far E., Egypt and other Mediterranean countries, Brazil, the U.S.A., and in some W. Indian is.

Rice Bird, Paddy Bird, or Java Sparrow (*Munus oryzivora*), weaver bird, which is one of the worst avian enemies of the rice cultivator. It is more commonly kept as a pet than any other foreign bird. See also BOBOLINK.

Rice-paper is made from the pith of *Aralia papyrifera*, a tree which grows in the is. of Formosa. The paper is much used in China and Japan for brightly coloured pictures and designs. It is also employed in making artificial flowers. A paper has been prepared by the Jap. from rice straw.

Rich, Claudius James (1787-1820), Eng. orientalist and traveller, b. at Dijon and educated at Bristol. His proficiency in the E. languages was so great that he was made a writer to the E. India Company at the age of seventeen, and finally became their resident at Bagdad. He displayed his great literary talents in two memoirs on the ruins of Babylon and on the site of anc. Nineveh, and his valuable collection of about 900 vols. of oriental MSS., together with a large number of Gk. and oriental coins and gems and antiquities from Babylon, was purchased by the trustees of the Brit. Museum. See S. Lloyd, *Foundations in the Dust*, 1947.

Rich, Edmund, see EDMUND (RICH), SR.
Rich, John (1692-1761), Eng. actor, noted for his development of pantomime at Covent Garden in the eighteenth century. At Lincoln's Inn Fields (1723) he produced *The Necromancer, or History of Dr. Faustus* as a rival pantomime to John Thurmond's *Harlequin Dr. Faustus* at Drury Lane. Taking his inspiration for Eng. pantomime from the Fr. and It. harlequins and scaramouches he used a serious legendary story told operatically by dance and song.

Richard I., called **Richard Cœur-de-Lion** (1157-99), king of England, was the third son of Henry II. and Eleanor of Poitou. He became duke of Aquitaine in 1170, and succeeded to the Eng. throne in 1189, and at once prepared to join the third crusade. He reached Acre in June 1191, and within a month forced it to surrender, and shortly after took possession of Ascalon. He defeated Saladin near Arsuf in that year, and in the following year defeated him again at Jaffa. His brother John having usurped his authority at home, he was compelled to conclude a truce, and hastened to Europe. Travelling in disguise through Europe, he was captured near Vienna by the duke of Austria, who handed him over to the Emperor Henry VI. He had to pay a ransom of 150,000 marks for his freedom, which

he obtained in March 1194. The return of Richard settled the fate of John's insurrection, but owing to the alliance between John and Philip Augustus, king of France, he was unable to return to the E., as had been his intention. He went to Normandy in May 1194, defeated Philip, and two years later made peace with him. He was mortally wounded in besieging the castle of Chalus. During R.'s reign important constitutional, financial, and legal developments occurred. His long absences made necessary baronial co-operation to carry on the administration of the kingdom; offices were sold and constant scutages levied in an effort to meet R.'s financial demands; the coroner became an essential figure in the operation of Eng. law. The accounts of the chroniclers point to R. as the most popular of all medieval Eng. kings; it seems clear that he was personally brave, probably devout, and appealed to the imagination of the London mob. But his relations with the king of France illustrate his lack of diplomacy; and it may be suggested that he laid the foundations for the baronial revolt of 1214. During his reign financial exactions became unprecedently heavy; his policy left an empty exchequer and marked the beginning of the Angevin expulsion from France; while his absence showed the baronial party how to unite to support an absent monarch, a process they were later to adopt to coerce a recalcitrant one. See W. E. Aytoun, *Life and Times of Richard I.*, 1840; J. H. Ramsay, *The Angevin Empire*, 1903; R. L. Poole, *The Exchequer in the Twelfth Century*, 1912; Kate Norgate, *Richard the Lion Heart*, 1924; and C. Wilkinson, *Richard Cœur-de-Lion*, 1933.

Richard II. (1367-1400), king of England, was the younger son of Edward, Prince of Wales ('the Black Prince'), and succeeded Edward III. in June 1377. During his minority there was a struggle for the control of affairs, and in 1381 the Wat Tyler insurrection broke out. He married (1382) Anne, sister of Wenceslaus, king of Bohemia, and in that year, attaining his majority, attempted to wrest the government of the country from John, duke of Lancaster. He appointed Michael de la Pole, whom he created duke of Suffolk, as chancellor, and, though he sent Lancaster on a mission to Spain, he had to contend against the nobles, who resented the appointment. The struggle was continuous until 1397, when the earl of Arundel and the duke of Gloucester were condemned to death. A rising in 1399, under Henry of Lancaster, duke of Hereford, was successful, and R. surrendered and was imprisoned at Pontefract, where he died on Feb. 14, 1400. His first consort, Anne of Bohemia, died in 1394, and two years later he married Isabella, daughter of Charles VI. of France. R.'s position was from the start difficult; he succeeded to a kingdom weakened by expensive wars and disheartened by recent defeats, disorganised by the Black Death, in the midst of a period of social transition, and suffering from the emergence of the 'over-mighty subject,' the

result of Edward III.'s cessions to his many sons. R. became unpopular because of developments arising from his predecessor's policy, and for actions taken in his name by others during his long minority; an unhappy childhood may have been responsible for his unbalanced character. His reign was a conflict in which R. appears as struggling for the trappings of power even more than for the sake of the power itself; he has been called the last of the medieval Eng. kings to rule by virtue of divine right; his defeat marks the end of a theory for 200 years. His actions, especially in his last years, suggest a progress from chronic instability to something closely allied to insanity. He failed to keep his throne, not because of his arbitrariness, but because he lacked the political sense of Henry Bolingbroke, and was increasingly governed by emotion. See C. Oman, *The Great Revolt of 1381, 1386, and life* by A. Steel, 1941.

Richard III. (1452-85), king of England, was the eleventh child of Richard, third duke of York. He was a brave man and an able soldier, and was present at Barnet and Tewkesbury; but he early acquired an evil reputation, and it was rumoured that he instigated the murders of Edward, Prince of Wales, and Henry VI. On the death of Edward IV. (1483) he was appointed regent during the minority, but there was much intriguing against him, and sev. attempts to deprive him of his power. Parliament offered him the crown in 1483, and by his acceptance he alienated many of those who had formerly supported him. When the news of the death of the princes in the Tower became known, public feeling was strong against him. Henry, earl of Richmond, the representative of the Lancastrian line, invaded England in 1485, and on the field of Bosworth Richard was defeated and slain. His character is still debated by historians, and much research remains to be done on the events of his reign, at present one of the most obscure in fifteenth-century hist. The chroniclers' accounts are disjointed and conflicting, and passages may well have been suppressed by later monarchs. The suspicious circumstances of his accession dogged him; personally intelligent and brave, R. appears to have been gradually overwhelmed by his own ambitions. Though admirably suited to the position of regent, he failed to grasp that an attempt by so partisan a personage to win the crown could never succeed without more powerful support than he could command. See J. Ramsay, *Lancaster and York*, 1892, and life by Sir C. R. Markham, 1906.

Richard de Bury, see AUNGERVILLE, RICH.

Richard of Cirencester (c. 1335-c. 1401), Eng. historian, was a native of Cirencester, Gloucestershire. In 1350 he joined the Benedictine Abbey of St. Peter, Westminster. The MS. of his unreliable compilation, entitled *Speculum Historiale de Gestis Regum Anglorum, 447-1066*, rests in the Cambridge Univ. library.

Richard of Cornwall (1209-72), second

son of John, king of England, assisted William of Salisbury in the recovery of Gascony (1226). The following year Henry III. was compelled by his barons to settle Cornwall on his brother. In 1257 Richard was crowned titular king of the Romans. He was at one point the leader of baronial opposition to Henry III.; but during the De Montfort rising he supported Henry, and suffered a year's captivity (1264). See life by N. Denham-Young, 1947; also Sir F. M. Powicko, *Henry III. and the Lord Edward*, 1947.

Richardia, or *Zantedeschia*, more commonly known as the arum lily, genus of S. African plants (family Araceae) with white, yellow, or rose-coloured spathes and decorative arrow-shaped leaves. The best-known species is *R. africana* (*æthiopica*), from which sev. varieties have been derived. It is usual to set out the plants in rich moist soil in early summer, lifting and repotting early in Sept., when they can be divided. While flowering a stimulant is desirable.

Richards, Gordon (b. 1904), Brit. jockey, b. at Oakengates, Shropshire. His father was a miner, and R. learned to ride pponies. He was apprenticed to Hartigan, the trainer, and first raced in 1920, becoming champion jockey five years later, a position he held for more than twenty years, with only short intervals in 1926, 1930, and 1941. In 1947 he broke all records by riding 269 winners. He had already in 1943 beaten Archer's (q.v.) record, by winning his 2750th race at Windsor.

Richards, Theodore William (1868-1928), Amer. physicist, b. at Germantown, Pennsylvania, became prof. at Harvard. His work on the revision of the atomic weights of the elements won him the Nobel prize in 1914. He also made researches into the structure of the atom.

Richardson, Henry Handel (Mrs. J. G. Robertson) (c. 1875-1946), Australian novelist, b. in Melbourne. She went to school in Melbourne, at eighteen studied music and Ger. at Leipzig, and did not return to Australia. Leipzig supplies the background for her first novel, *Maurice Guest* (1908), a book of rare imaginative power not unworthy of Flaubert or even Tolstoy. In 1910 appeared a story of school life entitled *The Getting of Wisdom*, a book, curiously enough, showing far less maturity than her first. But with the pub. in 1917 of *Australia Felix*, the first vol. of her Australian trilogy *The Fortunes of Richard Mahony*, she had launched out on her best work. The background of this vol. is Ballarat in the gold rush and its keynote is frustration and cultural barrenness. The second vol., *The Way Home* (1925), reflects the contrast between 'colonial intelligence' and Eng. social civilisation, and the concluding vol., *Ultima Thule* (1929), shows the frustrated Mahony gripped by insanity. Other books are *The End of a Childhood* and *other Stories* (1934) and *The Young Cosima* (1939) in which Wagner and Liszt are interpreted with brilliant insight, though the dominant figure is Cosima herself.

Intensity and seriousness are the main features of her work, and in the opinion of many she is to be remembered as the most remarkable novelist Australia has produced.

Richardson, Sir Owen Willans (b. 1879), Eng. physicist, b. at Dewsbury, was educated at Batley Grammar School and Trinity College, Cambridge. He was prof. at Princeton, U.S.A., at King's Colleges, London and Yarrow, prof. of the Royal College. He has written books on the emission of electricity from hot bodies and the electron theory of matter and on molecular and hydrogen and its spectrum. R. won the Nobel prize for physics in 1928, and was knighted in 1939.

Richardson, Sir Ralph David (b. 1902), Brit. actor, b. at Cheltenham and educated at the Xaverian College, Brighton. His first stage appearance, as Lorenzo in *The Merchant of Venice*, was in Brighton in 1921. In 1926 he appeared in *Yellow Sands* at the Haymarket Theatre, London. He estab. a reputation as a great Shakespearian actor at the Malvern festivals, with the Old Vic, and in New York. He entered films in 1933 and gave outstanding performances in *South Riding*, *The Citadel*, and *The Silver Fleet*. In 1944 R. rejoined the Old Vic as joint director. Since the Second World War he has played in *Peer Gynt*, *The Alchemist*, *Cyrano*, and *Uncle Vanya*. His most notable Shakespearian part has been his superb rendering of Falstaff in *Henry IV*. R. was knighted in 1947.

Richardson, Samuel (1689-1761), Eng. novelist, b. in Derbyshire, but came to London and, after serving an apprenticeship to a printer, set up in business in 1719 on his own account. For twenty years he pursued this calling, and then two booksellers, Rivington and Osborne, suggested that he should write a vol. after the style of 'The Police Letter-writer.' The idea appealed to R., but he improved upon it, and wrote the story in letters known as *Pamela; or, Virtue Rewarded* (1740). This was a great success, and not even Fielding's parody, *Joseph Andrews*, could stop its triumphal march. His next work was *Clarissa* (1748), and this was followed by *The History of Sir Charles Grandison* (1753). His books are little read now, owing to their sentimentality and narrow outlook on life, but R., who has been called 'the father of the modern novel,' must always occupy an important place in the hist. of Eng. literature. His correspondence, prefaced by a biographical account by A. L. Barbauld, was pub. in 1804. See lives and studies by C. L. Thomson, 1900; A. Dobson, 1902; H. W. Downs, 1928; P. Dutton, 1931; and A. D. McKillop, 1936.

Richborough, tn. of Kent, England, near Sandwich on the S.E. coast. R. lies on the R. Stour, and is the site of a military port and harbour which was famous in both world wars for the train ferry which it maintained with France. In the Second World War it was an embarkation port for the invasion of Normandy and for many other missions, and here units of Pluto (see FIRE-LINES) and

'Mulberry' harbour were made. R. is well known for the extensive remains of a Rom. fortress and station (Rutupia), which is often mentioned by the Lat. authors, chiefly as a port of arrival in Britain, and in particular by Juvenal for its oysters. The site has been scientifically excavated and is one of the show-places of Rom. Britain. Its real importance began with the invasion of Claudius in A.D. 43, and the defensive ditches of the base camp have been located, as have the granaries and other wooden buildings of the supply depot which followed the Claudian camp. About A.D. 85 the camp area was cleared for the erection of a magnificent marble-cased building furnished with bronze statues, probably to mark the final conquest of Britain by the Emperor Domitian; the great cruciform foundation of it still exists. There was intensive occupation in the second century, while in the second half of the third century an earthwork fort with triple ditches was built to protect the coast from sea raiders; the ditches as excavated may still be seen. The most prominent feature of the site is the great stone walls and ditches of the Fort of the Saxon Shore, one of a series built as a defence from the Saxon pirates and sited round the coast of S.E. Britain from the Wash to Portsmouth. It was probably built in the reign of the usurper Carausius (A.D. 287-93), who set himself up as emperor in Britain. There was still an intensive occupation late in the fourth century, and even in the early fifth century. More than 300 wells and rubbish pits in the area have been completely excavated, and the most interesting of the objects found in these pits and elsewhere on the site are preserved in the museum. See *Society of Antiquaries Research Reports, Richborough I., II., and III., 1926-32.*

Richelieu, Armand Jean du Plessis, Cardinal, Duc de (1585-1642), Fr. statesman, b. in Paris. He was originally intended for the army, but when his elder brother resigned the bishopric of Luçon, in the family preferment, R. was given the benefice. After obtaining a dispensation from Rome, because of his youth, he was consecrated bishop of Luçon in 1607. He soon showed a flair for politics, and possessed in large measure the necessary craft, clear-headedness, and callousness. In 1614 he was a clerical deputy at the States-General. He then became almoner to Anne, wife of Louis XIII., and by gaining the favour of the queen-mother, Marie de' Medici, and her confidants, was made secretary of state. After Concini's murder R. accompanied Marie to Blois, and eventually procured her return and reconciliation with her son. He was rewarded with a cardinal's hat (1622), and by 1624 was chief minister and the supreme power in the country. In 1631 he received a dukedom. Many plots were directed against him: the duke of Orleans waged a constant struggle with R. between 1626 and 1632, and R. broke the conspiracy of Cinq-Mars in the last year of his life. His ability,

patriotism, and resolution are undoubted. Personally frail, and frequently ill, he yet conducted campaigns in person; incapable of inspiring affection, he nevertheless retained the confidence of the king from the time of his accession to power until his death, in spite of the ceaseless antagonism of the court. His courage and competence, coupled with a highly efficient system of espionage, made him proof against all intrigues and assured his successive triumphs.

During the period of his power he kept constantly before him the ideal of a state in which the power of the Crown would be absolute, and which should be supreme and unassailable in Europe, and he did much towards its realisation. When he

RICHELIEU

Engraving after the portrait by Philippe de Champagne.

took office the royal power was limited in two directions. The Huguenots still enjoyed a certain amount of dangerous freedom, and the great nobles retained a degree of power and privilege which was incompatible with unfettered monarchical authority. R. devoted all his energies to the subjugation of Huguenots and nobles. At La Rochelle (1629) the Huguenots were crushed as rebels, but were then granted civic privileges and religious toleration. The nobility's power was curbed; fortified castles were destroyed, and local administration placed in the hands of civil servants. The nobles were encouraged to become court parasites. Abroad France was still menaced on every frontier by the power of the Hapsburgs. R. intervened in the Thirty Years war with the skill of the master-intriguer, giving subsidies to the Hapsburgs' opponents, even to the king of Sweden, the champion of Protestantism. He saw the struggle as a war of ter., not of religion, and his efforts ensured that at the peace of Westphalia France gained strengthened frontiers and enhanced prestige. As a

patron of science and literature R. rebuilt and endowed the Sorbonne, and founded the royal printing house at Paris, the botanic garden, and the Fr. academy. Of his writings, his memoirs (ed. by J. Lair and Baron de Courcel, 1907-12) are still of interest.

R.'s place in Fr. hist. can scarcely be exaggerated. He prepared the way for absolute monarchy in France, and he destroyed the Hapsburg menace to Fr. independence. The worthiness, to France, of his ends has made him a national hero; but his means were more questionable. He was extravagant and improvident. In his selection of ministers and captains he looked for subservience rather than for initiative, and it is significant that the most decisive victories of France in the Thirty Years war were won after his death. Under him the checking of natural political developments began, which led eventually to the revolution; but he laid the foundations for the glory of expansion of France under Louis XIV. See lives by G. Hanotaux (new ed., 1933-35); E. C. Price, 1912; K. Vödem (Eng. trans., 1928); H. Belloc, 1930; and C. J. Burckhardt (vol. i.), 1940.

Richelieu (called also St. John, or Chamblay), riv. of Quebec, Canada, navigable below Chamblay; rising in Lake Champlain and flowing due N. to the St. Lawrence, which it meets at Sorel on Lake St. Peter.

Richepin, Jean (1849-1926), Fr. poet, dramatist, and novelist, b. in Médéa, Algeria. He studied letters at the École Normale. In 1870 he fought with the *francs-tireurs* of the army of Bourbaki, and this experience is reflected in his early poems. After the war he was an actor, then he went to sea, and afterwards entered journalism. His work is considerable both in quantity and in quality, of prose, verse, and drama. His first poems, *La Chanson des gueux*, appeared in 1876, and cost him a month in prison and a fine; they were followed by *Les Carences* (1877); *Les Blasphèmes* (an atheist Bible, 1884); *La Mer* (description of sailor life, 1886); and *Mes Paradis* (1894). His most brilliant play is *La Glu* (1881). Others include *Le Filibustier* (1888); *Par le glaive* (1892); *La Martyre* (1897); *Don Quichotte* (1905); these formed part of the repertoire of the Comédie Française, of which he was for a time director. A famous play of his, with music by Xavier Leroux, is *Le Chemineau* (1897). He acted with Sarah Bernhardt in his *Nana Sahib*. Among his novels are *Les Morts bizarres* (1877); *Madame André* (1877); and *Miarka* (1883).

Richet, Charles Robert (1850-1935), Fr. physiologist, b. in Paris and educated there. From 1887 to 1927 he was prof. of physiology at Paris Univ. R. became famous through his discovery of anaphylaxis, and was awarded the Nobel prize in 1913 for his work on this subject. He also studied the treatment of nervous diseases, and his work on serum therapy was of great importance. He collaborated in the writing of a physiological dictionary, and ed. the *Revue scientifique*.

Richtl, Alois (1844-1924), Austrian philosopher, b. at Bozen, a follower of the neo Kantian school. He attempted to limit philosophy to a theory of cognition, and from this arrived at a pure formalism. His chief pub. was *Der philosophische Kritizismus und seine Bedeutung für die positive Wissenschaft* (1876-87, 1924-26). See study by C. Siegel, 1932.

Richmond and Gordon, Charles Henry Gordon-Lennox, sixth Duke of (1818-1903), Eng. soldier and politician, b. in London, and educated at Westminster and Oxford. He served in the Horse Guards till 1844, was aide-de-camp to the duke of Wellington (1842-52) and to Lord Illing (1852-54). In 1870 he was made leader of the Conservative party in the House of Lords, in 1874 lord president of the council, and in 1885-86, secretary for Scotland.

Richmond and Lennox, Frances Teresa Stewart, Duchess of (1647-1702), mistress of Charles II. Her father was a physician. After being educated in France she came to England as a maid of honour to Catherine of Braganza, and became the king's mistress in 1668. She was a noted beauty, and was the original model for Britannia on Brit. coins.

Richmond, Sir Herbert (1871-1946), Eng. sailor and naval historian. In his naval career he reached eminence on the technical side as a torpedo officer, and later became recognised as a leading authority not only on naval hist. but on naval strategy. As a captain he commanded the famous battleship *Dreadnought*; as rear- and vice-admiral he was commander-in-chief on the E. Indies station. When in 1927 the College of Imperial Defence (q.v.) was formed he was its first commandant. R. was made K.C.B. in 1926 and admiral in 1929. In 1934 he succeeded Dr. Holland Rose as Vere Harmsworth prof. of imperial and naval hist. at Cambridge, and, later, was elected to the mastership of Downing College. His original researches into naval hist. found expression in *The Navy in the War of 1739-48* (1920); *The Navy in India, 1763-83* (1931); and various pamphlets. Pubs. on the modern application of the strategical lessons of hist. include *National Policy and Naval Strength* (1922, 1931); *Economy of Naval Security* (1931); and *Sea Power in the Modern World* (1934); also, chiefly for naval consumption, *Command and Discipline* (1930) and *Naval Training* (1933). His Ford Lectures (1943) at Oxford were pub. in 1946 as *Statesmen and Sea Power*.

Richmond, Sir William Blake (1843-1921), Eng. painter, b. in London, studied at the Royal Academy and in Italy. In his youth he joined the pre-Raphaelite movement. He was Slade prof. of fine art at Oxford, 1878-83, and R.A. in 1895. In 1891 he undertook the decoration of St. Paul's Cathedral in mosaic. Much of his best work is in portraits.

Richmond: 1. Municipal bor. of Surrey, England, and residential suburb of Greater London. R. Hill to the S.E. commands a fair and famous prospect of meadows, uplands, woods, and of the ls. of the winding Thames, on which the tn. stands.

The stately park (2357 ac.) was once the deer forest and pleasure ground of Charles I. A gateway is the one memorial of the royal palace of Sheen, where Edward III. and Elizabeth died, and where Wolsey lived. Henry VII., who renamed the tn. after his earldom, held a splendid tournament here in 1492. Keau, who leased the theatre (estab. in 1719), lies buried in the par. church, as does the poet James Thomson (1700-48), author of *The Seasons*. R. is celebrated for its extensive parks and open spaces. Pop. 41,400. See R. Crisp, *Richmond and its Inhabitants*, 1866; E. B. Chancellor, *History and Antiques of Richmond*, 1894; and H. M. Cundall, *Bygone Richmond*, 1925. 2. Anct. chartered bor. and mrkt. tn., at the foot of Swaledale in the N. Riding of Yorkshire, England; the centre of farming dists. and a garrison tn. serving Catterick Camp near by. Of the castle, founded by Alan Rufus in 1071, there remains the Norman keep, situated on a natural eminence above the Swale. Its historical associations, old churches, Georgian theatre, and large cobbled square give it a unique place among Yorkshire tns. Pop. 7000. See D. Brooks, *The Story of Richmond*, 1946.

Richmond. 1. Cap., largest city, and port of entry of Virginia, U.S.A., 114 m. S.S.W. of Washington, stands on the James R. (130 m. from its mouth), whose falls supply power for the tobacco, iron and steel, lumber, and packing-case industries. In Capitol Square stand the Washington Monument (1838) and a bronze statue to Stonewall Jackson beside the historic Capitol (1785-92). Edgar Allan Poe lived in R. Pop. 193,000. 2. Bor. of New York city, U.S.A. Pop. 174,400. 3. Co. seat of Wayne co., 67 m. E. of Indianapolis, on Whitewater R., Indiana, U.S.A. Important as a railway centre and as the seat of the manuf. of agric. implements, furniture, machinery, etc., it is noted also for Earlham College, chartered in 1859 and controlled by the Friends, who also founded the city. Pop. 35,100. 4. Tn. with a live-stock market and manufs., 93 m. S.E. of Louisville, and co. seat of Madison co., Kentucky, U.S.A. Pop. 7300. 5. Vil. about 90 m. S.S.W. of Quebec, in Quebec prov., Canada. Pop. 3000. 6. City and port of Contra Costa co., central California, U.S.A. Pop. 23,600. 7. Attractive suburb, 2 m. S.E. of Melbourne, in Bourke co., Victoria, Australia. Pop. 41,000. 8. Tn., noted for the Hawkesbury Agric. College, 34 m. N.W. of Sydney, in Cumberland co., New S. Wales. Pop. 1800. 9. Tn., 40 m. S.W. of Hanover, and over 50 m. E. of Victoria West, in Cape Prov., S. Africa. Pop. 1800.

Richmond and Steveston, municipality of Brit. Columbia, Canada, 6 m. S. of Vancouver, at the mouth of the R. Fraser. Includes Sea and Lulu Is., on the former being Vancouver airport. Salmon is canned at Steveston on Lulu Is. Pop. 8200.

Richter, Hans (1843-1916), Austrian conductor, b. at Raab, Hungary, studied for violin, horn, and theory, at Vienna Conservatoire, 1860. In 1866 he met

Wagner, with whose music he is pre-eminently associated. After visits to various European caps., he assumed command of court opera and the philharmonic concerts in Vienna, 1875. In 1877 he made his debut in England at the Albert Hall Wagner concerts, and in 1879 he founded the R. concerts. From 1897 he was associated chiefly with Manchester, but he also did important work at the Birmingham festivals and at the Covent Garden Opera House. He made his last appearance in 1912. R. was the greatest conductor of his day, and besides being a Wagnerian authority, he presented many of Elgar's works for the first time. Elgar dedicated his first symphony to him.

Richter, Johann Paul Friedrich (1763-1825), Ger. humorous and satirical writer, b. at Wunsiedel in Bavaria, generally known as Jean Paul, the Fr. pen-name which he himself adopted. He was the son of a schoolmaster, who afterwards became pastor at Joditz and Schwarzenbach. R. was also intended for the church, and by way of preparation for that calling was sent in 1781 to the univ. of Leipzig. There he read with eagerness the classics of Germany, France, and England, and, fired with enthusiasm, determined that he too would become a great writer. His first efforts in this direction, of a satirical nature, were not received with much favour, but in 1793 there appeared *The Invisible Lodge*, which brought him immediate fame. This was followed in 1795 by another famous romance, *Hesperus*, and by *Flower, Fruit, and Thorn Pieces*, or *Siebenkas*, in 1796-97. To this period also belong two idylls of a more finished character than is general in R.'s works, *Dominie Wuz* and *Quintus Firlein*, the former appearing in 1793 and the latter in 1796. In 1801 he married Caroline Meyer, and in 1804 finally settled in Bayreuth, where he lived a placid, simple life. The period following his marriage was prolific in literary productions. From 1799 onwards he was in receipt of a pension from the Prince-Primate Dalberg which relieved him from pecuniary distresses. In 1800-3 he wrote his great romance, *Titan*, which he himself held to be his prin. novel, and *Wild Oats*, in 1801-5. His satirical style appears again in *Schmelzle's Journey to Flatz*, known to Eng. readers through Carlyle's trans. (R. had much influence on Carlyle's style), and *Dr. Katzenberger's Trip to the Spa*, both of the year 1809. An idyll, *Libel's Life*, appeared in 1812, and in 1820-22 another romance, *Nicholas Margraf, or The Comet*. He wrote on education in his work *Lernna* (1807), and propounded his theory of art in the *Vorschule der Aesthetik* (1804).

There is a good deal of imaginative incoherency and wandering from the point to be met with in R.'s writings. With the exception perhaps of *Dominie Wuz* and *Quintus Firlein* his novels have little or no artistic form. His humour depends for its finest effects on a certain grotesqueness and eccentricity and a feeling for the incongruous.

His collected works were first pub. in 1926-38, and in a critical ed. by E. Berend (1927-42), who also ed. his letters (1922-1926). See lives and studies by J. Alt, 1925; W. Harich, 1925; W. Meier, 1926; and M. Kommerell (2nd ed.), 1939; also P. Stapfer, *Humour and Humorists*, 1911, and E. Berend, *Jean Paul und die Schweiz*, 1943.

Richthofen, Manfred, Baron von (1882-1918), Ger. airman, b. at Breslau. He was appointed commander of the 11th Chasing Squadron in Jan. 1917. His 'circus', or squadron, of planes was remarkable for the number of planes they brought down. R. received the Order Pour le Mérite in 1917, and later the Order of the Red Eagle with Crown and Swords. In his *Memoirs* (Aug. 1917) he speaks highly of the Brit. airmen's fighting qualities, and he himself had a reputation for chivalry in air combats. The command of his squadron passed to Hermann Goering (q.v.) after R.'s death in battle over the W. front.

Rickert, Heinrich (1863-1936), Ger. philosopher, b. at Danzig. With his teacher W. Windelband, he was a leader of the Baden school, building up neo-Kantianism to a philosophy based on values. His works include *Der Gegenstand der Erkenntnis* (5th ed. 1928) and *System der Philosophie* (vol. I, 1921). See study by A. Faust, 1921.

Rickets, or Rachitis, constitutional disease of the first two or three years of infancy, characterised by improper or incomplete development of bone. The symptoms, which are not marked until the latter end of the first year, are digestive disorders, loss of appetite, weakness, diffuse tenderness, and sweating about the head and neck. The bones are soft, but the first indication of malnutrition of the osseous structures is seen in the enlargement of the ends of the bones, as in the wrists, ankles, and junction of the ribs with the costal cartilages. The imperfect development of bone may give rise to bowed legs, knock-knees, curvature of the spine, distortion of the pelvis, square head, or other deformities, while dentition and the closing of the fontanelles in the skull are delayed. The cause of R. is a shortage of vitamin C, which is present in cod-liver oil and can be formed by the skin in presence of sunlight. Treatment should aim at better nutrition and a healthier environment. Breast-fed infants with good surroundings as regards air, light, and cleanliness are not likely to develop the disease. It is not hereditary in the usual sense.

Ricketts, Charles (1866-1931), Brit. painter, b. at Geneva. In 1896 R. started the Vale Press, a series of octavo reprints for which he designed the type founts known as Vale, Avon, and King's, together with numerous engraved illustrations. R. also did a number of beautiful pen-drawings for different pub., one of his best being 'Edipus and the Sphinx.' He was elected associate of the Royal Academy in 1922. His chief pictures in public galleries are 'The Death of Don Juan' (Tate Gallery), 'The Plague' (Musée

de Luxembourg, Paris), and 'Montezuma' (Manchester). His later contributions to the Academy included mostly painted illustrations to literature, drama, or music. R.A. in 1928. He pub. *The Prado and its Masterpieces*, a book on Titian, and *Unrecorded Histories* (1933). See memoir by T. S. Moore, 1933.

Ricketts, Howard Taylor (1871-1910), Amer. pathologist, after whom are named the Rickettsia bodies living in lice and other arthropods, whence they may be transmitted to man and animals. *Rickettsia prowazeki* causes typhus fever; *R. psittaci* is responsible for psittacosis (q.v.) in parrots and occasionally in man.

Rickmansworth, tn. of Hertfordshire, England, 4 m. W.S.W. of Watford, on the Rs. Colne, Gade, and Chess and the Grand Union Canal. It is primarily residential, but it has printing works and manufs. of paper, asbestos, and lorries. Pop. 25,000.

Ricochet, name given to the rebounding from a flat surface, as of a stone from water, or cannon ball or bullet from ground or water; the motion commonly known as 'ducks and drakes.' Vauban (q.v.) in the siege of Philippsburg in 1688 introduced his invention of R. batteries, in which the projectiles were so fired as to R. into the besieged tn. In firing at a fortification sufficient elevation was given just to clear the parapet, so that the projectile might bound along the banquette without rising far above its level. It was effective on smooth hard ground against bodies of men or such obstacles as abattis, and also upon water, with either round shot or rifle-balls.

Riddell of Walton Heath, George Allardice Riddell, first Baron (1865-1934), Brit. newspaper proprietor, b. at Braxton, London, son of James R., a photographer, of Whitstone. R. was first in England in solicitors' law final examination and admitted to the rolls in 1888. He practised first at Cardiff, and afterwards and until 1903 was head of a firm of solicitors in London. When Lascelles Carr founded the *Western Mail* R. became its editor; after this he became legal adviser to the *News of the World*; in 1903 he gave up the law and became chairman of the *News of the World* and also head of the firm founded by Sir George Newnes, to which latter organisation he added *Country Life* and *John O'London's Weekly*. Knighted 1909. He played a prominent part in the settlement of the coal strike of 1912. He became friendly with Lloyd George, 1919, and was appointed press representative at the Versailles peace conference, and acted in a similar capacity at other conferences in 1921 and 1927. In 1920 he was raised to the peerage. R. gave £100,000 to the Royal Free Hospital, of which he was president in 1925; also a similar sum to the Eastman Dental Clinic. He wrote *War Diary, 1914-18* (1933); *Intimate Diary of the Peace Conference and After, 1918-23* (1933); and *More Pages from my Diary, 1908-14* (1934).

Riddings, industrial par. in the Alfreton urb. dist., Derbyshire, England, 3 m. S.S.E. of Alfreton. It has coal-mines,

iron foundries, and factories manufacturing chemicals, floor blocks, and concrete products. Pop. 4400.

Riddle (Ger. *Rätsel*), paraphrastic presentation of an unmentioned subject, the design of which is to excite the reader or hearer to the discovery of the meaning hidden under a studied obscurity of expression. Anciently it was put to important uses, although in its inferior phase of conundrum it was a part of the intellectual entertainment at Gk., and afterwards at Rom., banquets. In the E. it naturally associated itself with symbolical modes of thought, and was also, as it still is, abundantly employed for didactic purposes. The so-called proverbs or sayings attributed to Solomon frequently assume the form of Rs. Every reader of the O.T. is familiar with the R. which Samson proposed to the Phillistines, and the 'enigmas' (as the Septuagint has it) that the queen of Sheba proposed to Solomon. The R. is found in the Koran, and sev. books of Rs. exist in Arabic and Persian. It would appear that they were also known to the anc. Egyptians, while among the Gks. they were allied in the earliest times with the *oracula*, or mystic utterances of the inspired priests, and were generally in verse. Even the greater poets did not refuse to introduce the R. into their writings, and the lt. of the Sphinx is probably the most celebrated in the whole circle of philosophical puzzles. Among the Romans, professional R. makers did not make their appearance till the latest period of Rom. literature, the reason assigned for which is, the superior gravity and earnestness of the Rom. genius. Apuleius wrote a *Liber Ludicrorum et Grifhorum*, but it is no longer extant. The R., more as an amusement than as a serious intellectual effort, was much cultivated during the Middle Ages. The Reformation checked the merry pastime of R.-making, but in the seventeenth century it came into favour again. The Abbé Cotin was a famous fabricator of Rs. In the eighteenth century the taste for the manuf. of Rs. continued to increase, and most of the brilliant Fr. *littérateurs* did a little in this line. In Germany Schiller gave a broader development to the R. In his hands it again became something grave and sibylline and attained a high degree of literary force. See also CHARADES.

Rideau Canal, in Ontario, Canada, connecting Ottawa with Kingston, on Lake Ontario, by way of the Rideau R. and lake, and by connections with the Mud Lake and Cataract R. The canal, built between 1826 and 1831, is 12½ m. long, and has a navigable depth of 4½ ft.; it has greatly declined in importance since the advent of railways. Rideau Hall, at Ottawa, is the residence of the governor-general.

Ridgeway, prehistoric track along the Eng. Berkshire Downs from White Horse Hill to Streatley, S. of and parallel to the Icknield Way. See H. F. Timperley, *Ridge Way Country*, 1935.

Ridgeway, co. seat of Elk co., Pennsylvania, U.S.A., on the Clarion R., 719

m. S.E. of Erie; it has tanneries, dynamo and engine, iron, clay, and lumber works. Pop. 6000.

Riding is practised in four different main systems: (1) ordinary R.; (2) rough R.; (3) military R.; (4) ladies' R. But of each system there is one general principle, that good horsemanship depends on balance, grip being left to exceptional moments of insecurity. The rider should always strive for a firm, natural seat and a well-braced back, and he should hold the reins fairly long to allow full freedom to the horse's head. In mounting a man should stand alongside the horse's near or left shoulder, and with the reins in his left hand should take hold of the mane; the left foot is placed in the near stirrup with the right hand, which is then placed on the cantle as far to the off-side as possible. In the spring as little weight as possible should be put on the stirrup; the right leg is swung over the animal's back and the rider sinks lightly into the saddle. The feet should be placed well in the stirrup, not under the ball of the foot, since this throws the seat out of alignment, and a good rider naturally avoids putting his weight on the stirrups as he avoids hanging on to the reins. In learning to ride bare-backed, practice is invaluable, and as many different horses as possible should be practised on, beginning with a thoroughly trustworthy animal, so that the rider's actions become automatic. In ordinary R. the reins should be held in both hands, especially when using a double-bridle (see BRIDLE). Rough riders greatly depend for security of seat on the construction of their saddles. With the development of international competitions, such as the Olympic Games (*q.v.*), military R. has much improved in recent years. It is of a composite character, and calls for skill, adaptability, and very thorough training. Ladies' R., which is side-saddle R., has been almost completely replaced in popularity by the cross-saddle. This is to be regretted not only on account of the loss of elegance and tradition, but also because in many cases a woman can maintain a better balance, and greater control of her mount, when R. side-saddle. To mount, the rider holds the offside of the saddle seat, with the reins in the right hand and the left hand on the top pommel. Then placing the left foot in the stirrup she straightens the knee and lightly steps into the saddle with a little twist. See also CAVALRY; DRESSAGE; FOX-HUNTING; HAUTE-ÉCOLE; HORSEMANSHIP; POLO; RACING; STEPLECHASING. See W. Fawcett, *Elements of Horsemanship*, 1932, and *Riding and Horsemanship*, 1935; H. D. Chamberlain, *Riding and Schooling Horses*, 1935; J. Phillis, *Breaking and Riding*, 1937; S. Kournakoff, *School for Riding*, 1939; Maj. D. Marsh-Macmillan, *Equitation and Horsemanship*, 1948; E. Harrison, *Riding: a Guide for Beginners*, 1949; Lt.-Col. W. E. Lyon (ed.), *The Horseman's Year*, 1949.

Riding, name of the three administrative divs. of Yorkshire, England. The old word, used in Scandinavia, was 'thrithing'.

Ridinger, Georg (1568-1616), Ger. architect, b. at Strasburg. Between 1605 and 1614 he designed the castle at Aschaffenburg, one of the outstanding buildings of the Ger. renaissance.

Ridley, Nicholas (c. 1500-55), Eng. prelate, b. in Northumberland and educated at Pembroke Hall, Cambridge, where he first became imbued with the spirit of the Reformation. He became chaplain to Archbishop Cranmer (1537), chaplain to Henry VIII., canon of Canterbury (1541), and of Westminster (1545), and bishop of Rochester (1547). He quickly became one of the leaders of the Reformed Church, took part in the first revision of the Prayer Book (1548), and succeeded Bonner as bishop of London in

BISHOP RIDLEY

1550. R. was not an extreme reformer, and that Anglicanism retains so many of the usages of the medieval church may be due to his moderating influence. On the death of Edward VI., R. supported Lady Jane Grey, but was arrested by Mary and sent to the Tower. In 1554 he was condemned for heresy and burned at Oxford, at the same time as Latimer (1555). See his *Life and Works*, ed. by H. Christmas, 1841, and J. C. Ryle, *Bishops Latimer and Ridley*, 1925.

Riel, Louis (1844-85), Canadian agitator, b. at St. Boniface, Manitoba, championed the cause of the Métis or half-breeds, to whom he belonged by reason of his Fr., Indian, and Irish descent. The first rebellion which he headed was in 1869. It arose out of the hostility of the settlers at Red River to the transfer of the N.W. Terr. from the Hudson's Bay Company to Canadian administration. In all the discussions preceding the transfer, the one group whose interests had not been consulted were the settlers already in the N.W., who numbered about 10,000, the most numerous of these being

the Métis, who regarded themselves as pioneers of Fr.-Canadian settlement on the plains. The Métis feared they might lose their language and schools. In R., an inveterate enemy of the Canadian Gov. domination, they found a leader and decided to oppose the new regime. A 'provisional gov.' under R. was set up, but in the next year the dispute was compromised in the Manitoba Act, which granted a prov. gov. at Red River and recognised the right of the Fr.-speaking settlers to their language and schools. R. escaped, and in 1873 was elected to the dominion Parliament, but expelled and outlawed. Unbalanced in judgment and vain, qualities aggravated in 1884 when he headed the second rebellion of Métis, he was none the less sincere and in some ways able. On the occasion of the second rebellion there was discontent among the Indians of the Saskatchewan region, as well as among the Métis. The latter were especially disaffected over the Ottawa Gov.'s failure to grant them titles to their farms, while the Indians brooded over their lost freedom. It was in these circumstances that messages were sent to R. and the rebellion broke out in March 1884. The gov. of Ottawa was taken by surprise but moved with alacrity. Troops were sent from Winnipeg to hold the new railway which had recently been completed from there to the mts. The rebellion ended almost as suddenly as it began. One main engagement lasting three days was fought at Batoche; the settlement was captured and R. surrendered a few days later and was executed. See G. W. Brown, *Building the Canadian Nation*, 1942.

Riemann, Georg Friedrich Bernhard (1826-66), Ger. mathematician, b. at Breselenz, near to Dannenberg, Hanover. He denied the axiom that two straight lines cannot enclose a space, and advanced proofs to show that observation cannot establish that space is strictly Euclidean. He attempted to show that it may be finite, though like Euclidean space, unbounded. In his geometry every straight line would return into itself and be closed, just the same as a geodesic on a spherical surface. His system of non-Euclidean geometry is practically that of spherical space, that is, the surface of an ordinary sphere. Riemannian space and curvature tensors have been incorporated in Einstein's relativity theory and other modern cosmological theories.

Riemann (Karl Wilhelm Julius) Hugo (1849-1919), Ger. musical scholar, b. at Grossmehlra, near Sondershausen. He studied music at the Leipzig Conservatoire, and later became lecturer at the univ. there from 1878 to 1880, and again, after various appointments elsewhere, from 1895 to 1901, when he became prof. Among his many works on musical subjects are a *Musiklexikon*, *Handbuch der Musikgeschichte*, *Opernhandbuch*, works on notation, harmony, phrasing, hist., etc. He ed. many standard works. R.'s greatest service to music lay in his knowledge of and emphasis on the musical traditions of the past. He was, however,

far from a narrow traditionalist, believing that an acknowledgment and sense of musical continuity was vital to the balance of modern music. See H. L. Denecke, *Die Komposition-Lehre Hugo Riemanns*, 1937.

Riemenschneider, Tilman (11460-1531), Ger. mason and sculptor, b. at Osterode. He was one of the most outstanding of Ger. sculptors: he combined the tenderness of late Gothic styles with a sensuousness that foreshadowed baroque; his work has a rare quality of piety and pathos, and is, at the same time, essentially spontaneous. One of his most decorative yet appealing sculptures is the 'Madonna' in the cathedral at Würzburg, executed about 1503. See lives by C. Streit, 1888; H. Schrade, 1927; F. Knapp, 1935; K. Gerstenberg, 1940; and K. H. Stelu, 1944.

Rienzi, Cola di (1313-54), Rom. political reformer, b. in Rome. The son of a tavern-keeper, he was an enthusiastic student of ant. Lat. literature, and thus gained the desire to restore the former greatness of Rome. His zeal for reform received an impetus from the murder of his brother by a noble. He became a notary of some importance, and in 1343 went on a mission to Pope Clement VI. at Avignon. He won the papal favour, but returned to Rome in 1341, and in May 1347 invited all the citizens to a meeting in the Capitol. The new laws he proposed were at once adopted, and he was made tribune of the new republic. For a short time his rule was popular and successful, but his arrogance disgusted both his own people and foreign princes, and the nobles, with the consent of the pope, drove him out of the city at the end of the year. He was restored by Innocent VI. in Aug. 1354, but was killed by the mob in Oct. See Bulwer Lytton, *Rienzi*, on which Wagner's opera was based. See also lives by P. Mar, 1931, and V. Fleischer, 1918.

Riesa, tn. of Saxony, Germany, on the R. Elbe, 12 m. N.W. of Meissen. The harbour is good, and one of the chief industries is boat-building. Steel, textiles, and marble are produced. Pop. 26,200.

Riesengebirge, chain of mts. between Silesia and Bohemia, and part of the Sudetic range. They culminate in the height of Schneekoppe (5265 ft.), and form a much-frequented tourist centre.

Rieti, tn. in the prov. of the same name, Italy, 40 m. N.E. of Rome. It is an old Sabine city, and has a fifteenth-century cathedral. Wheat and sugar-beet are grown in the area. Pop. 34,700.

Rievaulx, or Rivaux, Abbey, Cistercian foundation situated in the N. Riding of Yorkshire, 2½ m. N.W. of Helmsley, dating from 1131, and now in ruins. The word means 'valley of the Rye' from a small riv. that flows by the ruins. There is a vill. of R.

Rif, Er Rif, or Rif, mountainous strip of coast in N. Morocco, stretching from Ceuta to Algeria. There are some 1,500,000 inhab. in the R. country.

Rifle. The main varieties of military Rs. are described in the article GUN; it is

proposed therefore to deal with sporting Rs., and also with shotguns in general in this article.

A sporting R. is a weapon designed for shooting game of various kinds. All modern Rs. are of the breech-loading type, and fire a cartridge made up of four components: (a) A brass cartridge case which serves as a holder for the propellant powder and also as a gas seal preventing a flow of gas rearwards; (b) the propellant powder; (c) a priming cap; (d) the bullet. The barrel is rifled, i.e. there are spiral grooves to impart a high rotational velocity to the bullet to ensure that it maintains equilibrium in flight. The cartridge is supported in the breech of the barrel by a member known as the breech block, which usually contains the firing mechanism. The latter normally consists of a pin known as a striker, capable of indenting the cartridge. Pressure on the trigger actuates a piece known as the sear, which releases the striker or hammer, which is then thrown forward to fire the cartridge by means of a powerful spring which hitherto has been kept in a state of compression.

Sixty years ago the double-barrelled sporting R. was in general use, of very large calibre for elephants and other pachyderms (10 and 12 bore, 600 in., 577 in., 500 in.), medium calibre such as 450 in., 375 in., and 9 mm. being preferred for dangerous soft-skinned animals, and the smaller calibres, 303 in. and 8 mm., being reserved for deer and antelope. The heavy calibre Rs. have gradually been ousted, largely owing to the fact that they are very cumbersome because of their great weight. Moreover the 'double' R. was designed for cartridges of low chamber pressure which relied for their high striking energy on heavy projectiles propelled at a somewhat low velocity rather than the use of lighter projectiles at a relatively higher velocity. The chief advantage of this type of R. over other patterns is that the hunter is assured of a rapid second shot should this prove necessary, an important point when confronted with dangerous big game. Apart from ballistic considerations and the modern preference for high-velocity hunting weapons, the 'double' R. is very expensive and costs at least five times as much to produce as the single barrel bolt action magazine R. which is now by far the most universally used sporting weapon. The most popular types of bolt actions employed are those based on the Mauser system, and are identical in essentials to the Ger. military R. (Model 1898) action (see GUN).

The cartridges of European manuf. for hunting purposes which are most often met are as follows: 6.5 mm., 7 mm., 303 in., 7.9 mm., 9 mm., 9.3 mm., 375 in. H. and H. Magnum, and 10.75 mm. Another pattern bolt action R., which achieved popularity between 1905 and 1939 was the Mannlicher-Schoenauer (particularly in 256 in. (6.5 mm.) calibre) manufactured in Austria. In the U.S.A. the bolt action R. is popular, but in many parts of the Continent, where hunting is carried out on

horseback, the need for a good saddle R. is felt, and consequently the lever action R. is found more convenient. In this weapon the breech block is operated by means of raising and lowering a lever which is, in point of fact, a trigger guard extension; the magazine is usually of the tube type located immediately beneath the barrel.

The main developments in the U.S.A. of recent years indicate a marked tendency towards reduction in calibre and increase in velocity, great strides having been made in extraordinarily accurate small bore cartridges (.22 in. to .27 in.) with a very flat trajectory, yet by virtue of their high velocity (3000 to 4000 ft. per sec.) may be used on small game satisfactorily and humanely. The two best-known cartridges in this class are probably the .220 in. Swift and .22 in. Hornet. A multitude of similar cartridges are used for 'vermin' shooting, which has developed in recent years into a serious sport. Unquestionably the .22 in. rim-fire sporting R. is the most popular in all countries. Unlike the R. hitherto mentioned, the cartridge utilised for this R. contains its priming in the base rim, which is exploded by a blow from the striker on firing, hence the term 'rim-fire,' as opposed to 'centre-fire' cartridges containing a priming cap in the centre of the base of the cartridge. .22 in. rim-fire R.s. are most effective on small vermin and rabbits up to 100 yds., and make excellent practice target weapons; ammunition is relatively cheap and plentiful.

R. sights fall into three basic categories: (a) Open 'iron' sights; (b) aperture sights; (c) telescopic sights. Both 'iron' and aperture sights have a common type of foresight which consists of a projecting blade fixed to a ramp bed located on the end of the barrel. The open 'iron' backsight consists of a raised piece of metal with a 'U' or a 'V' notch cut in the centre of it. Aim is then taken by getting the tip of the blade or the bed of the foresight in line with and in the centre of the shoulders of the 'U' or the 'V' of the backsight; the height of the backsight can usually be elevated or depressed for varying ranges. In the aperture rearsight, instead of a 'U' or a 'V' notch, there is merely a ring in the centre of which the tip of the blade of the foresight must be located for an accurate aim. In the telescopic sight a graticule in the form of a cross is incorporated. When taking aim the intersection of the cross wires of the graticule are superimposed on the target.

Shotguns have changed little in the last fifty years; they can be divided into four main categories: (a) Those with double barrels arranged side by side or superimposed, known as 'over and under'; (b) single barrel guns without magazines; (c) single barrel guns with three- or five-shot magazines semi-automatic; (d) as (c) above, but the loading and ejection of cartridges is achieved manually by means of a pump action. The double barrel (side by side) is the most common Eng. shotgun, and is manufactured in 12, 16, 20, 28, and .410 in. bores, the 12 bore being

most often encountered in the United Kingdom. There is a variety of well-known action systems, such as Purdey, Holland & Holland, and Anson & Deeley. The modern trend is for 'hammerless' guns, i.e. guns in which the action is totally enclosed within the body.

See G. Burrard, *Notes on Sporting Rifles*, 1920, and *The Modern Shotgun*, 1932; E. Keith, *Big Game Rifles and Cartridges*, 1943; T. Whelen, *Small Arms, Ballistics and Design*, 1945; and C. S. Landis, *Twenty-two Calibre Varmint Rifles*, 1947.

Rifle-bird, or Rifleman-bird, bird of paradise known as *Ptiloris paradisica*. It occurs in Australia and New Guinea, and is purplish-black in colour with patches of green bronze. The Eng. name is said to have been given by settlers in Australia from the resemblance of the colour of the plumage to that of the uniform of the Rifle Brigade.

Rifle Brigade, one of the most famous infantry regiments of the Brit. Army, raised in 1800 as the Rifle Corps, or Corps of Riflemen, and drawn from various line regiments. The riflemen were used, like the Fr. *tirailleurs*, to cover the front of the ordinary infantry by scouting and skirmishing. Hence their green uniform, for camouflage, and the bugle used to give commands, which forms a part of the badge of all rifle regiments. Three other battalions were added in 1805, 1855, and 1857, and until after the First World War the R. B. shared with the Royal Fusiliers, Middlesex Regiment, K.R.R.C., and Shropshire Light Infantry the distinction of being the only line regiments with four battalions, or more than two. With so many battalions the R. B.'s battle honours are necessarily numerous, including the battles of the Peninsular war, S. Africa (1846-47; 1851-53), the Crimean war, the Burmese war, 1835-37; Khar-toum, and the S. African war. In the First World War the R. B. was augmented by numerous regular special reserve, service, and territorial battalions, including the Tower Hamlets Militia. Various battalions of the R. B. figured in practically every important battle of the First World War, from Mons in 1914 to Valenciennes in 1918. They were especially conspicuous in the fighting of 1914, at Mons and Le Cateau; in 1915 at St. Eloi; in 1916 at Beaumont-Hamel and at Guillemont; in 1917 at Ypres; and in 1918 at Villers-Bretonneux and Cambrai. In 1939-40 the R. B. fought in France, and was conspicuous at the defence of Calais. Converted to lorried infantry after Dunkirk it fought in armoured divs. in the N. African and It. campaigns, and was among the units which landed in Normandy in June 1944, serving in N.W. Europe until the Ger. collapse.

Rift Valley, geological structure formed by the sinking of a strip of land between two unmoving parallel faults. The E. African lakes and the Dead Sea occupy R. V.s., and the Rhine valley is another example, lying between the Vosges Mts. to the W. and the Black Forest granites to the E.

Riga, cap. of the Latvian S.S.R. and

a seaport, lies 8 m. above the mouth of the Dvina, before it enters the gulf of Riga, and 366 m. by railway S.W. of Leningrad. Formerly the centre of the export trade of N.W. Russia, it suffered severely during Russia's economic collapse, but gradually recovered. There are manufs. of textiles, chemicals, rolling stock, building materials, etc. It still preserves some of its anct. buildings of the period when it was a great Hanseatic League tn., and also of the period when it belonged to the Teutonic knights. The castle of Walther von Plittenburg, master of the knights (1500), was the seat of the government before the Second World War. The present cathedral, built in the sixteenth century, replaces the old church, St. Mary's, built 1215, the organ in which is one of the largest in the world. It has a univ., estab. 1919. R. became Russian in 1710, having been long an object of strife between Russia, Poland, and Sweden. It was the scene of much fighting during the First World War, being captured by the Gers. in 1917. Bolsheviks took the city in 1919, but were expelled the same year. It became the cap. of Latvia on the formation of the republic in 1918. In the Second World War the Russians took Latvia in June 1940 and incorporated the country into the U.S.S.R. The next year the Gers. seized the greater part of Latvia and R. became a powerful Ger. stronghold and naval base, but in Oct. 1944 it was recaptured by the Soviet generals Maslennikov and Eremonko (see EASTERN FRONT IN THE SECOND WORLD WAR). Pop. 378,000. See Z. Ligers, *Histoire des villes de Lettonie et d'Estonie*, 1946.

Rigadoon (Fr. *rigaudon*). Fr. dance probably originating in the S. (Provence or Languedoc), dating back to the seventeenth century at the latest. It is in lively common or 2-4 time, and consists of three or four parts, each repeated, the third being the shortest.

Riga, Gulf of, gulf of the S. coast of the Baltic Sea, S. of the gulf of Finland. It is 100 m. long and 60 m. broad at its widest. The greatest depth is 22 fathoms, and it is frozen for about 120 days in the year. The R. Dvina flows into it past the seaport tn. of Riga (q.v.).

Rigaud, Hyacinthe (1659-1743), Fr. portrait painter, b. at Perpignan, entered the Ecole des Beaux Arts in Paris in 1681. At Le Brun's suggestion he studied in Rome, and formed his style on that of Van Dyck. A diligent worker and a careful artist, he counted Louis XIV., Le Brun, Boileau, Bossuet, and Charles XII. of Sweden among his sitters. 'Marie Serre' (his mother) is perhaps his masterpiece. See life by J. Roman, 1919.

Rigel, or β Orionis, seventh brightest star, its magnitude being 0.3. Its spectrum shows it to be of the helium type and a short-period binary of twenty-two days. Its distance is about 600 light-years and its luminosity is 17,000 times that of the sun. Its spectrum shows that it belongs to the B3 class, in which hydrogen lines are prominent, but the helium lines, observed in great intensity in class B2, have barely

faded out. Stars of this type have temps. of about 20,000° C. R. has a companion distant 9.6" of mag. 8, which is itself a double star.

Rigging, see under SAILS AND RIGGING; YACHTS.

Righi, see RIGI.

Right Ascension (in astronomy), see ASCENSION, RIGHT.

Right of Way, right which a person or body of persons has of passing over another's lands. It is in the nature of a privilege or convenience and not a profit (see also EASEMENTS; INCORPoreal CHATTEL; HEREDITAMENTS; LAND LAWS; PRESCRIPTION). A R. of W. by necessity arises where A grants (see GRANT) a piece of land to B surrounded by other land of A's; for if a R. of W. were not implied B could never get to the land bought from A. Public lts. of W. usually arise either by express grant or by prescription. See also FOOTPATHS, AND PRESERVATION OF.

Right, Petition of, see PETITION OF RIGHT. **Rights, Declaration and Bill of**, see BILL OF RIGHTS.

Right-whale (*Balæna*), genus of whales, characterised by the large head and mouth, long plates of whalebone being attached to the palate, and by the absence of the dorsal fin. The Greenland or R. (*B. mysticetus*) is the best-known Cetacean, and was long supposed to be of world-wide distribution. Other species have, however, been identified, including the S. or Cape whale (*B. australis*).

Rigi, or **Righi**, mt. of Switzerland, rising between the lakes of Lucerne and Zug. Altitude 5906 ft. Its popularity with tourists is due to the fine view it commands. The summit may be reached by a railway from Vitznau, on the S., or by one from Arth, on the E.

Rigidity, see under ELASTICITY and STRENGTH OF MATERIALS.

Rigor, sensation of chill accompanied by shivering, which is characteristic of the initial stage of many feverish conditions. Notwithstanding the feeling of intense cold, the actual body temp. is higher than normal, and the sensation is due to a disturbance of the cutaneous heat-regulating mechanism, the surface capillaries being for the time constricted. This is generally accompanied by internal congestion, and the cold sensation is followed by a feeling of heat as the blood temp. gradually rises. In most forms of malaria there is a regular succession of cold and hot fits with little difference in body temp.

Rigor Mortis, see under DEATH.

Rig Veda, see under VEDA and VEDISM.

Rijeka, see FIUME.

Rijssel, see LILLE.

Rijssen, see RYSSSEN.

Rijswijk, see RYSWICK.

Rikwa, **Rukwa**, **Likwa**, **Hikwa**, or **Leopold Lake**, in Tanganyika Terr. E. Africa, situated between Lakes Tanganyika and N'gasa. It was discovered by Joseph Thomson in 1885, and is salty and ammoniacal.

Riley, **Charles Valentine** (1843-95), Amer. entomologist, b. in London and

educated at Dieppe and Bonn. He went to the U.S.A. in 1860. He became state entomologist in Missouri, and his activities during the locust plague of 1870, when he correctly forecast the date on which the plague would end, brought him into prominence. He went before Congress and secured an appropriation for a commission of entomology to deal with future problems of this nature. R. also investigated the problem of the phylloxera insect which was causing great destruction to Fr. grapes. In 1878 he became entomologist to the newly formed Dept. of Agriculture at Washington. He dealt successfully with the citrus scale which had attacked the Californian orange-groves; but a change of president found him out of favour with the administration, and R. resigned, continuing his research work privately. R.'s fine scholarship was combined with a spirit of enterprise and an infectious enthusiasm: his efforts ensured federal and state recognition of the value of the entomologist in preventing famine and hunger and increasing agricultural production.

Riley, James Whitecomb (1853-1916), Amer. dialect-poet, b. at Greenfield, Indiana, son of Reuben A. Riley, a lawyer. Disliking law, he became an itinerant sign-painter, actor, and mimic entertainer. He worked on the Indianapolis *Journal* from 1873; writing verses for it, chiefly in Hoosier dialect. *The Old Swimmer's Hole* and *Leven More Poems*, 'by Benj. F. Johnson, of Boone,' 1883, was his first book. Perhaps the most widely popular of his poems (which are nearly all short) is *Little Orphant Annie* (1885).

Rilke, Rainer Maria (1875-1926), Austrian poet, b. in Prague of Bohemian and Alsatian stock. He was educated at the military academies of St. Polten and Weiskirchen, but then decided to adopt a literary career. He studied literature and the hist. of art in Munich and Berlin, and visited Russia. In 1901 he married Clara Westhoff, the sculptress. R. travelled a great deal in Europe, living for some time in Paris, where he was Rodin's secretary. He spent the last seven years of his life in Switzerland. R.'s position in literature is somewhat isolated; his closest affinities probably lay with the Dan. mystic-romantics and the Fr. symbolists, and it was in France that he gained the greatest bearing and spent his happiest years.

His first collection of poems, *Leben und Lieder* (1894), are generally conventional and show few signs of his latent genius. They show the influence of Heine and not that of the then fashionable Impressionist poets. In *Advent* (1898) and *Mir sur Feter* (1899) he moved further towards a depersonalised idiom in an attempt to arrive at a standpoint of complete objectivity and realism. When he fully achieved this, as in many of the *Drüeser Elegien* (1923) and the *Sonnets an Orpheus* (1923), the intense, all-pervasive spirituality of his poetry has few rivals. Such a poetic ideal, however, leaves no room for mediocrity, and when R. fails to achieve it completely his work is jarring and the

style artificial. His apparent ability to detach himself from the universe in order to see, as a spectator, the greatness of God and puniness of Man, and from these to understand and convey eternal, fundamental truths, is unique. He tried to sublimate everything in his poetry to the central theme of man's struggle for spiritual vision and clarity. His own religious crises and triumphs became symbolic of the struggle, death, and regeneration of mankind. Besides the works mentioned above other notable pubs. of R. include *Buch der Bilder* (1903) and *Die Aufzeichnungen der Malte Laurids Brigge* (1909).

His collected works were pub. in 1879 and *Letters* (ed. and trans. by R. F. C. Hull) in 1948. See lives and studies by A. Schäffer, 1921; R. Faesi (2nd ed.), 1922; E. Jaloux, 1927; E. M. Butler, 1943; and Nora Wydenbruck, 1949; also Princess Thurn und Taxis, *Erinnerung an Rilke*, 1933; M. Betz, *Rilke räumt*, 1937; E. Jaloux, P. Valéry, and others, *Rilke et la France*, 1942; R. Guardini, *Zu Rilkes Deutung des Daseins*, 1946; and J. Gebser, *Rilke und Spanien* (2nd ed.), 1946.

Rimbaud, Jean Arthur (1854-91), Fr. poet, b. at Charleville in the Ardennes. As a boy he displayed extraordinary talent, and, having run away from home three times, his poem *Le Bateau ivre* won him the friendship of the poet Verlaine. Subsequently he lived an adventurous life as tramp, soldier, and merchant by turns. While he was living in Abyssinia, his friend Verlaine, believing him to be dead, pub. his poems under the title of *Les Illuminations* (1886). These took Paris by storm and originated the 'decadent' movement, and from R. stem also the *Symbolists* and the *surrealists*. A further vol. of his poems, *Reliquaire*, was pub. in 1891. His complete works were pub. by the *Mercur de France* (2nd ed.), 1898. See lives and studies by P. Berriochon, 1912; H. Jacob, 1921; J. M. Carré, 1924; R. de Rénéville, 1929; E. Y. Gaucellette, 1936; J. Rivière (2nd ed.), 1938; Enid Starkie, 1938, 1947; W. Fowhe, 1946; also P. Verlaine, *Les Poètes maudits*, 1884; M. Raymond, *De Baudelaire au surréalisme*, 1933; Enid Starkie, *Rimbaud in Abyssinia*, 1937; Marguerite Y. Méléra, *Résonances autour de Rimbaud*, 1946.

Rime, deposits of white ice crystals, similar to hoar frost, on the windward side of objects, by a wet (super-cooled) fog at temps. below freezing. This is soft R.; hard R. is when the ice is formed so quickly that solid clear ice is formed to windward; it may extend for sev. inches. Hard R. is distinguished from glazed frost in that it is formed in fog or drizzle with wind, whereas glazed frost occurs on all surfaces, and accumulates round twigs or telegraph wires when super-cooled rain falls.

Rime, see RHYME.

Rime Giant, see YMIR.

Riming Poem, see RHYME SONG.

Rimini, Francesca da, see FRANCESCA DA RIMINI.

Rimjin (Lat. *Ariminum*), seaport of Italy in the prov. of Forlì, Emilia, on the

Marecchia, 2 m. from its mouth in the Adriatic. The most interesting of its buildings are the anct. castle of Sigismondo Malatesta (1448), now used as a prison; the fifteenth-century cathedral, or Tempio Malatestiano, one of the most important monuments of the Renaissance in all Italy; originally a Franciscan church of the thirteenth century, it was remodelled in 1450 by Sigismondo Malatesta and Leon Battista Alberti was the architect of the exterior, the church of St. Giuliano, and the bridge and arch of Augustus. Among the modern buildings

also escaped. The Castello Sigismondo sustained damage but remained structurally sound. Pop. 74,600.

Rimmon, or Hadad, Assyrian thunder god, mentioned in 2 Kings xviii., where Naaman, after his healing by Elisha, seeks pardon from the latter if in the course of his duties as a 'captain of the host of the King of Syria' he worships in the temple of R. at Damascus.

Rimouski, tn of Quebec, Canada, 180 m. E of Quebec. There are saw-mills, peat mines, and a cod-liver oil refinery; the tn has an agric. college. Pop 7000.

Rimini and the Marecchia Canal

E.N.A.

are an archaeological museum and a municipal picture gallery. Here the Flaminian Way ends. The tn has fisheries, mineral springs and baths, silk mills, brick-works, sulphur furnaces, iron works, and foundries, and the sea bathing attracts many visitors in the summer. It was the site of the Council of Arians and Athanasians (359). It was held in turn by Byzantines, Goths, Longobards, and Franks. The notorious Malatesta reigned at R. for three centuries from 1203. It was then sold to the Venetians (1503) and was under papal authority from 1528 to 1860. In the Second World War it formed the E. or Adriatic end of the Gers's Gothic line, but fell to the Brit. Eighth Army on Sept. 22, 1944. It was a key-point in the Ger line of defence and, consequently, the damage sustained by its monumental buildings was very severe. The cathedral was amongst the seriously damaged buildings, but Agostino de Ducci's reliefs of the Arts and Sciences suffered no damage. The tomb of Sigismondo, which was elaborately protected,

Rimsky-Korsakov, Nicholas Andreievich (1844-1908), Russian composer, b at Tikhon, near Novgorod. His youthful promise in music led to nothing until he joined the nationalist school with Balakirev, Cui, Mussorgski, and Borodin. His first symphony (1865, St Petersburg) was a landmark in the list of Russian music. Retiring from the navy, R. now gave his whole efforts to music, becoming a prof. at St. Petersburg Conservatoire (1871), director of the Irc School of arts (1874-81), and conductor of the Russian symphony concerts (1886-1900). His first opera, *The Maid of Pskov*, appeared in 1872; then came a period of study, followed by another opera *The Night in May* (1878). Other operas filled with his racy music, colour, and imagination are *The Snow Maiden* (1881); *Mlada* (1893); *Christmas Eve* (1894); *Silko* (1896); *The War's Bride* (1898); *Servilia* (1901); *The Golden Cockerel* (1907). He left also three symphonies, a piano concerto, and a considerable quantity of minor orchestral and instrumental music,

some songs, and some church music. See his *My Musical Life* (1923); *Principles of Orchestration, Practical Manual of Harmony* (1930); also life by M. Montagu-Nathan, 1916.

Press Portrait Bureau
RIMSKY-KORSAKOV

Rinderpest, or Cattle Plague, contagious and eruptive fever, affecting bovines, rarely sheep, camels, and certain wild ruminants, with a fatal termination in from six to ten days. Its occurrence in Britain is notifiable, but no outbreak has been reported since 1877. On the other hand, it is still prevalent in Brit. E. African dependencies and other parts of the continent. Formerly the disease used periodically to sweep over the African plains with the rapidity and ferocity of a wild fire, decimating the cattle pops. But veterinary science has gradually got this and most animal diseases under control, and in recent years grants have been made under the Colonial Development Act for the purpose of combating occasional outbreaks.

Ring (O.E. *hring*), circular ornament for the finger, ear, nose, or lip. Rs. of gold, silver, or some other precious metal are still worn in the nose and lip by savage peoples, while earrings have remained fashionable among European women. Rs. for the finger with signets engraved on the 'bezel' were used in primitive times as a seal or signature in place of writing. Anc. Egyptian Rs. have been discovered made of gold, silver, bronze, glass, or carnelian, with an oblong bezel. The Gks. wore Rs. of great beauty, but the early Romans imitated the Spartans in wearing simple iron Rs., the privilege of a free citizen. Later ambass., senators, and high officials came to wear massive gold Rs., a custom which became generalised in the later empire. The R. formed an essential feature in the investi-

ture of eccles. dignitaries during the Middle Ages, and in England still has a part in the coronation serv.ce. All prelates of the Rom. Catholic Church and bishops of the Church of England wear the R. The pope's official R. of investiture is the 'Fisherman's Ring,' bearing a device of St. Peter in a boat. It is broken at the death of a pope. Nuns wear a R., usually of silver, to show that they are wedded to the church. The origin of the wedding R. is anct., and is popularly supposed to have once signified the bondage of women. The betrothal R. was given in Rom. times as a pledge, and in all probability the bestowal of the wedding R. grew out of this custom and later received the sanction of the church. 'Posy' and memorial Rs. with engraved mottoes have now gone out of fashion, as also have thumb Rs. There is a splendid collection of Rs. in the Brit. Museum, augmented in 1897 by a bequest of Sir A. W. Franks, and another formed by Edmund Waterton in the S. Kensington Museum. For the former see *Catalogue* by Marshall (1907). See also C. W. King, *Antique Gems and Rings*, 1872; W. Jones, *Finger-ring Lore*, 1877; and C. F. King, *Rings for the Finger*, 1917.

Ringbones, bony enlargements on the large and small pastern bones of the horse, sometimes due to an injury and sometimes to rheumatic tendencies. Treatment is not often satisfactory. Rest is needful and a bandage of hay placed round the leg and kept soaked with cold water helps to reduce the inflammation. The application of a suitable shoe relieves the lameness.

Ring-dove, see CUNHAT.

Ringelike, see under VIKING ART.

Ringing the Changes. Larceny by the trick, when giving or receiving change, of pretending that the amount put down was greater than actually was the case, or that sufficient change has not been given.

Ring Money, generic description loosely and almost certainly inaccurately applied to those objects of gold (less often of silver or bronze) which, fashioned in the shape of rings or hoops, could be used for personal adornment in the form of torques for the neck and of armlets, bracelets, and earrings. In addition to their use as ornaments these objects undoubtedly possessed a currency value, especially when they were made of gold or silver. They are characteristic of many early civilisations, including those of the Near E.; in Europe they have been found in France and (in considerable numbers) in the Brit. Isles, and especially Ireland, being attributed to the Early Bronze Age culture of W. Europe.

Ring Ousel, mt. song-bird, *Turdus torquatus*, with brownish-black plumage, and a broad white patch on the throat. It nests in heather or on banks in moorland dists. The R. O. belongs to the thrush family and is a summer visitor to the Brit. Isles and Europe generally.

Rings, Fairy, see FAIRY RINGS.

Ring-tailed Eagle, golden eagle in its early plumage (from one to two years of age).

Ringwood, mrkt. tn. of Hampshire, England, on the R. Avon, 12 m. N.N.E. of Bournemouth, and on the W. edge of the New Forest. It is noted for its fishing. Pop. of par. between 6000 and 7000.

Ringworm, or *Tinea trichophytina*, disease of the skin due to a vegetable parasite, *Trichophyton tonsurans*. On the body (*Tinea circinata* or *marginata*) the disease is characterised by the formation of circular red patches; these lead to itching and the desquamation of epithelium in branny particles. The patch heals in the centre first, so that the appearance of a red ring is usually presented. Mercury ointment is usually effective in bringing about a cure. R. of the scalp (*T. tonsurans*) is a more obstinate condition. Round, greyish, slightly elevated patches are presented in which the hair is broken off near the skin. The spores of the parasite are found in the substance of the hair roots, and are not easily reached by any parasiticide. The usual mercurial ointment or tincture of iodine treatment may meet with success, but a previous application of X-rays in order to remove dead hairs, etc., is recommended. R. is most common among children, and a contagion is probably through spreading of the spores, an affected individual should be removed from school, etc., and all brushes and other articles suspected of contamination should be thoroughly cleansed. R. of the beard (*T. sycosis*) forms round scaly patches, which tend to become nodular and lumpy through inflammation of the underlying tissues. The treatment is the same as in R. of the scalp. Cats, dogs, and other animals are subject to R., which can be communicated by them to human beings.

Rintelen, Franz von Kleist (1883-1949), Ger. saboteur. He entered the Ger. Navy, and had a post on the naval war staff at Berlin in 1914. In 1915 he was sent to the U.S.A. as a spy. His organisation in New York smuggled bombs, which were detonated by the action of acid, on board munition ships, a scheme which caused many losses at sea. When returning to Germany he was taken from the Holland-America liner by the Brit. Naval Intelligence, and later extradited to America and sentenced to four years imprisonment for sabotage. In 1933 he related his adventures in *The Dark Invader*, which became a best-seller. R. lectured in the U.S.A. and in England, and finally settled in London. From 1939 to 1945 he was interned on the Isle of Man.

Riobamba, see CAJABABA.

Rio Branco, state of Brazil created in 1943. In the N. Boa Vista, the cap., previously belonged to Amazonas state. Area 82,749 sq. m. Pop. 14,000.

Rio Colorado, riv. of Argentina, forms the N. limit of Patagonia, and flows from the Andes E.S.E. into the Atlantic S. of the Bahía Blanca.

Rio Cuarto, garrison tn. of Cordova prov., Argentina, on the San Martín and Mitre railways, 360 m. N.W. of Buenos Aires

and 140 m. S. of Cordova. Its chief activity is agriculture. Pop. 50,000.

Rio de Janeiro: 1. Cap. of Brazil and one of the prin. seaports of S. America, is situated on the W. side of one of the finest natural harbours in the world, which measures 15 m. by from 2 to 7 m. It occupies a narrow strip of alluvial land between the mts. and the sea, being remarkable for the beauty of its position. The conical Sugar Loaf Mt., 1230 ft. high, ascended by an aerial cableway, stands at the harbour entrance, and Corcovado, 2300 ft., rises from among the buildings of the city. It is separated from the prov. of Rio de Janeiro, and constitutes an independent municipality, with an area of 521 sq. m., divided into nineteen pars. This is called the Federal Dist., and is governed by a prefect. Parts of the city have been remodelled, the E. end reconstructed, and Morro do Castella levelled, the soil being used to reclaim Sacco da Gloria. A number of skyscrapers on the Amer. model have been erected, with unfortunate effects on the beauty of the tn. The setting of the tn. between mt. and sea forms, however, an extremely attractive sight. A beautiful promenade of marble, 5 m. long, lines the waterside. The old streets are narrow, the chief of these being the Rua Direita or Rua Principe de Marco, and the Rua Ourvidor. The Avenida Rio Branco is spacious and lined with beautiful buildings, including the gov. buildings, the library, art school, supreme court and municipal theatre. Rio is the seat of an archbishop who is generally a cardinal. The churches and monastic buildings, which number over fifty, are extremely ornate, and mostly built in the Jesuit style; the La Candelaria (built seventeenth century) and La Gloria are the two most conspicuously situated. The public buildings include the monastery of São Bento, the hospital of Dom Pedro II. (built 1841), a lunatic asylum (founded 1841), and a military hospital. Among the literary and scientific institutions are the College Dom Pedro II.; National Museum; Institute of Hist., Geography, and Ethnology; Military and Naval School; Lyceum of Arts; an Astronomical and Meteorological Observatory, and National Library. There are also botanic and zoological gardens. The univ. (the only official univ. in Brazil) was founded in 1920. In it are incorporated the School of Fine Arts and the National Institute of Music. There are sev. engineering and mining polytechnics in the univ. The Oswaldo Cruz Institute is devoted to experimental medicines. R. is one of the healthiest cities of the tropics, though in the sultry summer season about Christmas the gov. depts. are moved to Petropolis in the neighbouring hills. It is well served by rail, by steamship lines, by air services, and, locally, by trams and buses. The water supply, which is very abundant, is carried along elaborate aqueducts over a distance of 12 m. The bay, at the entrance (about 1 m. wide) of which are the Fort St. Juan and Fort Santa Cruz, provides a safe anchorage of 50 sq. m. Industries

include brewing, sugar refining, and flour milling, and there is an extensive trade in coffee, sugar, hides, diamonds, tobacco, timber, etc. Rio is the seat of the principal arsenal of the republic. It was discovered on Jan 1, 1502, by Gonçalo Coelho, the Portuguese navigator. Some 18 colonists were the first settlers in the neighbourhood (1555). The Portuguese took possession of it in 1567, and in 1808 the Portuguese royal family resided there. Pop. 2,052,700. 2 Coastal prov., the cap. of which is Niteroy (pop. 125,000), has an area of 26,827 m. and is mountainous in the centre. It is the chief

Amer states. Each party undertakes to assist in meeting the attack. On the request of the state or states attacked and pending the decision of the 'Organ of Consultation,' each party may determine the measures which it should itself adopt to fulfil this obligation. This article applies when the attack takes place within the territory of an Amer state or within a region bounded in the way specified. These boundaries completely enclose the Amer continent, including Canada, Greenland and Antarctica. Canada is not a member of the Pan Amer Union, a signatory of the Act of Chapultepec, or a

RIO DE JANEIRO

E.N.A.

prov. of Brazil and its forests are rich in timber. Its soil, which is rich and fertile, is very extensively cultivated, the chief crop being coffee. It has a naval school and an arsenal. There is a naval dock yard at the Ilha das Cobras. Area 16,400. Pop. 2,150,000.

Rio de Janeiro, Treaty of (1947), for the mutual defence of the Americas, signed on Sept. 2 at Rio de Janeiro. It opens with a condemnation of war by the high contracting parties and a pledge not to resort to force in any manner inconsistent with the charter of the United Nations or the treaty itself. The parties undertake to endeavour to settle such controversies as may arise between them before referring them to the General Assembly or the Security Council of the United Nations. The vital Article 3 registers agreement that an armed attack by any state against an Amer state shall be considered an attack against all the

signatory of this treaty. Greenland is Danish and in 1949 the U.S.A. had not negotiated with Denmark an agreement concerning its defence. If the integrity, sovereignty or independence of any Amer state should be affected by aggression not amounting to armed attack or by any situation that might endanger the peace of America the Organ of Consultation shall meet at once to agree on the measures to be taken. This body is formed by the ministers of foreign affairs of the republics which have ratified the treaty, but the governing board of the Pan Amer Union may act provisionally pending the meeting of the Organ of Consultation. The treaty remains in force indefinitely, but may be denounced by any contracting party by notification to the Pan Amer Union and ceases to be in force in respect of that state two years after the notification has been received.

Rio de la Plata, see PLATA

Rio de Oro and **Adrar**, N. African colonial possessions of Spain, stretch S. along the coast from S.W. Morocco to Cape Blanco. They are under the governorship of the Canary Is. Dates and fish are exported. The cap., *Villa Cisneros*, is an air station. Area 105,000 sq. m. Pop. 32,000 (whites 850), exclusive of some 31,000 nomads who enter the area after the rainy season.

Rio Grande: 1. Riv. rising in the Rocky Mts., Colorado, and flowing through New Mexico and Texas to the gulf of Mexico. There is an irrigation dam at Engle, New Mexico, for Mexican use. El Paso, Texas, is the prin. tn. on the riv. Length 1800 m. 2. See *ARAGUAYA*.

Rio Grande, seaport of Brazil in Rio Grande do Sul on the strait leading to the *Lagoa dos Patos*, 730 sea m. from Rio de Janeiro, and less than half that distance from Montevideo. It has a large harbour and is Brazil's most southerly port for ocean-going shipping. It is the distributing centre for the S. part of its state and exports dried meat, hides, and tobacco. There are cotton, woollen, and jute factories, an oil refinery, and fisheries. Pop. 60,000.

Rio Grande do Norte: 1. Riv. of Brazil, rising in the S. of Minas Gerais, and flowing westwards into the Atlantic at R. G. do N., or Natal. Length 450 m. 2. Atlantic state of Brazil in the N.E. Coclinoal, sugar, cinchona, coffee, cotton, tobacco, timber, and rubber are produced, and horses and cattle are reared. The cap. is Natal. Area 20,482 sq. m. Pop. 893,700.

Rio Grande do Sul, S.E. Atlantic state of Brazil, bounded on the W. by Argentina, and S. by Uruguay. It contains two large lakes, *Lagoa dos Patos* and *Lagoa Mirim*. The surface is grassy steppe in character, supporting vast herds of cattle; dried beef and hides are exported. Coal of inferior quality is mined, also wolfram, and copper, gold, agates, and amethysts are found. Agric. products include coffee, tobacco, rice, cereals, and sugar. Soap and textiles are made. The cap. is *Pôrto Alegre*. Area 109,067 sq. m. Pop. 3,863,800.

Rio Hacha, tn. of Colombia, in the prov. of Magdalena, standing near the base of the *Goajira Peninsula*, 100 m. E. of Santa Marta, both being on the Caribbean sea coast. The roadstead is open and shallow. There are pearl fisheries, and dealing in vegetable ivory, manure fibre, and rubber. Pop. 10,000.

Rioja, delicate red wine of good flavour, produced in N. Spain.

Rioja, or *La Rioja*: 1. Andine prov. of Argentina, situated between Cordova, San Juan, and Catamarca. In the N.W. is the *Sierra Famatina* (20,000 ft.). Gold, copper, silver, and iron are found, and the soil is fertile in vines, maize, cotton, etc. Area 33,394 sq. m. Pop. 109,400. 2. Cap. of above prov., at the side of the *Sierra Velasco* at an altitude of 1670 ft. Pop. 15,000.

Riom, tn. of France, in the dept. of *Puy-de-Dôme*, 115 m. S. of Paris, with linen and tobacco factories, and trade in

wines and corn, etc. It has many quaint buildings, including the fourteenth-century church of *S. Chapelle*, formerly a chateau owned by the dukes of Auvergne, and the fifteenth-century church of *Notre Dame de Marthuret*. At R., in Feb. 1942, the Fr. Vichy Gov. began the trial of the politicians and soldiers alleged to be responsible for the defeat of France, the trial being suspended when Laval came to power.

Rion (anc. *Phasis*), riv. of Transcaucasia, with a course of 200 m. from the S. slopes of the Caucasus to Poti on the Black Sea. Its link with the voyage of the Argonauts gave it fame in antiquity.

Rio Negro: 1. Riv. of Argentina (see *NEGRO*, Rio). 2. Riv. of S. America (see *NEGRO*, Rio). 3. Ter. of Argentina in N. Patagonia, adjoining the *Chubut Ter.* on the N., and bounded by the R. Negro on the S. It is mainly plateau and has been made fertile by irrigation. Alfalfa and cereals are grown, and cattle are reared for stock. Viedma is the cap. Area 77,610 sq. m. Pop. 139,600. 4. Dept. of Uruguay, bounded by the Negro on the S. and the Uruguay on the W. Cereals are grown and stock are raised. *Fray Bentos* is the cap. Area 3270 sq. m. Pop. 47,600.

Rio Pardo, tn. in Rio Grande do Sul, Brazil, 76 m. W. of *Porto Alegre*. Pop. about 35,000.

Rios, or *Los Rios*, inland prov. of Ecuador, W. of the Andes. Cap. *Babahoyo*. Area 2295 sq. m. Pop. 150,800.

Riot, generally defined as a tumultuous disturbance of the peace by three persons at least, assembling together of their own authority with an intent mutually to assist one another against any who shall oppose them while engaged in the execution of some enterprise of a private nature, and afterwards actually executing the same in a violent and turbulent manner to the terror of the people. It is immaterial whether the object of the rioters be lawful or unlawful, the whole gist of the misdemeanour being the unlawful manner of proceeding, namely with circumstances of force and violence. By the *Riot Act*, 1714, a justice of the peace, sheriff, or mayor may, where the rioters number twelve or more, require them by proclamation (called reading the *Riot Act*) to disperse; if the rioters continue together after the lapse of one hour from the reading of the Act, they are guilty of felony and liable to penal servitude to the extent of life. Similarly, it is a felony to oppose the reading of the Act. Prosecutions under the Act must be begun within twelve months after the felony. Under the *Riot Damages Act* (1886) the local police authorities can be sued for damage done during a riot.

Rio Tinto (*Minas de Rio Tinto*), tn. in the prov. of Huelva, Spain. It is one of the greatest copper-mining centres in the world, with an ann. yield of over 1,000,000 tons of iron pyrites. Pop. 12,000.

Riouw-Lingga, or *Riau-Lingga*, archipelago composed of two groups of is. of Indonesia, lying S. of the Malay Peninsula, from which they are divided by the

straits of Singapore. It formed, before 1950, with Karimon, Anambas, Natuna Is., Tambelan, and the ter. of Indragiri in Sumatra, the residency of Rlouw and dependencies. The seat of government is Tanjong Pinang, on the is. of Rlouw or Bintang. Pepper, gambler, and rubber are cultivated, and tin and bauxite mined. Area 12,506 sq. m. Pop. 298,200.

Riparian Rights, see **RIVERS**, *Law Relating to Rivers*; *Riparian Rights*.

Ripley: 1. Mkrt. tn. and urb. dist. of Derbyshire, England, 10 m. N.N.E. of Derby. The tn. has coal-mines, iron-foundries, textile manufs., boiler works, etc. Pop. 18,000. 2. Vil. of Surrey, on the R. Wey, 5 m. from Woking. It was important in coaching times. Pop. 3000. 3. Vil. of Yorkshire on the Nidd, 3 m. from Harrogate. R. Castle dates from the sixteenth century, but has been modernised. Cromwell stayed there before Marston Moor. Pop. 200.

Ripon, **Frederick John Robinson**, Viscount **Goderich**, afterwards first Earl of (1782-1859), politician, b. in London. He entered the House of Commons in 1806, was chancellor of the exchequer from 1823 until 1827, in which year he became secretary for war and leader of the House of Lords. On Canning's death (1827) he was Prime Minister, but resigned in the following year. In 1830 he was again secretary for war. In 1833 he was created earl of Ripon, and held the offices of president of the Board of Trade (1841) and of the Board of Control for Indian Affairs (1843-46). He was an inept politician and a weak Prime Minister, but had some financial ability.

Ripon, **George Frederick Samuel Robinson**, first Marquis of (1827-1909), Eng. statesman, b. in London. He entered Parliament in 1853, and during the Palmerston administration became under-secretary for war (1859), under-secretary for India (1861), secretary for war (1863), and secretary for India (1866). Under Gladstone he was appointed president of the council (1868). He was chairman of the High Joint Commission on the *Alabama* claims (1871), for which he received his marquessate. Gladstone appointed him viceroy of India in 1880, and though his administration was fiercely criticised in England, he was very popular with the native pop. Later he was First Lord of the Admiralty.

Ripon, city and municipal bor. on the Ure in the W. Riding of Yorkshire, England, 24 m. N. of Leeds. The present cathedral dates from 1154 to 1520, and was restored by Scott in the nineteenth century. This building replaced an earlier structure, of which the seventh-century crypt remains. Other buildings of interest in R. include the Norman chapel of St. Mary Magdalen, the old almshouses, and the eighteenth-century tn. hall. Studley Royal and Fountains Abbey (q.v.) are near by. The bishop's palace is outside the tn. R. was once famous for its cloth and its spurs. Paint and varnish is now the chief local manuf. and there is trade in agric. produce. The city grew up round the abbey, which was founded

by missionaries in the seventh century. The first abbot was St. Wilfrid, to whom the cathedral is dedicated. The tn. became famous for its markets and fairs, which belonged to the archbishop of York and the eccles. commissioners until 1800. The wakenman remained the leading official until the seventeenth century. An old custom which still persists is the blowing of a horn in the market square every evening at nine o'clock. In 1640 Charles I. made the treaty of R. here with the Scots. The collegiate church became a cathedral in 1836. Pop. 9300.

Ripon Falls, on the Victoria Nile, in Uganda, where the riv. emerges from Lake Victoria. They were discovered by Speke on July 28, 1862. They are only about 15 ft. high, but between them and the rapids known as the Owen Falls (q.v.), a distance of 3 m., the Nile Bridge (combined road and rail) crosses the riv., and from the bridge a fine view may be obtained of the broken water of the riv., and the rugged scenery of its banks. Viewed by the pedestrian from the riv. the most impressive feature of the falls is the great rush of water over their verge, and, though not remarkable for their height, it is possible from the railway bridge to see their full expanse, which is not usually obvious from the bank. The R. F. are notable for fishing; the Nile immediately below the falls at Jinja contains a very large supply of barbel (*Barbus altianalis radcliffei*).

Ripponden, tn. of the W. Riding of Yorkshire, England, 5 m. S.W. of Halifax. It manufs. cottons, woollens, silk, and paper. Pop. 4900.

Riqueti, **André Boniface**, **Honoré Gabriel**, and **Victor**, see **MIRABEAU**, **COMTE DE**.

Risca, tn. of Monmouthshire, Wales, 6 m. W.N.W. of Newport. It is engaged in coal-mining and the manuf. of chemicals and tinplate. Pop. 15,100.

Rise, see **under MINING**.

Rishis: 1. 'Seers,' name given to the sons of Brahma, poets of the Vedic hymns, representing the families of Gritsamadas, Kusikas, Vamadevyas, Atris, Bharadvajas, and Vasishthas. The title was later given, with the significance of semi-divine, to men who had given up temporal power for an ascetic life. 2. In astronomy the constellation of the Great Bear.

Rishton, tn. of Lancashire, England, 3 m. N.E. of Blackburn, engaged in coal-mining and the manuf. of paper and cotton. Pop. 6300.

Risinge, vil. in the prov. of Ostergötland, Sweden, 22 m. N. of Linköping. Pop. 8000.

Rispetto, type of old It. improvised folk-poem of six to ten (usually eight) inter-rhyming lines, sung to popular tunes.

Ristori, **Adelaide** (1822-96), It. actress, b. at Cividale del Friuli. She became attached to the company of actors organised by Mascherpa for the duchess of Parma. She travelled in France, England, Belgium, Austria, and Germany, and played many important roles, challenging Rachel's supremacy. Her

portrayal of Lady Macbeth was one of her most successful parts on the stage.

Rita, pseudonym of Mrs. Desmond Humphreys (*née* Gollan) (d. 1938), Eng. novelist, b. in Gollanfield, Inverness-shire, educated in Australia, and travelled considerably. Her works include *A Husband of no Importance* (1894); *Peg the Rake* (1894); *The Sinner* (1897); *Souls* (1903); *Queer Lady Judas* (1905); and *The House called Hurrikah* (1909).

Ritardando (It. *retarding*), musical term, indicating that the time should be slackened. It is usually abbreviated in MSS. to *rit.* The same direction is also expressed by *rallentando* (slowing down) or *ritenuto* (holding back).

Ritchie, Charles Thomson, first Baron Ritchie of Dundee (1838-1906), Eng. politician, b. at Dundee. Educated at the City of London School, he became partner in his father's office (jute spinner). R. became Conservative M.P. in 1874, representing successively Tower Hamlets, St. George's in the East, and Croydon. He is chiefly remembered for introducing the Local Government Act, 1888, and for his two Public Health Acts of 1891. He sat with the Conservatives, but his ideas were too progressive for many of his colleagues. His agitation was brought about by Joseph Chamberlain's attitude on tariff reform, the latter objecting to R.'s abolition of the corn duty.

Rite, see **RITUAL**.

Ritornello (It. 'little return'), originally a refrain and thence, in the early seventeenth century, a recurrent instrumental piece played in the course of a musical stage work; later the instrumental passages between vocal portions of an anthem or aria, from which in turn is derived the meaning of the word R. as applied to the orchestral *tutti* in concertos, especially in rondos where the same theme returns several times.

Ritschl, Albrecht (1822-89), Ger. Protestant theologian, b. at Berlin. He lectured on theology at Bonn (1852-59) and at Göttingen (1859-89). His early work showed the influence of the Tübingen school in directly reflecting the teaching of Baur, as in *Das Evangelium Marci* and *das kanonische Evangelium des Lukas* (1846). The second ed. of his *Die Entstehung der altkatholischen Kirche* (1857) showed that he had considerably modified his views. In 1861 R. came under the influence of Rudolf Lotze, and explained his system of theology in *Die Christliche Lehre von der Rechtfertigung und Versöhnung* (1870-74). See L. Stählin, *Kant, Lotze, and Ritschl* (Eng. trans., 1889); A. E. Garvie, *The Ritschlian Theology*, 1899; J. Orr, *Ritschlianism*, 1903; R. Mackintosh, *Ritschl and his School*, 1916; and studies by A. von Harnack, 1922; C. Stange, 1922; and E. Vischer, 1922.

Ritter, Karl (1779-1859), Ger. geographer, b. at Quedlinburg, was appointed prof. of geography at Berlin in 1820, and lecturer at the military school. R. was one of the first to make a wide comparative study of geographical science. His chief work is *Die Erdkunde im Verhältnis*

zur Natur und zur Geschichte des Menschen (10 vols., 1822-59). See life by W. L. Gage, 1887.

Ritual (Lat. *rituale*), generic name for all the outward ceremonies of religion as distinguished from private exercises of devotion, meditational prayer, etc. The word is, however, most frequently used in a more restricted sense for certain medieval and post-medieval books containing directions for the administration of the Sacraments and similar priestly functions. Originally all such directions were contained in Sacramentaries. In the eighth century the rites peculiar to bishops were taken out and formed the Pontifical; likewise the directions and rites for the Mass formed the Missal; much later in the sixteenth century the R. was formed of what was left. The first official Rom. R. was pub. by Pope Paul V. in 1611. The Orthodox call their R. the *Ευχολογιον*, Eucharologion. The R. (in the broad sense) of the Anglican Church is largely traditional, but the Book of Common Prayer contains some directions. See also **LITURGY**.

Ritualists, name given to those who were influenced by the Oxford Movement, which was due to the work of such leaders as Keble, Newman, Pusey, Froude, and others. A quotation from the *Contemporary Review* for Oct. 1874 may assist in forming an unbiased opinion regarding the justification for this movement. W. E. Gladstone said: 'It must be admitted that the state of things from which the thing popularly known as ritualism took historically its point of departure, was dishonouring to Christianity, disgraceful to the nation, disgraceful most of all to that much-vaunted religious sentiment of the English public which in impenetrable solemnity endured it, and resented all interference with it. . . . The actual state of things was bad beyond all parallel known to me in experience or reading.' He goes on to enlarge on the baldness of the services, the horrors of the so-called music, the coldness and indifference of the lounging or sleeping congregations, and concludes by describing the services as 'probably without parallel in the world for their debasement.' With the revival of sacramentalism there arose the desire for more ornate ceremonial, but violent opposition to the movement was met with wherever the new ritual was introduced. In 1847, when the Rev. John Mason Neale took up work as warden of some old almshouses at E. Grinstead, the bishop of Chichester inhibited him. It was known that he had placed a cross, candles, and flowers on the altar of the restored chapel of Sackville College, and the inhibition remained for fourteen years. The Public Worship Regulation Act, 1874, failed to curtail the activities of the clergy who were drawn into the movement, and sev. of them were imprisoned for refusing to obey the orders of the courts. Amongst these were Arthur Tooth, T. Pelham Dale, R. W. Emtragh, S. F. Green, and J. Bell Cox. By the 1874 Act a layman was made the official principal of a new arches court instead of the judges who had previously

been appointed by the archbishops of Canterbury and York in their prov. courts of arches. In 1875-76 this court decided against an offending clergyman, but when he appealed to the higher court it made some modifications in the decrees of the court of arches, the jurisdiction of which many clergy refused to recognise, preferring to go to prison. It is interesting to know that in 1869, before the reform in the court of arches, it was decided there, in the famous Purchas case, that the ornaments of the churches and vestments of the clergy, mentioned in the First Prayer Book of Edward VI., were allowable, but the Judicial Committee of the Privy Council on appeal reversed this decision. The decision of the latter court was then, and has been since 1869, openly disregarded by many of the clergy, and at present (1950) most bishops are extremely reluctant to take proceedings against their clergy on the grounds of ritualistic practices or even doctrinal matters, unless the latter are of very serious nature. The agitation against ritual that was once very violent has now largely subsided, and toleration has replaced suspicion and opposition.

Riu-Kiu Islands, see **RYUKYU**.

Riva, tn. and seaside resort in the Trentino, Italy, at the N. of Lago di Garda. There are some fine medieval buildings. The chief manu. is silk. Pop. 11,000.

Rivarol, Antoine (1753-1801), Fr. author and wit, the son of an innkeeper, b. at Bagnols in Languedoc, assumed the title of Comte de R. He came to Paris in 1777, and was soon celebrated for his mordant wit and biting sarcasm; on the outbreak of the revolution he emigrated. Amongst his works are *Sur l'Université de la langue française* (1784) and *Dictionnaire des grands hommes de la révolution* (1790), but his talent was exhibited to the best advantage in conversation and impromptu witticisms.

Rivaux Abbey, see **RIEVAUX**.

Rive, Auguste de la, see **LA RIVE**.

Rive-de-Gier, tn. in the dept. of Loire, France, 13 m. N.E. of St. Etienne, on the R. Gier and canal. It produces silk, glass, steel, iron, and coal. Pop. 13,900.

Rivera, Diego (b. 1886), Mexican painter, b. at Guanahuato. He studied art in Spain, France, and Mexico. His most outstanding work appears in his frescoes, where his portrayal of historical subjects shows a treatment owing much to ant. Mexican folk-art. See life by B. D. Wolfe, 1939, and *The Frescoes of Diego Rivera*, 1929.

Rivera, Miguel Primo de, see **PRIMO**.

Rivera: 1. N.E. dept. of Uruguay. There is much cattle breeding, and gold is mined. Area 3793 sq. m. Pop. 75,500. 2. Cap. of the above, 130 m. E. by N. of Salto, on the Brazilian frontier. It is the N. terminus of the Central Uruguayan Extension Railway. It produces cattle, tobacco, and fruits. Pop. 23,000.

River Engineering comprises the works necessary (1) to regulate the flow of water by aiding the discharge of flood water and maintaining the flow in dry seasons; (2) to prevent or control the natural erosion of

banks; (3) to preserve or construct navigating channels, or canalise the riv.; (4) to utilise the waters for purposes of irrigation; (5) to arrange lateral reservoirs, docks, and wharves, and, in general, prevent destructive action and render the riv. useful to man's industry, or in the physical sense to remedy the grading of an immature riv. Flood waters may be more rapidly discharged by deepening the shallow fords and cataracts, or blasting away rocky bed or cliff; by forming new cuts from curve to curve, straightening the course and increasing gradient; by regulating drainage of parts of its area, and leading the collected water into suitable portions of the riv., or by cutting extra channels. The water when scarce can be retarded in its flow by constructing weirs or regulating drainage, by embanking portions where the gradient is almost lost. In most rivs. works of both kinds are necessary and must be mutually accommodated; weirs must be capable of adjustment to different levels. In many cases old bridges with narrow arches and heavy piers have to be removed or reconstructed. Embanking is usually the first remedy, as it fixes the course of the stream; it may be of massive masonry, of logs of wood fixed horizontally one above the other, of cement blocks laid down in sacks and hardened by the water, of loose rock or piled blocks of stone. Often hurdles or fagots will serve well, or loose earth embankments, afterwards bound by suitable planting and tended from time to time. Floods, however, help to maintain the channel of a riv. by depositing silt over surrounding country rather than in the bed of the lower course where it would decrease gradient, and embanking increases the silting up of lower reaches. In the flood plains of mature rivs. embanking needs continual increase, and the natural tendency of the riv. to raise its bed is aided, with danger of bursting its banks and inundating the plain. The remedy is to supplement the banking by continuous dredging and straightening the channel, by building sufficiently high and strong embankments, and by placing them well beyond the natural banks, leaving a flood foreshore. It is also important to prevent encroachment by wharves or buildings; these should be set well back and served by docks and water channels. Where possible lateral reservoirs or lakes, or unoccupied and unproductive low land, may receive flood waters. As a last resort with very old rivs., in lands practically at sea level, pumping by windmills or any economical means is adopted.

Weirs are dams with adjustable sluice gates or sliding doors arranged across them; sometimes it is sufficient to build them solid and allow flood waters to flow over them; they may also be arranged as steel plates in grooves, so arranged as to leave the cross-section of the stream quite free in flood time, as at Richmond-Thames. A system of weirs divides a riv. into a series of almost horizontal layers, in each of which a navigable depth is maintained.

Locks are necessary concomitants of weirs in navigable rivs., to allow the raising or lowering of vessels from one reach to another. They are often arranged in a new cut, but the occurrence of an is. may afford a suitable site for lock and weir.

Tidal Portions of Rivers are best regulated by dykes built longitudinally, but jetties thrown out at intervals tend to keep a central channel, though they form difficult shoals and currents. They are not as good as cross dykes, which serve to protect the longitudinal ones from being taken in the rear, and also protect the land beyond. The longitudinal dykes are usually formed of cement or rough stones carefully adjusted and known as *training walls*. They are usually carried out with careful preservation of the funnel-shape of a good estuary and are prolonged into deep water to preserve current. They diminish the scouring action of the tide by limiting the amount of water passing up-channel, but they locate more definitely the shoals and sand-banks and carry them further out to sea, thus simplifying dredging operations. Liverpool is fortunate in having its estuary bottle-necked, a form of natural training. See also CANALS; DREDGING; DOCKS. See J. Stevenson, *Canal and River Engineering* (3rd ed.), 1886; L. F. Vernon-Harcourt, *Rivers and Canals* (2nd ed.), 1896; R. C. R. Minikin, *River and Canal Engineering*, 1920; C. McD. Hadfield, *English Rivers and Canals*, 1945.

River Fisheries, see FISHERIES.

River Hog, ungulate mammal, *Potamochoerus*, found in W. African forests, and also called the Red Bush-pig. It is red in colour, with a short, smooth coat, and is usually about 2 ft. high.

River Horse, see HIPPOPOTAMUS.

Riverina, dist. of New S. Wales, Australia, situated in the W. of the state, between the Murray and Darling. It is particularly noted for its fine and extensive sheep-grazing grounds; wheat is grown, and here the Murray red gum is found. The prin. tns. are Hay and Deniliquin.

River Police (London), see under POLICE.

Rivers, Anthony Woodville, or Wydeville, second Earl (1412-83), eldest son of the first earl. Known first as Lord Scales, and a famous joustier, he became earl when his father and brother were executed by the king-maker, 1469. Uncle to the Prince of Wales (Edward V.), he became his guardian in 1473. When Edward IV. died, R., at Northampton, met the protector Gloucester (afterwards Richard III.), who arrested him and had him executed at Pontefract on June 25. His *Dictes and Sayings of the Philosophers*, a trans. from the Fr., was the first dated book to come from Caxton's printing press (March 18, 1477).

Rivers, August Henry Lane Fox, Pitt-, see FITT-RIVERS.

Rivers, Richard Savage, fourth Earl (2nd creation) (1680-1712), second son of the third earl, nicknamed 'Tyburn Dick' for robbing his miserly father. After the death of his elder brother, c. 1680, he was called Viscount Colchester. In 1681 he was M.P. for Wigan and nine years later he fought the Jacobites in Ireland. He succeeded to the earldom in 1694, and became general of horse in 1708. When Marlborough's downfall was imminent R. changed sides. He was Constable of the Tower in 1709, and master of the ordnance in 1711. See also SAVAGE, RICHARD.

Rivers, Richard Woodville, first Earl (d. 1469), after being esquire to Henry V., was made governor of the Tower by Henry VI. in 1424, and knighted in the following year. He took part in the war in France and in the Wars of the Roses, at first on the Lancastrian side. He married Jaquette of Luxembourg, widow of the duke of Bedford, and subsequently the marriage of his daughter, Elizabeth, with Edward IV. caused him to join the Yorkists. Edward made him constable of England, Baron R. in 1448, and Earl R. in 1466. He was beheaded in 1469, after King Edward's defeat at Edgecot.

Rivers form a link in the circulation of the hydrosphere. The moisture precipitated from the atmosphere, after percolating through the ground, collects and finds its way to the surface (see SPRINGS), or, if solid, as in mountainous regions where it collects as snow, forms glaciers which melt on reaching the warmer regions, again affording a surface origin. In both cases the source commences a natural drainage channel, and by the union of these drainage areas are formed, with a main riv. and tribs. Each channel has its own drainage area and the line bounding it is the water-divide. Most drainage areas have an outlet to the ocean, but in some, known as inland drainage areas, the channel or channels empty into salt lakes or by evaporation even cease to exist; such areas exist in the great dry regions of the continents, e.g. the Rs. Amu-Darya and Syr-Darya (Aral Sea), Helmund and Murghat of Seistan, Jordan, many in the Sahara, central Australia, W. S. Africa, Argentina, W. U.S.A. Some rivs., e.g. Indus, Tigris, and Euphrates, Nile, Orange, Murray-Darling, Colorado, succeed in crossing dry areas, with diminution of volume; they are fed with rains outside the areas and gain an ocean outlet, but are not, or only with difficulty, navigable. The normal or typical riv. may be considered as flowing perennially with slight variation of volume, due to minor fluctuations of rainfall either in season or in distribution over the drainage area.

Characteristics of a Normal River.—The main channels of a riv. may be regarded in its distinctive portions as (1) torrential, (2) middle course, (3) lower course, (4) estuary. These arbitrary divs. correspond to variation of gradient. No sooner is land elevated above the surface of the ocean than forces are at work to reduce it again; of these erosion by rivs. is the greatest. 'Young' rivers soon work a

short torrential course to the sea, with narrow ravines, cataracts, and waterfalls. The life-like behaviour of rivers is complete in every aspect; the main object being to produce a definite gradient whereby its course is least obstructed (*see diagram*); in this activity it is not merely destructive, but constructive. Over hard strata falls gradually deepen, undermine, and work back forming gorges; along the reaches a

steadier, less vigorous erosion wears down a channel, while in the more level regions the accumulated sand, mud, and pebbles are deposited, raising the bed. These differently applied forces tend to produce the more uniform gradient shown in the diagram. The term 'graded river' is applied to one which has largely attained this state. On more level stretches, where the velocity is less, not only is material deposited, but every obstruction has an effect in deflecting the river laterally, producing meanders. These, by the action of the current moving from side to side, undercutting the outer bank and depositing alluvium on the upper bank, often become so accentuated that the river cuts through the narrow neck of land separating them, leaving an ox-bow lake. At this stage the river is constructive, depositing fine mud; its banks are above the level of the surrounding country, which is naturally fertile and well watered, and often in the case of large rivers, densely pop. A breach in the bank may then cause immense destruction. The lower Mississippi has experienced many disastrous floods. The less the velocity of the current, the greater is the amount of mud, sand, and mineral salts deposited along the course of the river. The Mississippi is calculated to throw out at its mouth every year 6,700,000,000 cub. ft. of suspended silt, 750,000,000 silt dragged along the bed, and 1,400,000,000 dissolved mineral salts. Such carrying away of earth material represents a lowering of the surface over the drainage area of a foot in periods of 500 to 10,000 years. Rivers formed before geological disturbance has elevated the land along their courses are known as antecedent rivers, those consequent to the uplifting of an area, consequent rivers. Often a river develops a tributary, or subsequent river, which in turn can develop its own tributaries, or obsequent rivers. Rivers not only extend their length at the mouth by depositing alluvium, but also 'eat backwards' from their source; the rate at which this occurs varies with the hardness of the geological formation of the area, and sometimes by this development a river can capture the waters and drainage area of another. With submergence of shore lines and the formation of floods, etc., a river and its tributaries may be separated; the resulting streams are known as dismembered rivers. Underground rivers may be caused by faulting, but they occur generally in regions where the rocks are highly solvent.

Relation to Rainfall.—The rainfall is not all discharged by the river. Much is evaporated and much goes to maintain the general level of ground water, which is utilised by the vegetation. The occurrence of lakes as part of the drainage system regulates the flow, while lateral lakes in old rivers or dry areas may store flood water. The Nile has two distinct floods, due to contributions at different times from the Abyssinian and the equatorial mts. (*see also WATER SUPPLY*). The following rivers have a length of over 3000 m.: Amazon, Congo, Mississippi-Missouri, Murray-Darling, Nile, Yangtze; 3000–2000 m.: Amur, Irtysh, Lena, Mackenzie-Peace, Madeira, Mekong, Niger, Ob, Paraná, Volga, Yellow R. (Hwang-Ho), Yenisei, Yukon; 2000–1500 m.: Brahmaputra, Danube, Euphrates, Ganges, Indus, Nelson, Orinoco, Paraguay, Purus, Rio Grande, St. Lawrence, Salween, São Francisco, Si. Syr-Darya, Tocantins, Ural, Yapura, Zambezi.

Law Relating to Rivers: Riparian Rights.—The banks of a river, and the bed up to the middle line belong to the owners of the land on either side, and rivers and streams are private property. There is no right to the public of a low-path even along navigable rivers, but in all the above cases public rights are acquired by statute or by prescriptive possession or use. Private rights are held subject to non-interference with benefits held by owners of other parts of the river; the level of water may not be sensibly altered; any alteration or strengthening of banks must not deflect the current to the injury of other owners. Certain communal rights to water, deflection, etc., have been acquired by prescriptive use. In the curves of streams defensive embankments may be erected; the middle line in all gradual alterations remains the boundary, accretions on the inside of the bend adding to the property of the owner on that side; where sudden changes occur, the old middle boundary remains. In case of impounding or deflection under statutory powers, full purchase of right must be made or proportionate compensation paid. Fishing is private, and may not be acquired by custom or prescriptive use. The rights of fishing and navigation are public in the tidal portions of rivers, the bed being Crown property with a boundary at high-water mark; beyond that, private rights are exercised as in the river above tide-end. A channel when formed suddenly affords public rights of navigation at once, but the bed remains to the former owner.

Conservancy.—In the case of certain important rivers, conservators are appointed by Acts of Parliament to regulate and protect navigation and exercise the rights of the Crown for the public. By-laws are made, dredging and embankment carried out, locks and weirs established, and tolls taken, which must be expended in the public interest. Works are carried out to regulate floods, but the conservators are not liable in the case of injury due to 'natural causes.' Under various fishery Acts the control of waters containing char, trout, or salmon may be vested in con-

servancy boards, the fishery dists. being established by quarter sessions under power granted from the Home Office.

Pollution of Rivers.—See under PUBLIC HEALTH.

Pitt-Lewis, *Handbook of Thames River Law*, 1900; W. H. Hunter, *Rivers and Estuaries*, 1913; L. Dudley Stamp, *Britain's Structure and Scenery*, 1946; and J. W. Kompster, *Our Rivers*, 1947.

Riverside, co. seat of R. co., California, U.S.A. It is specially famous for its citrus fruit, the seedless orange being developed here. Portland cement is made. Here is one of the colleges of the univ. of California, for resident instruction and research. Pop. 34,700.

River Valleys, see under VAILEY.

Rivet, fastener resembling a bolt in shape. In its manufactured state before being driven it is a round shank with a formed head at one end. Rivs. are made from a special round steel bar, which has been tested for its high tensile and shear stress values. The rivet is heated to a red heat and passed through a machine fitted with hollow-shaped dies, which squeeze and cut the bar into the required shape and length of R. There are numerous shapes or types of R. head. Those in common use are snap (or round), cone, and countersunk; other shapes include flat, oval, button, globe, steeple, pan, and mushroom.

Riveting is a simple method of joining or fastening, dating back to very ancient times. It is used for a variety of purposes, principally in shipbuilding, bridge-building, boiler-making, steel erection, and aircraft construction. The types of joint most commonly used are the lap joint, i.e. when the plates or parts to be joined overlap each other, and the butt joint, i.e. when the plates or parts are aligned in the same plane, butted together, and bonded by a cover plate or butt strap. The joints are prepared for riveting by drilling or boring holes through the plates, and particular attention is paid here to the diameter and pitch (the distance from centre to centre of adjacent holes) of these holes. The actual riveting may be done with hot or cold Rivs., using hand or machine riveting hammers. In the first case, of hand-riveting, a full crew, comprising three men and a 'boy' is usually employed—two hammermen, one holder-up, and a R. boy. The boy heats the R. in a portable hearth or furnace, and passes it to the holder-up who, having made sure that its surface is clean and free of oxide flaking, inserts it into the hole and presses on the R. with a tool called a dolly, or dolly-bar, which is capped or hollowed out to receive the R. head. The two hammermen, on the opposite side, immediately hammer down the protruding shank or shank point to form a tight joint. Machine riveting is used wherever practicable, and has

largely superseded the hand method. In this case the R. is inserted and pressed between two dies by hydraulic or steam pressure. Another method of R. driving, not widely used, is that of the explosive R., which is used in the main only in aircraft construction where the joint is complicated and difficult. The R. is drilled at the end, and a small explosive charge is fitted into the cavity. The R. is inserted into the parts to be joined, and an electrically-heated holding-up tool is held against the R. head. Heat is conducted through the R. to the charge, which fires at a given temp., and the explosion draws out the sides of the hollowed R., and forms a cup-shaped head.

Riviera, narrow strip of coast bordering the Ligurian Sea, extending from Toulon to Leghorn, round the gulf of Genoa. The W. part from Toulon to the It. frontier is known as the Côte d'Azur; from there to Genoa it is called the Riviera di Ponente, and from Genoa to Leghorn, Riviera di Levante. The Maritime Alps, which in France form the R.'s background, reach altitudes of nearly 6000 ft.; the It. Apennines are lower. In both cases, however, the mts. rise almost direct from the sea, sometimes leaving a narrow coastal plain. The dist. being thus protected on the N., and open to the S., enjoys a delightful climate, marred only by an occasional bitter wind, the mistral. The mild winter and the beauty of the surroundings attract many visitors, especially during the season, which is between Nov. and May. It is equally famed as a holiday resort and as a health resort for convalescents and those suffering from asthma, rheumatism, nervous disorders, etc. The best known of the numerous towns and vills. are Cannes, Antibes, Nice, and Mentone in France, and Bordighera, San Remo, Savona, Genoa, and Spezia in Italy. There is also the principality of Monaco, with its famous tn. of Monte Carlo. A railway skirts the coast from Fréjus to Spezia, and the celebrated Corniche Road, a remarkable piece of engineering, takes the same route. The vegetation is naturally rich and varied, and has been greatly augmented by imported trees and plants, e.g. palms, cacti, and aloes. Roses, carnations, violets, mimosa, etc., are grown for export and for perfumeries. The fishing industry is locally important. See G. Home, *Along the Riviera of France and Italy*, 1908; Sir F. Treves, *The Riviera and the Corniche Road*, 1921, and *A New Handbook to the Riviera*, 1930; and J. Sion, *La France méditerranéenne*, 1934.

Rivière, Briton (1840-1920), Eng. painter, b. in London, and educated at Cheltenham and Oxford. He became an R.A. in 1881, having attained special fame as a painter of animals. Among his best-known works are 'The Empty Chair', 'The Last of the Garrison', 'Charity', 'Circé' (1871); and 'Daniel in the Lions' Den' (1872).

Rivière du Loup, riv. of Quebec. It has its source in the N. of the prov. and flows into Lake St. Peter, near Fraserville, the lake really being part of the

St. Lawrence. Fraserville (*q.v.*) is sometimes called Rivière du Loup en Bas.

Rivoli: 1. Tn. in Piedmont, Italy, 8 m. W. of Turin, with two royal palaces and silk and macaroni manufs. Pop. 12,900. 2. Vil. of Venetia, Italy, in the prov. and 12 m. N.W. of the city of Verona. It was the site of a Napoleonic victory over the Austrians (1797), and of a struggle between the Austrians and Piedmontese (1848). The eighteenth-century castello was gutted in the fighting in Italy in 1945, though repairs were put in hand. Pop. 1900.

Rixdorf, see NECKÖLN.

Riyadh, tn. of Saudi Arabia, 500 m. N.E. of Mecca, both tns. being caps. A walled tn., surrounded by date gardens, it is inhabited by Wahabi Muslims. Pop. 100,000.

Rizal Mercado y Alonzo Realonda, José (1861-96), Filipino patriot, b. in Calamba, Laguna prov., Luzon, of aboriginal Tagalog race. He attended the Jesuit school in Manila. He graduated from Madrid in 1882, and visited other European univs., becoming an accomplished linguist. In 1886 he pub. *Noli Me Tangere*—a novel exposing the tyranny of the Spaniards in his country, from which they drove him in 1887. In 1891 his *El Filibusterismo* appeared. This was a sequel to his former novel. In 1892, returning to Manila, he was arrested and banished to Mindanao. He was seized, 1896, while on the way to Cuba as physician in a yellow-fever epidemic, and was shot as a traitor at Manila.

Riza Shah Pahlavi (1877-1941), founder of the Pahlavi dynasty, the reigning house of Persia. He served from an early age in the Cossack brigade of the army, eventually becoming its colonel. Followed a *coup d'état* in 1921 when the brigade marched into Teheran unopposed, he became commander-in-chief. Soon afterwards he became minister for war and thenceforward he was the supreme ruler of Persia. Later he reorganised the army and then nominated himself Prime Minister (Oct. 31, 1923). The youthful Ahmad Shah was prevailed on to make a journey to Europe for his health, and presently fled to Paris. On Dec. 16, 1925, R. accepted the throne and was crowned the following year. A vigorous though despotic reformer, he set out to introduce W. methods and ideas; thus he reorganised the ministries and depts. of government, and brought about the emancipation of women. He also created a small air force and revived the small Persian Navy. But perhaps his most striking work was the construction of the 865 m. coast-to-coast trans-Iranian railway, declared open in Aug. 1938, at a cost of £30,000,000. Towards foreign powers R. maintained an aloof and independent attitude. When war broke out in 1939 he was deaf to Brit. and Russian warnings and his ministers temporised, with the result that he abdicated in favour of Mohammed, his son, when in 1941 the Russians and Brit. entered the country. See PERSIA, History.

Rize, prov. of Turkey on the Black Sea

coast, the cap. being of the same name. Pop. 172,100.

Rizzio, David, see RICCIO.

Rjukan, waterfall in Telemark, Norway, formed by the Maaselv, and having a fall of 805 ft.

Roach, or *Leuciscus rutilus*, species of Cyprinidae found in the fresh water of Britain and of Europe generally. Its lower fins are tinged with red and rather large scales. Allied to and very like dace and chub, the R. swims in shoals in rivers and lakes and is used as live-bait for jack-fishing.

Roads. Strabo states that Babylon possessed paved R. as long ago as 2000 B.C., and in anct. Greece R. were regularly and well maintained. The Romans were great road-makers, an art which it is thought they acquired from the Carthaginians, and relics of Rom. R. still exist in Britain. The latter were carriageways about 16 ft. wide, marked often, though not always, by two parallel ditches, the causeway between which was excavated to a firm foundation; the base course, about 9 in. thick, was of two courses of large flat stones with cement or rough concrete between them; above this came a 6-in. layer of lime concrete carrying a 6-in. layer of brick, broken pottery, or stones cemented together with lime mortar. The alignment, set out by smoke signals and accurate surveying instruments, was straight ('shotgun location') over hill and dale, changes of direction being made on hill-tops; in very hilly country a road sometimes followed the contours. The chief R. were planned on a strategic basis rather than for local convenience, and were very durable, but fell into disuse when the Romans left Britain, after which wheel tracks and bridle-paths took their place, no care being taken in the construction of these tracks. A law of 1285 enacted that when a wheel track or bridle-path became impassable, as was frequently the case in bad weather, another had to be made alongside it. In 1346 the first toll for highway repairs was levied in this country, but the first Road Improvement Act was not passed until 1523, up to which time R. and bridges were kept in repair by lords of the manor, or in default by religious communities. In 1750 road-making revived in both England and in France, although in U.S.A. it lagged behind at this time; in that country sundry states began to pass laws making state aid for road-making possible, until to-day U.S.A. leads the world in R. In Britain R. were very neglected as a consequence of the enormous development in railways in the last century, and did not revive on a really large scale until the coming of the motor-car at its end, since when they have gone ahead very greatly.

Construction.—Road-making in England is associated with the names of two famous civil engineers, Thomas Telford (from 1803), and James Loudon Macadam (from 1813). Telford used a hand-packed foundation of vertical stones 12 to 18 in. high, covered with 24-in. stone in a layer 4 to 6 in. thick above it, while Macadam

used such broken stone ('macadam') in both foundation and surfacing. Telford's system proved the best, and is still used. The layers of stone were rolled with a heavy steam roller, and the top finished to a camber sufficient to drain away surface water falling on the road. Fine-grained granite, dolerite, crystalline limestone, flint, or iron blast-furnace slag are used for road construction, the wearing surface of 2½-in. stone being slurried in with wet hoggins (clayey gravel), and when dried out sealed with refined road tar applied at the rate of about 1 gallon per 4 sq. yds. of surface, blinded with hard cubical stone chippings; this surface dressing has to be renewed every three to five years. An improved form of construction substitutes tar macadam (a form of macadam in which broken stone is coated with tar) for the older waterbound macadam wearing surface; extensive improvements have taken place in the use of bitumen (a by-product of crude petroleum) as binders. The oldest and most expensive form of bituminous road surface is that known as rock asphalt, in which bituminous limestone is ground into a fine powder, heated, and laid hot with smoothing irons to a finished thickness of 1 to 2 in.; mastic asphalt is a form of surface in which old rock asphalt is ground up, remelted, and mixed with bitumen and stone, run into cakes, the latter being heated on site and laid hot with wooden trowels; rolled asphalt is broken stone coated with bitumen and laid hot.

R. paved with blocks have been popular in the past, especially for heavy traffic, but have now been replaced in many cases by jointless surfacings of the asphalt type. Originally they consisted of stone blocks (setts) of granite, whinstone, or gritstone in random lengths, 5 to 7 in. deep and 3 to 4 in. wide, laid on foundations of hard core or of concrete, the joints being grouted with a thick bitumen or cement mortar; in time wood blocks came to be used in a similar manner, the timber being creosoted deal or Oregon pine of a depth of 4 or 5 in. laid tight jointed; wood paving was quieter than stone setts, but for various reasons is gradually being replaced by jointless surfacings. Footways are often surfaced with materials of the same type as those used in carriageways, but of lighter construction; in recent years concrete slabs have come into wide use for this purpose, the slabs being bedded on ashes or sand; formerly York stone was extensively used, but has tended to fall into disuse owing to cost. The edges of footways are defined by granite, whinstone, or gritstone kerbs 6 in. wide and 12 in. deep laid on a bed of concrete; for lightly trafficked R. concrete kerbs are widely used, and if properly made are quite suitable, though they are never of the same quality as natural stone kerbs.

Concrete is widely used for the construction of R., especially in dist. in the E. and S.E. of England where supplies of hard stone of suitable size for the construction of Telford bases do not exist. Concrete carriageways are 8 to 12 in. thick, and are laid in bays 10 to 20 ft. across, the

smaller bay being preferable; the joints between the bays being filled with bitumen. Concrete makes a good foundation for a black-top surfacing and lasts for years without surfacing on lightly trafficked R., such as on housing estates, but it is difficult to repair, is non-resilient, and cracks easily. It, on hill slopes are banked up with retaining walls, the drainage channel being on the verge against the hill, and the outlet may run beneath the road to the lower level. A longitudinal gradient should not exceed about 1 in 25 maximum, and should exceed 1 in 200 minimum; the camber depends on the type of surfacing (the smoother the surface the flatter the camber), but is usually about 1 in 36, except on steep hills. In open country the surface of the road is kept above that of the surrounding lands, since then drainage is facilitated. Water in the base of a road is fatal to continued long life, and must be avoided at all costs. In modern work sight distances of 500 ft. upwards are aimed at on arterial R., with curves of the greater radius possible and super-elevation of the outer surface to counteract centrifugal force. In Germany the construction of the *Autobahn*, with its long, unbroken stretches, designed for the rapid movement of motor transport, produced many interesting forms of clover-leaf and fly-over crossings. On trunk routes in America these systems have been developed to an advanced stage to carry fast-moving, heavy traffic. During the Second World War steel mesh and perforated steel plate was used for the construction of R. and tracks at short notice. For the law of R. see HIGHWAYS; also ROAD SAFETY; RULE OF THE ROAD; TRAFFIC; TRANSPORT.

See D. C. Broome, *Testing of Bituminous Mixtures*, 1934; E. J. Elford and P. E. Spielmann, *Roadmaking and Administration*, 1934; R. H. and R. G. Knight, *Road Aggregates—their Uses and Testing*, 1935; H. J. Collins and C. A. Hart, *Principles of Road Engineering*, 1936; A. C. Hughes and P. E. Spielmann, *Asphalt Roads*, 1936; A. C. Hughes, W. G. Adam, and F. J. E. China, *Tar Roads*, 1938; B. H. Knight, *Modern Road Construction*, 1938; and C. W. Scott-Giles, *The Road Goes On*, 1946. See also Brit. Standards issued by the Brit. Standards Institution, London, and 'Road Abstracts' and technical reports issued by the Road Research Laboratory, Harmondsworth, Middlesex (H.M.S.O., London).

Road Safety. In Great Britain the number of deaths from road accidents rose steadily between the two world wars, reaching a total of 6645 in 1939. This increased to 9160 in 1941. The Ministry of Transport, in conjunction with the Royal Society for the Prevention of Accidents, then launched a nationwide R. S. campaign. As a result, the total number of road deaths in 1948 had been reduced to 4513. This was slightly exceeded in 1949 (4773), but this, apart from 1948, was the lowest total since 1926. The groups most affected by road accidents are child and adult pedestrians,

cyclists and their passengers, and motor cyclists.

A comparison of the totals of road accidents shows:

Year	Deaths	Seriously injured	Slightly injured
1947	4,881	35,697	125,621
1948	4,513	33,067	115,817
1949	4,773	43,410	128,596

The worst feature of road accidents has been the number of children killed and injured. Before the Second World War education authorities and teachers co-operated with the Royal Society for the Prevention of Accidents in an effort to reduce the figure of fatal child accidents, but in 1941 the total rose to nearly 1500. The campaign against child accidents was intensified, and by 1949 the total of fatal cases in this category had been reduced to 965, although over 38,000 children were injured.

In all kinds of accidents it is clear that the real cause in the majority of cases is the failure of the human element rather than of the machine or the road conditions. In the case of drivers causes of accidents have been excessive speed in the circumstances, carelessness at cross-roads, improper overtaking, careless reversing, etc. In the case of pedestrians most accidents are due to some form of 'heedless crossing.' The most important requirement for safe driving is the proper regulation of speed to the prevailing circumstances.

The Royal Society for the Prevention of Accidents has done invaluable work in impressing the gravity of the R. S. problem upon central and local government authorities and upon the general public. The society has put forward many suggestions for lowering the accident rate; its 'kerb drill' has been widely and successfully adopted. In March 1950 a national children's safety campaign was conducted under the society's auspices. This society deals also with the prevention of all other types of accidents, e.g. in industry and the home.

Road Town, cap. and only tn. of the Virgin Is. (q.v.), on the S.E. coast of Tortola. It is a port, and trades in fish, poultry, and vegetables. Pop. 700.

Road Traffic Acts, see under HIGHWAYS. **Roanne**, tn. of France, in the dept of Loire, on the Loire, which is navigable at this point, 54 m. W.N.W. of Lyons. It contains an old castle, a fifteenth-century church, and a new *hôtel de ville*. There are anthracite mines, and spinning and weaving manufs. Machinery is manufactured. Pop. 44,500.

Roanoke (formerly **Big Lick**): 1. City in Virginia, U.S.A., formerly in R. co., on the R. riv. in the Great Valley, 50 m. W.S.W. of Lynchburg. It became a city in 1884. Three years earlier, its pop. numbered only 700, and R. owed its prosperity to the Virginia Railway. An important railway centre, R. carries on stock-raising, mining, and tobacco-growing and has machine shops. It contains Virginia College and a sanatorium, and has mineral springs near by. Pop. 69,300. 2. Riv. of Virginia and N. Carolina, U.S.A., formed

by the Dan and Staunton Rs. Rising in the Alleghany Mts., it flows across the Appalachian valley and then S.E. out into the W. end of Albemarle Sound. Length 388 m., navigable to Weldon for steamers. There is a canal round the falls at Hallsfax.

Roanoke Island, is. of E. Dare co., N. Carolina, U.S.A., separated by Croatan Sound from the mainland. Raleigh attempted to settle the first Eng. colony in America here (1585-87).

Roaring, see HORSE (DISEASES).

Roaring Forties, nautical expression for regions S. of lat. 40° S., in the Southern Ocean, where heavy westerly winds prevail, which sometimes cause mariners to return to Europe by the Cape Horn route instead of by the Cape of Good Hope. The winds are known as *Brave W. Winds*.

Roasting, see under COOKERY.

Roasting (in metallurgy), see under METALLURGY, *Extraction Metallurgy*.

Roatan, or **Ruatan**, is. in the Caribbean Sea, opposite the coast of Honduras, Central America. Length about 20 m.; greatest width, 5 m. It was discovered by Columbus on his fourth voyage in 1502. It has been a Brit. possession since it was given up by the Mosquito king in the seventeenth century. The pop. are largely Eng. by ancestry, being descendants of pirates and mutineers who sought refuge there in the seventeenth and eighteenth centuries, and Eng. is the most widely spoken language. Pop. 4400.

Robartes Family, see RANNOR, EARLS OF.

Robber Council, see EUTHYCHES.

Robbery, forcible taking from the person of another, or in his presence, and against his will, of any money or goods to any value. The violence may be actual, or constructive, as by putting into fear by threats of any kind of injury, whether to the person, property, or reputation. The whole gist of this aggravated form of larceny is the force or bodily fear, though the degree of fear required to be proved to sustain a conviction necessarily varies with the circumstances: it is not necessary to prove that the fear actually existed at all, if it can be shown that the circumstances were such as to be calculated to induce fear. If there be actual physical force or violence, the offence is R., though there be no fear at all. In any case the force or fear must either precede or be synchronous with the stealing; therefore, if a pickpocket subsequently uses force to keep a stolen purse, his offence will not be R., but simple stealing from the person. The maximum punishment for R. is imprisonment for fourteen years.

Robbia, **Andrea della** (1435-1525), Florentine sculptor, nephew of Luca della Robbia (q.v.), b. at Florence. He was a sculptor of considerable merit, and worked at reliefs and medallions of the Madonna, and medallions of infants for the foundling hospital at Florence. R. was one of his uncle's most distinguished pupils, and in some ways perfected Luca's technique, and extended the use of enamelled terracotta reliefs. See M. Crutwell, *Luca and Andrea della Robbia and their Successors*, 1902; and A. Marquand, *Andrea della Robbia and his Atelier*, 1922.

Robbia, Luca della (1399-1482), It. sculptor, *b.* at Florence. He early devoted himself to sculpture, though brought up as a goldsmith, and probably studied with Ghiberti. He is best known for his works in enamelled terra-cotta, called 'Robbia ware,' a valuable collection of which may be seen in the S. Kensington Museum, chiefly in the form of medallions. He also executed a beautiful series of bas-reliefs for the Cantoria in the Cathedral of Florence; the tomb of the bishop of Fiesole; and a bronze door for the sacristy of Florence Cathedral. His technique was improved upon by his successors, but the spiritual beauty of his work was never surpassed. *See* J. Cavallucci and E. Molinari, *Les Della Robbia*, 1884; M. Cruttwell, *Luca and Andrea della Robbia and their Successors*, 1902; and P. Schubring, *Luca della Robbia und seine Familie*, 1921.

Robe, *see* SURPLICE.

Robertus Men, *see* ROBERT'S MEN.

Robert I. (d. 1035), duke of Normandy, known also as Robert the Devil. He was the father of William the Conqueror, and the son of Richard II., duke of Normandy, whose sister Emma had married first Ethelred, king of England, and afterwards Canute. He governed his duchy well, securing it from the king of France and defeating all his rivals. When his son William was seven years old R. set out on a pilgrimage to Jerusalem. He died on his way home.

Robert I. of Scotland, *see* BRUCE, ROBERT.

Robert II. (1316-90), king of Scotland from 1371 to 1390, son of Walter Stewart and Marjory, only daughter of Robert the Bruce (*q.v.*). He acted as regent during the exile and captivity of his uncle, David II., and was most prominent during the latter's reign. In 1371 he succeeded David, and became the founder of the Stuart dynasty. His reign was troubled by feudal dissensions, and sev. barons, including the earls of Douglas, Mar, March, and Moray, made independent raids into England. The distress occasioned by these raids and their reprisals was very great; after the successful expeditions of 1384 and 1385 by John of Gaunt and Richard II. respectively, the Scottish completely routed the Eng. at Otterburn in 1388.

Robert II. (Curt-hose) (c. 1055-1134), eldest son of William the Conqueror, whom he succeeded as duke of Normandy. From 1074 to 1079 he was engaged in disputes with his father, which flared up into actual war in 1078 when he had to seek refuge in Flanders. All his life R. was an ineffective rebel, relying on feudal claims without giving proof of ability to discharge his feudal obligations and with little sense of political responsibility, though he seems to have been a competent soldier. R. fought both his brothers, William II. and Henry I.; but his capacity for endangering them was lessened by the haphazard, sporadic character of his attacks and by his continuous shortage of money. In 1106 R.'s quarrel with Henry became acute. A battle was fought

between them at Tinchebrai (*q.v.*) in which R. was taken prisoner. He remained in captivity till his death. By this battle, won by an Eng. army under Henry, Normandy was won back for England. William Clito, R.'s son, was at one time a claimant for the Eng. throne.

Robert III. (1340-1406), king of Scotland. He succeeded his father Robert II. in 1390. The war with England broke out again on the accession of Henry IV. in 1399. In Aug. of the following year, Henry entered Scotland at the head of a powerful army, and advanced as far as Edinburgh, which was, however, successfully defended by the king's eldest son, the duke of Rothesay. In the following year, however, Henry Percy (Hotspur) made a more destructive inroad as far as Preston in E. Lothian. In consequence of the successes of the Eng., attempts were made to arrange a peace between the two countries, but without success. R. was generally incompetent, the gov. being carried on by two of his brothers and his son David.

Robert Grosseteste (c. 1175-1253), Eng. scholar and prelate, *b.* at Stradbroke, in Suffolk, of humble parentage, and educated at Oxford and Paris. In 1221 he was made prebendary of Lincoln, in 1224 rector of the Franciscans at Oxford, and in 1235 bishop of Lincoln, a post which he held till his death. At Oxford he held a position equivalent to that held later by the chancellor. He had disputes with the Lincoln chapter, the Canterbury monks, and Henry III., opposing the latter's demands for one-tenth of the church revenues, whilst he quarrelled with the pope on the question of the granting of Eng. benefices to foreigners. R. was, however, a religious reformer of the most orthodox kind. He was a voluminous author, writing philosophical treatises, mathematical works, and books on agriculture and household economy. He was a keen Gk. scholar. His political ideas may well have influenced Simon de Montfort, who was one of his friends. *See* life by F. S. Stevenson, 1899.

Robert, Leopold (1791-1835), Swiss painter, *b.* at Les Epatures. He engraved in Paris, and later turned to painting. R. achieved a European reputation with his pictures of it. peasant life, which show marked classical and romantic influence. *See* life by D. Berthoud, 1911.

Robert of Brunne, *see* MANNING, ROBERT.

Robert of Gloucester, *see* GLOUCESTER, ROBERT OF.

Robert of Jumièges, *see* JUMIÈGES, ROBERT OF.

Robert of Molesmes, Saint (1018-1110), Fr. saint and monastic reformer, *b.* at Troyes. He became a Benedictine, and gave up his abbacy at St. Michael of Tonnerre to become superior of a hermits in the forest of Collans. In 1075 he migrated to Molesmes with this community. As it prospered he became dissatisfied with its standards of conduct, and twice left Molesmes. On the second occasion R. went, with SS. Stephen,

Harding, and Alberic, at Cîteaux, where they founded a monastery more in keeping with their strict ideals. This became the mother house of the Cistercian Order (q.v.). R. later returned to Molesmes at the earnest request of the monks, who appealed to Rome. See K. Spahr, *Das Leben des heiligen Roberts, eine Quelle zur Vorgeschichte von Cîteaux*, 1944.

Robert of Newminster, Saint (d. 1159), Eng. saint, b. in Yorkshire. He became a Benedictine at Whitby, but later went to Fountains Abbey (q.v.) where the stricter Cistercian rule was being followed. Newminster Abbey was founded from Fountains in 1137, R. being its first abbot and largely responsible for its successful foundation.

Robertson, Sir Hugh Stevenson (b. 1874), Scots musician, b. at Glasgow, founder-conductor of the Glasgow Orpheus Choir, estab. 1905. Under his guidance this body has performed throughout the Brit. Isles, in the U.S.A. and Canada, and in sev. European countries, and has estab. a world-wide reputation. Composer of many songs and part-songs, he has made a distinctive contribution to the culture of Scotland in the collecting, editing, arranging, and popularising of her folk-music and traditional psalm-tunes. For many years he has been one of the most popular of musical festival adjudicators. R. is the author of books on musical subjects, of plays, poems, and humorous sketches, and a prolific journalist-essayist.

Roberts, Sir Charles George Douglas (1860-1943), Canadian poet and author, b. at Douglas, York co., New Brunswick, and educated at Fredericton Collegiate and the univ. of New Brunswick. He was prof. of Eng. and Fr. literature at King's College, Nova Scotia, from 1885 to 1887, and of economics, from 1887 until 1893. He became associate-editor of the *New York Illustrated American* in 1897. In Britain he was best known for his *Some Animal Stories* (1921), but in Canada he was acclaimed as an outstanding poet and as the 'father of Canadian literature.' His work showed imagination and sensitivity, and he had a remarkable prose style. R. was a prolific writer, publishing many vols. of fiction, poetry, essays, and hist. They include *Orion, and other Poems* (1880); *Ace: an ode for the Shelley Centenary* (1892); *Around the Camp Fire* (1896); *A History of Canada* (1897); *Kings in Exile* (1909); *New Poems* (1919); and *Canada Speaks of Britain* (1941). He was knighted in 1935. See life by E. M. Pomeroy, 1943.

Roberts, David (1796-1864), Scottish landscape and figure painter. He was b. at Stockbridge, near Edinburgh, and apprenticed to a house decorator, employing his evenings in the study of art. He was scene-painter at Glasgow, Edinburgh, and Carlisle (c. 1820), and at Drury Lane (1822). He travelled widely in Europe, Africa, and Asia, bringing back numerous sketches. R.A. in 1841. His works include 'Rouen Cathedral' (1820); 'Interior of St. Stephen's, Vienna'; 'Church of St. Paul at Antwerp' (Tate Gallery); 'Interior of Seville Cathedral' (1834); 'The Pyra-

mids from the Nile' (1845). The Victoria and Albert Museum contains many pictures by him. See life by J. Ballantine, 1866.

Roberts, Frederick Sleigh, first Earl Roberts of Kandahar, Pretoria, and Waterford (1832-1914), Brit. soldier, b. at Cawnpore, India, and educated at Clifton, Eton, Sandhurst, and Addiscombe. He entered the Bengal Artillery in 1851. He first saw active service in the Indian mutiny, in the course of which he won the Victoria Cross. He also served in Abyssinia; and on the outbreak of the Afghan war, 1878-80, he was appointed to command the Kuram div. of the army, with the rank of major-general. In 1879 he distinguished himself by forcing a difficult Afghan position on the peak of Peiwar Kotal, and by gaining the victory of Charasia. For these services he was created K.C.B. In the following year he was put in command of the force sent to Kabul. From Kabul he proceeded on his victorious march to the relief of Kandahar, and near the latter place he defeated Ayub Khan, Sept. 1, 1880. He was made a baron in the following year, and was then appointed commander-in-chief of the Madras army. R. was commander-in-chief of the forces in India from 1885 to 1893. He was promoted lieutenant-general in 1883, general in 1890, and field marshal in 1895. In December 1899 he was sent out to S. Africa to take command of the Brit. forces in the Boer war (see BOER WARS; SOUTH AFRICA, THE UNION OF, History). R. returned to England in Dec. 1900, and in the following year he was made an earl, and received a grant of £100,000 from Parliament. In the same year (1901) he followed Lord Wolseley as commander-in-chief. He held the office until its abolition in 1904. In 1905 he resigned his position on the Committee of National Defence to advocate in the country the estab. of a system of national military service. He pub. *The Rise of Wellington* (1895) and an autobiographical vol., *Forty-one Years in India* (1897). Until the outbreak of the First World War he was busy with his compulsory service campaign. He attended the first war council. Being appointed colonel-in-chief of the Indian contingent in France, he went there on Nov. 11, 1914, caught a chill, and died at St. Omer. See lives by Sir G. W. Forrest, 1914, and H. de Watteville, 1938.

Roberts's Men, or Robberies Men, set of lawless rogues who were notorious for their outrages in the time of Edward III. They are named in an Act of that reign with 'wastours and drawlatches' as committing divers robberies and manslaughter. Their name may be derived from Robin (Robert) Hood.

Roberts, Morley (1857-1942), Eng. novelist, b. in London and educated at Bedford Grammar School and Owens College, Manchester. In 1876 he went to Australia, where he worked in the bush—chiefly with sheep and cattle, and on the Victorian railroads. In 1879 he returned to England, and was employed in the civil service. He travelled widely and

visited Texas, Iowa, California, Canada, the Sandwich Is., Samoa, Rhodesia, Teneriffe, Corsica, etc., his experiences greatly influencing his books. Pubs. include: *The Western Avernus* (1887); *Everyman's Library*, 1924); *Land Travel and Sea-faring* (1891); *A Son of Empire* (1900); *Thorne's Way* (1911); *The Private Life of Henry Maitland* (based on life of George Glasing, 1912); *Followers of the Sea* (1923); *On the Earthquake Line* (1924); *The Serpent's Fang* (1930); *Women and Ships* (1931); *A Humble Fisherman* (1932); *Malignancy and Evolution* (new ed., 1934); *Bio-Politics* (1938); and *The Behaviour of Nations* (1941); also ed. two books by W. H. Hudson, *A Wind in Richmond Park* (1922) and *Men, Books, and Birds* (1925).

Robertson, Sir Brian Hubert, Brit. soldier and administrator, b. 1896, son of F.-M. Sir Wm. R. (q.v.). He served in the Royal Engineers in the First World War and was awarded the D.S.O. and M.C.; then served in the Waziristan expedition (1922-23) with the rank of major. On succeeding to the baronetcy he retired from the army (1933) and settled in S. Africa, where he became managing director of Dunlop (S. Africa) Pty., and joined the Union Defence Force. He accompanied the S. African troops to the Middle E., served in the Eighth Army, and became chief administrative officer to Gen. Alexander (q.v.) in Italy. After the armistice he was restored to the active list of the Brit. Army, and became deputy military governor, later (1947) military governor and commander-in-chief in the Brit. zone of Germany. With the end of military government there he was appointed high commissioner for the Brit. zone (a civil appointment). He was promoted lieutenant-general in 1946 and general in 1947. In March 1950 he was appointed commander-in-chief, land forces, Middle E., provisionally with effect from June of that year.

Robertson, Sir Charles Grant (1869-1948), Brit. historian, educated at Highgate School and studied at Hertford College, Oxford. In 1893 he became a fellow of All Souls, and was senior hist. tutor at Magdalen from 1905 till 1920. He was principal of Birmingham Univ. from 1920 to 1938 and chancellor between 1927 and 1938. He returned to All Souls as domestic bursar during the Second World War. He was a brilliant administrator, and his detailed pubs., such as *England under the Hanoverians* (1911), *Bismarck* (1918), and *Chatham and the British Empire* (1946), have become standard works. It was knighted in 1928.

Robertson, J. Forbes, see FORBES-ROBERTSON.

Robertson, Mrs. J. G., see RICHARDSON, HENRY HANDEL.

Robertson, Joseph Clinton, see under PERCY ANECDOTES.

Robertson, Sir Macpherson (1860-1945), Australian philanthropist, b. in Ballarat of poor parents. As founder of the Australian confectionery firm which bears his name, he became famous for his successful organisation of a large-scale manu-

facturing industry and also for the public-spirited use which he made of his wealth. As a boy he sold newspapers in the streets of Leith, Scotland, where his family lived for a time. Soon after his return to Australia he was apprenticed to a confectionery maker and later hawked his own home-made sweets for sale. From this modest beginning he soon developed a solid business. In 1923 he gave a large sum for the relief of suffering in the Jap. earthquake. Among R.'s numerous gifts to Victoria state was a large sum towards the expenses of the Australian Antarctic Expedition, 1929-30 (MacRobertson Land in Antarctica commemorates his name). In 1938 he financed and organised a 10,000-m. motor transport exploration expedition round Australia; in 1933 he gave £100,000 to the gov. of Victoria in connection with the centenary celebrations of 1934. R. initiated the air race from England to Australia.

Robertson, Thomas William (1829-71), Eng. dramatist, b. at Newark-on-Trent. He began as an actor, but it was as a writer of plays that he became famous. His first success was *David Garrick* (1864), and this was followed by *Society* (1865). Then came *Ours* (1866), *Caste* (1867), and *School* (1869), *Caste*, his greatest success, is revived from time to time, enduring largely by virtue of its admirable technique. His plays reflect faithfully the manners of his time. See life by T. E. Pemberton, 1893.

Robertson, Sir William Robert (1860-1933), Brit. soldier, b. at Welbourne, Lincolnshire. He enlisted at Worcester in 16th Lancers, 1877, as a private, and showed such promise that he was commissioned, and went to India in 1888 as 2nd lieutenant in 3rd Dragoon Guards. He rose to the rank of staff captain, and entered the Staff College at Camberley in 1897, being the first man from the ranks to do so. It was on the headquarters staff in S. Africa, and promoted lieutenant-colonel in 1900. He was appointed commander of the Camberley Staff College in 1910. He was director of military training at the War Office from 1913 to 1914. R. went to France as Q.M.G. of the Brit. Expeditionary Force in 1914, and was chief of Imperial General Staff from 1915 to 1918. He was made a general in 1916. R. strongly opposed plans for the diversion of forces from the W. front to more distant theatres of war, and in Feb. 1918 was, shortly before the soundness of his judgment was proved by the success of the Germ. in France, superseded by Sir Henry Wilson, and given the E. command at home. He was commander-in-chief on the Rhine from 1919 to 1920, and was appointed field marshal in the same year. R. had been knighted in 1913 and made a baronet in 1919. In 1921 he pub. his autobiography, *From Private to Field Marshal*.

Robertson, w. -growing list. of S.W. Cape of Good Hope, S. Africa, forming part of the Little Karoo, intersected by Broede R. Irrigation is extensively practised. R., 80 m. N.E. of Cape Town, is the cap. Pop. 4600.

Robertson-Scott, J. W. (b. 1866), *see* under 'COUNTRYMAN, THE.'

Robes, Mistress of the, see HOUSEHOLD, ROYAL.

Robeson, Paul (b. 1898), Amer. actor and singer, b. in Princeton, New Jersey. His father was a Presbyterian minister there. A Negro, R. graduated with honours at Rutgers College, the majority of whose students are white, and became prominent in the football and baseball teams. He won the coveted distinction of being elected to the Phi Beta Kappa (q.v.), a famous college fraternity. He graduated in law from Columbia Univ., but did not practise, entering upon a stage career. He appeared in America in *Emperor Jones* and sev. other plays by Eugene O'Neill (q.v.), and then embarked upon a successful career as a concert singer, specialising in Negro spirituals. He came to London in 1928, appearing in the title roles of *Emperor Jones* and *Othello*, and gave a superb performance in the musical play, *Shubert*. He played sev. of his most successful roles in the screen productions. In 1942-45 R. appeared in a new production of *Othello* in the U.S.A., which was considered by many to be the finest performance of his career. He devoted himself increasingly to politics, and in the presidential election of 1949 supported Henry Wallace. *See* life by Mrs. Robeson, 1930.

Robespierre, Maximilien Marie Isidore (1758-94), Fr. revolutionary leader, b. at Arras. His father d. when he was young, and he owed his education to the bishop of Arras. Tradition says that R. learned the doctrines of republicanism from one of his tutors. He followed the family profession of advocate. In 1789 he was one of the deputies of the Third Estate at the States-General. His fanaticism, self-confidence, and oratorical skill soon made him well known, and, vigorously defending the liberty of the press, he attached himself to Mirabeau in the early days of the revolution. Soon he estab. a secure position among the Jacobins (q.v.), the extremist group. R. made the proposal that members of the Constituent Assembly should be barred from its successor, the Legislative Assembly. Therefore it was as a Jacobin club member, and not as a deputy, that he continued to exert his influence on the revolution. Calculating and callous, R. connected himself with the Marat-Danton group, using them as means to gain an undisputed ascendancy, and then bringing about their destruction. Yet his actions seem to have been dictated not from motives of personal ambition (his extraordinary disinterest in personal gain earned him Carlyle's title of 'the sea-green incorruptible'), but because of his conviction that only through him could the revolutionary ideals in which he believed so passionately be fully realised. This egotism grew with each new victory, so that, in R.'s last days, it amounted to some state of mental unbalance.

In Sept. 1792 he was elected to the National Convention, the organ which proclaimed the Fr. republic. He had

already helped to create the Revolutionary Tribunal. After the execution of Louis XVI., and the downfall of the Girondists, R. became a member of the newly formed Committee of Public Safety, the body which was the real ruler of France and in which he was supreme. He was largely responsible for the 'Reign of Terror' which destroyed his former friends, Danton (q.v.) and Desmoulins (q.v.). His power was now unchallenged, but his tyranny soon caused a plot for his destruction. At this point his character appeared to disintegrate, and his confidence wavered. He secluded himself from the meeting of the Convention on July 27, 1794, at which he was openly accused of despotism, and when, too late, he tried to obtain a hearing, his power had gone, and a decree of arrest was sent out against him. He

ROBESPIERRE

died, but was captured and guillotined on July 28. His death marked the beginning of the reaction against the revolution which he had characterised in its most extreme form. *See* also under FRANCE, History. *See* lives by H. Belloc, 1901; A. Mathiez, 1921; G. J. Renier, 1936; and R. Korngold, 1937. *See* also T. Carlyle, *The French Revolution*, 1837, and E. Hamel, *L'Histoire de Robespierre après des papiers de famille, des sources originales, et des documents entières inédits*, 1865-78.

Robin, see ROBIN REDBREAST.

Robin Goodfellow, see PUCK.

Robin Hood, Eng. legendary hero, regarded as the leader of a band of outlaws who lived in Sherwood Forest. With his companions, pre-eminent among whom were Little John, so called from his huge stature, Friar Tuck, a jovial, pleasure-loving priest, and Maid Marian, his wife. R. H. lived a life of careless freedom and good-natured philanthropy, robbing the rich to give to the poor, and oppressing no righteous man. The oldest mention of R. H. at present known is in *Piers the Plowman* (1377); he was very popular in the fifteenth century and onwards, and

was mentioned at greater or less length by Shakespeare, Ben Jonson, Fuller, etc. Sov. theories have been put forward to explain the legend. It is at least probable that there is some historical basis for them, although he is regarded by some as simply the personification of the wind god, or a forest elf. Many of the customs and practices associated with his name were certainly added at a later date. See the collection of ballads in the fifth vol. of F. J. Child's *English and Scotch Popular Ballads*, 1888; also J. Hunter, *The Great Hero of Ancient Minstrelsy of England: Robin Hood*, 1852; Carola Oman, *Robin Hood*, 1937; and J. H. Gable, *Bibliography of Robin Hood*, 1939. See ROBERT'S MEN.

Robin Hood's Bay, seaside resort on an inlet in the E. coast of Yorkshire (N. Riding), England, 5 m. S.E. of Whitby, situated on lofty cliffs. The old vil. is one of the most picturesque in England. Pop. of par. (Fylingdale) 1300.

Robinia, genus of leguminous plants, grows wild only in N. America. It contains half a dozen species, all of which are large trees. *R. pseudacacia*, the bastard or false acacia, or locust-tree, is cultivated in Britain.

Robin Redbreast (*Erithacus rubecula*), commonest of the Brit warblers (*Sylvidae*) and the friendliest and most cherished Brit. bird. It has long been protected from human cruelty and destructiveness by an extraordinary amount of superstition and legend. Its protection is thoroughly deserved, for, while it is quite harmless to garden and farm crops, it destroys an enormous number of insects and other animal pests. Its sweetly modulated song is continued through the greater part of the year, and is especially noticeable in winter. Male and female differ very slightly in plumage, but the latter is rather less brightly coloured. The young birds are yellowish olive-brown on the upper part, and dull reddish-brown on the chin, throat, and breast. Two or three nests are made during the year, often in erratic and even ridiculous positions. In the U.S.A. a migratory thrush is called the robin. See D. Lack, *The Life of the Robin*, 1943.

Robins, Benjamin (1707-51). Eng. mathematician and engineer, b. at Bath. He studied engineering, and commenced experiments in gunnery, the results of which were pub. in his *New Principles of Gunnery* (1742). He made observations and experiments on the force of gunpowder, flight of rockets, etc., and invented the ballistic pendulum.

Robinson, Edwin Arlington (1869-1935), Amer. poet, b. at Head Tide, Maine. He attended Harvard Univ., but did not graduate, and afterwards he moved to New York and engaged in various occupations, among them a clerkship in the U.S. Customs House. He soon became known as a poet, some calling him a New England Browning. Keeping to the old regular forms of verse, he nevertheless showed his modernity by his frequent plunges into the subconscious, and was a leading 'psychological' poet. He sev. times received the Pulitzer prize for the

best poetry of the year. His best books include *The Children of the Night* (1897); *Captain Craig* (1902); and *The Man against the Sky* (1916). See lives by L. Lippincott, 1937; E. Kaplan, 1940; and E. Neff, 1949.

Robinson, Earné Stuart Lennox (b. 1886), Irish dramatist, b. at Douglas, Cork, and educated at Bandon Grammar School. From 1910 to 1914 and 1919 to 1923 he was manager of the Abbey Theatre, Dublin, of which he became a director in 1923. His best-known plays are *The Whiteheaded Boy* (1916) and *The Lost Leader* (1918), produced in London 1921 and 1920 respectively, also in the U.S.A. He also wrote sev. short stories and a novel. In 1946 he ed. the letters of Lady May Gregory. He pub. his reminiscences, *Curtain Up*, in 1942.

Robinson, Frederick John, see RIRON, EARL OF.

Robinson, Henry Crabb (1775-1867), Eng. journalist and diarist, b. at Bury St. Edmunds, Suffolk, and educated privately. He travelled abroad between 1800 and 1805, and two years later became *The Times* correspondent at Altona, and in 1808 represented the same paper in the Peninsula. He was called to the Bar in 1813, and joined the Norfolk circuit, of which he later became leader. He was a well-known figure in the literary society of the day, and knew Goethe and Schiller. He was a famous conversationalist. His *Diaries and Journals* were ed. by Thomas Sadler, and pub. in 1869. See Edith J. Morley (ed.), *The Correspondence of H. C. Robinson with the Wordsworth Circle, 1808-1886, 1927*, and *On Books and their Writers, 1937*; also lives by L. I. Vincent, 1913; Edith J. Morley, 1935; and J. M. Baker, 1937.

Robinson, Sir Hercules George Robert, first Baron Rosmead (1824-97), Brit. colonial administrator. He entered the army in 1844, but retired two years later, and served in Irish Gov. depts. until 1854, when he held various colonial appointments. He became governor of Cape Colony and high commissioner of S. Africa from 1880 to 1889. In that year he retired, being two years later created baronet. However, he returned to S. Africa in 1895, and within a few months of his arrival the Jameson Raid occurred, of which he had had no previous information. On his return to England in the following year he was raised to the peerage. He was an able colonial governor and an excellent administrator.

Robinson, William Heath (1872-1944), Eng. artist, b. at Islington. He studied at the R.A. schools. He illustrated Hans Andersen's *Fairy Tales*, *Arabian Nights*, Poe's *Tales of Mystery and Imagination*, *Don Quixote*, and *Rabelais*. His best-known work, however, was his humorous drawings for periodicals, his speciality being grotesque and laborious mechanism involving the most complicated operation, in order to achieve the simplest possible purposes. See life by L. Day, 1947.

Robot, term derived from the Czech *robot*, meaning 'work,' and which has now

passed into current usage in Eng. since 1923, the year when Karel Čapek's play *R.U.R. (Rossum's Universal Robots)* was trans. into Eng. by Paul Selver. The play portrayed a society dependent on the work of mechanical men, and the term R. is now applied to all mechanisms which engineering science has devised to do the work ordinarily done by man. R. mechanisms have been used to steer ships without human aid (1927), to operate telephone transmitters (1927), and to pilot an aeroplane (1931). See also *AUTOMATON*; *REMOTE CONTROL*.

Rob Roy, alias Robert MacGregor (1671-1734), Highland freebooter, b. at Glen Gyle, Perthshire, by Loch Katrine. He derived his prin. income from cattle-lifting, exacting money (known as black-mall) for affording protection against thieves. He espoused the Jacobite cause in 1691, and in consequence of this and his plundering raids the penal laws were renewed against his clan in 1693. In 1712 he was accused of fraudulent bankruptcy, and in 1715 followed in the wake of the rebel army at Sheriffmuir and stood watching for the booty. He surrendered to the duke of Atholl in 1717, but soon escaped, probably through the protection of the duke of Argyll, to be again captured and imprisoned. He was, however, pardoned in 1727, and lived the rest of his life as a peaceful subject. He was buried beside his kindred at Balquhither churchyard, by the shores of Loch Voil. See the introduction and notes to *Scott's Rob Roy*, and lives by K. Macleay (now ed.), 1881, and A. H. Miller, 1883; also A. A. MacGregor, *Wild Drumalbyn*, 1927, and *Somewhere in Scotland*, 1948.

Robsaart, Amy, see *LEICKSTER, ROBERT DUDLEY, EARL OF*.

Robson, Flora (b. 1902), Brit. actress, b. at S. Shields. She studied at the Royal Academy of Dramatic Art and made her first professional stage appearance in 1921. In 1933 she joined the Old Vic Company. She estab. a reputation as a fine Shakespearian actress and also gave outstanding performances in Tchekov's plays. She has appeared in a number of films, including *Fire over England* (1937); *Cæsar and Cleopatra* (1946); and *Black Narcissus* (1947).

Robson Peak, mt. in the Canadian Rockies, on the border between Brit. Columbia and Alberta. Height 12,975 ft.

Roe, or Rukh, fabulous bird, often identified with the Arabian *anāḥ* and the Persian *simurgh*. It was supposed to be of enormous size and capable of performing wonderful feats of strength, e.g. carrying off elephants to feed its young. The legend of the R. is contained in *The Arabian Nights*.

Roca, Cape, most westerly point of the Iberian Peninsula, 20 m. N.W. of Lisbon.

Rocamadour, vil. in the dept. of Lot, France, a famous place of pilgrimage. Its fifteenth-century church of Notre Dame contains a famous wooden figure of the Madonna. Pop. 1000.

Rocambolæ, or Allium Scoredoprasum, species of Liliaceæ.

Roccella, see *ARCHIL*.

Rooh, St., see *ROQUE, St.*

Rooha, tn. of Urugnay, S. America, cap. of the dept. of Rooha, 105 m. N.N.E. of Montevideo. It was founded in 1793. The dept. has an area of 4280 sq. m. and a pop. of 82,800. Stock-raising is carried on and lead, iron, and copper are mined.

Rochdale, co. and municipal bor. of Lancashire, England, on the Roch, 11 m. from Manchester and 200 m. from London. It lies on the E. rim of the Lancashire industrial area, with the moors and hills of the Pennines rising to the E. and W. The setting of the tn. centre is impressive. Notable buildings are the Gothic tn. hall, built 1866-71, containing some striking examples of modern stained glass, the art gallery, the museum, library, infirmary, and sev. modern churches of all denominations. On the hill behind the tn. hall is the par. church of St. Chad, the fabric dating back to the fourteenth century. There are technical schools and high schools, five large parks, and about 144 ac. of recreation grounds and playing fields. Industries include cotton spinning and weaving, dyeing, finishing and bleaching, textile engineering, rubber and cable making, felt-mongering, leather manufl., and paper and paper-tube making. There are important cattle markets, and the corporation controls the large covered market hall. The Byron family became owners of the manor of R. in 1462, and retained it, except for a short period during the Commonwealth, until 1823. In the sixteenth century R. was famous for its hats and cutlery, but it did not become a bor. until 1856. R. is known as the bp. of the Co-operative movement in its modern form (see under *CO-OPERATION*). It was also the home of John Bright, who is buried here, and whose statue stands on the park slopes, and the bp. of Grace Fields. An old R. custom is the gathering of rushes in Aug. with which to cover the cold stone floors during the winter, and this ceremony of carrying the rushes to the church is still commemorated in 'Rushbearing Week,' the parallel of 'Wakes Week' of other tns. Pop. 87,000.

Rochdale Canal, in Lancashire and Yorkshire, England, extends from the Bridgewater Canal at Manchester to the Calder and Hebble Navigation at Sowerby Bridge, near Halifax. It has 78 locks and is 31 m. long.

Roche Abbey, ruined Cistercian abbey in Yorkshire, England, 2 m. S. of Malby. R. A. was founded from Fountains Abbey (q.v.) in 1147. Parts of the chancel, gateway, and transepts remain.

Roche, Alexander Ignatius (1861-1921), Scottish painter, b. at Glasgow. He studied art in Glasgow and Paris. He specialised in landscape painting in which some figure drawing was incorporated. In 1896 he moved from Glasgow to Edinburgh and developed portrait painting. He became an R.S.A. in 1900. R. is remembered for his frescoes in the banqueting hall of Glasgow municipal buildings, executed in 1900.

Roche Alum, see *ROCK ALUM*.

Roche, Sir Boyle (1743-1807), Irish

politician and soldier. In 1777 he was elected a member of the Irish House of Commons. A man of rare wit and humour which included some of the most famous 'bulls' on record, he won a great reputation. Made a baronet in 1782.

Roches, Mazo de la see **DR LA ROCHE**
Rocheschouart, Françoise Athenais de, see **MONTEPIN, MARQUISE DE**

Rochefort, town in the prov. of Namur, Belgium, 20 m S.E. of Dinant. It is noted for its quarries of red marble and lead mines and also for the remarkable caverns and grottoes existing in the neighbourhood. Pop. 3500.

Rochefort-Lucay, Victor Henri, Marquis de (1830-1913) known as **Henri Rochefort**, Fr. journalist and publisher in

of France on the Atlantic coast cap of the dept. of Charente Inférieure. Its industries include shipbuilding, saw milling, and the manuf. of briquettes and chemicals as well as sardine and tunny preserving and petroleum refining. The rearing of oysters and mussels and the exploitation of salt marshes are also carried on. Trade is mainly conducted by means of the port **La Pallice** which was inaugurated in 1891 to enable the largest vessels to approach **La R.** and large quantities of wine, brandy, fancy goods, skins, coal, and briquettes and furniture are exported annually. The chief buildings are the cathedral in massive Gothic style with a dome, the *hôtel de ville* resembling a fortress, the episcopal palace

RICHIEUX AT THE SIEGE OF LA ROCHELLE

A painting by Henri Motte

Paris and educated at the College of St. Louis. His first attempt at play writing in 1816 was a vaudeville (*Un Monsieur bien mis*). He followed up this success by writing a number of farces and vaudevilles. He gradually abandoned play writing for journalism and was attached to the staff of several prominent Parisian papers including the *Figaro*, the *Secur* and *L'Événement*. The vigour and irony of his criticisms brought R into conflict with several celebrities of the time and he fought a number of duels. Eventually he ed. his own paper *L'Intransigent*.

Rochefort-sur-Mer, seaport of France in the dept. of Charente Inférieure near the mouth of the Charente, 127 m S.W. of Paris. Iron and copper founding and shipbuilding are carried on. There is trade in brandy, dairy products, wines, cattle, grain, and salt. **Pierre Loti** (q.v.) was b. in R. sur M. Pop. 29,500.

Rochefoucauld, see **LA ROCHEFOUCAULD**, **FRANÇOIS, DUC DE**

Rochelle, La, fortified city and seaport

with a library of 25,000 vols. and a museum and the arsenal. **La R.** is surrounded by ancient fortifications; there are three towers facing the sea, two of them dating from the fourteenth century. It was a Huguenot centre in the fifteenth and sixteenth centuries. **La R.** stood the siege of the duke of Anjou in 1573. **Richelieu** besieged it in 1627. It surrendered after great suffering in Oct. 1628. In the sixteenth and seventeenth centuries it was the centre of trade with **La Canada**. During the Second World War **La R.** was used as a U-boat base by the Germans and is such was frequently bombed by the Allies. Pop. 48,900. See *Le Vaux de Poitiers*, *La Rochelle autrefois et d'aujourd'hui*.

Rochelle Salt, or **Seignette's Salt**, tartrate of sodium and potassium ($\text{KNaC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$) discovered by **Seignette** of Rochelle. It is a colourless solid forming rhombic prisms, is soluble in water and possesses a saline taste. It is prepared by neutralising acid potassium tartrate with

sodium carbonate, and concentrating the solution until solidification is imminent, when it is allowed to crystallise. It is used in medicine as a laxative by itself, and also as an ingredient of the 'blue' powder in a Seidlitz combination. It is also a constituent of Fehling's solution, which is used in the estimation of sugars.

Rochers de Naye, one of the chief peaks of the Bernese Oberland Mts., Switzerland, with an altitude of 6710 ft.

Roches Moutonnées, bare, smooth, rounded rocks, so called from their supposed resemblance to sheep, which are the result of glacial action in former ages.

Rochester, John Wilmot, second Earl of (1647-80), Eng. courtier, b. at Ditchley, Oxfordshire, and educated at Wadham College, Oxford. After travelling abroad and serving in the navy against the Dutch, he became one of the profligate set at the court of Charles II. that included Buckingham, Sir Charles Sedley, and Henry Saville. R. was interested in literature, and was a patron of Dryden. He himself wrote numerous verses, in which he showed himself possessed of an agreeable power of lyrical and satirical composition, though many of his pieces are marred by their licentiousness. A fairly full ed. of his poems was pub. by J. Tonson in 1741; in 1926 they were ed. by J. Hayward. The fullest ed. of his poems is that of 1731-32. See lives by V. de Sola Pinto, 1935, and C. Williams, 1935.

Rochester, Viscount, see SOMERSET, EARL OF.

Rochester, city and port of Kent, England, on the Medway, 30 m. E.S.E. of London, of great historical interest. It began as a small and prosperous tn. in the Rom. occupation, and as it stands where the Dover Road (Walling Street) crosses the tidal Medway, it has played an important part in national as well as Kentish hist. Its importance dates from A.D. 604, when Augustine founded a bishopric (the third in the kingdom), and a church was endowed by King Ethelbert. A Norman cathedral and Benedictine priory replaced the Saxon church, and about the middle of the Norman period a strongly defended castle was built. The earliest charter is of 1165. There are important remains of the cathedral, priory, and castle. The W. doorway of the cathedral with its highly decorative carving is unique in England. Extension to the fabric was made possible by rich offerings to the shrine of William of Perth, a pious baker who was murdered close to Rochester in 1201 during the course of a pilgrimage. He was buried in the cathedral; miracles took place at his tomb, and he was canonized in 1256. Charles Dickens spent some of his childhood at Chatham (adjoining R.), and the last years of his life at Gadshill Place on the R.-Gravesend road. His writings incorporate a great fund of local associations, and the city is often regarded as the centre of 'Dickens Land.' There are notable churches, public buildings, and old houses. There are manufs. of agric. and other light machinery, and of gypsum

and cement products. Pop. 41,700. See R. F. Jessup, *Travel Association Information Sheet No. 40*, 1946.

Rochester: 1. City of New York, U.S.A., co. seat of Monroe co., on the Genesee 67 m. E.N.E. of Buffalo. The city is well laid out, with boulevards, parks, and other open spaces, and possesses a univ. Manufs. comprise clothing, boots and shoes, furniture, cigars, carriages, machine-shop products, photographic apparatus, and optical appliances. Pop. 325,000. 2. City of Stratford co., New Hampshire, U.S.A., on the Corbisco R.; has various manufs. Pop. 12,000. 3. City and co. seat of Olmsted co., Minnesota, U.S.A.; has grain elevators and stock-yards, as well as foundries, machine shops, and flour and grist mills. Pop. 26,300. 4. Ror. in Beaver co., Pennsylvania, U.S.A., about 25 m. N.W. of Pittsburgh. It is in the coal and oil region. Pop. 7400.

Roche-sur-Yon, La, formerly *Napoléon Vendée*, tn. of France, cap. of the dept. of Vendée, on the Yon, 45 m. from Nantes. The castle of La Roche was the scene of many battles in the Hundred Years war and in the wars of religion, and the stones from its ruins were used by Napoleon in 1801 (when he made La Roche the cap. of the dept.) for the erection of the gov. buildings. The tn. is a market for farm produce, and has flour-mills. Pop. 18,100.

Rochet, narrow-sleeved linen garment, the lower part being of lace, worn under the *mozetta* as part of the choir dress by prelates who are not members of religious orders. To wear it not covered by the *manteletta* is a sign of jurisdiction.

Rochford, tn. of Essex, England, 3½ m. N. of Southend; it was the bp. of Anne Boleyn. Pop. 18,800.

Rochlitz, tn. of Saxony, Germany, 16 m. N.W. of Chemnitz. It has textile and other manufs., and porphyry is quarried. Pop. 6300.

Rock (O.F. *roke*, probably of Celtic origin), in common speech, large mass of hard earth-forming material; in geology all masses forming part of the earth's crust, whether they be hard or soft. Rs. are primarily classified according to their origin as sedimentary, igneous, or metamorphic. *Sedimentary* Rs. are those which have been deposited in layers by the action of water; *igneous* Rs. are those which have solidified from the molten state; if ejected at the surface of the earth they are known as volcanic Rs., and if occurring deep down below the surface they are termed plutonic Rs.; *metamorphic* Rs. are those which were originally sedimentary or igneous, but have undergone alteration of form through heat, pressure, etc. The study of the arrangement and composition of Rs. is part of the science of geology. Sedimentary Rs. often contain fossilised remains of animals and plants; these phenomena are classified and studied under the name of *paleontology*. The description of R. material itself comes under petrology. Many Rs. are composed of varying proportions of a number of simpler substances known as minerals and studied under the head of mineralogy. If of crystalline form, these minerals are

further studied in the science of crystallography.

Rockall, or **Rokol**, uninhabited rocky is., part of a reef in the Atlantic, 289 m. W. of Arduamurchan Point in Scotland, and 268 m. from Bloody Foreland, Ireland. It is 250 ft. in circumference, and appears to be the highest peak of a submerged mt. range, possibly part of a drowned land mass. The is. supports a famous colony of guillemots. It lies in an area extremely dangerous to shipping, and is otherwise well known as giving its name to a weather forecast (*q.v.*) area of the Air Ministry meteorological service.

Rock Alum, or **Rochs Alum**, alum of good quality, said to have been first prepared at Rochs or Roha (Edessa).

Rock Asphalt, see **ROADS, Construction**.

Rockaway Beach, summer resort of New York, U.S.A., with a long beach, on the S. coast of Long Is., 17 m. S.E. of Brooklyn.

Rock-basins, concave depressions in rock, sometimes of great extent, and often filled with water. Many lakes in the highlands of Scotland and other mountainous regions fill R. The most generally accepted theory as to their origin is that they were formed by the action of ice during the glacial period. The effect of a glacier flowing down a valley would be to erode the rocks over which it flowed, shearing masses from the tops of the hills and causing the striated effect generally associated with ice action. It is also suggested that where the configuration of the valley caused the massing of the ice in a narrower and deeper layer, the rock would be scooped out in a concavity whose general features would be that of a rock-basin. It is only fair to add that many prominent geologists do not approve of the glacial theory, and do not regard the formations known as R. as a general type with a common characteristic.

Rock Channel, S. fairway into the mouth of the Mersey, along the N.W. coast of Wirral Peninsula, Cheshire. It is 5 m. long and about $\frac{1}{2}$ m. wide.

Rock-climbing is really part of mountaineering (*q.v.*), but is practised independently in the Brit. Isles, where climbing on snow and ice are rarely available, except in Scotland in winter. R.-C. in the Brit. Isles is more artificial than mountaineering proper, as it usually involves the choice of a way up the 'difficult' side of a mt., instead of the line of least resistance to the summit (the summit being the goal in both cases). The good rock-climbers, however, have the merit that once embarked on they must be followed, no alternative easy way being available. The chief centres for the sport are the Eng. Lake Dist. (notably Scafell, Great Gable, Pillar, Langdale Pikes), N. Wales (notably Lliwedd and Clogwyn Dy'r Arddu on Snowdon, the Glyders and Tryfan), and Scotland (notably Glencoe, Ben Nevis, the Cairngorms, the Torridons, and Skye). Historically R.-C. began during the last century with 'gully' climbs, where gymnastic strength rather than delicate balance is required; later rock-climbers came to consider *détés* rather than the often wet and dirty gullies

as the most favourable route for attack. In the last few years the adoption of 'rubbers' in dry weather instead of nailed boots has raised the standard of what is possible, and climbers have worked out many exposed routes on the actual rock faces. The rope is used chiefly to make possible for the rest of the party anything that the leader can climb, the principle being to divide the rock-climb into pitches; at the top of each pitch the leader must be securely placed himself, and able to belay the rope round a firm piece of rock while he brings the second up; when the second is secure the leader climbs the next pitch, the second brings up the third, and so on; occasionally the rope can be used, too, to safeguard the leader, e.g. on an exposed traverse, or for a difficult step when the second is near him. The various available courses have been classified in great detail. R.-C. has gained enormously in popularity in recent years, and was used in the Second World War as part of the training of col.andos and other special troops. A vogue for R.-C. has also sprung up on the Continent, accompanied by widespread use of pitons, slings, snaplinks, and other devices, which have made it possible to climb overhangs and holdless vertical walls and faces. Opinions differ as to whether such methods are compatible with R.-C. as a sport.

R.-C. in the Brit. Isles, owing to weather conditions and shortness of expeditions, is much less dangerous than mountaineering; but accidents are frequent, and any would-be climber must serve an apprenticeship with a leader of experience. Proficiency in R.-C. is of the utmost value to the mountaineer, and may be a great safeguard to the whole party on any expedition; it is indispensable in many of the major climbs in the Alps, Rockies, and Himalayas. See the guides, pub. by and the journals, and bulletins of the Climbers' Club, Fell and Rock Club, and the Scottish Mountaineering Club; also J. E. Q. Barford, *Climbing in Britain*, 1916; G. W. Young, *Mountain Craft* (5th ed.), 1946; W. H. Murray, *Mountaineering in Scotland*, 1947; and G. D. Abraham, *British Mountain Climbs*, 1943.

Rock Drills, see under **INDUSTRIAL TOOLS**.

Rockefeller, **John Davison** (1839-1937), Amer. capitalist, b. at Richford, New York, and educated at schools in Cleveland, Ohio. Later he secured a job as an assistant book-keeper in a commission house. Although his salary was small he managed to save enough by 1868 to buy a share in a produce firm. The production of petroleum had become a big industry in the U.S.A., and Samuel Andrews invented a process for cleaning the crude oil, or 'oil refining.' R. and his partner backed Andrews, and, in 1867, the firm became Rockefeller, Andrews & Flagler. By 1870 they had become the leading oil firm in Cleveland, the capital of the firm now organised as the Standard Oil Company (*q.v.*) being \$1,000,000, R. holding nearly three-fourths of the shares.

This new corporation began rapidly buying up and consolidating smaller concerns. By 1880 it had control of about 90 per cent of the Amer. oil refineries. The

J. D. ROCKEFELLER, SENIOR

Standard Oil Company became known as a ruthless competitor. In 1882 R. founded the first of those gigantic combinations which have since become known as 'Trusts.' The trustified companies were able to cut overhead costs and maintain a certain level of prices. The Standard Oil Trust was capitalised at \$100,000,000. Various decisions against it were pronounced by state courts, but were overruled. Finally, in 1911, the U.S. Supreme Court ordered the dissolution of the trust on the ground that it was a combination in restraint of trade under the Sherman Anti-Trust Law. Meanwhile R. had become the world's richest man. He not only had a vast fortune out of oil, but owned big ore-fields in Minnesota, extensive coal-fields in Colorado, and also held large shares of stock in the railways and big blocks of bank stock. He retired from the presidency of the Standard Oil Company of New Jersey in 1911, turning over all his business affairs to his son, John D., junior.

The suits against all companies and the exposure of some of the business methods employed inflamed public anger and R. for some time was probably one of the most hated men in the country. But his huge gifts to science, education, and public health and favourable press reports gained him popularity in his later years. He became indeed a classic Amer. 'character,' personifying the successful business magnate. To charities and educational institutions he gave in his lifetime over \$500,000,000. See also under STANDARD OIL COMPANY. See lives by J. T. Flynn, 1933, and A. Nevins, 1941.

Rockefeller, John Davison, junior (b. 1874), Amer. industrialist and philanthropist, only son of J. D. R., b. in Cleveland, Ohio, U.S.A., and educated at Brown Univ. He entered his father's business, and soon became his leading assistant in

the oil and coal enterprises. When his father retired all his affairs were put into the hands of his son, who devoted much time to superintending the gifts made by the various R. foundations. Among his lavish gifts was a large sum towards the restoration of Rheims cathedral. In 1946 he gave the United Nations land, worth about £2,000,000, as a site for its buildings in New York.

Rockefeller Foundation, with kindred organisations endowed by John D. Rockefeller (q.v.), the oil millionaire, wealthiest public trust in the U.S.A. The R. F. proper was chartered in 1913 for the stated purpose of benefiting all mankind. It has not only devoted its beneficences to America, but to countries all over the world, aiding them to fight plagues like yellow fever, malaria, hook worm disease, and endowing medical colleges and nursing institutions. In 1949 assets of the R. F. proper amounted to \$125,767,836, \$383,234,492 having been expended since the foundation was instituted. The original endowment was \$182,314,480. The General Education Board, also endowed by Rockefeller, has given over \$282,466,599 to schools and colleges. The Rockefeller Institute for Medical Research, also heavily endowed, has conducted extensive investigations in medicine and surgery. Its laboratories are among the finest in the world and, with its rich resources, it is enabled to give to researchers extensive facilities.

Rocket, term applied to sev. plants of different genera all belonging to the family Cruciferae. *Cakile maritima*, the sea-rocket, grows on the coasts of Britain; it has a long tap-root and fleshy leaves. The two Brit. species of *Barbarea* are known as yellow-rocket or winter-cress, and the one Brit. species of *Hesperis* is also a R.

THE 'ROCKET'

Rocket Engines, see under AERO-ENGINES.

'Rocket', The steam locomotive built by George Stephenson (q.v.) which in Oct.

1829 won the famous Rainhill competition, and so decided the use of locomotives on the Liverpool and Manchester Railway. The design of locomotives changed little from that of the 'R.' until the 1870s.

Rockets. Invented by the Chinese about A.D. 1200, the rocket became well known in Europe soon afterwards, both as a firework and as a spectacular but erratic weapon of war. Its serious military development was begun in 1801 by Sir Wm. Congreve, stimulated by reports of its effective use against the Brit. by Hyder Ali in Mysore, India. As a result of Congreve's experiments war R. with ranges up to 3000 yds. and weights of up to 42 lb. became extensively employed in many countries, and for a while challenged the crude guns of the period: but improvements in artillery rendered them obsolete by 1850. For the next seventy years the main use of the rocket was in pyrotechnics (q.v. and see below) and life-saving apparatus.

In the twentieth century interest in the rocket was revived when it was realised by Zolotovskv, Goddard, Oberth, and others (see *Space Travel* below) that rocket propulsion was effective in a vacuum and that enormous improvements in performance would be possible if the old gunpowder type propellants were replaced by liquid fuels. The development of the liquid-propellant rocket was commenced in the U.S.A. around 1920 by R. H. Goddard and in Germany from 1927 onwards by the Verein für Raumschiffahrt ('Society for Space Travel'). The first actual flight of a liquid-propelled rocket was made by Goddard at Auburn, Massachusetts, in March 1926. Progress was slow owing to lack of support and general scepticism, except in Germany, where after 1933 the work of the Verein für Raumschiffahrt was continued by the army at the great research station at Peenemünde, on the Baltic, and elsewhere. This resulted in the long-range projectile V.2 (V.4) and many other guided missiles and rocket devices. Considerable work, though on a much smaller scale, was conducted by the Allies during the Second World War in the field of solid-propellant R. for short-range bombardment, A.A. defence, etc. At the close of the war a wide variety of rocket weapons existed, many of a revolutionary nature. Extensive research, particularly into the problem of the long-range guided rocket, is now being carried out in many countries. The Centre for Brit. Commonwealth research will eventually be the Anglo-Australian range near Adelaide. It extends across the desert and on to the Indian Ocean, so that projectiles with ranges up to 3000 m. may ultimately be tested. It is still convenient to divide R. into the two classes of solid- and liquid-propelled, and the uses of the various types are listed below.

Solid Propellant.—Although solid-propellant R. have been made with weights of well over 1 ton, and ranges of 120 m., most R. in this category are relatively small and of short range. They include the familiar pyrotechnic and life-saving devices, and their most important military

application has been as recoilless projectiles. Since the rocket provides its own propulsion, it needs only the lightest of launching gear, and is therefore at an enormous advantage over conventional artillery. It has thus become possible for aircraft to carry the equivalent of 6-in. guns, or for one man to handle and fire a weapon (e.g. the anti-tank Bazooka) as

Imperial War Museum. Crown copyright

V.2

A rocket leaving the firing table during experiments conducted by the British Army Special Projectiles Operations Group, Cuxhaven, Oct. 10, 1945

powerful as a small field-piece. Although such R. have a relatively poor accuracy, this is not always a disadvantage and massed rocket-projectors are a very efficient means of laying down barrages for assault purposes.

Rocket torpedoes and rocket-accelerated bombs have also been developed, the latter to give increased penetration. Solid-propellant units have been widely

employed for the assisted take-off of aircraft (see below).

Liquid Propellant.—The modern liquid-propellant rocket employs two fuels stored in separate tanks, and forced into the motor by pumps or gas pressure. Its thrust, unlike that of the solid-propellant rocket, can thus be regulated or reduced to zero at any time. The powers developed are also very much greater (e.g. up to 600,000 h.p. in the case of V.2). Attempts have been made to develop R. using a single propellant, which would greatly simplify design, but only one 'monopropellant,' concentrated hydrogen peroxide, has been successfully used on any scale. The best-known fuel for bi-propellant R. is the mixture of alcohol and liquid oxygen used in the V.2, first fired at Peenemünde in July 1942, and used operationally against London, Belgium, and Holland from Sept. 1941 until the end of the war. About 2000 crossed the Eng. coast, and some 1230 fell in the London area. Its maximum speed was about 3600 m.p.h., and with 1 ton of explosive its range was over 200 m.; V.2s fired vertically have reached altitudes of 115 m. Of the rocket's total mass of 12½ tons, 8½ tons were propellant, which it consumed in about 1 min. It was steered in flight by small vanes in the exhaust jet, controlled by a mechanism which slowly turned the rocket from its initial vertical ascent to an angle of 45° with the horizontal, and cut off the power when the missile had attained the speed necessary to give it the required range. The large external fins served merely to keep the rocket (now travelling as a free projectile) on the correct course when it re-entered the dense lower atmosphere. The total duration of flight for the 200 m. was about 5 min. V.2 may be regarded as the prototype of the long-range rocket of greatly improved performance, which may eventually replace the heavy bomber. For many missions the rocket is more economical than the bomber, and it is practically immune from interception. At the close of the Second World War the Gers. were considering a transatlantic missile with a maximum speed of 8000 m.p.h. This would have been a two-stage rocket, the upper component being a winged V.2 which would be 'boosted' into space by a much larger rocket, jettisoned as soon as its fuel was exhausted. This principle of the 'step-rocket' will play an important part in future development, since by using a sufficient number of 'steps' any desired final speed can be attained.

Numerous smaller guided missiles were developed by the Gers. during the Second World War for various purposes, such as A.A. defence and attacks against shipping. These R. were winged and capable of speeds in the sonic region: when controlled by radio and fitted with proximity fuses they would have been deadly weapons against aircraft. They offer the only conceivable form of defence, and that a slim one, against the long-range rocket. Such missiles may also be expected in due course to replace the heavy guns on battle-

ships: as they could be launched from quite small vessels they might in fact render the large capital ship superfluous. Because of their short endurance R. have had only limited application for aircraft propulsion. One pure rocket fighter did, however, appear in the Second World War, the Ger. Me. 163, burning hydrogen peroxide and a mixture of hydrazine hydrate and methyl alcohol. The maximum speed was nearly 600 m.p.h., and though the powered endurance was only 12 min. this could be extended by gliding. Its enormous rate of climb (over 10,000 ft. a minute) made continuous patrols unnecessary, and it was planned to keep the aircraft on the ground until the enemy bombers were a few miles away, when it would climb almost vertically to intercept them. Such a machine may be regarded as a half-way step to the unmanned, radio-controlled guided missile.

The chief aeronautical use of R. has been for assisted take-off for heavily loaded aircraft. This technique is of considerable economic importance, since it would make higher payloads and ranges possible; it may become standard for the large jet aircraft of the future.

As the rocket provides the only means of leaving the earth's atmosphere, it is now extensively used for very high altitude research, and numerous missiles have been built to carry scientific instruments to altitudes of 200 m. or more. Some of these operate radio transmitters so that observations can be continuously recorded at ground stations, and techniques have now been evolved to return the instruments safely to earth. Much has already been learned about cosmic rays and extra-terrestrial radiations which are shielded by the atmosphere, and cannot be observed in any other way.

The very heavy fuel consumption when chemical propellants are employed makes it appear unlikely that R. will be used for long-range passenger transport, though if it proves possible to utilize atomic energy for rocket propulsion this objection may be overcome, and commercial speeds in the range 10,000–20,000 m.p.h. may ultimately be expected. The most significant future use of the rocket, however, may not lie among its 'terrestrial' applications, but its employment for the propulsion of interplanetary spaceships.

Space Travel.—Interplanetary flight has been the subject of literary speculation for centuries, but only in recent times has it become possible to indicate solutions of the many problems involved. Chief among these are the need for a form of propulsion which will operate in airless space, and a supply of energy sufficiently great to overcome the earth's gravitational attraction. The rocket whose efficiency in vacuum is considerably greater than in air, automatically fulfils the first requirement, and may in principle fulfil the second. Realisation of this fact (notably by Goddard in the U.S.A. and Oberth in Rumania) was directly responsible for the great interest in R. which began in the 1920s, and culminated in the

spectacular developments of the Second World War.

To escape from the earth a rocket must attain a speed of 11.2 km./sec. (25,000 m.p.h.), after which it would travel on into space with no further expenditure of power. Attainment of such speeds with chemical propellants demands a multi-stage or 'step' technique, in which a large rocket carries a smaller one as its payload, and is jettisoned when its fuel is exhausted. The small machine may carry yet a third stage, and with a sufficiently large number of steps any final speed may be reached at the cost of a large initial mass. Since Mars and Venus may be reached with velocities only about 3 km./sec. greater than that needed to escape from earth, such machines could have interplanetary ranges.

Two solutions have been proposed to overcome the difficulty of the enormous size of R. required to carry sufficient food, air, etc., to enable men to make such voyages. A rocket reaching a horizontal speed of 7.9 km./sec. (18,000 m.p.h.) just outside the atmosphere would continue to circle the earth indefinitely like a second moon, and if other R. were sent up into the same orbit they could be brought to rest, by steering jets, with respect to it, and so could transfer their surplus fuel (as in aircraft 'flight refuelling'). In this way the tanks of the first machine could be replenished, and as it would now need an additional speed of only 3.3 km./sec. to reach the 11.2 km./sec. 'escape velocity,' journeys to the moon and nearer planets would then become possible.

Such 'orbital' techniques may have other extremely important applications, and the construction of artificial satellites or 'space stations,' both for refuelling interplanetary vessels and for scientific research, has received much attention. They would be ideal meteorological and astronomical observatories, and appear to provide a complete solution to the otherwise intractable problem of world-wide radio and television coverage. Their military value is also obvious, and was studied by the Gers. before 1945, and, later, by the U.S. Gov. Even with these techniques, however, interplanetary journeys would still require enormous quantities of fuel, and the practical development of 'astronautics' awaits the harnessing of atomic energy. A few pounds of fissile material would, in theory, suffice to propel sev. hundred tons to any point in the solar system. Attempts will probably be made to produce nuclear reactors, operating at very high temps., which will accelerate jets of a light gas (e.g. hydrogen), and so provide a propulsive thrust. The other problems of space flight, though numerous, are of a subsidiary character, and many have already been solved in the development of high-altitude flying. Two possible hazards, meteors and cosmic rays, have been greatly exaggerated: statistical analysis has shown that the risk of meteor collisions is very small. A condition which may prove dangerous in space is that of 'weightlessness.' This would obtain

for the whole duration of any journey apart from the few minutes of take-off or landing, and *not* merely at the balance-point between opposing gravitational fields. However, if necessary an effect of apparent gravity could be produced by giving the ship a slow spin about its axis. Centrifugal force would then give an impression of normal weight.

Typical orbits for journeys to Mars and Venus are shown in the diagram. These are the paths requiring the least fuel expenditure, since they make the greatest use of the planets' existing orbital velocities. The duration of the journeys would be approximately: Earth to Venus, 146 days; Earth to Mars (mean distance),

THE ORBITS FOR JOURNEYS TO MARS AND VENUS

The most economical orbit ('cotangential ellipses') and the approximate speeds of the planets and of a spaceship at the beginning and end of its journey are shown. It will be seen that the 'transfer velocities' to change from one orbit to another are relatively small, i.e. 3 km. sec.

258 days. The more direct and much quicker paths would require enormously greater fuel expenditure. The exploration of the solar system, and the estab. of suitably heat- and air-conditioned bases on many of the planets, may well be by far the most important outcome of the harnessing of atomic energy. Its consequences in every field of life and philosophy will be matched, if at all, only by the revolution in human thought following the discovery of the world in Renaissance times. Rock-fish, see WRASSE.

Rockfoil, see SAXIFRAGE.

Rockford, city and co. seat of Winnebago co., Illinois, U.S.A., on the Rock R. It is one of the most important industrial cities of Illinois, and manufs. furniture, agric. implements, hosiery, and foundry and machine-shop products. Water power for industry is obtained from the Rock. Pop. 84,600.

Rockfowl, Guinea and Cameroon, see under PICATHARTES.

Rockhampton, tn. of Queensland, Australia, in Livingstone co., on Fitzroy R., 420 m. N.W. of Brisbane. Precious metals are mined and gems found. Meat preserving is a thriving industry. Pop. 36,000.

Rockingham, Charles Watson-Wentworth, second Marquess of (1730-82), Brit. statesman, educated at Westminster School and St. John's College, Cambridge. He was made earl of Malton in 1750 and in the same year succeeded to the marquise. He was a Whig, and held sev. minor offices from 1751 until 1762; but three years later became Prime Minister for a short time and repealed the Stamp Act. He led the opposition in the House of Lords until March 1782, when he again formed an administration. His zealotness led him into blunders, and he was an ineffectual leader. See memoir by Lord Albemarle, 1852.

Rocking Stones, large boulders or rocks, so resting on their bases that they move gently to and fro when agitated by the hand. There are sev. famous R. S. in Cornwall, in Wales, and in Ireland. The Logan rocking stone in Cornwall is one of the largest and best known in England. R. S. have been used for purposes of divination at various times. They are of interest to geologists as examples of differential weathering and denudation.

Rock Island, city and co. seat of Rock Is. co., Illinois, U.S.A., on the Mississippi. It has manufs. of lumber and agric. implements. On an is. in the riv. is a great arsenal and armoury. Pop. 38,000.

Rockland: 1. City of Maine, U.S.A., co. seat of Knox co., situated on Penobscot Bay, 88 m. E.N.E. of Portland. It has developed into a fashionable seaside resort. Shipbuilding and the manuf. of cotton and iron and steel products are the leading pursuits. Pop. 8900. 2. Township of Plymouth co., Massachusetts, U.S.A., 20 m. S.E. of Boston; manufs. boots and shoes, and tacks. Pop. 8100.

Rockland Lake, vil. of Rockland co., on the Hudson R., about 30 m. from New York. It is near Rockland Lake, a large sheet of fresh water from which 300,000 tons of ice are annually cut.

Rockling, term applied to small fishes of the genus *Onus* or *Motella* in the cod family Gadidae. Sev. species are found on Brit. coasts.

Rock Melon, see CANTALOUPE.

Rock Monday, see FLOUGH MONDAY.

Rock Oil, see PETROLEUM.

Rock Plants, those which thrive best

among stones or rocks in exposed places. Good drainage is essential, because many alpine, which make admirable R. P., while not injured by severe cold and strong sun, cannot withstand excessive moisture. A simple way of making a rock garden is to dig out soil to a depth of about 18 in., putting a layer of broken bricks for drainage. This should be filled in with a good light soil intermixed with sand and peat, and arrange rough pieces of rock or sandstone and there should be plenty of soil for the plants to root freely. Dwarf plants and other suitable species of saxifrage, sedum, candytuft, lithospermum, dianthus, primula, anemone, etc., should be chosen. See R. Farrer, *The English Rock Garden*, 1919; C. Elliott, *Rock Plants*, 1935; and G. A. R. Phillips, *The Rock Garden and Alpine Flowers*, 1947.

Rock Rabbit, see under HYRAX.

Rock River, riv. of the U.S.A., rising in Wisconsin and flowing into the Mississippi near Rock Is. It is 330 m. long.

Rock Rose (shrubs), see CISTUS.

Rock Salt, see SODIUM.

Rock Sculpture and Engraving. Its distribution ranges over many countries, and broadly speaking varies in date from the Upper Palaeolithic to the Bronze Age. The R. S. and E. of early man may represent a magic protection to his home; it is certainly linked in some cases with hunting economy and the influencing of food supplies; and again elsewhere there is the possibility that this decoration marks a folk-gathering place or even a cult-shrine or religious sanctuary. In the Sahara there are rock engravings which seem to date from the end of the Palaeolithic period down to the present day. In S. Africa the sacred animals of Egypt are represented together with those of Central Africa, and it is thought that the bushmen were still practising this form of art in the nineteenth century. The most famous sculptures and engravings are those in caves in various parts of S. France (see LASCAUX CAVES) and Spain; their distribution is governed by the presence of suitable limestone caves. Animals such as the horse, rhinoceros, bison, and mammoth, together with a few tectiform and simple linear patterns, are found, and all belong to the Upper Palaeolithic. Rock engravings of the Mesolithic period with naturalistic representations of animals are known on the coast of Norway. In Sweden, N. of Gothenburg, are rock carvings of the full Bronze Age which include ships, agriculturalists using an ox-drawn plough, and a fight between armed men on horses. The bibliography is extensive and much of it consists of invaluable foreign studies. See in general M. C. Burkitt, *Prehistory*, 1925, and the various vols. pub. by the Institut de Paléontologie Humaine, Paris.

Rock-soap, or Saponite, black or nearly black mineral consisting of a mixture of aluminium silicate and iron oxide. It is a soft, friable substance with a greasy touch, and is used for the preparation of artists' crayons. Deposits are found in Saxony, Bohemia, Skye, and Autrin.

Rock Springs, city of Sweetwater co., Wyoming, U.S.A., 258 m. W. of Laramie. Lignite is found near here. Pop. 9800.

Rock Temples, religious buildings hewn out of solid rock, found in many parts of the world, notably in India, Ceylon, Egypt, Arabia, and China. There are also some interesting examples in the U.S.A., one being in Missouri near Salt R. Examples are to be found in India at Ellora and Elephanta, in Ceylon at Dambulla, in Egypt at Abu-Simbel (Ipsambul), in Arabia at Petra.

Rockville, city of Tolland co., Connecticut, U.S.A., 14½ m. N.E. of Hartford. It manufs. woolen and silk goods. Pop. 7600.

Rockwell Test, see METALLURGY, Metal Testing

Rocky Mount, tn. in Edgecombe co., N. Carolina, U.S.A., 50 m. N.E. of Raleigh. It has cotton mills and lumber works. Pop. 25,600.

Rocky Mountain Goat (*Haploros montanus*), a member of the *Bovidae* which occurs in N. America. It is intermediate in position between a goat and an antelope, the latter term is, however, used popularly and is without any precise zoological significance. The R. resembles a goat in size and has long white hair with woolly undercoat, black, hollow horns, compressed at the base, and short ears.

National Film Board Canada

THE ROCKIES - ATHABASCA GLACIER, JASPER PARK, ALBERTA

In the foreground, descending in zigzag formation, are men of the 101st Scouts Regiment in training during the Second World War.

Rocky Mountains, most important mt. system in N. America, traversing Mexico, Arizona, New Mexico, Utah, Colorado, Idaho, Wyoming, Montana, Canada, and

Alaska. It is the watershed of the Amer. continent, reaching from the Yukon R. in Alaska to New Mexico in the S., a distance of 2200 m. The chief ranges are Coeur d'Alene Mts., Bitter Root Mts., Salmon R. Mts., Big Horn, Black Hills, Crazy Mts., Shoshone Mts., Wahsatch Mts., Sawatch and Elk Mts. The chief peaks are Pike's Peak, Long's Peak, Gray's Peak, Mt. Harvard, Mt. Stephen, Blanca Peak, Mt. Massive (14,418 ft.), and Mt. Elbert (14,431 ft.), the highest of the system in the U.S.A. In Canada the highest peak is Mt. Logan (19,850 ft.) and in Alaska Mt. McKinley (20,300 ft.), and the volcano, Mt. St. Elias (18,008 ft.) In Colorado there are more than forty peaks over 14,000 ft. high. From this dist. northward the R. M. decrease in altitude as they contract in breadth. In the U.S.A. the N. group of mts. is divided from the S. by a broad depression in Central Wyoming, through which runs the Union Pacific railroad. In the system of the R. M. the following rise. Arkansas, Colorado, Columbia, Missouri, Platte, and Rio Grande. Among its special features are its gorges, canyons, and parks. Through the Kicking Horse valley pass the Canadian Pacific Railway crosses the R. M. at an altitude of over 5000 ft. A motor road crossing the range by the Vermilion pass also rises above 5000 ft. See also under CANADA, UNITED STATES OF AMERICA. See F. S. Smythe, *Rocky Mountains* 1918.

Rocky Mountain Sheep, see BIG HORN SHEEP

Rococo (Fr. *rocaille*, rock-work), in art. term denoting a florid debased form of ornament which succeeded the style favoured by Louis XIV and XV, and which exaggerated the chief features and peculiarities of that fashion. It is chiefly remarkable for the lavish abundance of its details, which are sometimes thrown together without propriety or logical connection. Scroll and shell ornaments are frequently used and sometimes rock-work pavilions, birds and fishes combined with enormous flowers. Derivatively, the term has come to mean bad taste in design or ornament generally, though good examples of R. exist.

Rocroi, tn. of N. France in the dept. of Ardennes, 2 m. from the Belgian frontier. It was besieged by the Spaniards in 1643, but they were defeated by the Fr. under Condé. R. was first fortified in the sixteenth century. The present fortifications, almost surrounding the tn., were built by Vauban. Pop. 2400.

Rod, Pole, or Perch, unit of lineal measure, equivalent to 5½ vds., or 16½ ft. It is largely employed in surveying, whilst a square rod, or rood (16½ × 16½ = 272¼ sq. ft.) is the usual measure employed in estimating brickwork.

Rode, Helge (1870-1937), Dan. poet, dramatist, and literary critic, b. in Copenhagen, son of a. n. of letters. His poetry has a religious quality and reveals him as a champion of modern mysticism. He was an opponent of materialism and of Darwin's theory of natural selection. Among his pubs. were *Heide Blomster*

(1892); *Den Rejsende* (two series; 1900, 1929); *Solsagn* (1904); *Komedier* (1905); *Ariel* (1914); *Krig og Aand* (1917); *Moderen* (1921); *Theatret* (1922); *Regenerationen i vort Aandsliv* (1923); *Udvalgte Kritiker* (1923); *All er godt* (1928); and *Den vilde Rose* (1932).

Rodenbach, Georges Raymond Constantin (1855-98), Belgian poet and novelist, b. at Tournai, and educated at Paris and Ghent Univ. He became a barrister, spending most of his life in Paris, where he died. His main interest was poetry, however; he was a follower of the symbolist-impressionist school, and his poetry gives a fine impression of the passive melancholy of the Flem. countryside, which he knew well. Many of his works are idealisations of his youthful experiences of Flem. life. He gave a vivid study of Bruges in his novel *Brugis-la-Morte* (1887). See lives by K. Glaser, 1917, and P. Maes, 1926.

Rodentia, large order of mammals, the largest of which does not exceed the size of a small pig, and many are among the most diminutive quadrupeds. The brain is relatively small, and the intelligence low. As a whole, their diet is vegetarian, and the characteristic dentition is so specialised that the teeth are an invariable guide to the identification of a rodent. There are only two kinds of teeth, incisors and grinders, and except in the rabbit and allied forms, which have an additional pair of rudimentary incisors, only two incisors are present. These have open roots, and continue to grow throughout the animal's life, being kept always sharp by the dentine, which forms the greater part of the tooth, being worn away more rapidly than the harder enamel which is left as a sharp front edge. Many R. are burrowers, some aquatic, and some arboreal, and many hibernate. Among the R. are the most destructive of man's enemies. Typical examples are the rats, mice, and squirrels.

Rodent Ulcer, form of progressive or 'gnawing' ulcer (hence the name 'rodent'), usually occurring near the eye, nose, or ear. The growth is malignant (cancerous), but is very slow in progression, taking years to advance to a dangerous degree. All kinds of tissue may be involved, but the cancer does not disseminate to other parts of the body, the ulceration being continuous throughout its course. The most certain treatment is excision of the part if that be possible. A large measure of success has attended the application of X-ray treatment to this form of tumour, especially where no great depth of tissue is involved. Large doses as measured by Sabouraud's pastilles are applied at fairly long intervals. Radium treatment is also effective; in the early stages good results are obtained by the use of carbon dioxide 'snow'.

Roderic (d. 711), last Visigoth king of Spain; he murdered, and usurped the throne of, Witiza in 710. His reign was very short, but is memorable as the epoch of the termination of the Gothic and the beginning of the Arab domination in Spain. He was defeated by the Arab

or Saracenic forces under Tarik which had invaded Spain to help Witiza's sons to regain the throne, in 711, at Xeres on the banks of the Guadalete, and was probably either slain in battle or drowned in his flight. He is the hero of Scott's *Vision of Don Roderick* and Southey's *Roderick the Goth*. See A. H. Krappe, *The Legend of Roderick*, 1926.

Rode-Saint-Genève, see SAINT-GENEVIÈVE-RODE.

Rodewisch, tn. of Saxony, Germany, 14 m. S.W. of Zwickau; it has manufs. of textiles and hardware. Pop. 10,000.

Rodez, tn. of France, cap. of the dept. of Aveyron. It has a Gothic cathedral, begun in 1277, and the remains of a Rom. amphitheatre. Cloth and linen are manu. factured. R. was the Rom. Segodunum. Pop. 20,400.

Rodin, François Auguste (1840-1917), Fr. sculptor and etcher, b. in Paris. At first he studied under Barre, but necessity drove him in 1864 to accept employment in the studio of Carrier-Bellasse, with whom he remained for six years. Here he acquired mastery of the technique of sculpture. After 1870, however, there was nothing to attract him in Paris; all art had been temporarily crushed by the siege. The following year he went to Brussels, where for six years he worked under Van Ryssbourg. Subsequently he returned to Paris, where most of his finest work was accomplished. Here he became the best-known and most successful sculptor of his day. His output reached prodigious proportions. Casts of his statues were purchased for collections all over the world. His most important works are on permanent view at the Musée R. in Paris, a building which was made available to R. at the height of his career. R.'s genius led him outside the old Gk. ideals. His modellines of the human figure are unsurpassed; the accentuation of muscles is characteristic; he produced a splendid depth of shadow, and the beauty of every curve was well brought out. At the same time the psychology of his subjects was expressed with a truth and conviction almost unparalleled in sculpture; the man's hands in 'The Kiss,' and the imprisonment of a hand or foot in the marble block in sev. of his pieces, are wonderful in their vivid portrayal of emotion and of spiritual significance. The influence of his work brought forth a school of vigorous naturalism, which has continued to inspire sculptors up to the present day. *Movement* is the pre-dominant feature of his sculpture. It lacks almost entirely the monumental calm of pre-classical Gk. sculpture, but is stable only in so far as it is a representation of arrested movement. The contemporary progressive school of sculpture has reacted strongly against R.'s conception of sculpture and has sought inspiration from primitive carving rather than the untiring observation of the human figure, which was the foundation of all R.'s work. He remains, nevertheless, unsurpassed in his power of vision and in the passionate humanity of his work, which has had a wider appeal than

that of any sculptor after his time. Some of his finest pieces are 'The Burghers of Calais' of which there is a replica in the Victoria Tower Garden, London. The brass 'St John the Baptist', 'Danald', 'The Thinker' (presented by Lord Gunthorpe to the Brit. nation 1901), 'The Hand of God', 'The Prodigal Son', and 'The Gate of Hell', a colossal inspiration after Dante's *Inferno*. He made busts of Hugo, Bastien-Lepage, Rochefort, Berthelot and Puvion de Lavannes. See lives by C. Black 1905, J. Cladel 1908, J. Kahn 1912, C. Maclair 1918, A. M. Ludovici 1926, E. Waldmann 1915, R. M. Pilske (Eng. trans. 1916), and Phaidon Press *Rodin* 1949.

Rodman, Thomas Jefferson (1815-71). A mer. military officer was b. at Salem, Indiana. He invented the R gun which is cast on a hollow core, the metal being cooled by a stream of water running through the inside.

LORD RODNEY

Rodney, George Brydges Rodney, first Baron (1719-92). Eng. sailor b. in London. He entered the navy in 1742 and in ten years rose to the rank of captain. In 1774 he took part under Hawke in the action against the Fr. under De la Potherie off Rochelle and was highly commended. He was promoted rear-admiral in 1779 and in July of that year bombarded Havre and destroyed the flotilla designed for the invasion of England. At the close of 1779 when he had been advanced to the rank of admiral he accepted the command of the Leeward Is. station but on his way encountered the Sp. fleet off Cape St. Vincent and defeated it. His famous naval victory of the Battle of the Saints over the combined Fr. and Sp. fleets secured to England her W. Indian colonies. The battle was fought off Dominica on April 12, 1782. The opposing fleets, the Eng. under R. and Hood and the Fr. under de Grasse, were in single

line ahead on parallel but opposite courses when R. seizing his opportunity, executed the brilliant manoeuvre famous ever after of breaking the enemy's line. By thus dividing the enemy's fleet into two portions which could not afford mutual support he secured a complete and signal victory but refused to pursue the enemy. He was raised to the peerage and granted a pension of £2000 a year for himself and his successors (commuted 1924). See also *SIXTH BATTLE OF*. See lives by G. B. Mundy 1830, and D. Hannay 1891.

Rodosio or Tekir Dag, tn. of European Turkey on the sea of Marmora 78 m. W. of Istanbul cap. of it of the same name (pop. 204,200). It exports cereals, cotton, wool, silk and silkworms eggs and cocoons. Pop. 30,000.

Rodriguez, Ventura (1717-95). Sp. architect b. at Cazorzuelos. His reputation in Spain was very great. He built churches, colleges, hospitals and palaces in the chief tns. including Manila, Saragossa, Toledo, Granada and Malaga. Among his works are the palace of the duke of Infantado in Madrid, the famous figure of St. James in the cathedral at Santiago, the Corinthian facade of Pamplona Cathedral and the church of St. Philip de Neri at Malaga. He combined the styles of late baroque with the beginnings of classicism.

Rodriguez or **Rodrigues** is in the Indian Ocean 300 m. E. of Mauritius of which it is a dependency. It is under the administration of a magistrate, who takes his orders from the governor of Mauritius and is a station on the cable route between S. Africa and Australia. Cattle, beans, salt fish and goats are the prin. exports. Area 42 sq. m. Pop. 11,900.

Roe, Richard, and **Doe, John**, see 1110N. **TRAIL RECOVERY OF LAND**.

Roe, Sir Thomas (1581-1644). Eng. traveller and diplomat b. at Low Leyton, Essex and educated at Magdalen College, Oxford. He received a court appointment in 1603 and was knighted two years later. In 1610 he sailed up the Amazon and Orinoco and made other voyages to this area in later years searching for gold. In 1611 he went as Eng. ambas. to the Mogul court where he established foundations of Eng. power in India by obtaining privileges for Eng. merchants there. Later he was ambas. at Constantinople and undertook missions to Poland, Sweden and Germany. He was M.P. for Tamworth in 1614 and for Oxford Univ. in 1640. He is a striking example of the close link between commerce and politics in the early seventeenth century, and his life illustrates the versatility of the Jacobean gentleman. A revised ed. of his *Journal* was pub. in 1917 (ed. Sir W. Foster).

Roebourne, tn. of W. Australia 750 m. N. of Perth, about 10 m. inland. It has pearl fishing and is also found in the neighbourhood. Pop. 100.

Roebuck, John (1718-94). Brit. chemist, b. in Sheffield. He took a degree in medicine at Edinburgh Univ. and became a

medical practitioner in Birmingham. He made scientific experiments in his spare time, and invented the first commercial method for manufacturing sulphuric acid, the lead chamber process, in 1746. Later he helped to found the iron industry in Scotland.

Roebuck, John Arthur (1801-79), Eng. politician, b. at Madras and educated in Canada. He settled in England, and was called to the Bar in 1831. In the following year he entered Parliament. He held radical views, and among his projects was a forerunner of the Asquith Parliament Act, limiting the veto of the House of Lords. He was an independent member, but in sympathy with the Radicals, and became an original member of the Reform Club (1836). In 1855 he moved for an inquiry into the conduct of the Crimean war, and was thus instrumental in bringing about the fall of the Aberdeen ministry. Later he abandoned his alliance with the Radicals, and supported Disraeli's R. policy. See life by R. E. Leader (1897).

Roedean School, public school for girls, near Brighton, England, founded in 1885. The first buildings were in Kemp Tn., Brighton, but in 1898 the school moved to a new site 3 m. E. of the tn. In 1938 R. was incorporated by royal charter. It is governed by a council. The school is divided into junior and senior depts., and there is accommodation for 380 pupils.

Roedeer (*Capreolus caprea*), small deer, native to Britain, where a few still survive in a purely wild state, though many are preserved in Epping Forest, New Forest, and elsewhere. The buck stands about 26 in. at the shoulder, and is 48 in. in length, from the nose to the tiny tail. The colour in summer is red-brown, in winter the redness disappears, and the underparts are yellowish-grey. The young at first are reddish-brown with white spots. The horns average about 8 in. in length with points. Rs. are stalked with the rifle from June to Aug., the venison is somewhat inferior. The mating season is in July to Aug.; the young are born in the following May and June.

Roehm, Ernst, see ROHM.

Roe, see RUHR.

Roelants, Maurice (b. 1895), Flem. poet and novelist, b. at Ghent. He is one of the few outstanding Flem. authors of the period between the two world wars. His subtle and melancholic poems are full of sympathy with suffering humanity: *Het eerszaken* (1930) and *Pygmalion* (1947). In his novels he shows himself a fine psychoanalyst: *Komen en gaan* (1927); *De Jazz-Speler* (1928); *Het Leren dal wij droomden* (1931); *Alles komt vrucht* (1937); and *Altijd opnieuw* (1943). Some of his works are transl into Fr., Ger., and Eng.

Roermond, tn. in Limburg, on the Meuse, 26½ m. N.E. of Maastricht. The chief industries are the manuf. of cotton and woollen goods and tobacco, and dyeing. There is some fine carving in the thirteenth-century minster. R. was the objective of very severe attacks by the Allies against the Gers. in Nov. and Dec. 1944. Pop. 21,000.

Roeselare (Fr. *Roulers*), tn. in W. Flanders, Belgium, 12 m. N.W. of Courtrai. A famous weaving centre in the Middle Ages, it now cultivates flax and manufs. lace, linen, gloves, carpets, pottery, tiles, and chicory. It is situated on the R. Mandel, a trib. of the Lys, and is connected with the latter by a canal. During the Second World War R. was an important Ger. communications centre and suffered much from repeated allied bombing. Pop. 31,800.

Roeskilde, or **Roskilde**, seaport on the R. Fjord, is. of Zealand, Denmark, 20 m. W. by S. of Copenhagen. Until 1443 this tn. was the cap. of Denmark, and its cathedral, dating from the eleventh century, contains the tombs of the Dan. kings. Pop. 14,000.

Roestone, see OBLIT.

Rogaland, administrative div. (Norwegian *fylke*) of S.W. Norway. It is a densely forested area. Stavanger (after which the div. was named until 1919) is the cap. and port. Area 3515 sq. m. Pop. 199,000.

Rogation Days (Lat. *rogare*, to ask), April 25th and the three days preceding Ascension Day, so-called because the Litany is on these days chanted in procession. The practice has continued down to the present day in the Rom. Catholic Church, and has been extensively revived in recent times in the Eng. Church.

Roger I. (1031-1101), count of Sicily, b. in Normandy. In 1058 he went to Italy and succeeded in obtaining Calabria for his brother, Robert Guiscard. In 1060 he journeyed to Sicily, and there conquered the Saracens, eventually being made count of Sicily by his brother, to whose possessions he succeeded after his death in 1085. See life by E. Curtis, 1913.

Roger II. (c. 1093-54), king of Sicily, son of Roger I. (q.v.). In 1127 he became the ruler of Apulia owing to the death of Robert Guiscard's grandson, and this he added to his domains of Calabria and Sicily. In 1139 he captured Pope Innocent II., and the conditions of his release secured R.'s recognition as king of Sicily. He also attacked the Byzantine Empire in 1146, and conquered parts of Greece and Africa, importing from the former country workers in the silk industry. See life by E. Caspar, 1904.

Roger de Coverley, Sir, type of an Eng. country gentleman as portrayed by Steele (q.v.) and Addison (q.v.). He was the chief character in the club professing to write the *Spectator*. The dance which was invented by the great-grandfather of Roger de Coverley, or Roger of Cowley, near Oxford, is named after him.

Roger of Salisbury (d. 1139), Anglo-Norman cleric and justiciar, the most noted member of a family of 'curiales-bishops.' He was originally a priest of Caen. The chronicler states that he attracted Henry I.'s attention by the speed at which he could say mass. R. became Henry's chaplain, and, after Henry's accession, was made chancellor, bishop of Salisbury, and justiciar. He is said to have created the elaborate system of the medieval Eng. exchequer described

in the *Dialogus de Scaccario* by Richard Fitz-Nigel, treasurer from 1160 to 1198; if his actual role was less definite, it seems certain that he played a vital part in the systematisation of the financial machinery. His power became very great, and when Stephen rashly attempted to curb his family's privileges, R. was able to swing the weight of Eng. eccles. opinion decisively against him. R. was efficient, ruthless, and extremely acquisitive, but there is little evidence that he had any real religious zeal, though under his episcopate Salisbury Cathedral was much enlarged. See W. Stubbs, *Select Charters of English Constitutional History*, 1870, and R. L. Poole, *The Exchequer in the Twelfth Century*, 1912.

Roger of Wendover (d. c. 1236), chronicler and monk of St. Albans. His chief work is the *Flores Historiarum* (ed. by H. G. Hewlett, 1886-89).

Roger, Pierre, see GREGORY (popes), Gregory XI.

Rogers, James Edwin Thorold (1823-1890), Eng. political economist, b. at W. Meon, Hampshire, and educated at King's College, London, and at Oxford, becoming Drummond prof. of political economy there (1862-67). His chief works are *History of Agriculture and Prices in England* (1866); *Six Centuries of Work and Wages* (1885); *First Nine Years of the Bank of England* (1887); *The Economic Interpretation of History* (1888). His theories on fourteenth-century England have been largely discredited by later historians.

Rogers, John (c. 1500-55), Eng. martyr, b. at Aston, Birmingham. In his youth a priest, he was converted to Protestantism at Antwerp, becoming a pastor at Wittenberg (1537). Under Edward VI. he held various appointments in London and was a prebendary of St. Paul's. He was imprisoned for his views and outspoken preaching in Mary's reign, condemned by Gardiner and Bonner, and burned at Smithfield. R. prepared 'Matthew's' Bible from the version of Tyndale and Coverdale. See life by L. Choster, 1861, and J. Foxe, *Acts and Monuments*, 1563.

Rogers, Samuel (1763-1855), Brit. poet and conversationalist, b. at Stoke Newington. He entered his father's bank, becoming head of it in 1793. In 1781 he began to contribute verses to the *Gentleman's Magazine*. In 1792 he pub. *The Pleasures of Memory*, and among his other works were *Columbus* (1810), *Jacqueline* (1814), and *Human Life* (1819). He was highly esteemed as a poet by contemporaries, and in 1850, on the death of Wordsworth, was offered the laureate-ship, which he declined; but his work is not now widely read. He is remembered chiefly as a conversationalist; his breakfast parties were famous, and Fox, Sheridan, Moore, Byron, and Wordsworth were among his friends. At his house in St. James's Place, overlooking the Green Park, he began a famous art collection and library. His literary work lacks original inspiration but has style and taste. His *Recollections* were pub. in 1856, and his *Table-Talk* four years later. See life by P. W. Claydon, 1889.

Rogers's Pass, mt. pass in Brit. Columbia, Canada, by which the Canadian Pacific Railway crosses the Selkirk Mts. Height 4275 ft.

Roget, Peter Mark (1779-1869), Eng. physician and lexicographer, b. in London and educated at Edinburgh Univ. He became prof. of physiology at the Royal Institution, but is chiefly remembered as the author of a *Thesaurus of English Words and Phrases* (1852). This was enlarged by his son J. L. Roget (1879). R. also wrote an introductory *Lecture on Human and Comparative Physiology* (1826); treatises on *Electricity, Galvanism, Magnetism, and Electro-Magnetism* for the library of *Useful Knowledge* (1832); and *Animal and Vegetable Physiology considered with reference to Natural Theology* (1834). In 1821 R. discovered the phenomena of persistence of vision. He also helped to establish a univ. in London.

Roggeveld, mt. range of S.W. Cape of Good Hope, forming part of the watershed between the Olifants and Orange R's. The range (100 m. long, 5000 't. high) continues E. into the Nieuwveld range.

Rogier (Roger) van der Weyden, or **Rogier de la Pasture** (c. 1400-64), Flem. painter, b. at Tournai. In 1436 he became official painter to Brussels city. In this capacity he painted the altar-piece for the Chamber of Justice in the *hôtel de ville*. This was destroyed in the seventeenth century, but accounts make it clear that already the naturalist characteristics of R.'s main works were apparent, though the subject, the story of Herkenbald, was quite medieval. R.'s 'Last Judgment' is in the museum of the hospital at Beaune. Authorities consider that he may have had the help of Dirk Bouts and Memline in this painting; the portraiture is superb, and the skilful composition and rich colouring place it among the finest of R.'s work. It was perhaps more of a medieval painter than the Van Eycks. He expressed naturalism within the framework of the conventional subjects, and evolved a new technique of composition and proportion, while retaining the traditional scenery, expressions, and postures. He combined the realism of the N. Renaissance with the symbolism of the Middle Ages. In his ability to portray suffering R. surpasses all his Flem. contemporaries. It was under his influence that the realistic tendencies of the Van Eycks pervaded Germany. See lives by F. Winkler, 1913; J. Huizinga, 1930; J. Desroë, 1930; O. Kerber, 1936; and E. Fiddler, 1938.

Rogus, see VAGRANTS.

Rogue Money, in old Scots law, co. assessment, now abolished, to defray the cost of arresting, prosecuting, and maintaining criminals.

Rohan, name of a famous Fr. family with many distinguished members. The name is derived from R., a small tn. in Brittany. The best-known members of this family are

Henri, Duc de Rohan (1579-1638), Fr. Protestant soldier, b. at Blain, Brittany. He led the Fr. Huguenots in their insurrections against the Catholics. He married

the daughter of Sully, the minister of Henry IV. He was made marshal of France by Louis XIII., and has left memoirs describing his campaigns, ed. by von Zurlauben, 1758.

Louis René Edouard, Prince de Rohan (1734-1803), Fr. cardinal and diplomat, b. in Paris, and educated at the St. Magloire seminary. His uncle, Constantin de R., bishop of Strasburg, chose him as his coadjutor. He was ordained in 1760 as bishop of Canope *in partibus*. He was made ambas.-extraordinary at the court of Vienna, but alienated the favour of Maria Theresa by the scandalous and extravagant mode of living which he adopted, and was recalled from Vienna. His name is associated with the affair of the diamond necklace, in connection with which he was imprisoned.

Other members of the R. family included *Hercules de Rohan*, duke of Montbazou, and *Armand de Rohan*, the cardinal of Soubise (see SOUBISE).

Rohilkand, or **Rohilkund**, div. of the United Provs., India, bounded by the Ganges on the W. and S. and the Himalayas on the N. and N.E. It is a flat, fertile dist., and takes its name from the Rohillas (q.v.). The cap. is Bareilly. Area 10,829 sq. m. Pop. 6,196,000.

Rohillas, Pathan hill tribe of Afghanistan who, in the middle of the eighteenth century, raided and settled in Rohilkhand, India. The ruler of Oudh, with the assistance of the East India Company, succeeded in expelling them in 1774. They were expert horsemen. See Sir J. Strachey, *Hastings and the Rohilla War*, 1892.

Röhm, or **Roehm**, Ernst (1887-1934), Ger. politician, b. at Munich. He became a professional soldier, and was commissioned just before the First World War. Later he was involved in von Epp's plot against the left-wing gov. at Munich. He was one of the original members of the National Socialist party, and an intimate friend of Hitler. He was jailed for his part in the *putsch* of Nov. 1923, and afterwards went to Bolivia and served in the army there. In 1931 he became Hitler's chief of staff and leader of the S.A. and S.S. He was shot during the purge of June 30, 1934, on charges of plotting against Hitler (q.v.).

Rohtak, tn., cap. of R. dist., of E. Punjab, India, 42 m. N.W. of Delhi; it manufactures cotton turbans. Pop. 38,000. Area of dist. 1797 sq. m. Pop. 956,800.

Rois Fainéants, Les, see FAINEANTS.

Rokol, see ROCKALL.

Rokossovsky, Konstantin (b. 1887), Russian soldier, b. in Warsaw, which he left in 1914 as a Russian conscript. During the revolution of 1917 he joined the Bolsheviks. At the outbreak of hostilities between the Soviet Union and Germany in 1941, R., as a lieutenant-general, commanded one of the armies defending Moscow. R. later commanded the divs. that encircled the army of von Paulus at Stalingrad (Nov. 1942-Jan. 1943). His group of armies took a leading part in the Russian summer-offensive of June 23-Aug. 31, 1944, planned in opera-

tional liaison with the W. allies, R.'s armies being concentrated in White Russia in the Pripiet marshes. His great victory in these operations was that of Bobruisk where, in five days' fighting on the S. part of the central zone, he utterly defeated the Ger. Ninth Army. For this great success and masterly manoeuvring he was promoted marshal of the Soviet Union. R. was in command of the Soviet armies on the Vistula at the time of the Polish underground rising under Gen. Bor in Warsaw, when requests from the Brit. and Amers. for the use of Soviet airfields for supplying the insurrection were refused. He directed operations in Poland and took part in the conquest of E. Prussia, as commander of the First and Second White Russian armies. In 1949 he was made a marshal of Poland on his appointment as minister of national defence in the Polish Gov., and was co-opted into the central committee of the United Workers' Party.

Rokycana, Johannes (c. 1397-1471), Bohemian Calixtine or Utraquist (name given in 1420 to the Calixtines because they received the Eucharist in both kinds), leader, b. at Rokycany. In 1433 he was a Bohemian delegate at the Council of Basle, and became rector of Prague Univ. in 1438. His life was devoted to an attempt to achieve a reconciliation with Rome, while preserving the essentials of Utraquism.

Roland, *Chanson de*, epic poem of the Carolingian cycle, dating from the eleventh century. Its lofty and courageous tone marks it out as the greatest heroic poem of the Romance period. It is probably of Norman origin. The earliest existing copy is in the Bodleian Library, but the theory which has been advanced that this is the original MS. has been refuted. The story related in the *chanson* deals with the battle of Roncevaux, here represented as a piece of strategy on the part of the Saracen king, Marsile, who planned thereby to kill Roland, the hero of the *chanson*, and nephew of Charlemagne. In this he is successful, and Roland, Oliver, and Archbishop Turpin perish after making a gallant stand against the enemy. Before he dies R. blows his ivory horn, which Charlemagne hears, though he is thirty leagues away. He hastens to the scene with his army, but is too late to save his nephew, though he avenges his death by inflicting defeat on the Saracens. See modern Fr. ed. by L. Gauthier (Eng. trans. by C. Scott-Moncrieff, 1920).

Roland, Holst Adrian (b. 1888), Dutch poet, b. at Amsterdam. He lives near the sea, and spent much of his youth in England. Both these circumstances have had great influence on his works. The rhythm is broad, his main symbols are the wind, the rain, the water, and the gulls. Among his works are *De Bekijden van de Stille* (1913); *Voorbij de Wegen* (1920); *De wilde Kim* (1925); *Een Winter aan Zee* (1937); *Tegen de Wereld* (1947); and *In Ballingschap* (1948).

Roland Holst-van der Schalk, Henriëtte (b. 1869), Dutch poet, b. at Noorderwijk,

near Leyden. She is without doubt the greatest living woman poet of the Low Countries. She was a zealous adherent of the Socialist cause, and later became a member of the Dutch Communist party. Finally when she grew disillusioned the mystic-religious character of her poetry predominated. Always, however, her work was of extraordinary lyrical value. Her most important publs. are *De Vrouw in het Woud* (1913); *Verzonken Grenzen* (1918); *Tusschen twee Werelden* (1923); *Tusschen Tijd en Eeuwigheid* (1934); *Uit de Diepte* (1946); and *Een Requiem voor Gandhi* (1948). She has also written sev. biographies, studies on social subjects, and dramas in verse.

Rolandseck, vil. of the former Ger. prov. of Rhineland, Germany, on the l. b. of the Rhine, opposite Honnef. Near by are the ruins of the old castle of R., standing 340 ft. above the riv.

Rolland, Romain (1866-1944), Fr. author, b. at Clamecy, and educated there and at the Ecole Normale, Paris, and, later, in Rome. He returned to the Ecole Normale as lecturer on the hist. of art, and in 1903 went to the Sorbonne as prof. of the hist. of music. It was in musical hist. indeed that he achieved his first great success with his life of Beethoven (1903). This paved the way for the pub., in 1904, of the first of his studies of the life of the imaginary Jean Christophe, evolved from the ideals of the period of Ger. culture represented by Beethoven and Goethe. It described them as 'the tragedy of a generation that has disappeared.' Ten vols. came out between 1904 and 1912. For this remarkable work R. was awarded the Nobel prize for literature in 1915 and the Fr. Academy's Grand Prize for literature. During the First World War he occasioned much controversy, especially by his *Au-dessus de la mêlée* (1915) and other collections of articles in the *Journal de Genève*, in which his uncompromisingly pacifist efforts to judge the war objectively led to accusations that he was pro-Ger. After the war he turned to irony, either a light, lambent irony as in *Liluli* (1919), or the more serious irony of *Clerambault* (1918), the 'history of a free conscience during the war.' But bitterness was not in his nature, as is shown in the tender sentiment of his love story *Pierre et Luce* (1919), and in the noble compassion of the study of the Gk. philosopher in Empedocles, in *Empedocle d'Agrigente et l'âge de la haine* (Paris, 1918).

Later books on the Indian thinkers and religious leaders, such as his *Mahatma Gandhi* (1924), were widely read in the E. but were less known in France. Of his plays both *Danton* (1901) and *Le 14 Juillet* (1902) could be appreciated by select Fr. audiences, but the Fr. as a whole did not regard them highly, perhaps owing to their didactic tendencies. His *Charles Péguy* (1942) presents, in a masterpiece of writing, all that is best in the life and work of the great Fr. moralist and critic. See lives by J. Bonnerot, 1921; S. Zweig, 1921; and C. Sénéchal, 1935.

Rolle, Richard (c. 1300-49), Eng.

hermit, poet, and mystic, b. at Thornton, in Yorkshire. Though a brilliant scholar (he studied theology at Oxford) he forsook the barren scholasticism of the univ. of his day and became a hermit at Hampole, near Doncaster, describing his mystical experiences both in lat. and the vernacular. He typified the fourteenth-century desire to gain religious satisfaction through faith, rather than by way of the hair-splitting dialectic of the schools. His vernacular writings are extremely beautiful, and his treatises in Eng. and trans. of the Psalms were widely read by laymen. The ardour and splendour of R.'s mystical writing is rivalled by the *Revelations of Divine Love* of Dame Julian of Norwich (c. 1342-1413 and after). His Eng. writings have been ed. by Hope E. Allen (1931). See life by Francis M. M. Cowper, 1929, and T. W. Coleman, *English Mystics of the Fourteenth Century*, 1938. See also Grace Warrack's ed. of *Revelations of Divine Love*, with prefatory note to 13th ed. (1949) by P. F. Chambers.

Roller Bearing, see under BALL BEARINGS.

Rollers, name given to any species of Coraciidae in the sub-family Coraciinae, on account of the curious habit of both male and female birds of rolling over when in flight. These birds occur exclusively in the Old World, and are found in the woods of hilly districts.

Roller Skating, see under SKATING.

Rollleston, Sir Humphry Davy (1862-1944), Brit. physician, b. at Oxford and educated at Marlborough and St. John's College, Cambridge. He received his medical training at St. Bartholomew's Hospital. R. became distinguished as a pathologist and as the editor of Allbutt's *System of Medicine*. His other major editorial work included *The British Encyclopedia of Medical Practice*, pub. 1936, and the main direction of the medical periodical *Practitioner* from 1928. He was president of the Royal College of Physicians from 1922 to 1926, and succeeded Sir Clifford Allbutt as regius prof. of physic at Cambridge in 1925. He was physician-in-ordinary to King George V. from 1923 to 1932, and physician-extraordinary from 1932 to 1936. Created a baronet in 1924, G.C.V.O. in 1929.

Rollleston, Thomas William (1857-1920), Irish author, b. at Glashouse Shlirone, O'ahy, and educated at Rathfarnham and Trinity College, Dublin. He played a leading part in the Irish literary revival: he was joint editor of *The Treasury of Irish Poetry* (1900) and pub. *Imagination and Art in Gaelic Literature* (1900) and *Myths and Legends of the Celtic Race* (1911). Other publs. include a life of Lessing (1889).

Rollier, Augusto (b. 1874), Swiss physician, b. at St. Aubin. R. was a pioneer in the treatment of tuberculosis by heliotherapy, and his clinic in Leysin gained a world-famous reputation.

Rollin, see LARIVIER-ROLLIN.

Rollin, Charles (1661-1741), Fr. historian, b. in Paris. In 1688 he became prof. of eloquence in the Collège de France, and in 1694 rector of the univ. of Paris,

to which he was re-elected in 1720. He exercised great influence on French thought and life. He published *Quintilian* (1715), *Traité des études* (1726, 1731), and *Histoire ancienne* (13 vols., 1730-38).

Rolling Mills In early times malleable iron was generally hammered down into shape and the important advantages occurred when R. M. were used to replace the older water tilt hammers and steam hammers. Although modern rolling may

Swede by the name of Polhem suggested placing two small rolls between two large ones thus anticipating the modern four high mill fully 200 years before it had received any considerable attention. The only other outstanding advance in the design of rolls prior to the steel era is Cort's invention. Both for driving the tilt hammer and turning the R. M. the discoveries of James Watt and subsequent workers caused the development of the steam engine, which has been the main

Richard Thomas & Baldwins Ltd

ROLLING MILL

The six stand continuous hot strip mill — the last stage of rolling on the half mile long hot mill at Ibbw Vale works

be said to have commenced with Cort's invention of grooved rolls in 1784 the rolling was practised for many years before this. There is evidence that a Frenchman Brulier passed gold and silver between rolls in 1573 in order to ensure an even thickness. In 1615 de Caus erected a mill to roll sheets of tin and lead for organ pipes. Like all other primitive processes these mills were driven by hand power. Bianca a Roman engineer designed a power driven mill in 1629. It is doubtful if it ever worked but the idea of using the hot air currents from a blacksmith's forge to drive a wheel, and further to use gearing to assist, was ingenious. In 1728 John Payne and Maj Hanbury of Pontypool were granted a patent for rolling tinplates, instead of the previous method of hammering. Early in the eighteenth century a

source of power for driving mills during the past century.

When steel making commenced the engines employed were all of the beam type running at low speeds with low pressure steam usually throttled by small pipes and faulty valves so that in spite of their imposing dimensions they really gave very little power. In order to prevent the mill being pulled up or 'stalled' as the men call it a heavy flywheel was necessary. As a consequence these early mills were an imposing sight but were not capable of much hard work. The beam was replaced by direct acting engines in which the crankshaft was connected straight through to the main shaft of the rolling mill. Subsequent developments of mill engines using steam for steelworks rolling have taken place along the lines of the two and three cylinder high-

pressure type. In some cases compound steam engines are in use.

Electrically driven reversing motors for 'cogging,' that is the first stage of roughing down the ingot, were first tried in Austria in 1850 and have found extensive application in modern steelworks. Modern practice is based almost exclusively on the use of electrical power. These developments have probably constituted the outstanding features of importance in steel and non-ferrous metal-rolling practice.

Rollo, see under **NORSEMEN**.

Rollright, Great and Little, two adjacent vills. In the co. of Oxfordshire, England, 11 m. S.W. of Banbury. Between Great R. and Little R. are the R. Stones, a famous megalithic structure, consisting of the King Stone, the King's Men, and the Whispering Knights. The King's Men is a circle of some seventy standing stones; the Whispering Knights is the remains of a burial chamber. There is interesting folklore about each. See T. H. Ravenhill, *The Rollright Stones*, 1932.

Rolls, Henry Charles Stewart, see under **ROLLS-ROYCE LTD.**

Rolls, Keeper of the, see **CUSTOS ROTULORUM**.

Rolls, Master of the, keeper of the records and head of the Record Office, ranking after the lord chancellor and the lord chief justice of England. Originally an officer of the court and chief of the masters in chancery, he is now the president of the chancery div. of the high court of justice in England. He was formerly capable of being elected an M.P., but this privilege was abrogated in 1873.

Rolls-Royce Ltd. Henry Royce (1863-1933) and the Hon. C. S. Rolls (1877-1910) first met in 1904 when the firm of F. H. Royce and Company was in being, producing Royce cars to the design of the great engineer. The firm of C. S. Rolls & Company were at that time well estab. in London, as dealers in high-grade continental cars, but with the advent of the Royce car they changed their policy and in 1906 they founded R.-R. Ltd. The first R.-R. factory was built at Derby and opened on July 9, 1908. The floor space of some 48,000 sq. ft. has now grown to 382,000 sq. ft.

As the fame of the car spread throughout the world depots were opened in many countries, each in the charge of men trained in Derby. During the First World War contracts were accepted for the design and manuf. of complete aero engines. The first R.-R. aero engine, the 'Eagle,' was an outstanding success and it has been estimated that more than half the aero engines in service in the First World War were of R.-R. design and manuf.

Between the wars the company prospered in many directions, other factories were built in the Derby area, and a flight development estab. was started at Hucknall, Nottinghamshire. In 1938 the Air Ministry asked R.-R. to build a large factory for the production of Merlin aero engines, and factories were built at Crewe and Glasgow. Before the end of the

Second World War the personnel employed totalled 57,000. It is now well known that R.-R. played an important part in the development of the Whittle jet-propulsion aero engine. R.-R. jet-propulsion engines to the Whittle design were in operational service during the last year of the war and are now manufactured under licence in the U.S.A., Australia, France, Argentina, and Belgium.

Roma, Rom. goddess, personifying the power of Rome, or rather the *Fortuna populi Romani* or τυχη Ρωμαίων. The origin of this cult was due to oriental and Hellenistic influences; it was long in establishing itself in Rome. Hadrian built a *templum urbis* to Venus and R. in Rome. In Asia Minor the cult of R. was estab. as far back as 195 B.C., when Smyrna built a *templum urbis Romæ* (Tacitus, *Annales*, iv. 56); Alabanda (Caria) in 170 B.C. had not only a temple of R., but also introduced the R. festivals and athletic sports, known as Ρωμαία, which later on were instituted in many cities of Greece (Athens, Chalcis, Mantinea, Egina, and others), Asia Minor (Pergeum, Magnesia, etc.), and Italy (Naples). Augustus, who reorganised the *commune isis*, officially introduced the cult of R. in the municipalities of Asia Minor. The temple of R. at Athens is assigned to the period of Augustus (*Inscr. Græc.* iii. 1, 63). On the acropolis of Puteoli (modern Pozzuoli, prov. of Naples) there was a temple dedicated to R. and Augustus. On coins R. is portrayed as a warrior maiden accompanied by the goddess of victory.

Rolls of Parliament, see **RECORD OFFICE**.

Romagna, the N.E. part of the former papal states, Italy, comprising the modern provs. of Bologna, Ferrara, Forlì, and Ravenna, forming the region of Emilia-Romagna (q.v.).

Romance (Ρωμαϊκός, Rom., Byzantine), vernacular language of modern Greece, akin to the popular dialect developed before the fall of the Byzantine Empire. Prodrômus wrote in this tongue in the twelfth century. See C. Krumbacher *Geschichte der byzantinischen Literatur* (2nd ed.), 1897, and R. Nicolai, *Geschichte der neugriechischen Literatur*, 1876.

Romains, Jules (b. 1885), Fr. author, b. at St. Julien-Chapteuil, his real name being Louis Farigoule. He graduated from the Ecole Normale Supérieure, Paris, and taught philosophy for ten years. In his early years he belonged to the group of young poets known as the 'Groupe de l'Abbaye.' R. was a founder of *Unanimité* (q.v.) on which he wrote *La Vie unanime* (1908), a vol. of poems. R. became a successful playwright, showing technical skill and the ability to produce sophisticated, sparkling comedy, as in *Knock* (1923). But his outstanding achievement was as a novelist, with his series *Les Hommes de bonne volonte*, which extended to 27 vols. between 1903 and 1941. This was in fact a 'continuous novel' attempting to survey realistically the whole panorama of contemporary life. The main characters appear, temporarily vanish, and reappear again at a later vol., an attempt to portray

life objectively on a grand scale. R. went to America during the Second World War. In 1942 he pub. a life of Stefan Zweig, and again turned to drama in *Salsette discovers America* (1942), a play which shows Shavian influence. See A. Cuisenier, *Jules Romains et l'humanisme*, 1933, and P. Brodin, *Les Ecrivains français de l'entre-deux-guerres*, 1945.

Roman, or Romanu, tn. of Moldavia, Rumania, chief tn. of the dept. of R., at the junctions of the R. Moldava and Sereth. There is a magnificent sixteenth-century cathedral, R. being the seat of a Gk. Orthodox bishop. Pop. of dept. 140,000. Pop. of tn. 28,000.

Roman Army. The backbone of the R. A. was, and remained until far into the third century A.D., the legion (q.v.). At the end of the second century B.C. the legions were each 4500 strong, composed of thirty maniples, each divided into two centuries of heavy infantry, 3000 in all; 1200 *velites* or light infantry; and 300 cavalry. A major reorganisation is attributed to Marius (q.v.). He abolished the two troops (*velilla*) of cavalry belonging to the legions, and also the category of *velites*, whose role of skirmishers was now taken over by auxiliary infantry cohorts. The number of colonels (*tribuni*) was increased from six to ten, and their commands were no longer the *quincunx* of five maniples with attached *velites*, but the uniform, homogeneous cohort of 600 men or six centuries. The century of not quite 100 infantry became the tactical unit instead of the maniple which, however, was retained for some administrative purposes. This organisation remained substantially the same until the time of Diocletian (A.D. 284), except that Augustus incorporated a single *velillum* of 120 horsemen into each legion; however, they acted not as cavalry but as dispatch-riders and mounted orderlies. Under Augustus the legion was no longer commanded in rotation by the tribunes, but permanently by a general (*legatus*) of consular rank. Tribunes were of equestrian rank. Centurions rose from the ranks and their promotion was advanced by the command of all the sixty centuries in turn, beginning with the lowliest, that of the second century of the tenth maniple of *hastati*, and ending with that of the first century of the first maniple of *triarii*, which was the most honorific. By the time a centurion had reached this stage of his career he was too old for further promotion, and all he could hope for if he stayed in the army was the appointment of camp commandant (*castrorum praefectus*). In practice the higher ranks were only open to young men of good family who entered the service as tribunes. Besides the legions Augustus also raised the *cohortes praetoriae*, of which there were nine—partly stationed permanently in Rome and partly accompanying the commander-in-chief wherever he went. Internal security was provided by cohorts of *vigiles*, who acted as police and firemen and were stationed both in Rome and in the larger prov. tns.* Under the earlier emperors there was no great mili-

tary power inimical to Rome and therefore no need for a field army. Apart from the praetorians and the *vigiles* the only function of the army was that of frontier defence against tribal raids. These were kept in check by the legions concentrated at strategic points behind the actual fortified frontier (*limes*), which was manned by auxiliaries. Augustus greatly expanded and reorganised these troops. Auxiliary infantry, like the earlier *socii*, were formed into cohorts of infantry and *ala* of cavalry. While the praetorian and *vigiles* cohorts were 1000 strong, and the legionary cohorts 600, an auxiliary cohort might contain ten centuries each of 100 men, or only five centuries of the same size. *Alae* could likewise be either 500 or 1000 strong, but were divided into eight *veclla* of 120 each. There were also mixed cohorts of one *veclillum* of horse and four centuries of foot, and mixed *ala* *pedatae* of one century and three *veclla*, or twice that number in the same proportion. Colonels of auxiliaries were sometimes called *praefectus* instead of tribunes. This rank had previously been held by the squadron-leader of legionary cavalry under the republic (*praefectus equitum*). There were also marines (*classarii*) forming cohorts on the auxiliary model. The term *veclillatio* was not originally applied to a fighting unit, but meant either a draft of reinforcements or a working party responsible for a stretch of road or sector of fortification. But under the late empire barbarian mercenaries began to serve the empire under their own leaders, and both *veclillationes* and *cunei* were probably only a vague name for native war-bands and not part of the Rom. organisation at all. After the time of Diocletian such bodies came to preponderate in the army and the legion, whose infantry strength had been slightly reduced by the introduction of field engines (*tormentæ, ballistæ*), which were not served by a separate corps of artillery but by detachments drawn from within the legion and the cohort, was further reduced in strength, though the number of legions remained the same. See also under PRAETORIAN GUARD.

Roman Catholic Church. Institution and Object.—The Church is defined by R. C. theologians as 'the union of all the faithful under one head'; this includes the Church Triumphant of the Saints in heaven, the Church Suffering or the Souls in purgatory (q.v.), the Church Militant or the faithful on earth. The last is the usual meaning of the word, and as such is defined as 'the association of baptised Christians united by profession of the same faith and by participation of the same sacraments under the jurisdiction of the bishop of Rome as the representative of Christ.' R. Cs. maintain that this visible Church was personally and directly founded by Christ (Matt. xviii. 18-20, etc.) for the salvation of souls (John xx.

21); to which end He endowed it with the threefold right and duty of teaching (Luke x. 10), sanctifying (John xv. 16), and ruling (Matt. xviii. 17-18) in His name. As authorised teacher of revealed truth, the R. C. C. claims an infallibility (*q.v.*) vested in (1) the ordinary teaching body (bishops) scattered throughout the world, (2) general councils, (3) under certain conditions the pope alone. The R. C. C. exercises her sanctifying power by the administration of the sacraments and the offering of the eucharistic sacrifice (mass). She includes in her jurisdiction the rights of legislating, of judging and of inflicting censures on refractory members. She cannot, however, revoke any precept of natural or divine law.

Notes of the Church.—The so-called Nicene Creed proposes four characteristics or notes by which the Church of Christ may be known: she is one (John x. 16), holy (Eph. v. 25-28), catholic or universal (Acts i. 8), apostolic (Eph. ii. 20). R. Cs. hold that these notes are wholly and solely verified in the R. C. C. She is *one* by unity in faith, in liturgy (eucharistic sacrifice and the sacraments), and in submission to one head; uniformity of ritual is not required. She is *holy* in so far as her doctrine safeguards holiness; she offers the means of holiness to all in the sacraments, and is distinguished by the heroic sanctity of so many of her children (saints); she does not pretend all R. Cs. are holy (*cf.* Matt. xiii. 24-30). She claims to be *catholic* as being universally widespread in place and time, to be restricted to no class, age, or race, and to contain in her teaching the fullness of Christ's doctrine. Her assertion of apostolicity rests upon identity in principle of doctrine, liturgy, and ruling power with the primitive Church, and historic continuity in descent from the authority and jurisdiction of the Apostles.

Organisation.—In 1907 by the decree *Lamentabili* (Nos. 52-56), and parallel passages in an Encyclical letter *Pascendi dominici gregis*, Pius X. repudiated on behalf of the R. C. C. the modern theory that Church authority comes not from Christ, but from the common religious consciousness of the faithful. The R. C. system is as follows: Christ is the invisible head of the Church (Eph. v. 23). He is represented on earth by the bishop of Rome as successor to St. Peter, 'the Rock,' on whom Christ built His Church, giving him the keys of the kingdom of heaven (Matt. xvi. 18, 19) and making him shepherd of the whole flock (John xxi. 15-17). The bishop of Rome therefore enjoys a primacy of honour and jurisdiction over other oriental patriarchs who are in communion with Rome. The Vatican Council (1870) declared his authority to be everywhere *episcopal, ordinary, and immediate*. Nevertheless, it is ordinarily exercised through the patriarchs (*see* C. Butler, *The Vatican Council* (1930), vol. ii. chap. x.), metropolitans, and other bishops who rule local churches by 'ordinary' jurisdiction. Oriental (Uniate, *q.v.*) churches are

directly responsible to their patriarch, but Rome is always the final court of appeal. In the W., dioceses usually governed by bishops are grouped into provs. under archbishops called 'metropolitans'—though not all archbishops are metropolitans. These have little ordinary jurisdiction outside their own dioceses except the power to summon and preside over a provincial council. Some metropolitans are also cardinals (*q.v.*). The title primate is now practically obsolete. Missionary dists. are ruled by vicars-apostolic and prefects-apostolic as representatives of the pope. Many religious orders and congregations are exempt from the jurisdiction of their local bishop, but they are responsible to him for any par. work they may have been entrusted with. The administration of the sacraments, except baptism and matrimony, is exclusively in the hands of the clergy. The ordination of bishops, priests, and deacons is admittedly a sacrament, though R. C. theologians debate as to whether the distinction of these orders is due to the personal intervention of Christ or not. The subdiaconate and the four minor orders of acolytes, exorcists, readers, and doorkeepers are of eccles. origin; some writers nevertheless admit their sacramental character. Their reception is a necessary preliminary to the priesthood, but otherwise is of little practical importance nowadays. The R. C. C. claims thus to be a perfect society, containing within herself all the necessary means to achieve her own end, the salvation of souls; receiving her authority directly from God through Christ, and entirely independent of civil authority (the State) with which she co-operates on an equal footing in 'mixed' matters—*i.e.* things pertaining to both jurisdictions. At the same time, as her aim (the salvation of souls) is higher than that of the State (the physical well-being of citizens), she arrogates to herself the right to criticize and, if need be, to condemn, legislation sacrificing the former to the latter object. By the Lateran Treaty of 1929, the pope was recognised as sovereign of the Vatican City State, and quite independent of the It. State. Many countries are in diplomatic relations with the pope, papal representatives abroad being known as nuncios or legates.

Extra Ecclesiam nulla salus—'Without the Church, no salvation'—is a saying of St. Augustine (*q.v.*) officially adopted by Innocent III. in the profession of faith to be made by converted Waldensians (1208) and ever since held by all R. Cs. It has been badly misunderstood to imply reprobation of all who, however inexcusably, find themselves outside the R. C. C. Rightly explained, it excludes from salvation those who deliberately separate themselves by heresy or schism from the Church, or who remain separated after recognising the strength of her claims. R. C. theologians differ in their explanations of how those who through no fault of their own, are outside the Church, are saved. But there is no question as to whether they are saved; the point under

debate is their precise relationship to the Church.

See *The Codex Juris Canonici* (the R. C. C.'s official law book compiled from ant. sources and promulgated in 1917 by Benedict XV.; it applies to the W. half of the Church only); and H. J. D. Denzinger, *Euchiridion Symbolorum et Definitionum*, 1874. See also HISTORY: P. Hughes, *History of the Church* (3 vols., 2nd ed.), 1947-48. DOGMATIC TREATISES: C. Hart, *Students' Catholic Doctrine* (11th ed.), 1931; B. Faa, *Catholic Belief*, 1936. Roman Catholic Emancipation, see CATHOLIC EMANCIPATION.

Romance, originally designated a tale written in *roman*, or eleventh- or twelfth-century Fr., instead of in Lat. Its exact nature is not easily defined. In contradistinction to the seriousness and solidity of epic it may be said to possess the qualities of fantasy and mystery. But as all epic is not serious, so all R. is not fantastic, and the romantic fiction of the chivalric period shades into epic on the one hand and into the purely fantastic on the other. The origin of R. is to be found, probably, in the traditional tales and literature of the Celts of Wales and Brittany, whose characters it metamorphosed into medieval Frenchmen, but whose peculiar beauty it did not capture. R. had also a direct forerunner in France itself. This was the *chanson de geste* (q.v.), of which a fine example is the *Matière de France*, or saga of Charlemagne, which was nearer to the epic in its tone of lofty heroism and its spirit of seriousness. Yet, strangely, it was more romantic than R. itself, in that it possessed more of the fantastic, and that its spirit of wonder is much more genuine. In the R., on the other hand, this is employed in a merely theatrical manner. Both types, however, were of the same genre. The *dramatis personæ* of both were similar, the geographical scene of both was alike, and the fundamental plots were the same. Only the spirit is different. The romantic school had discovered the uses of a love-interest in fiction. This is used to supreme advantage. In the R. the relation of the sexes is changed. This art of love may be traced to Ovid and the later Lat. poets. Imbued by a literary *coterie* who communicated it to society at large by the means of lyric verse, assisted by poetic contests and 'courts of love,' this spirit soon found its way into the R. or fiction of the day. By the twelfth century this *art d'amour* had taken vigorous hold of the Gallic mind. It is by the 'discovery' of love that R. constituted something quite different from its predecessors in

fiction. It attained also a sophistication not seen in W. European literature since the Rom. Empire. But the Fr. romancers were in reality a highly unromantic body of writers, their love of the strange being merely an interest in novelty. As a result, the R., especially in France, has a cloying artificiality and frequently fails to convince. These faults are not found in the *chansons de gestes*, which are often extremely moving. In form, and in delicacy and beauty of language, however, the R. is supreme. The Eng. versions, too, possess some spiritual feeling and pathos which is lacking in most Fr. Rs., and Monmouth's Arthurian legends have some of the emotion and drama of the Song of Roland.

The matter of the R. was to a large extent Arthurian. There are sev. theories as to how the myth of Arthur (q.v.) grew into prominence, but in the twelfth century his story began to awaken general interest, which soon developed into a passionate admiration. For some time the tale was hawked about the country by jongleurs and minstrels, until at length it was seized upon by Geoffrey of Monmouth, who placed upon it the stamp of chivalric R. From England and France the tale penetrated to Germany and Italy, and for at least a century and a half remained the staple fictional matter of Europe, though the stories were much elaborated and distorted from the original. Geoffrey was followed by Wace, Marie de France (1150-65), Béroul (c. 1150), Thomas (c. 1130), Chretien de Troyes (d. 1182), and Guyot. Later the Grail legend became annexed to the Arthurian pure and simple, and the whole was welded into matchless symmetry by Sir Thomas Malory in the *Morte d'Arthur*. See also under NOVELS; ARTHUR; CHANSONS DE GESTES; TROUBADOUR.

Romance Languages, a main branch of languages (see under LINGUISTIC FAMILIES), originated, or rather estab., between the ninth and twelfth centuries from vulgar Lat., or else from Lat. *colony*, which was spoken in the Rom. Empire during the last centuries of its existence. The variety between the main R. L.—It., Fr., Provençal, Sp., Portuguese etc.—is due to the variation of the native non-Rom. dialects and the differences in the vulgar Lat. as it was spoken in Italy, Spain, Gaul etc. The classification of the R. L. is uncertain; this difficulty has already been emphasised by H. Schuchardt (*Ueber die Klassifikation der romanischen Mundarten*). According to F. C. Diez (1794-1876), the founder of this field of studies (1836), there are six R. L.: It., Walachian (= Rumanian), Portuguese, Sp., Provençal (including Catalan), and Fr. His theory was based on the existence of literatures. The It. G. I. Ascoli added (1873) a group of dialects, termed *Ladin*, i.e. the *Romansch* (q.v.) dialects of Switzerland, the R. dialects of S. Tyrol and Friulan. The Ger. W. Meyer-Lübke distinguishes the following nine members of this branch, from E. to W.: (1) Rumanian, (2) Dalmatian, (3) Rheto-Romanic, (4) It., (5) Sardinian, (6) Provençal (including Cata-

lan), (7) Fr., (8) Sp., and (9) Portuguese. His criteria are not accepted by It. linguists, according to whom Dalmatian, Rhaeto-Romanic, and Sardinian cannot be considered as independent languages, but as minor units allied or co-ordinated with, if not subordinated to, It., exactly as Galician should be considered as connected with Portuguese, and Catalan as allied with Provençal. They therefore distinguish the R. L. into seven groups (having added a group termed Franco-Provençal). Other scholars choose a compromise (including Dalmatian and Sardinian in the It. group, but considering the Rhaeto-Romanic dialects as independent). This extremely important branch of languages competes with the Germanic branch (see *INDO-EUROPEAN LANGUAGES*) for first place in number of speakers and cultural and historical importance.

Romance of the Rose, see *ROSE*, ROMAN DE LA.

Roman de Rou, see *WACE*, ROBERT.

Roman-Dutch Law, compound system of law, of which the basic principles are those of the Law Natural (see *JURISPRUDENCE*), made up of Ger. customs modified by the principles of Rom. law, and developed by later Dutch customary law. The founder of the system of jurisprudence known as R.-D. L. was Hugo de Groot (Grotius), he being the first writer to systematise the confused mass of legal principles which obtained in his day, and it is upon Grotius's classic (*Introduction to the Jurisprudence of Holland*) that subsequent legislators and jurists have erected the whole modern fabric of R.-D. L. The study of R.-D. L. is necessary to enable a student for the S. African Bar to practice there. See J. W. Wessels, *History of the Roman-Dutch Law*, 1908; Hugo de Groot, *Introduction to Roman-Dutch Law*, Eng. trans. by R. W. Lee, 1926; A. F. S. Maasdrop, *The Institute of Cape Law*, (4th ed.), 1922-26.

Roman Empire, Holy, see *HOLY ROMAN EMPIRE*.

Romanes, George John (1848-94), Brit. biologist and psychologist, b. at Kingston, Canada. At Cambridge he became a friend of Charles Darwin, and extended Darwin's theories of evolution into the field of psychology. He became a member of the Royal Society in 1879. He founded the R. Lecture at Oxford in 1891, whereby an ann. lecture on a literary or scientific topic should be given by some eminent person. His works include *A Candid Examination of Theism* (1878); *Animal Intelligence* (1881); *Charles Darwin* (1882); *Mental Evolution in Animals* (1883); *Jelly-Fish, Star-Fish, and Sea-Urchins* (1885); *Mental Evolution in Man* (1888); and *Mind and Motion and Monism* (1896).

Romanesque Architecture, see under *ARCHITECTURE*.

Roman History. The Lat. (see *LATINI*) was a branch of the Indo-European peoples who came into Italy from across the Alps towards the end of the second millennium B.C. The numerous hill-top settlements of these folk gradually coalesced into larger city states, the

greatest of which was Rome. The dominant position of Rome was assured by its geographical situation within easy reach of the sea and the centre of the peninsula, by its command of the Tiber ford, and by its consequent control of an important salt route between the mouth of the riv. and the Apennines.

So far as written hist. goes the earliest period of Rome is shrouded in myth. It is probable that government by kings was adopted about the end of the seventh century B.C. Again, the kingly period is obscure. We can, however, say that some of the kings were Etruscans (*q.v.*); that they were advised by a senate representing the noblest patrician clans; and that the less privileged orders were divided into thirty *curiæ* and, for military purposes, into *centuriæ* upon a property basis. The whole people, patricians (*q.v.*) and plebeians (*q.v.*), were included in a number of tribes which eventually increased to thirty-five in the third century. Under the Etruscan kings Rome advanced in civilisation, in commercial prosperity, and in geographical extent. It should, however, be noted that the Etruscan civilisation was essentially oriental and urban in character, but that despite its influence Rome remained essentially Lat. and agric.

At the end of the sixth century the last king, Tarquinius Superbus, was expelled, the monarchy abolished, and an aristocratic republican constitution set up. Two annually elected magistrates called consuls (*q.v.*) were appointed, though in an emergency these might be superseded by a dictator (*q.v.*).

THE REPUBLIC: (a) c. 509-265 B.C.—This period is best considered under two headings, the struggle between the orders, and the struggle for power in Italy. From the beginning of the republic the plebeians had grievances. The wealthier members of their order desired political and social equality with the patricians. They were incapable of holding public office and of contracting marriage (*connubium*) with the patricians. The poorer demanded more land, amelioration of the severe laws of debt, and a measure of personal security against the power of the magistrates. The prin. weapon in the struggle for these rights was the *secessio*, whereby the plebeians in a body left the city and set up, as it were, a state within the state.

After the first secession to the Mons Sacer the plebeians secured the appointment of their own officers, tribunes (*q.v.*) and aediles (*q.v.*). The former enjoyed personal inviolability and a power of veto. The latter had charge of the temples and public places. In 471 the *Lex Publilia Voleronis* made the plebeian assembly lawful and empowered the tribunes to propose and carry measures therein. These enactments (*plebiscita*) were binding only on the plebeians. The effect of the promulgation of the code of laws known as the Twelve Tables (*q.v.*) (451-450) was to limit the power of the patrician magistrates. In 449 the Valerio-Horatian Laws enacted that the determinations of the

plebeian assembly should be binding on the whole people, subject to ratification by the senate. Four years later the plebeians gained the right of *connubium* by the *Lex Canuleia*, and in 421 the quaestorship. This social legislation was interrupted by war, but in 387 the 'Licinian Rogations' enacted that one consul must be a plebeian, and ten years later a plebeian Caius Marcus Rutillius, held the office of dictator. The censorship (see CENSORS) and praetorship (see PRÆTOR) were occupied by plebeians in 350 and 337 respectively, and in 300 the *Lex Ogulnia* opened to them

were linked in a union known as the Lat League, and with this league Rome now negotiated an alliance in face of the threat. The Æqui and Volsci were the first to attack. In the first half of the fifth century the Romans and Latins with the independent tribe of the Hernici conducted a successful defensive. In the second half they went over to the offensive and to final victory. In 406 the expanding Roman influence resulted in a clash with Etruria. This campaign was concluded in 396 with the capture of Veii, and the whole of Etruria was annexed.

Much of the Roman success in this area was due to the preoccupation of the Etruscans with the Gauls who were invading from the Alps. In 390 these savage tribes entered Roman territory, defeated the Roman Army on the banks of the Allia, sacked the city, but withdrew after a fruitless siege of the Capitol. The Romans never forgot this disaster (*diem illensum*) which was a severe blow to their prestige. Once more it was necessary to put down risings of neighbouring tribes and once more the Roman army triumphed and extended their boundaries. The Lat League was reorganised (358) on terms somewhat less favourable to the Latins. These attempted to regain their independence (340-338) but were crushed. The league was finally dissolved, and each member obliged to enter into treaties directly with Rome.

Roman interests became paramount in Campania following the alliance with Neapolis (326) and three campaigns resulted against the Samnites. Despite the humiliation of the Caudine Forks (321) in 321 the Romans inflicted a crushing defeat upon their enemies at Sentinum (295) and five years later the Samnite coalition was finally destroyed.

Meanwhile the Greek settlements of the S. E. viewed with increasing apprehension the advance of Roman arms. The *casus belli* fell in 281 when the Tarantines, not without provocation, attacked a squadron of Roman warships which had entered their waters and insulted the Roman ambasador who demanded satisfaction. Tarentum summoned to its aid King Pyrrhus (317) of Epirus. He landed in Italy (280) but after two 'Pyrrhic' victories at Heraclea and Asculum was decisively beaten at Beneventum (276).

Rome had now conquered the whole of Italy except Cisalpine Gaul. Her triumph had been achieved not only by force of arms, but also by her policy of colonisation and the building of roads. Much of the peninsula now enjoyed Roman citizenship and those who did not were bound to Rome by alliances of various grades. While direct taxation fell exclusively upon citizens all citizens and allies, were bound to do military service. Most important, a common culture superseded local languages, cults and customs.

(b) 264-146 B.C. *The Punic Wars*—This period of one hundred and twenty years marks the second great crisis of the West, for the Carthaginian civilisation which now confronted Rome was no less essentially Asiatic than was the Persian

A ROMAN TRIUMPH

A successful general returning, to Rome after a campaign, publicly honoured by a triumph

the exclusive college of pontiffs (q.v.) and augurs (q.v.). Finally in 287 the *Lex Hortensia* enlarged the provisions of the Valerio Horatius laws by exempting the plebeian decrees from senatorial ratification. The sovereignty of the people was now established, and if the newly won political privileges were accessible only to a small clique of rich men the less fortunate benefited by the distribution of land as the conquest of Italy proceeded and by such measures as the *Lex Poetelia de Neris* which abolished imprisonment for debt. We have now to consider the stages whereby Rome became mistress of the peninsula. After the abolition of the monarchy Rome found herself between the sea and a wide semicircle of hostile peoples, the Etruscans, Samnites, Æqui, and Volsci. The other cities of Latium

which confronted Greece in the first crisis and those which have since periodically imperilled W. culture. There had long been rivalry between the two great commercial centres of S. Greece and Carthage (*q.v.*), and the representation of the Gk. cities had now passed to Rome. The occasion of the clash was the decision of Rome (264) to aid the Mamertines against Hiero II. (*q.v.*) of Syracuse. Carthaginian influence in Sicily was strong; consequently the decision was regarded as an act of war. In this, the first Punic war, Rome, despite the loss of three fleets, won some remarkable successes by sea, especially the battle of Mylae (260). When the war ended in 242 Carthage agreed to pay an indemnity, and evacuated Sicily whereby Rome acquired her first overseas possession.

It was clear to both sides that the contest would sooner or later be renewed. The two powers could not share the Mediterranean world. The years between the first and second Punic wars saw the Rom. occupation of Sardinia and Corsica; the Illyrian wars (229-219), which resulted in the suppression of piracy on the Dalmatian coast and Rom. alliances with Apollonia, Epidaurium, and the island of Coreyra (Corfu); and preparation for the impending struggle with Carthage. At Carthage the influence of the brilliant family of the Barcas was hampered by a jealous aristocracy, and Hamilcar Barca (*q.v.*) estab. a military state in Spain where Carthage already had commercial dependencies. He and his son-in-law, Hasdrubal (*q.v.*), consolidated the whole of E. Spain; and when Hasdrubal was assassinated (221) his place was taken by Hamilcar's son, Hannibal (*q.v.*), who immediately began to extend his authority northwards. In 218 Hannibal took Saguntum, a city in alliance with Rome. This was the signal for war, and Hannibal crossed the Alps into Italy. Owing to the military genius of Hannibal and the lack of generalship among the Romans, the Carthaginian Army delivered a series of crushing blows, culminating in the disaster of Cannae (216). The Romans, however, with amazing tenacity and the skill of new commanders, notably Quintus Fabius Maximus (see under *FABIA GENA*) and the younger Scipio (*q.v.*), gradually resumed the offensive. Hannibal meanwhile lacked the support of his gov.; Capua fell in 212, and in 207 the Carthaginians under Hannibal's brother, Hasdrubal, were completely routed at the Metaurus. Hannibal was recalled to Africa in 203, and in the following year suffered a total defeat at the hands of the younger Scipio (*q.v.*) at Zama. Carthage signed a treaty of peace in 201 which gave Rome Spain and the Mediterranean Is., left Carthage with only twenty war-ships, and the obligation to pay a war tax for fifty years, and virtually gave the Romans a decisive voice in the affairs of Carthage, both at home and overseas.

The next fifty years proved that these humiliating conditions had not destroyed the commercial genius of Carthage, and Rome, led by M. Porcius Cato (*q.v.*), deter-

mined that Carthage must be destroyed ('*Carthaginem esse delendam*'). The occasion was given in 153. The Numidian king Massinissa (*q.v.*), an ally of Rome, appropriated the rich district of Emporiae, part of the Carthaginian ter. The Carthaginian Gov. attempted to regain it by force of arms contrary to the treaty of 201, and despite their efforts to avoid war with Rome a Rom. army landed in Africa (149) under the command of Scipio Aemilianus (*q.v.*), forced Carthage to surrender, and razed the city. The dist. of Carthage became the Rom. prov. of Africa (116) with Utica as its cap. Two important results followed from the Punic wars. Rome was now mistress of the whole W. Mediterranean area and W. culture was saved. It was the Rom. destiny to spread that culture through the medium of universal dominion. Economically, Rome henceforward relied upon imports of corn and the native agriculture began to decline. The wealth of Rome was vastly increased, and this imperial aggrandisement with its accompanying seeds of degeneration was hastened from another quarter.

(c) 200-133: *Rome and the East*.—The Romans had already come under the influence of Gk. culture in the cities of S. Italy. Since the death of Alexander the Great (*q.v.*) the Gk. mainland had fallen into a state of virtual anarchy. During the second Punic war, Philip V. (*q.v.*) of Macedonia had allied himself with Hannibal, and Rome, after Zama, had punished his delinquency at the battle of Cynoscephalae (197). Philip, however, was granted peace on generous terms and the freedom of the Gk. cities was reaffirmed (194).

Antiochus III. (*q.v.*) of Syria was another of those who had leagued himself with Hannibal; the Romans now turned upon him and defeated him at Thermopylae (191) and Myonesus (190). Antiochus forfeited his possessions in Europe and Asia Minor, and these were divided by Rome among friendly monarchs until such time as she chose to absorb them.

War against Macedonia was renewed in 171. It ended with the Rom. victory at Pydna (168). The Macedonian king Perseus was captured with all his treasure and a republic was estab. In 147 the Achaean League (*q.v.*) attempted to regain Gk. independence. The league was finally defeated in 146 when Lucius Mummius sacked Corinth and transported its immense wealth and priceless works of art to Rome. Two more Rom. provs. were set up, Macedonia and Achaia, and a Rom. protectorate was recognised in Asia.

(d) 146-49: *The Revolution*.—In little more than a hundred years Rome had advanced from the status of a powerful city state to that of a world power, and the machinery of government which had hitherto served her had become totally inadequate. Moreover, the increase of wealth, with its accompanying moral decay and the decline of agriculture, had resulted in near chaos. Those who sought to remedy this state of affairs believed that

the foundation of recovery was agrarian reform, and a lead was given by Tiberius Gracchus (q.v.). He was elected tribune in 133, but the measures which he proposed evoked such violent opposition from the senate and capitalists that he was assassinated. Nor did his brother Caius Gracchus (q.v.) meet with much more success, suffering a like fate in 121.

The struggle for power now shifted to the military sphere. Gaius Marius (q.v.) had reformed the army, successfully concluded (106) a war against the Numidian king Jugurtha (q.v.), repelled a barbarian irruption, and, together with his colleague Sulla (q.v.), suppressed the rebellion of the Itals, known as the Social war. The mutual jealousy of Marius and Sulla ripened into civil war. In 83 Sulla, having defeated Mithridates the Great (q.v.) in Asia, marched on Rome, and by the victory of the Colline Gate made himself master of Italy. He posed as the champion of senatorial gov., was appointed dictator for an unlimited period, and after a reign of terror known as the Sullan proscriptions, set up a new constitution which aimed at making the senate supreme. Sulla retired into private life, and immediately the democratic party sprang to life. After an abortive attempt by Marcus Aemilius Lepidus (q.v.) to restore the constitution, a civil war in Spain (see SERTORIUS), and the slave revolt of Spartacus (q.v.), order was for a time restored. The prin. agent of the senate in suppressing these revolts was Cnaeus Pompeius (q.v.) (Pompey the Great). He now (70), with his colleague in the consulship, Marcus Licinius Crassus (q.v.), leagued himself with the democratic party, restored the pre-Sullan constitution, and reorganised the administration of the provincial taxes.

Pompey was next called upon to settle affairs in the E. By the *Lex Gabinia* he was given a three years' command with extraordinary powers against the Mediterranean pirates, and fulfilled his mission within three months. He was next entrusted by the *Lex Manilia* with the continuance of the second Mithridatic war which, with varying fortune, had been in progress since 74. Having repelled the immediate danger to the Rom. provinces in Asia Minor, Pompey ordered certain pressing E. affairs, notably the boundary dispute between Parthia and Armenia. Syria was made a prov., as were Asia, Bithynia, Pontus, Cilicia, and Crete. During the five years (67-62) of Pompey's sojourn in the E. Rome was again in confusion. The conspiracy of Lucius Sergius Catilina (see CATILINE) had been broken by the vigilance of Marcus Tullius Cicero (q.v.) as consul; but the senate refused to ratify Pompey's E. settlement, and it quarrelled also with the Equites (q.v.). At this juncture there returned from military triumphs in Further Spain, Caius Julius Caesar (q.v.). With him and Crassus Pompey formed the first triumvirate, and in 59 Caesar was elected consul. In this capacity he forced the ratification which the senate had withheld and carried other reforms calculated to restrict the

senatorial power. If these measures were not entirely popular Caesar yet laid the foundations of a strong central gov., maintained order, and extended the privileges of the provincials. It was already clear to him that if gov. was to be successfully carried on it must be in the hands of one man, and that his own were the most capable to guide the state. He obtained from the senate an extraordinary military command for five years with power to raise levies and appoint his subordinates.

Caesar at once left for Gaul, from where, in the intervals of some brilliant campaigns, he made two expeditions to Britain (q.v.). One result of these successes was to rouse the apprehension of Pompey, who now tried to increase his own power. But he lacked support, and so in 56 the triumvirate was renewed. In 55 Pompey and Crassus were consuls, but after the defeat and death of Crassus at the hands of the Parthians at Carrhae (53) Pompey received dictatorial powers as *consul sine collega*, and the breach between him and Caesar rapidly widened. The climax was reached in 49 when Pompey successfully attempted to have Caesar declared a public enemy. The die was cast, and Caesar, who had been watching events from Ravenna, crossed the Rubicon with one legion, and civil war began.

(c) 49-31: *End of the Republic.*—At his approach the senate fled from Rome, which Caesar occupied. There followed a series of astonishing campaigns whereby Caesar made himself master of the whole Rom. world. Pompey's lieutenants, Lucius Afranius and Marcus Petreius, were routed at Ilerda in Spain, and Caesar crossed into Epirus (48) where he defeated Pompey at Pharsalus. Pompey fled to Egypt where he was assassinated; Caesar followed him there and estab. Cleopatra and her brother Ptolemy XIII. as joint rulers. He then hurried to Asia Minor where Pharnaces II. (q.v.) of Bosphorus had invaded Rom. terr., and defeated him at Zela (47), the occasion of his celebrated message to the senate, 'Veni, Vidi, Vici.' The following year he won Numidia at the battle of Thapsus against the Pompeian forces under Scipio, and in 45 gained his crowning victory in Spain at Munda.

In the intervals of these campaigns Caesar began to settle the affairs of Rome. He restored order in Italy, reorganised the finances at home and in the provs., and reformed the calendar. In all but name he was monarch; nor was he at pains to hide the fact, understanding that it was the only method by which the empire could be satisfactorily governed. The jealousy thus aroused in disappointed ambition issued in Caesar's murder (March 15, 44), and once again Rome was on the brink of civil war.

The leading conspirators in the murder, Marcus Junius Brutus (q.v.) and Cassius Longinus (see CASSIUS), in the face of popular hostility fled to the E. Marcus Antonius (q.v.), once Caesar's able though disolute lieutenant, went to Cisalpine Gaul. Caesar's great-nephew and heir,

Gaius Julius Cæsar Octavianus (the future Augustus), posed as champion of the senate, won the support of Cicero, and rallied an army of Cæsar's veterans. Octavianus was sent to the relief of Mutina besieged by Antony, but in the following year he, Antony, and Marcus Aemilius Lepidus (*q.v.*) formed the second triumvirate. Savage proscriptions now began, and among the thousands who perished therein was Cicero (43). The triumvirs next met and defeated the republican forces under Brutus and

ferring of the title Augustus, however, made his pre-eminence clear to all, while the *imperium proconsulare* and *tribunicia potestas*, which he received for life made him absolute master of the state, civil and military, both at home and abroad. Order was restored at home, the provinces reorganised, and the frontiers extended to the Danube. If Augustus died (A.D. 14) an unhappy man through family misfortunes, he had given Rome fifty years of peace and good government, and had established an empire whose supremacy is still

H. I. Munsell

THE DEATH OF CÆSAR

Mark Antony's funeral oration is given by J. D. Court. Two of the conspirators, Gaius Cassius and Marcus Brutus, are seen on the left of the painter.

Cassius at Philippi (42). The situation hardened into a contest between Antony in the East and Octavianus in the West. It was resolved in 31 at Actium, one of the decisive battles of the world, and Octavianus emerged as sole ruler of the Roman world.

THE EMPIRE (*a*) *Augustus* (*q.v.*) *Marcus Aurelius* — It was the intention of Octavian while exercising supreme power, to preserve on the one hand a show of republican institutions and to restore, on the other the old Roman manners and religion which formerly inspired her arms. As giver of peace he had the support of all classes, and future ages looked back to his reign as to a Golden Age. Styling himself *princeps senatus* he restored, at least in name the authority of the senate, the magistrates, and the popular assemblies. The con-

ditions of the Roman Empire, however, felt in European law, art, and literature, there were, however, from the beginning certain defects in the Roman Empire which were eventually to destroy it. Perhaps the most fundamental defect, and that which characterised all the empires of antiquity and many to-day, was a total ignorance of the nature of man and his destiny and a consequent blindness to his rights and duties. Hence the moral degradation of the empire, hence the savage autocracy of the less enlightened rulers as Caligula (37-41), Nero (54-68) and Domitian (81-96). More immediately evident were the economic weaknesses, chief of which was the impossibility to provide by a reasonable taxation for the defence of the enormous frontier line against the barbarian hordes who were already stirring at the gates. Again, the power of the emperors depended to an

increasing degree upon the armies, especially upon the praetorian guard which, from the time of Caligula, practically made and unmade emperors at its will. Among the more important events of this period we may mention the rise of Christianity; the beginnings of the Rom. civil service in the reign of Claudius I. (41-54) under the freedmen Pallas and Narcissus; the Jewish wars of Vespasian and Titus, which ended with the destruction of Jerusalem (70) and the beginnings of the *diaspora*; the brilliant 'Age of the Antonines' when the empire reached its zenith; and the ever increasing advance of the imperial dignity from principate towards autocracy. (See also: ANTONINUS PRUS; AUGUSTUS; CALIGULA; CLAUDIUS; DOMITIAN; GALBA; HADRIAN; MARCUS AURELIUS; NERO; NERVA; OTHO; TIBERIUS; TITUS; TRAJAN; VESPASIAN; VITELLIUS.)

(b) *Marcus Aurelius-Dioctetian*.—The Rom. Empire reached its greatest extent under Trajan. In the reign of Marcus Aurelius (161-80) the weakness of the frontiers first became apparent. The legions were largely composed of barbarian recruits, and they, lacking anything in the nature of patriotism, were as great a danger as their kinsmen without. A succession of soldier-emperors followed; they were placed on the throne by the sword, and by the sword most of them perished. Two of them, however, Claudius II., an Illyrian, and Aurelian, a Pannarian, managed to stem the tide of invasion and for a time to restore the lustre of the fading empire.

(c) *Dioctetian-Romulus Augustulus*.—Dioctetian succeeded in 284. He was an Illyrian by birth. He finally abandoned the last pretence of a diarchy of emperor and senate, even assuming the trappings of oriental despotism and the style of 'Dominus.' His reforms, however, both economic and political, were so far-reaching that a period of peace and prosperity ensued. In order more easily to repel the barbarians he associated himself with the title of Augustus Maximianus. He retained supreme command, but took as his special prov. Asia and Egypt while Maximian took Italy and Africa. Two subordinate sovereigns were also adopted with the title of Caesar, Gallinus in Thrace and Illyria, and Constantinus Chlorus in Gaul and Spain.

Immediately on Dioctetian's death (313) fierce quarrels broke out, and civil war raged for ten years until Constantine the Great emerged as sole emperor. Under him there occurred two events of vital importance in the hist. of the world. In 325 he summoned at Nicaea the first of a long series of general councils of the Church, the effect of whose decrees in the political as well as the theological sphere has endured until our own time. In 334 Constantine proclaimed Christianity as the official religion of the Rom. state. The other cardinal measure was the div. of the empire into E. and W. by the foundation of a new capital at Byzantium (Constantinople), with a new senate and a new nobility. This E. empire was Gk. in culture and developed into the Byzantine

Empire which endured through many vicissitudes but unvarying splendour until 1453. Once again, on the death of Constantine (337) the rival Caesars fought for power while the barbarians swept across the frontiers of the W.

In 364 Valens was appointed W. emperor by his brother, Valentinian I., of the Byzantium. For a time he succeeded in holding the Goths at bay, until his defeat in 378. Byzantium itself was now threatened; but the emperor Theodosius, by astute diplomacy, managed to save his own dominions and the throne of his W. colleague Gratian. From the death of Theodosius (395) the remaining hist. of the W. empire is chaos. Wave upon wave followed of Goths, Huns, and Vandals. Honorius (384-423), with the aid of his general Stilicho (a Vandal, defeated the Goths; but after Stilicho's death Alaric, the Visigothic king, after ravaging Macedonia and Illyria, captured and sacked the city of Rome. Gaul and Italy were overrun by the Huns, while the Vandals conquered N. Africa. In 451 the Vandal Genseric again sacked Rome; and finally in 476 the little emperor, Romulus Augustulus, resigned his throne to Odoacer (*q.v.*), who signified to Zeno, the E. emperor, that there was no longer need for a div. of the empire. Zeno should rule a united empire whilst Odoacer governed as patrician of Italy.

With respect to the sources of Rom. hist. from the estab. of Rom. supremacy in the Mediterranean until the fall of the republic (133-29 B.C.) only thirty-five of the 142 books of Livy's *Ab urbe condita libri* (trans. W. M. Roberts, 1912) remain, though epitomes of all but books 126 and 127 have survived. Of the *Bibliotheca historica* of Diodorus fifteen out of forty books remain. Connected narratives are to be found in the eleven extant books of Appian's *Civil Wars*, Sallust's *Catiline or Bellum Catilinarium* and *Jugurtha or Bellum Jugurthinum* (both trans. A. W. Pollard, 1882), and the *Commentarii* and *Gallie Wars* (both trans. G. W. A. McDermott, Everyman's Library, 1915) of Caesar. Neither of these works of Caesar completed the hist. of the Gallie and civil wars; the hist. of the former was completed in an eighth book usually ascribed to Hirtius, a partisan of Caesar, and the hist. of the Alexandrine, African, and Sp. wars was written in three separate books which are also ascribed to Hirtius. From the year 63 B.C. onwards the hist. of Dion Cassius is completely preserved, books 36-54 embracing the hist. from the wars of Luculus and Pompey against Mithridates to the death of Agrippa (10 B.C.). His description of this age is well supplemented by the writings of Cicero. Reference should also be made to the biographies of Plutarch (trans. B. Perrin, Loeb ed., 1914-26). It is only for the first century of the imperial age (29 B.C.-A.D. 285) that the sources are abundant enough to enable us to gain a relatively clear idea of it. Of the two great works of Tacitus (the 'Annals,' trans. G. G. Ramsay, 1904-9; also in the Loeb ed., describing the period from Augustus to

Nero, and the 'Histories,' trans. G. G. Ramsay, 1915, which embrace events from 69 until the death of Domitian) important portions are lost; but despite his prejudice he is the most trustworthy witness of that great age. Of Rom. historians writing in Gk. an extant hist. of the Rom. Empire in eight books from the death of Marcus Aurelius to the year 238, by Herodianus (trans. J. H. Hart, 1749; also in Loeb ed.), is valuable despite its defects. For the last period of the hist. of the W. Empire from its reorganisation by Diocletian and Constantine to the fall of the W. throne (285-476) the sources are more abundant than for the period 29 B.C.-A.D. 285, but are of very unequal merit. Of connected narratives only two are of real importance: the eighteen extant books, in Lat., *Resum Gestarum Libri XXXI.*, on the hist. of the empire from 353 to the death of Valens (378), by Ammianus Marcellinus (trans. C. D. Yonge, 1862), last of the great Rom. historians, and the hist. in six books in Gk. by Zosimus, a Gk. pagan historian of the time of Theodosius II., who comments severely on the faults and crimes of the Christian emperors, whence his credibility has been assailed by sev. Christian writers. Most valuable not only for legal and constitutional but even for contemporary hist. is presented by the great collections of laws which were made under the emperors Theodosius II. and Justinian. For our knowledge of the reorganisation of the empire by Diocletian and Constantine, we owe much to the *Notitia dignitatum*, a contemporary official document of great historical interest.

Romanino, Girolamo (1485-1566), It. painter, b. in Brescia. He painted chiefly in his native city, and was a fine colourist, with peculiar skill in the use of light and shade. Among his works are four frescoes in the cathedral of Cremona (1519-20); a 'Madonna' in the Doria Gallery at Rome; a 'Nativity' in the National Gallery in London, and one at Brescia.

Roman Law, law founded on the Twelve Tables (q.v.). It is on this basis that the body of the *corpus juris civilis* (q.v.) or later private law of Rome was developed. The Twelve Tables represent the private law of auct. Rome in its earliest period. Custom was its foundation; its elements were known only by tradition, but, later, jurists knew it as the *ius civile* or law peculiar to the Rom. State. The hist. of R. L. is that of the changes introduced into the *ius civile* and of the method adopted in its evolution. It was only in the later days of the empire that the *ius civile* began to be swept away; but for the student it is essential to recognise the elementary doctrines of the old *ius civile*. The chief of these peculiar principles are those which determine the position of a *paterfamilias* (see AGNATES), or father of a family; the succession to his estate; and the contracts and actions relating to the chief possessions of an agric. proprietor. The most important addition to the system of R. L. was the conception of the *lex naturae*—a conception borrowed from

the Stoics. By *lex naturæ* was meant the law by which the actions of man were to be guided as well as the law directing the universe, and out of it grew the *jus gentium* (q.r.), which, with the *jus naturæ*, were the two chief agents in modifying and extending the rigid and narrow system of the *jus civile*. In its final state R. L. is to be found in the *Institutes* of Justinian (q.r.), supplemented by *Novellæ*, and the *Digest* or *Pandects*. See also CIVIL LAW. See T. C. Sandars, *Institutes of Justinian*, 1859; H. S. Maine, *Ancient Law*, 1861; W. A. Hunter, *Introduction to Roman Law*, 1880; J. Muirhead, *Historical Introduction to Private Law of Rome*, 1886.

Romanov, House of, ruling house of Russia from 1613 to the revolution in 1917. Roman, a member of an old noble family, gave his name to the dynasty, and by marrying his daughter Anastasia to Ivan the Terrible, he allied his family with the ruling house of Russia. Anastasia's two brothers, Daniel and Nikita, were prominent in the state, and the latter was especially popular both for his democratic ideas and for the moderating influence which he exercised over the tsar. With the death of Ivan the Terrible, the R. family was scattered by Boris Godounov. Nikita's eldest son, Theodore, known as the monk Philarete, was separated from his wife by order of Boris and imprisoned in a monastery at Marlenburg by the king of Poland. At the end of the civil wars which followed the death of Boris Godounov, Michael, the son of Theodore, was elected tsar on Feb. 21, 1613, by a representative assembly specially summoned for that purpose. Michael was sixteen years of age at his accession, and he ruled jointly with his father, the Patriarch Philarete, until the latter's death in 1633. The rule of the R. dynasty, of which the most famous exponents were Peter the Great and Catherine II., is associated with the expansion of Russia to its natural limits and with the growth of autocracy. The latter served to keep the new empire together against the Swedes, the Poles, and the Turks. In later times, however, the autocracy was abused, and in the 1917 revolution the tsar Nicholas II. was deposed. This, followed by the assassination of the tsar, the tsarina, and the tsarevitch, ended the rule of the R. dynasty. See also under RUSSIA (HISTORY). See G. Botkin, *The Real Romanovs*, 1932.

Romanov, Panteleimon (1884-1936), Russian author, b. at Petrovsk. In his short stories and novels he dealt with the human problems common in the contemporary social system.

Roman Remains in Britain. It has often been pointed out that Britain was a prov. of the Rom. Empire for three centuries and a half. Of the occupation there are very extensive remains not only

of the dominating military system, but also of tns. and vills., shrines and tombs, and the coins, trinkets, pots, tools, and weapons of the Romans and the Romanised Britons. For the portable items museum study is necessary, and collections vary from the extensive ones of the Brit. Museum; Ashmolean Museum, Oxford; Tullie House, Carlisle; Colchester; Reading; Verulamium; and National Museum of Wales, Cardiff, down to the half-dozen pots and coins of a local library. In recent years there has been much organised research and exploration of Rom. Britain; the excavations on Hadrian's Wall (q.r.), of the tns. of Verulamium, Camulodunum, and Leicester, of the Saxon shore fort at Richborough, and the investigation of war-damaged areas in tns. of Rom. date, Dover, Canterbury, and Exeter, have yielded information of special importance.

The occupation was based on the road system, and the courses of the chief roads and of many minor roads are well known; many sectors are still visible, and aerial photography has assisted in discovery. In general they did not follow the line of earlier tracks, and they were sited to take full advantage of natural topography. The *Fosse Way* runs from Lincoln through Leicester to Exeter by Cirencester and Bath. *Walling Street*, starting at Richborough, connects Canterbury, London, St. Albans, Wroxeter, and Chester. London is linked to the north by *Ferne Street*. From Chichester, *Stane Street* run to London. The *Ickneld Way*, perhaps a prehistoric ridgeway in origin, traversed the Berkshire downs and the Chilterns. Sev. stretches of Rom. roads are preserved as anct. monuments.

There are extensive remains of Rom. forts and military works still in existence, the chief of which is Hadrian's wall (q.r.). At Chester, York, and Caerleon-on-Usk may be seen examples of legionary forts, while at Richborough, Reculver, Lympne, Fovvasey, Portchester, Burgh Castle, Suffolk, and Bradwell, Essex, are forts of the Saxon shore designed for protection against raids of the Saxon pirates. The Antonine wall has forts such as Bar Hill and Balmuldy which have been scientifically excavated. At Dover is a Rom. lighthouse which assisted cross-Channel navigation.

The walls of London, the largest tn. in Rom. Britain, are still visible in part, and over many years careful observation has resulted in the elucidation of the hist. and structure of the Rom. tn. At Wroxeter, Silchester, Colchester, and St. Albans extensive excavation has taken place; tn. walls remain, but the Jewry wall at Leicester, part of the forum, and the five gateways at Lincoln and Colchester are among the best out-of-door relics of Rom. Britain. At Verulamium (St. Albans) is an open-air theatre, the only one of its kind as yet known in Britain. It was probably used as a cockpit and not for the presentation of drama, and is now carefully turfed and preserved after its excavation. There is an amphitheatre at Dorchester, Dorset, exceptionally well preserved. The tn. of Bath (*Aquæ Sulis*)

was a small but luxurious watering place, the prosperity of which depended on its medicinal hot springs. The Great Bath, the central feature of the bathing system, may still be seen and there is good evidence of a magnificent temple with a sculptural pediment which was probably dedicated to Sul Minerva, goddess of the springs.

The most popular of the architectural remains of Roman Britain are the villas of which more than 500 examples have been recorded. They are found particularly in the Medway valley in W. Sussex, Hampshire and the Isle of Wight in Somerset on the Cotswold Hills and in S. Wales

and have been marked out on the ground in concrete. A small basilican building at Silchester now covered in, appeared to be a Christian church. Romano-British cemeteries and tombs are often revealed in farming and by industrial operations, as with pottery kilns; the structure is usually destroyed and the contents removed to a museum. A few conical Roman burial mounds, e.g. the Bartlow Hills, Essex, and the Six Hills, Stevenage, Hertfordshire, are still prominent features of the landscape. See under COCHISELL, LONDON; SILCHESTER, YORK; VIETRIUM. See the annuaries in the *Journal of Roman Studies*

THE ROMAN BATH, BATH

The villas were country estates self-contained and very often self-supporting in agriculture and industry such as cloth-milling. The house of the proprietor was often furnished with mosaic pavements, painted plaster walls, baths and glazed windows, and was centrally heated. A remarkably fine villa at Chedworth (Gloucester) was purchased by public subscription after its excavation and vested in the National Trust. There are others of special note at Bignor, Sussex, and Woodchester, Gloucester, while at Lullingstone Park, Kent, there was found in 1949 a villa with a large mosaic floor on which was a couplet based on an incident in the first book of the *Aeneid*.

Many other remains have been filled in after excavation. Such are the small rectangular temples of S and L, Britain, which are closely similar to buildings found in Germany and Gaul, and which were for the worship of Romano-Celtic gods; the lines of one at Farley Heath,

for current work in R. B. See R. G. Collingwood, *The Archaeology of Roman Britain* 1930, new ed. in preparation. See also R. G. Collingwood and J. N. L. Myers, *Roman Britain and the English Settlements* 1937 ed.

Roman Roads. See under ROADS. ROMAN REMAINS.

Romans, in the dept. of Drome, France, on the Isère 11 m. N.E. of Valence. The abbey (ninth century) was founded by St. Bernard of Vienne and lost some of its valuable stained glass through air raid damage during the Second World War. Silks and wools, other shoes, hats, oils and absinthe are made. Pop. 15,200.

Romans, Epistle to the, has been unanimously accepted as a genuine epistle of St. Paul. It forms indeed a part of the central group of that apostle's writings. This central group consists of 1 and 2 Corinthians, Galatians, Romans, here is an orderly exposition of the principles

of the Christian religion and salvation in Christ as opposed to Jewish legalism. It is the longest of the apostle's writings, and, possibly the greatest, containing an epitome of his whole doctrine. It was written from Corinth on the third missionary journey (c. A.D. 56), and the apostle apparently anticipates visiting Rome (Rom. xv. 24), where he has many friends (Rom. xvi.). It is clear that he holds this predominantly Gentile church in high esteem (Rom. i. 8). He hopes to make Rome the centre of fresh missionary labours in the W. (Rom. i. 15). The main theme of the epistle is the relationship between Jew and Gentile, and their common salvation through the death of Christ. There are three main parts: a doctrinal treatise on the universal need for salvation and the life according to faith (I.-xi.), an exposition of Christian morality (xii.-xv.), a more intimate and personal conclusion (xvi.-xvii.). It is admittedly the most difficult of St. Paul's writings, and this is due in part to rapid transitions and grammatically confused sentences, and in part to the technical language. See J. B. Lightfoot, *Notes on the Epistles of St. Paul*, 1895, 1904, and particularly P. M. J. LaGrange, *Épître aux Romains*, 1918.

Romansch (also **Romansh** or **Rumansh**; the native term is **Romaunsh**; the word is obviously connected with 'Roman') is the fourth, and most recent, national and official language of Switzerland (the other three being Ger., Fr., and It.). R. is mainly spoken in Grisons (Graubünden, Grigioni, R. Grishun), the largest of the Swiss cantons (occupying over one-sixth of the national ter.), but the most sparsely populated. Only in the Engadine valleys do the R. speakers form a majority (about two-thirds) of the inhab. R. is steadily losing ground and has done so since ancient times. In pre-Rom. times the pop. of the riv.-valleys of the It. Alps spoke Rhaetic dialects and employed the N.-Etruscan alphabet (see **ALPHABET**). R. can be divided into four main dialects: Surilvanian, Subsilvanian, Upper Engadine, and Lower Engadine. Apart from these vulgar dialects there is the literary language, which has become the aforementioned fourth national language of Switzerland.

The relationship of R. with other Romance languages (*q.v.*) and dialects is uncertain. According to the It. linguist G. I. Ascoli (1873), R. was the W. of the three sub-groups of a group of Romance dialects, which he called *Ladin*, from the Engadine term for the local language, *ladin* (Lat.); the central sub-group being constituted by the dialects spoken in the semi-Latin basins of Noce and Avisio S. of Fassa, in Ampezzo and beyond Chiusa, in Upper Cordevole and Comelico (i.e. roughly in the It. prov. of Venezia Tridentina); and the E. group being formed by the dialect spoken in Friuli (It. prov. of Udine), by about 800,000 people. This group has been called *Rätoromanisch* by T. Gartner (1883) and is also termed in Eng. 'Rhaeto-Romance' languages. According to this theory, the

three sub-groups are remains of one main group of dialects, originally spoken in the S. Alps from the Toce to Rhaas and later reduced to three linguistic is. by the expansion of Ger. in the N. and of It. dialects (Lombardic and Venetian) in the S. Ascoli's compatriot C. Battisti denies this historical and linguistic connection between the three 'sub-groups,' and considers R. as an independent group of dialects of the Romance languages.

Romanshorn, vil. in the canton of Thurgau, Switzerland, on the S. side of Lake Constance, 11½ m. S.E. of Constance; there are fisheries. Altitude 1300 ft. Pop. 6200.

Romantic Movement, term applied to a general artistic upheaval which culminated about 1830-40. It was a reaction against the accepted formulae of so-called 'classical' art, and although it may be regarded as having originated in the field of Ger. literature in the later eighteenth century (*e.g.* Lessing and Schiller), it rapidly embraced the whole of European art. The relative aims of classical and romantic art were summed up by Heine as follows: 'Classical art had to express only the finite, and its forms could be identical with the artist's idea; romantic art had to represent, or rather to typify, the infinite and the spiritual, and had therefore to be expressed symbolically.' Classical art may be said to possess objective beauty, since universal types are presented, the artist being chiefly a technical medium of realisation. Romantic art, on the other hand, is subjectively beautiful, since individual impressions are presented, the artist being primarily a psychological medium of interpretation. The rules evolved from classical tradition were not suited to romantic ideals; the former aimed at symmetry of outline and perfection of form, whilst the latter aimed at the expression of individuality. The R. M. therefore discarded formal beauty in favour of emotional intensity. The leading figures in the R. M. were in Eng. literature: Scott, Shelley, Byron, Wordsworth; in Ger. literature, Goethe, Heine, Tieck, and Hoffmann; in Fr. literature, Hugo, de Musset, George Sand, and Sainte-Beuve; in painting, Delacroix and Delacroix; and in music, Berlioz, Weber, Chopin, Schumann, and Meyerbeer. In these sources nearly all the important developments in modern art originated. See C. E. Vaughan, *The Romantic Revolt*, 1907, and D. G. James, *The Romantic Comedy*, 1948.

Roman Type, in printing, the upright character usually used, as opposed to the sloping characters or italics. The term rom. in reference to numbers denotes capitals or small letters (IV, iv) as opposed to the arabic (4).

Romanu, see **ROMAN**.

Romany, see **GYPSIES**.

Romberg, Sigmund (b. 1887), Hungarian-Amer. composer, b. at Szegedin and educated at Budapest Univ. He has written a large number of musical comedies and operettas in the Viennese tradition. His greatest successes include *The Student Prince* (1924) and *The New Moon* (1927).

Rome, prov. of Italy in Latium. Its area is 3258 sq. m. Pop. 2,077,200. Chief tn., the city of Rome, cap. of Italy. Civita Vecchia is the port of R. The prin. lakes are the Lago di Bolsena, the Lago di Vico (the Cimbrin lake of anct. writers), and the Lago di Bracciano. The chief riv. is the Tiber, which rises in the Apennines, and flows down through the centre of R., entering the Tyrrhenian Sea. *See under ITALY.*

Rome: 1. City in Oneida co., New York, U.S.A., on the Mohawk R. and Erie Canal, 15 m. N.W. of Utica, in a dairy-farming and market-garden dist.; it manufs. brass and copper products, locomotives, and motor-cars. Pop. 34,000. 2. City and co. seat of Floyd co., Georgia, 50 m. N.W. of Atlanta; it has iron foundries, cotton and lumber mills. Pop. 26,300.

Rome-Berlin Axis, *see* AXIS, ROME-BERLIN.

Rome, City of, cap. of the Rom. Empire; until the Reformation, of W. Christendom; from 1871 until 1946 of the kingdom of Italy; since 1946 of the It. republic. It stands on the Tiber, 17 m. from its mouth, at the S. edge of the Etruscan hill country, overlooking the rolling plain known as the Campagna. The wall of Aurelian (A.D. 271-76), which is nearly complete, enclosed a pop. of about a million. Medieval R. contained from 15,000 to 40,000, the latter figure about A.D. 1500; the present pop. is 1,573,900. The city is unequally divided by the Tiber. The left (E.) and larger section includes the chief part both of the anct. and of the modern tn. On the r. b. is situated the papal R. of to-day (the Vatican and St. Peter's) and part of the city (Trastevere, etc.), belonging to the It. republic. The precincts of St. Peter's and the Vatican palace, with St. John Lateran on the l. b., belong to the sovereignty of the popes. The royal palace and chief public offices are upon, or adjoin, the Quirinal Hill. The Seven Hills, all on the E. side of the Tiber, are still recognisable. The Esquiline and Viminal are modern industrial quarters. The Palatine, with the Forum below it on the E., is covered with important anct. ruins. The Capitol, the most imposing of the hills, the centre of anct. life and worship, has, apart from the additional monument of Victor Emmanuel, suffered little change since the sixteenth century. The active business life of the city is centred in the lower ground between the hills, the Pincio quarter, and the riv. This lower portion, with the Borgo di St. Peter's and Trastevere, formed the medieval city. R. now contains few secular buildings of that age. The great sack of R. prepared the way for a great era of rebuilding and enlargement. Most of the great palaces and also of the churches were erected or remodelled in the seventeenth and eighteenth centuries. Between 1870 and the First World War the city underwent rapid and drastic reconstruction. New quarters on the N. and E. were built, and central R. adapted to its urgent modern needs. The Tiber was in a large part embanked upon the medieval model of the Arno at Florence.

Under Mussolini a number of alterations were made in R. Mussolini's aim was to revive R.'s anct. grandeur on the basis of the historical glories of the Caesars, thus linking imperial R. with the Fascist Empire. A new thoroughfare, the Via dell'Impero, was built from the Colosseum to the Piazza Venezia. This opened up a magnificent view of the relics of anct. R., though its construction involved the bisection of the Imperial Fora, and throughout archaeological claims were

ROME: THE ANTONINE COLUMN

A pillar in the Piazza Colonna, raised by the Senate in commemoration of the victories of Marcus Aurelius Antoninus over the Marcomanni and other German tribes

second to political considerations. Much was done to lay bare the remains of the Palatine and Forum, so that they might be permanently visible. A public park, the *Passeggiata Archeologica*, was formed from the area on both sides of the Appian Way, bounded by the city wall. The Fascist Gov. demolished many medieval and later buildings in order to excavate Rom. remains, and also built a number of blocks of modern flats, both within old R. itself and in the suburbs, which grow considerably between the two world wars.

Of the important older streets, the Via Lata (the Corso), the Via Giulia (1503-10), and the Via dei Banchi remain much as they were, and the densely peopled centre of R., between the Corso and the Tiber, is

of such solid and dignified construction that the work of the sixteenth and seventeenth centuries serves the needs of to-day. Of the great squares, the Piazza Navona, Campo dei Fiori, Piazza Venezia, and Piazza del Quirinale survive; the Venezia is much enlarged. The Piazza di Spagna and del Popolo are of more recent date. The great houses of the Cenci, Savelli, Orsini (Monte Giordano), Sforza-Cesarini, Massimo, the Cancelleria, date from the fifteenth century or earlier. The Quirinal (royal palace), Borghese, Colonna, Barberini, Rospigliosi, Odescalchi, Doria Panfilii, Farnese, Corsini are of middle or late Renaissance style. St. Peter's (q.v.) is the work of the sixteenth and seventeenth centuries. The Piazza is due to Bernini, who designed the colonnades which enclose it. The basilica of St. Peter's retains nothing above ground of the great medieval church which was destroyed to make room for the much larger church originally projected by Pope Nicolas V. (q.v.) and resumed by Julius II., who (1506) laid the foundation-stone of a building planned by the Bramante. Raphael and Michelangelo (after 1547) continued the work; the latter designed, and partly completed, the drum and dome which surmounts it. Paul V. added the façade and Bernini completed the Piazza. Systematic archaeological investigations under the site of St. Peter's (q.v.) in 1940 led to the discovery of a complete Rom. cemetery, with pagan and early Christian tombs dating from the middle of the second to the end of the third century A.D. It came as a surprise that no trace was found below St. Peter's either of the circus of Caligula and Nero or of the Via Cornelia, both of which are shown by all the topographers of ant. R. under the Vatican basilica. It would appear from the indications given by the Elder Pliny and Tacitus that the circus lay within the Vatican area and probably to the S. of the Old Grottoes or crypts of St. Peter's. The Vatican palace, which adjoins the basilica, contains parts of early medieval date; parts of the wall of the gardens are remains of the wall of Pope Leo IV. (A.D. 850). Nicolas V. added a new wing, as did Paul II. and Innocent VIII. Alexander VI. carried on the work of extension (1492), but the chief residential portion of the Vatican is the work of Sixtus V. (c. 1575). The Sistine Chapel (the prin. chapel of the palace) dates from Sixtus IV. (1480), and was decorated by Michelangelo and other great artists subsequently. The palace contains about 1000 apartments, including those set aside for museum, library, archives, and the like. St. John Lateran (q.v.) on the S.E. border of the city, before which is a noble piazza, claims to be 'the chief church of all that are in Christendom,' and has, historically, precedence of St. Peter's, was founded by Constantine the Great (A.D. 306-37); hence *Basilica Constantiniana*; it was rebuilt in 904-11, again in 1365-70, and remodelled in the style of the late Renaissance between 1560 and 1650. Here the popes were often crowned, and sev. councils were held.

The Lateran Palace was the papal residence from the time of Constantine until the migration to Avignon (1309). The present imposing building was erected by Sixtus V., whose reign was a great epoch of reconstruction in Rome. It now contains an important museum of classical and Christian sculpture. The same pope built the Quirinal palace as the summer house (1574) of the pontiffs. Three other churches, 'Patriarchal' churches, are of very ant. origin: St. Paul's, rebuilt 1823, on foundations of the original building of A.D. 386, San Lorenzo, S. Maria Maggiore, San Clemente and S. Pudenziana are older still. San Lorenzo was damaged during an air raid in July 1943, one bomb falling wide of the target, the marshalling yards of the main railway. Amongst other churches of great antiquity are S. Maria in Trastevere, Santi Quattro Coronati, S. Agnese, S. Maria in Cosmedin, S. Sabina, S. Saba, Ava Cella, and S. Maria sopra Minerva. Certain churches occupied original pagan buildings, as the Pantheon, S. Maria Antiqua, lately excavated on the edge of the Forum, SS. Lorina and Damiani. Many contain mosaics of the fourth and fifth centuries, and sculptured work of the classical age. Through these churches is maintained the continuity of ant. and modern R., for of secular building other than ruins little survives in continuous use if we except the theatre of Marcellus, mausoleums of Augustus, and of Hadrian, and parts of the Capitol. The Tiber is crossed by fourteen bridges, of which the Pons Fabricius is of the Republican age; and the central arches of the beautiful Ponte Sant' Angelo date from Hadrian. The new bridges within the city are for the most part worthy of their setting. Outside, to the N., the Ponte Milvio, which carries the great N. road, is mainly of republican work (109 B.C.). Of the ant. city gates, sev. are preserved and are still in use. Others have been reconstructed and transformed. The Porta del Popolo (1562, etc.), the historic entrance from the N. Porta Pia, in the E. wall, is that by which the It. troops forced their way into the city in 1870. The Porta S. Giovanni, by the Lateran, is the starting-point of the road to Naples; the Porta Tiburtina to Tivoli, Sulmona, and the central Adriatic coast. At the Porta Sebastiana begins the Via Appia to Brindisi, bordered by ant. tombs, and retaining long sections of the ant. paving. The three last cross the Campagna, which in imperial days was already partly deserted owing to malaria, the ravages of which have been much abated in modern times by drainage and the planting of eucalyptus-trees. This broad belt of desolate, unenclosed land, surrounding the city upon three sides, is the peculiar characteristic of the situation of R. The surviving monuments of ant. R. lie chiefly S. of a line drawn E. and W. across the Capitol. To the N. of this stands the main part of the modern city. From the railway station by the E. wall run the Via Nazionale and Corso Vittorio Emanuele. This is met at Piazza Venezia by the famous Corso (now Corso Umberto

I.) which leads in a straight line to the Porta del Popolo, the N. gate. The Tiber is bordered for most of its length by wide boulevards. The public gardens of R. are few. That of the Villa Borghese (now the garden of Villa Umberto I.), public property, is the St. James's Park of R., much frequented by children. It lies outside the walls, on the N., and is connected with the Pincio gardens, a famous promenade situated high above the city, at their inner angle. The Villa Borghese, built by Cardinal Borghese early in the seventeenth century, is a sumptuous museum of sculpture and of painting. The heights above Trastevere, on the W. bank of the Tiber, on the Janiculum hill, are laid out as a public park, where there is a great statue of Garibaldi. The chief museums are the vast papal collection (dating from the fifteenth century) of the Vatican, including auct. sculpture, Christian inscriptions, coins, Etruscan and Egyptian objects; the picture gallery, the wall-painting of Raphael ('Sistine' and 'Loggia'), of Michelangelo, Pinturicchio (Borgia apartment), etc. The library is, though not very extensive, perhaps the richest in important MSS. The Lateran museum, the Capitol, the Thermæ, and many others are of special interest. Private galleries include the Barberini, Doria, Albani, Colonna. Other public collections of paintings are the Corsini and the Galleria d'Arte Moderna. The univ. (Sapienza), founded 1303, was at its height under Leo X. (1512-21), but is now of less importance. Various national seminaries for training Catholic clergy exist. The Fr. Academy of Art has its beautiful home in the Villa Medici; there are also Brit., Amor., and other schools of hist., archaeology, and art. But as an artists' centre R. has lost some of its importance since the end of the nineteenth century. The foundations of R. are remarkable. Certain sections of auct. aqueducts, bringing water from the Apennines beyond Tivoli and Palestrina, and from the Etruscan hills, are still in use. R. is one of the healthiest cities of Europe in spite of its trying summer climate. The public fountains of Trevi, Paola, Felice, and Marcia are monuments of distinction; but throughout the city water runs perpetually from hundreds of minor sources. R. has no large manufs. Its pop. is rapidly increasing, owing partly to its importance as the cap. and centre of government. The Senate and the Chamber of Deputies sit in R., and the public offices and the court involve a large residential element. The city government is in the hands of a Consiglio (city council) and Sindaco (lord mayor). The administration of health, public security, civic utilities, etc., is efficient and modern; transport within the city is highly organised, and there are tramway services from the falls of Tivoli (the Anio). The tns. on the Alban hills, 17-20 m. distant to the S.E., and Civita Castellana, to the N., 34 m., are connected with the system. There is air communication between R. and other world caps.

None of R.'s historical monuments

suffered serious damage during the Second World War; the damage done to St. Lorenzo was quickly repaired, and the Aurelian Wall had two breaches made in it. This damage occurred during the first Allied raid on R., the target being the railway marshalling yards, on July 19, 1943. On August 13 a heavy raid was made on military objectives near the city. Next day R. was declared an open city by the Badoglio Gov. In Sept. the gov. and royal family abandoned R. It was then garrisoned by Kesselring's troops. The real battle for R. began in May 1944, when fierce fighting took place in the Alban Hills. The Fifth U.S. Army entered the city on June 4 and R. became the seat of It. Gov. eleven days later (see further under ITALIAN FRONT, SECOND WORLD WAR CAMPAIGN ON). See also APPIA VIA, COLOSSEUM, FORUM, etc., for Rom. remains in R.; LATERAN CHURCH OF ST. JOHN, ST. PETER'S, VATICAN, etc., for Medieval and Renaissance R. also under ITALY, Roman History. See N. Young, *The Story of Rome*, 1901; E. Steinmann, *Rom in der Renaissance*, 1908; E. Hutton, *Rome*, 1909; H. Stuart-Jones, *Classical Rome*, 1911; E. V. Lucas, *A Wanderer in Rome*, 1926; G. Lugli, *I Monumenti antichi di Roma e suburbio*, 1930-40; R. Elston, *Cook's Traveller's Handbook to Rome* (6th ed.), 1935; F. Male, *Rome et ses vieilles églises*, 1942; L. Curtis, *Das antike Rom*, 1944; and J. More, *The Land of Italy*, 1949.

Rome, King of, see NAPOLEON II.

Rome, Prix de, highest award given to the pupils of the Fr. Academy of Fine Arts. It gives access to the Académie de France à Rome. There are minute rules governing the award, which is much coveted.

Römer, Ole, or Olaf, or Olaus Christensen (1644-1710), Dan. astronomer and mathematician, b. at Aarhus, Denmark. He went to the univ. of Copenhagen in 1662, where he made a special study of mathematics and astronomy. After leaving the univ. he became assistant to Picard and Cassini at the Observatory of Paris, and soon afterwards was made tutor to the Dauphin and was given a pension by Louis XIV. in 1672. In September 1676 he announced to the members of the Paris Académie des Sciences that the eclipse of the inner satellite of Jupiter, which was expected on Nov. 9, 1677, would be ten minutes later than the time computed on the basis of the previous eclipses, and the following year the eclipse took place in accordance with his prediction, thus proving conclusively that the velocity of light was finite. In 1681 he returned to Denmark as prof. of mathematics at the univ. of Copenhagen and soon afterwards was appointed astronomer royal to Christian V., who quickly recognised his ability in other spheres. R. was appointed to a number of important posts: master of the mint, inspector of naval architecture, advisor on pyrotechnics and ballistics, etc., and in 1688 he was made a member of the Privy Council. Early in the next century he was made mayor of Copenhagen and prefect of the police, and also a senator and

head of the state council. See R. Horrebow, *Basis Astronomix*, 1735.

Rome Scholarships, Brit. academic awards in painting, sculpture, archaeology, hist., etc., made by the faculties of art in those subjects of the Brit. School at Rome, founded in 1913. A Brit. student awarded a Rome scholarship spends two years in Rome studying his subject.

Romescot, or **Rom-fooh**, see PETER'S PENCE.

Romford, mun. bor. and mrkt. tn. of Essex, England, 12 m. E.N.E. of London, on the Rom. It is noted for its market. There was a Rom. station called Duro-lum hero. The parl. constituency of R. includes the urb. dist. of Brontwood. Pop. of bor. 73,000.

Romilly, Sir Samuel (1757-1818), Eng. lawyer and reformer, b. in London, and educated privately and at Gray's Inn. He was called to the Bar in 1783, and took silk seventeen years later. He entered Parliament in 1806 and in that year was solicitor-general in the short-lived second Grenville administration. He effected many legal reforms, helping to mitigate the severity of the criminal laws; it was R. who secured the abolition of the death penalty for many classes of petty crime. R. joined in the anti-slavery agitation, and opposed the suspension of the Habeas Corpus Act. His promising career was cut short by his suicide. He wrote *Observations on the Criminal Law of England, as it relates to Capital Punishment* (1818). See life by C. G. Oakes, 1935.

Romilly-sur-Seine, tn. in the dept. of Aube, France, 23 m. N.W. of Troyes; it has manufs. of hosiery and needles, and there are railway shops. Pop. 14,100.

Rommel, Erwin Johannes Eugen (1891-1944), Ger. soldier, b. at Heidenheim, near Ulm, Wurttemberg. He joined the army in 1910, and was commissioned in 1912. During the First World War R. served in France, Rumania, and Italy, was decorated with the Iron Cross, Class I., and the *Order pour le Merite*, and was promoted captain in 1917. After the war he was a company commander at Stuttgart until 1929, when he was appointed instructor at the War Academy, Dresden. Having been promoted lieutenant-colonel in 1935 he received a similar post at the War Academy at Potsdam. In Nov. 1938 R. was commandant of the War Academy at Wiener Neustadt. On the outbreak of the Second World War he held the rank of major-general, and was given command of the 7th Panzer Div. in Feb. 1940, and on June 12 R. received the surrender of Maj.-Gen. Fortune, four Fr. generals, and 19,000 allied troops at St. Valery-en-Caux in Normandy. He was awarded the Knights' Cross of the Iron Cross.

After the defeat of Graziani in Libya R. was appointed to command Ger. troops there, which at first consisted only of the 5th and 9th Light Divs. He was promoted lieutenant-general in Jan. 1941. (For R.'s campaigns in Libya and Egypt see under SECOND WORLD WAR.) For his advance in the summer of 1942 from Gazala to Alamein, R. was promoted

field marshal, decorated, and praised by the Ger. press. But he was not adequately supplied with ammunition and reserve tanks; on June 31 he had only twelve Ger. tanks in running order. Between then and the arrival of Montgomery (q.v.) on Aug. 15 he had to beat off six Brit. counter-attacks before he could again seek a decision at Alam Halfa on Aug. 31. During the four days of this battle he was ill, and on Sept. 24 was flown home to hospital, on the way seeing Hitler, to whom he appealed for more supplies and motorised troops. On Oct. 24, at the height of the Alamein battle, Stumme, his successor, died, and R. was flown from hospital to conduct the lost battle and the withdrawal to Tunisia. His request for more motorised troops had not been granted. The 164th Infantry Div. and the Ramcke Brigade of four paratroop battalions were his only reinforcements. From now until the end of the campaign R. was a sick man. In Nov. he again saw Hitler, who finally promised support. This, however, was not forthcoming. Ger. reinforcements were indeed poured into Tunisia, but R. did not get control of these until Feb. 22, 1943, when he became commander-in-chief Army Group Africa. At Kasserine Pass in that month he inflicted a heavy defeat on the Amer. 2nd Corps, but his counter-attack against the Eighth Army failed at Medonine on March 5. A week later R. flew to Germany, where (according to his family) he asked Hitler for permission to evacuate his troops, but this was refused, and he was accused of cowardice. He was in hospital for some weeks, and on May 12 again saw Hitler, who said to him: 'I should have listened to you earlier. Africa is lost now.'

After the allied victories in N. Africa R. was given command of troops in N. Italy. Despite his misgivings as to the North Sea and Atlantic defences in Jan. 1944 he accepted command of Ger. troops in Holland and of the Fifteenth and Seventh Armies in N. and N.W. France. (For the summer campaign of 1944 see WESTERN FRONT in the SECOND WORLD WAR.)

On July 17 R. was severely injured when his car was shot up by the R.A.F. He was suspected of complicity in the plot against Hitler (June 1944). When at home on convalescent leave he was offered the alternative of trial before a people's court or suicide by poison. He chose the latter, and died Oct. 14.

On the professional plane R. has been dismissed as a brilliant tactician but an indifferent organiser. If this were so he could never have succeeded in the desert, which as Gen. von Thoma, a later commander of the Afrika Korps, has said, was 'a tactician's paradise, but a quartermaster's nightmare.' His largest command in Africa was only a tactical one. Questions of supply were decided for him before the material left Europe, and R. suffered from the inefficiency of Cavallero and the omny of Kesselsring (q.v.). See E. Rommel, *Infanterie Greift an*, 1937; A. Morehead, *African Trilogy*, 1946; M. Shulman, *Defeat in the West*, 1947; H. B. Glasevius, *To the Hitler End*, 1948;

U. von Hassel, *Diaries*, 1948; H. Speidel, *Invasion*, 1914, 1949; and D. Young, *Kommel*, 1950.

Romney, George (1734-1802), Eng. artist, b. at Dalton-in-Furness, the son of a cabinet-maker. He early showed a taste for drawing, and was apprenticed to Edward Steele, the portrait painter, who lived at Kendal. R. came to London in 1762, and painted many pictures, travelling abroad to study when he could afford to do so. His portraits became popular, and he became a professional rival of Sir Joshua Reynolds. Perhaps his most famous sitter was Lady Hamilton, of whom he painted many likenesses. In his later years he suffered from despondency and ill health. After his death his works were little sought, but this unnatural reaction passed, and to-day they are of considerable value. R. excelled in portraying vital, radiant Eng. beauties of the day; he could express character in the simplest of pictures, such as 'The Parson's Daughter,' and his treatment of skin-textures and materials was particularly fine. See lives by R. S. Gower, 1904; H. Ward and W. Roberts, 1904; and B. L. K. Henderson, 1922.

Romney Marsh, 13½ sq. mi. of rich sheep pasture, Kent, England, near Rye, protected against the sea by a huge embankment and by a drainage system, under the management of an auct. corporation known as the Lords of R. M. Area 24,950 ac. There are sev. vils.

Romney Marsh Breed, see SHEEP.

Romney, New, municipal bor. and Cinque Port, Kent, England, 22 m. S.W. of Canterbury. It is now about a mile from the sea, its harbour having silted up in the thirteenth century. The par. of N. R. contains the watering-place of Littlestone-on-Sea. Pop. 2300. Old Romney is a par., 2 m. W. by N.

Romny, or Romen, ln. of the Ukrainian S.S.R., 110 m. N.W. of Poltava. It manufs. tobacco and flour. Pop. 30,000.

Romorantin, tn. in the dept. of Loir-et-Cher, France, 39 m. S.W. of Orléans. It has manufs. of cloth and oil refineries, and is noted for asparagus. It was once the cap. of Solozno. The edict issued from here in 1560 excluded the Inquisition from France. Pop. 7500.

Romsdal, valley in Norway, fylke of Møre, S.W. of Trondheim, extending from Mt. Snebbatten (7570 ft.) W. and N.W. to the Atlantic; is noted for its fine scenery, particularly in the valley of the Rauma and the peaks of Romsdalshorn (5093 ft.) and Trollinder (6010 ft.). Cap. Molde. Area 5787 sq. m.

Romsey, municipal bor. and mrkt. tn. of Hampshire, England, 8 m. N.W. of Southampton, on the Test. It has a brewery, jam manufs., and sev. other industries. The fine Norman church of St. Mary dates from the twelfth century, being originally the church of a Benedictine nunnery. Another notable building is King John's House (c. 1206). There is excellent fishing in the R. Test, and it is an excellent centre for the New Forest. Pop. 6500.

Romuald, Saint (c. 950-1027), It. saint

and monastic reformer, b. at Ravenna of the noble family of the Onesti. He became a Benedictine at Ravenna, and was abbot there between 996 and 999. In the latter year he resigned and led a wandering life in central and N. Italy, and the Pyrenees. He estab. hermitages and monasteries, the most famous of his foundations being the monastery of Camaldoli near Arezzo (1009). This still exists, and from it developed the Camaldolese order (q.v.). R. attempted sev. times to go as a missionary among the Slavs. His feast day is June 19; Feb. 7 commemorates the translation of his relics from Val de Castro to Fabriano.

Romulan Calendar, div. of Rom. year, see under CALENDAR.

Romulus, name of the mythical founder of Rome, son of Mars and Rhea Sylvia, and twin brother of Remus. A well-known legend tells how they miraculously escaped drowning, and were reared by a she-wolf, finally receiving protection from the herdsman, Faustulus, and his wife. On reaching manhood, they planned and succeeded to expel the usurper, Anullius, and restore his brother and their grandfather Numitor to the throne of Alba. They then asked his permission to build a city on the Tiber's banks, but quarrelled as to its site and name. R., according to the usual story, killed Remus for laughing at his walls on the Palatine Hill. He then made the Capitol an asylum for refugees and adventurers, and provided wives for his citizens by the 'rape of the Sabines.' The resulting war ended in the joint rule of Tatius, king of the Sabini, and R. Later R. reigned alone, was carried up to heaven, and later worshipped as the god Quirinus by the Romans. While all scholars agree that the whole story is artificial it is not exact to say, as some do, that it is either of Gk. or Etruscan origin. Indeed, the birth exposure, the miraculous rescue, the heroic deeds of the twins, the asylum to adventurers, etc., are tales of familiar type in oriental, Gk., or Etruscan mythologies, but there is no indication whatever that the Gk. or Etruscan tales were of oriental origin or that the Rom. tale was of Gk. or Etruscan origin. They probably were indigenous stories. However, there is no doubt that the name R. derived from the place-name Rome (R. was the adjective of Rome, a parallel with Siculus, Rutulus, Equiculus; see *Romula gens* in Horace; at a later period only *Romanus* was used to indicate the Rom. people), and not Rome from R., as the legend refers. Quirinus was a god and another eponymus of *populus Romanus Quirinus*; his identification with R. was thus obvious. According to Rom. tradition, a *niger lupus* was considered as connected with the sepulchre of R. or Faustulus or Hostilius. This *lapis niger* was in 1899 discovered by G. Boni not far from the church of S. Hadrian, but it has been proved that the supposed tomb of R. was not a tomb at all.

Romulus Augustulus, see AUGUSTULUS, ROMULUS.

Ronald, Sir Landon (1873-1938), Eng.

conductor and composer; *b.* in London, a son of Henry Russell, composer of *Cheer! Boys, Cheer!* and other popular songs, and educated at St. Marylebone and All Souls Grammar School and at Margate. He received his musical training at the Royal College of Music, London, and *R.* assumed the surname of Ronald. He first appeared as a pianist in a wordless play, *L'Enfant prodige*, 1891. From that year he was accompanist at Covent Garden, and toured with Melba in America, 1894. From 1908 *R.* conducted the Albert Hall Orchestra, and he was principal of the Guildhall School of Music from 1910. *R.* was knighted in 1922. He composed incidental music, songs, ballet music, and orchestral works.

Ronaldshay, Earl of, see ZETLAND, MARQUESS OF.

Ronaldshay: 1. North, most northerly of the Orkney Is., Scotland, 2½ m. N.N.W. of Sanday, from which it is separated by the N. Ronaldshay Firth. Area 1 sq. m. Pop. 400. 2. South, most southerly of the Orkney Is., Scotland, 6 m. N.N.E. of Duncansby Head, containing the vil. of St. Margaret's Hope. The surface is level and well cultivated; it is connected to Mainland of Orkney by Churchill Barrier. Length 8 m. Area (including adjacent is.) 18 sq. m. Pop. 2000.

Roncesvalles (Fr. *Roncevaux*; Basque, *Orhial*), vil. of Spain in the Pyrenees, in the prov. of Navarre, 22 mi. N.E. of Pamplona. The old church was erected in memory of Roland, a paladin of Charlemagne, who was overwhelmed by the Basques in 778 at the famous pass near by, and is a resort of numerous pilgrims. Pop. 150.

Ronda, tn. in the prov. of Málaga, Spain, 42 m. N. of Gibraltar, built on both sides of a deep gorge (530 ft. deep, 300 ft. wide) of the Guadiaro R., and there is trade in wine, leather goods, and horses. *R.* was, until 1485, cap. of a small Moorish kingdom, the old tn. being built by the Moors and the new by Catholic kings. Pop. 32,800.

Rondeau. A verse-form of Fr. origin. The word is a later form of *Rondel*; modern usage, following the practice of Beauvillie, has estab. an arbitrary distinction between the *rondel* (*q.v.*) and the *R.*, but this is not universally observed.

The term occurs in the thirteenth century when it is applied to the music or the words accompanying a dance or 'round'; Guillaume d'Amiens and Adam de la Halle use the form, but the structure of their poems is very varied both in metre and in the number of lines. Already, however, the lines fall into three groups, the whole of the first line coming as a refrain at the end of the second and third groups. In the fourteenth century the *R.* passed from the musical to the literary sphere. Various types are found in the works of Eustache Deschamps. Of these, two mainly survive, the form used by Charles d'Orléans in *Le temps a laissé son manteau* being described as a *rondel*. This has thirteen lines on two rhymes, grouped in three stanzas of four, four, and five lines (the first two lines recurring as the third and

fourth of the second stanza and the first line being repeated as a refrain at the end of the third stanza). The most usual rhyme scheme is ABba, abAB, abbaA, where capitals indicate the repeated lines.

During the fifteenth century, perhaps through misinterpretation of 'copyists' abbreviations, the refrain was reduced to the repetition, outside the rhyme scheme, of the first half of the first line. This second type was used by poets until the seventeenth century, when the form dropped out of use until its revival in the nineteenth century. The pattern, the second type now regarded as standard is that used by Voiture; it consists of thirteen lines, on two rhymes, grouped in three stanzas of five, three, and five lines with partial refrain after the eighth and last lines. The usual rhyme scheme is aabba, aabbl, aabbll, but later poets, e.g. de Musset, have varied this.

Rondebosch, residential suburb of Cape Town *q.v.*, S. Africa, 5 m. S. of the city. Here are Groote Schuur, the official residence of the Prime Minister, and the Cape Town Univ. on the mt. slopes above *R.*

Rondel: 1. Synonym of *rondeau* (*q.v.*). 2. In modern usage, restricted to the *rondeau* of thirteen lines as used by Charles d'Orléans. Some poets repeat the first and second lines at the end of the poem, thus making fourteen lines.

Rondo, or *Rondeau*, musical composition, most important musical form since the eighteenth century, next to sonata-form, and frequently forming part of a sonata-form work, especially as the finale. Its general principle is that of a return to an initial theme, as to a refrain, with different episodes between. The Fr. *rondel* of the eighteenth century was merely a matter of detached sections, the first of them recurring after each of the incidental ones, which were called *complets*. Later the episodes became linked to the prin. theme by transitions, and the highest development of the *R.* was, especially in Mozart's hands at first, the so-called sonata-*R.* form, where one of the episodes appeared at first in a key related to the tonic and returned as another episode in the tonic key, exactly like a second sonata subject. Like a sonata movement, a *R.* may have a coda; much more rarely one of the episodes may be in the nature of a thematic working-out. The recurrences of the theme are often saved from monotony by (e.g. Mozart) abbreviation or (e.g. Beethoven) variation.

Ronne, seaport of Denmark, cap. of Bornholm Is. (*q.v.*), situated on the W. coast of the is. The harbour has been deepened, and there are shipyards and kaolin pottery manufs. Pop. 10,000.

Ronsard, Pierre de (1524-85), Fr. poet, *b.* at the Château de la Poissonnière, Vendômois, son of Loys de *R.*, *maître d'hôtel* to the Dauphin. *R.* left the Collège de Navarre to become page to the Dauphin, and accompanied James V. and Madeleine of France to Scotland, where he spent two years. He then lived at the Fr. court until, at eighteen, deafness dashed his hopes of preferment. *R.* found comfort in learning and studied

Gk. under Dorat. R. collaborated with du Bellay in writing *Défense et illustration de la langue française* (1549), which inaugurated a new literary age, that of classicism, and then began to publish poetry of the kind advocated in the manifesto. Until the death of his benefactor, Charles IX., in 1574, R. lived at court and at his home in Touraine, much patronised and famous. He spent his last years in quiet retirement in Touraine. Few poets have achieved such glory during their lifetime as R. Kings and queens treated him as their equal; Mary of Scotland, Elizabeth of England, and Charles IX. loved him with admiration and honour. R.'s poetic work falls into four periods: 1550-54 (Pindaric odes); 1554-60 (Anacreontic inspiration); 1560-74 (court poems); 1574-84 (*Sonnets pour Hélène*); of these periods the second and fourth are the finest. His greatness as a lyric poet lies in his evident sincerity, his feeling for the fragility of human life and beauty, his fondness for natural beauty; he has been called 'the poet of the roses'. His chief faults are his tendency to diffuseness, and undue imitation of the classical poets and Petrarch, but his poetry has variety, force, and a rich, delicate beauty.

Joachim du Bellay (1525-60). R.'s collaborator in *La Défense et illustration de la langue française*, was b. at Liré, near Angers, deafness barring him from the worldly success to which, as a member of a distinguished family of prelates and diplomats, he might otherwise have aspired. His short, uneventful life was that of a scholar, brightened from 1547 by his friendship with R., and saddened by absence from his Angevin home, as when he lived in Rome (1551-54) with his relative, the Cardinal du Bellay. Among his finest work is *Les Regrets* (1559), a collection of poems satirising the modern Romes, and thinking wistfully of home. His poems reveal without reserve a melancholy mind which muses on the flight of time and the passing of human greatness. Du Bellay is the master of the sonnet. He shows the same faults as R., but is perhaps a more sincere poet, and might, had he lived longer, have surpassed his friend.

R. and du Bellay stirred to action the latent desire to rival in Fr. the achievement of Gk., Rom., and It. poetry. Great thoughts, they maintained, must be expressed not in Lat. but in Fr. The mother tongue must be defended against Lat. but rendered a worthy vehicle of expression, made illustrious by reforms in poetic diction. The way to reach that end they showed by precept in the *Défense*, and by example in their poems. R. and du Bellay treated the great lyric themes nobly. See also FRENCH LANGUAGE AND LITERATURE. See life of Ronsard by D. B. Wyndham Lewis, 1916; also G. Wyndham, *Ronsard and the Pléiade*, 1906; M. Raymond, *L'influence de Ronsard sur la poésie française*, 1927; J. Vianey, *Les Odes de Ronsard*, 1932; and Gladys Turquet's trans. of the *Défense*, 1939.

Ronsdorf, tn. of Germany, in the Rhineland (formerly Rhenish Prussia), 3 m.

S.E. of Elberfeld, with iron, steel, and copper works, and manufs. of silk ribbons. Pop. 14,000.

Ronse, Fr. Renalx, city in E. Flanders, 23 m. S.S.W. of Ghent. It manufs. cotton and woollen goods, silk, thread, hats, and shoes. The church of St. Hermes dates from the eleventh century and its crypt is one of the most interesting in the country. Pop. 25,900.

Röntgen, Wilhelm Konrad von (1845-1923), Ger. physicist and inventor, b. at Lennep. He studied at Zürich Univ. and elsewhere, and held chairs successively at the univs. of Hohenheim, Strassburg, Gießen, and Würzburg. In 1895 he discovered the famous R. or X-rays, with which his name will always be associated. This discovery revolutionised physics and modern surgery. He became prof. of experimental physics at Munich in 1899. He received the Nobel prize for his discovery of X-rays in 1901. R. pub. many papers on these, and other subjects, doing research connected with the magnetic notation of polarised light, the absorption of heat and gases, etc. See study by L. Zehnder, 1933.

Röntgen Rays, see X-RAYS.

Rood (A.-S. *rōd*), cross or crucifix, generally applied to the representation of the crucified Christ, with the figures of the Virgin and St. John standing on either side, which before the Reformation, was placed in Eng. churches at the entrance to the chancel and over a screen which is known as the R.-screen. Most Rs. were destroyed at the Reformation though more of the R.-screens survived, if often defaced. In some Anglican churches modern Rs. have replaced the medieval ones which were destroyed. A modern example of a R. is that in the Rom. Catholic cathedral at Westminster.

Rood (A.-S. *rōd*, a pole, or cross), measure of surface, the fourth part of a statute acre, and equal to 40 sq. poles or perches, or 1210 sq. yds.

Roo-de-poort, tn. of S. Africa, in the Transvaal, 25 m. N.W. of Johannesburg. It is the centre of the Witwatersrand goldfields, and has increased greatly in size and importance since 1930. Pop. (Europe) 23,000, (native) 30,000.

Roof, top covering of any building, designed for shelter from the sun, rain, etc., and for protection. Rs. are usually inclined, and slope downwards in each direction from a central ridge, but some Rs. are flat, or rather have only a small fall to let the water run off. These flat Rs. are usually covered with sheet lead or asphalt and are constructed after the manner of floors. Inclined or pitched Rs. are usually covered with slates or tiles, and are supported on rafters. In all except the smallest Rs. these rafters are supported by purlins which in turn are supported by trusses. The latter are triangulated frames made of strut and ties, and are of many types: king-post trusses, queen-post trusses, hammer-beam trusses, etc., but these three types of trusses or Rs. are now nearly obsolete. The hammer-beam truss, as in Westminster Hall, is noted for its architectural

quality rather than its structural efficiency. Steel is now mostly used for trusses, also reinforced concrete, though of recent years there have been developments in timber engineering and new types of timber Rs. are now being constructed. These new developments are chiefly due to the innovation of metal connectors and synthetic resin adhesives. The connectors are usually metal rings which enable strong and cheap joints to be made instead of mortise-and-tenon joints; and the new adhesives have led to the development of laminated trusses or arches which are made of a number of bent boards 'glued' together. A hipped R. has end pitches and therefore level eaves all round, whereas in a gabled R. the end walls of the building go up to meet the roof pitches, and there are only two slopes. A mansard R. has two different degrees of pitches, meeting at a curb, on each side of the ridge. See BUILDING.

Roof-boss, see Boss.

Rook (*Corvus frugilegus*), gregarious bird of the crow family which generally builds its rookeries near houses. The nest is a large structure, made with great labour, of twigs and straw, and in it are laid four or five bluish-green eggs blotched with greenish-brown. The adult male is about 18 in. long and the plumage is black with a purple gloss. The legs, toes, and claws are black. After the second moult the feathers round the base of the beak do not grow again, leaving the characteristic white patch in both sexes. Rs. are active friends of the farmer in that they destroy vast numbers of noxious insects, and the mischief they do is probably more than compensated by this service.

Rooke, Sir George (1650-1709), Brit. sailor, b. near Canterbury. He saw service against the Dutch, and was promoted to rear-admiral and commanded the squadron sent to relieve Londonderry. In 1690 he was engaged in the unfortunate action off Beachy Head. In 1692 he took part in the battle of La Hogue and led the night attack which led to the burning of thirteen Fr. ships. In 1693 he successfully resisted an attack on his convoy by the Fr. In 1702, with the rank of vice-admiral, he was in command of the expedition which captured or destroyed the Sp. treasure-ships and Fr. warships in Vigo Bay. In 1704, with Sir Cloudesley Shovel, he captured Gibraltar and successfully beat off an attack by the Fr. off Malaga.

Rookwood, tn. of New S. Wales, Australia, on Haslam's Creek, 10 m. S.W. of Sydney. There is a large cemetery, also brick-fields and meat-preserving works. Pop. 6000.

Roorkee, see Rurki.

Roosendaal, tn. of Holland, in the prov. of N. Brabant, 14 m. W.S.W. of Breda. Pop. 26,000.

Roosevelt, Anna Eleanor (b. 1884), Amer. politician, sociologist, and writer, b. at Pough-keepsie, New York, the daughter of Elliot R. and niece of Theodore R. (q.v.). She was educated privately. In 1905 she married Franklin Delano R. (q.v.), a distant cousin. After his election

to the presidency she became well known as a writer on current topics and as a public speaker, gaining popularity by her sympathetic, energetic personality and sincere persuasiveness. As a journalist she became famous for her column, 'My Day.' She was one of the U.S. delegates to the first United Nations Assembly in London in 1946, and in Dec. of that year she was nominated to the United Nations Commission on Human Rights. She became chairman of this commission, which, in June 1948, adopted a declaration setting out a common standard of human rights. Her pubs. include *My Days* (1938) and *If You Ask Me* (1918), both autobiographical.

Roosevelt, Franklin Delano (1882-1945), Amer. statesman and president, b. at Hyde Park, Dutchess co., New York, only son of James R., business man and country gentleman, and of Sara Delano, member of a Fr. family which left Leyden in the seventeenth century. President Theodore R. was a distant cousin. R. was educated at Groton and Harvard; he graduated in 1904. He studied law at Columbia Univ., and while there married Eleanor R. (q.v.). He was admitted to the New York Bar, 1907. In 1910, and again in 1912, R. was elected to the New York Senate on the Democratic ticket. Almost at once he made his name in the successful revolt against Tammany Hall over the election of a senator to Washington. Daniels, secretary of navy, invited him to take the post of navy assistant secretary, and in that capacity R. did much to increase the efficiency of the fleet. The Democratic Convention of 1920, which nominated Governor Cox to succeed Wilson, agreed that R. should be nominated for the vice-presidency, but his party was defeated and he returned to legal practice. In 1921 he was struck down by infantile paralysis. This might well have ended his career, but he bore the pain and deprivation with rare courage and gradually conquered both the disease and the physical incapacity it entailed, though he was never to regain the full use of his legs. Owing to his iron will and powers of resistance, however, he played a prominent part in the Democratic Convention of 1924 as a supporter of Alfred Smith. In 1928 he succeeded his old friend Smith as governor of New York State, an important office which raised him to presidential status, and was re-elected in 1930 by the highest majority ever given to a candidate for governorship. By the end of the second period of office in New York he had greatly enhanced his reputation by the just and fearless performance of his duties in the investigation of municipal affairs.

In the midst of the economic depression of 1932 the Republicans put forward Hoover (q.v.) for the presidential election of that year. At the Democratic Convention R. was nominated. As the campaign proceeded R.'s inspired nomination pledge of 'a new deal for the American people' seized the popular imagination. R. was returned with a majority of 4,000,000 votes and 480 of 531 in the electoral college. Before his inauguration,

while in Florida, an attempt was made on his life by a madman, and his companion, the mayor of Chicago, was killed.

R.'s inauguration speech was brief and announced immediate and drastic action. He soon convened Congress and, with his great Democratic support in both Houses, was able to pass through a vast programme of reform. His plans for national recovery covered the whole range of industry. There were complaints from business and other interests which felt themselves prejudiced by the 'New Deal' legislation (for full details, see NEW DEAL), but the President's proposals were carried through on a broad

United States Information Service:
American Embassy

FRANKLIN D. ROOSEVELT

wave of popular support. Eventually there came a legal check, for the 'codes' which his National Recovery Act of 1933 had imposed upon employers were adjudged unconstitutional by the Supreme Court and therefore invalid; and his Agricultural Adjustment Act met the same fate. R., however, faced the setback with coolness, and in spite of the loss of legislation which, however, had already served much of its purpose, the New Deal continued.

War debts and disarmament posed serious problems of foreign policy. Following a visit by Ramsay MacDonald in April 1933 to discuss the world situation, R. issued a message to the states concerned in the disarmament and economic conferences, suggesting a definite non-

aggression pact. But this tentative approach to Amer. participation in international conferences came to nothing and the world economic conference (g.v.) of 1934 broke down on the problem of the stability of international exchange.

By 1935 R. could claim that his basic programme was substantially completed. He entered on the presidential campaign of 1936 against Alfred Landon full of confidence. Landon was not a formidable opponent, but ranged against R. were the combined resources of financial and industrial leadership and a large percentage of the newspapers. But the electorate returned him with a majority of 8,593,130 votes and with only Maine and Vermont against him in the electoral college. It was a victory beyond all precedent. At the opening of his second term he put forward proposals for a reorganisation of the executive so as to increase the effectiveness of the office of president. But he had to shelve his scheme for electing an additional judge to the recalcitrant Supreme Court, his critics asserting that he was tampering with the constitution. On foreign affairs he sounded a warning note on world lawlessness. R. took what steps he could to reinforce the cause of peace, such as by extending his policy of the 'good neighbour' in relation to the lat. states of S. America—with gratifying results in 1941, when Japan attacked Pearl Harbour. On his visit in 1938 to open the new international bridge over the St. Lawrence he assured the Canadian people that the people of the U.S.A. would not stand idly by if Canadian soil were threatened by any other empire. In the same year he began more fully to exercise his influence in European affairs, sending appeals to Hitler during the Czech crisis (see CZECHOSLOVAKIA), urging the maintenance of peace, and helping to bring about the Munich Conference, though he had no illusions about the sinister character of Axis policies. At the beginning of 1939 he told Congress that he would take any step short of war to stop aggression, and his speeches at this period, while containing strong declarations of peace, contained yet stronger vindications of democracy. His policy, he declared, was the defence of civilisation against militarism, and he began to strengthen the material defences of the U.S.A. and ordered a comprehensive survey of Amer. industry. When Hitler seized the rest of Bohemia, R. made a last friendly bid to the Axis dictators, but it was abortive. Finally on Sept. 1 he begged the powers concerned to declare publicly that they would not bomb civilian peoples or unfortified cities. After this there was no course open to him but to declare America's neutrality (see NEUTRALITY ACT); but later the ban on armaments was relaxed under the 'cash and carry' plan. With the fall of France, however, the attitude of America began to change and demands for a large programme of national defence were made. R. announced that there could only be peace for America if they were 'prepared to meet force with force if the challenge is ever made.'

It was in July 1940 that he defined the 'four freedoms' (q.v.) as the aims to be satisfied if peace were to be restored to the world. Before the presidential election of 1940 R. declined, for some time, to say whether he would break with tradition so far as to stand for a third term. Meanwhile, however, he launched an immense programme for the production of munitions; transferred fifty destroyers to Britain in return for facilities to construct naval bases in the Brit. W. Indies and Newfoundland; and took two leading Republicans, Cols. Knox and Stimson, into his Cabinet. He took but little part in the election campaign against his opponent, Wendell Willkie, yet won easily, by a majority of 5,000,000 on the popular vote. He then introduced his generous lease-lend proposals, embodied in an 'Act to promote the Defense of the United States,' indicating that a better-armed Britain was essential to the liberties of his own people and plainly intimating that America would be 'the arsenal of democracy,' and emphasising the lesson of Woodrow Wilson that 'democracy could not survive in isolation.' In a broadcast on May 27, 1941, he announced that all measures necessary to the delivery to Britain of supplies would be taken (see LEND-LEASE). Later in the year he sent Amer. troops to Iceland and in Aug. he met Mr. Churchill at sea, the outcome of this meeting being the Atlantic Charter (q.v.). R. invited Congress to agree to a revision of the Neutrality Act, and also proved his determination to support Russia in her resistance to the Axis by a credit of \$100,000,000. On Dec. 7 came the Jap. attack on Pearl Harbour. On the following day he gave, in person, a message to Congress, calling for a declaration of war. Except for one member the answer was unanimous. And a few days later Congress accepted the challenge of the other two Axis nations.

R. now entered upon his career of war leader. Soon afterwards Mr. Churchill was in Washington to plan unity of action. This was the beginning of a wartime association based on mutual regard. As commander-in-chief it was R.'s task to make an isolationist people strategically minded and to interpret the conflict, not merely as an occasion to punish Japan, but as a world conflict, and this he accomplished despite criticisms from some sections of the press and the public. In April 1942 he proposed a seven-point programme to resist the rise in the cost of living and a large increase in taxation. The fear of inflation was always with him, the more so as Congress was somewhat reluctant to incur unpopularity by supporting R.'s drastic measures. By the summer he could validly say that America's reservoir of resources was almost at a flood stage and that huge quantities of supplies were being transported overseas for the assistance of the Allies. In Nov. 1942 came the landing in N. Africa, the suggestion of which great turning-point in the war was attributed by Mr. Churchill to R. Shortly after his

New Year Address in 1943 to Congress came his first budget for a hundred billion dollars, a measure of the nation's prodigious war effort. Soon afterwards R. was at Casablanca, with Mr. Churchill and Fighting Fr. representatives and a host of military and naval experts, at what he styled 'the unconditional surrender meeting' (using the historic words of Gen. Grant) in which every aspect of the war was considered. This was the first time an Amer. president had left his country in time of war. He also visited Brazil and Mexico on his way back to the U.S.A. In America he was faced with labour troubles, particularly in the mines. An Anti-Strike Bill which he vetoed was passed despite his veto, and he had other set-backs in domestic policy. Earlier in the year he had invited Mr. Churchill to Washington, when full agreement was reached on all points 'from Great Britain to New Britain and beyond.' In Nov. he went to Cairo and, with Mr. Churchill and Gen. Chiang Kai-shek, discussed future military operations against Japan. With Mr. Churchill R. then travelled to Teheran, where he met Marshal Stalin for the first time. On his return journey R. visited Cairo again for discussions with the Turkish president, and touched at Malta and Sicily. Early in Jan. 1944 he and Mrs. R. presented their homestead at Hyde Park to the U.S. Gov. as a historical national site. This followed upon an earlier gift of the Roosevelt Library there. In the same month he introduced his second budget for a hundred billion dollars. By now the Legislature had become largely hostile to his social policy, particularly in relation to taxation. It's description of the Tax Bill, which he vetoed, as relief 'not for the needy but for the greedy,' was an appeal over Congress to the people. In April 1944 he had to take a rest, but on his return to the White House, apparently well, the Democratic National Committee announced that he would accept the nomination for the fourth term, though R. himself declined to be drawn. In May he outlined the Amer. plan for a world security organisation, something which would be a 'new and better League of Nations' in the post-war world. On July 20 the Democratic Convention nominated him for president, following his announcement on July 11 that he would serve if elected. In the same month he was in Honolulu and also visited the Aleutians and Alaska. In Sept. he went to Quebec to meet Mr. Churchill. He made only one political speech in this presidential campaign. The result was once again a decisive victory for R. Though Dewey, his opponent, had some strength in the rural districts, the workers in the urb. centres were overwhelmingly for R. and in both Houses of Congress he had safe majorities.

Early in 1945 his message on the state of the union was read to a joint session of Congress. It was a masterly and far-ranging review of the military situation. His brief fourth inaugural address, on Jan. 20, 1945, was the first wartime presidential message since the time of Abraham

Lincoln. In Feb. he was at Yalta in the Crimea where, with Churchill and Stalin, complete agreement was reached for joint military operations in the closing phase of the war against Germany. He had accepted joint responsibility with Britain and Russia for the solution of the political problems in Europe. He now looked forward to participation in the San Francisco Conference, but, while final arrangements were being made, he died suddenly at Warm Springs.

R.'s place in hist. in relation to the greatest of other Amer. presidents has yet to be assessed, but the fact that he was four times decisively elected is one important factor to be noted. The two great and protracted crises in Amer. hist. through which he piloted the nation must have involved a searching test of character and consummate statecraft, and in both crises he retained the confidence of the great majority of his fellow countrymen. His triumph over the great economic depression of the 1930s would in itself have assured his fame in the roll of Amer. presidents. But though the aims of his liberal policy required an era of peace he revealed equally remarkable gifts in the calamity of war. With all his personal hatred of Axis tyranny he knew well that his foresight must not lead him to act too far ahead of public opinion, nor indeed was the nation fully united behind his war policy until the awakening of Pearl Harbour. That event only strengthened the realisation of his powers as a trusted interpreter of world events, and from that time, free from the restrictions that had hampered his course, he quickly became not merely the commander-in-chief in war, but a national war leader and an inspiration to the world of democracy. In council with other great war leaders overseas he enjoyed all the prestige due to his personality and to the fact that a nation stood firmly behind him. Nor did he lack the skill of the shrewd politician, able to gauge a situation with intuitive understanding. A man of R.'s stature was bound to arouse violent animosity as well as deep affection. Though as war leader he led a united America, his domestic policy was always bitterly opposed by certain sections. Some of his measures aroused, among the opposition, a bitter personal hatred. Slurs continued to be cast on his memory after his death. He was maliciously accused of vanity, extravagance, and ruthless ambition. No standard biography of R. has yet appeared. Memoirs pub. since his death have not generally confirmed the impression of paramount greatness which R. seemed to possess during his lifetime. Critics have occasionally suggested, perhaps somewhat superficially, that it was events which made R. great, that but for the upheavals of the world in which he lived, he would have been only an efficient administrator. But this could be said of most wartime leaders with varying degrees of truth. R. himself never claimed to be more than the people's representative. Final judgment may decide that R.'s greatness lay in his courageous solutions

of difficult situations, and in his capacity skillfully to guide and interpret the will of a great complex nation, which transformed the isolationist tradition of the U.S.A. in foreign affairs into a realisation of the nation's international obligations and its intimate concern with the fortunes of all other nations. After the war the Brit. Parliament, on the suggestion of the late Lord Derby, passed the Roosevelt Memorial Act, empowering the gov. to maintain in perpetuity a statue of President Roosevelt and its site in Grosvenor Square, London. The Pilgrims Society was responsible for raising the funds, the sum aimed at being £10,000, in subscriptions limited to 5s., so that as many persons as possible could subscribe. The memorial was unveiled by Mrs. R. in the presence of the king and queen on April 12, 1948, the third anniversary of the President's death. The memorial statue is in grey-green bronze and, with its pedestal, is nearly 12 ft. high. It is the work of the sculptor Sir Wm. Reid Dick, R.A., the gardens and lay-out being that of the architect, Mr. B. W. L. Gallanbaugh. See also *LEND-LEASE*; *NEW DEAL*; *WORLD WAR, SECOND*, etc. See lives by G. W. Johnson, 1942; Frances Perkins, 1946; and L. H. Klerman, 1948. See also B. Rauch, *History of the New Deal*, 1944; Elliot Roosevelt, *As He Saw It*, 1946; *Nothing to Fear: Selected Addresses of Franklin Delano Roosevelt* (ed. by B. D. Zevin), 1947; D. Webster, *Age of the Great Depression*, 1948; R. E. Sherwood, *The White House Papers of Harry L. Hopkins* (vol. 1), 1948; and E. R. Stettinius, *Roosevelt and the Russians*, 1948.

Roosevelt, Theodore (1858-1919), Amer. president, b. Oct. 27, in New York city, descendant of an old Dutch family which had settled in what is now New York State in 1649. His father had been collector of the port of New York. The future president went to Harvard Univ., graduating in 1880. He then studied law, but was attracted to politics, and was elected to the New York State Legislature in 1881. In 1889 President Harrison made him a member of the U.S. Civil Service Commission, and in 1895 he was police commissioner of New York city. In 1896 President McKinley named him assistant secretary of the navy. R. was ardently in favour of war with Spain, and did much to put the navy in a state of preparedness. After war was declared, R., with his friend Dr. Leonard Wood, then a surgeon in the U.S. Army, raised the volunteer regiment which became famous as the Rough Riders. R. resigned his navy post to join his regiment. In 1898 he was elected governor of New York State. Nominated vice-president on the Republican national ticket (1900) R. succeeded President McKinley on the latter's assassination (Sept. 6, 1901). In 1904 he was re-elected, and did not seek a third term in 1908, when he was succeeded by W. H. Taft. The biggest positive feature of R.'s presidency was the Hay-Pauncefote (q.v.) treaty, which made possible the Panama Canal scheme. In 1905 R. intervened in the Russo-Jap. war, and induced

the warring countries to send delegates to Portsmouth, New Hampshire, where a peace was signed. For this he was awarded the Nobel peace prize in 1906. R. was a voluminous writer. Among his best books are *Hunting Trips of a Ranchman* (1886); *The Rough Riders* (1899); and

Topical Press

THEODORE ROOSEVELT

autobiography (1913); and historical books on the winning of the great West, and on the war of 1812. See lives by J. A. Riis, 1904; N. M. Butler, 1919; W. R. Thayer, 1919; and H. Pringle, 1932.

Root, Elihu (1845-1937), Amer. statesman, b. at Clinton, New York, and educated at Hamilton College and elsewhere. He studied law, and held degrees of sev. univs. R. participated as counsel in sev. important cases, proving very successful as a pleader, and held official legal positions. He was secretary of war in McKinley's Cabinet (1899-1904), dealing with success with the insurrection in the Philippines. He was secretary of state under Roosevelt (1905-9), and entertained diplomatic relations with S. America and elsewhere. R. was elected as senator (Republican) for the term 1909-15, and was a peace advocate, and member of Permanent Court of Arbitration at The Hague. He was a Nobel peace prize winner in 1912.

Root, one of the three distinct parts of nearly all pteridophytes (ferns and their allies) and spermatophytes (seed-bearing plants, including angiosperms), the other parts being stem and leaves. True Rs. do not occur in the byrophytes (mosses and liverworts) or in the thallophytes (algae and fungi). Usually the R. penetrates into the soil, fixing the plant there and absorbing the various inorganic food materials essential to it. All that part of the plant which is underground is not necessarily the R. A number of plants, such as mint, potato, and hop, form underground stems. A primary R. is that

formed on the germination of a dicotyledonous seed by the growth of the radicle, and this may give off secondary Rs., from which a third series may arise, and so on. In some plants, especially biennials, the primary R. grows more strongly than the secondary Rs., becoming thickened into a tap R., which is conical as in the carrot, fusiform as in the radish, or napiform as in the turnip. In these plants food is stored as sugars and other carbohydrates, giving them their value as human and animal food. A fibrous R. is a much-branched system, the primary R. having been arrested in its development. Adventitious Rs. are secondary Rs. formed from the stems and other parts of the plant. Aerial or sub-aerial Rs. are those, mostly of adventitious character, which do not grow down into the ground, but remain partially or entirely in the air; e.g. those that arise from the climbing stems of the ivy, and those formed by many tropical orchids and other epiphytes. In some instances, such as the banyan tree and mangrove tree, sub-aerial shoots are produced which ultimately penetrate into the soil. At the tip of a R. is a protective *R. cap.*; behind this is the growing region and then the region bearing the absorptive *R. hairs*.

Root, in algebra, quantity from which a power is derived; r is the n th root of r^n ; the n th root of r is represented by $\sqrt[n]{r}$. The roots of an equation are those quantities which, when substituted for the unknown quantities, 'satisfy' the equation.

Root and Branch Men, those extremists of the parl. party who upheld the Root and Branch Bill and Petition of 1641. This Bill provided that episcopal government, 'with all its dependencies, roots, and branches, be destroyed.' Among its adherents were Hampden, Sir H. Vane, and Cromwell.

Root Pruning of fruit trees is beneficial where they tend to make too much growth at the expense of fruit production. A trench is opened in the soil 2 or 3 ft. wide half-way round the tree. Fibrous roots that cross the trench are left untouched, but roots more than half an inch thick are cut through with a saw and dressed with gas tar. If the soil is poor it can be enriched with ash and well-rotted manure when the trench is filled up. The following year the other half of the roots is similarly treated. The best period for the operation is between Oct. and Feb., the earlier the better.

Root Tubercles, or Nodules, colonies of bacteria which live in partnership (*symbiosis*) with leguminous plants, receiving from them sugar which they oxidize to effect the combination of free nitrogen, returning to the plants nitrogen compounds. Hence the practice of ploughing in clover, etc., to enrich the ground with combined nitrogen. This practice is very old, having been mentioned by Virgil in his *Georgics*. The bacteria in question are *Bacillus radicicola*; they are motile and rod-shaped.

Rope and Rope-making. Rope is a term applied to the larger varieties of

twisted fibre, usually those one inch or more in circumference. The general term for fibre made hauling or lashing material is 'cordage', 'thread' is composed of two or three twisted yarns, 'twine' is made of a dozen yarns or so, 'cord' is made of three or more strands each consisting of a few yarns, 'rope' is made of strands containing a large number of yarns. The general method of manufacture is the same in all cases: the yarns are twisted together so that the tenacity of the whole may be increased by the friction engendered, the strands are then twisted around each other in the opposite direction to the twist of the yarns. A 'hawser laid' rope consists of three strands, a 'cable' or 'cable laid' rope is composed of three such hawsers twisted together. A 'shroud laid' rope consists of a central strand with three or four strands twisted around it. Cordage is sometimes plaited to secure greater pliability, as in fishing lines, window cord, clock cords and the most modern types of driving ropes. Many different fibres are used in rope making. Jute, on account of its cheapness is used for twines and cords and, mixed with other fibres for various qualities of rope. In general its tenacity is insufficient to fit it for the best qualities of rope. Common hemp is the most commonly used fibre, but Manila hemp which is tenacious but somewhat stiff sisal hemp phormium hemp sunn hemp etc. are also used a great deal. The prime fibres for marine use are Manila and sisal which have greater strength and stand up to salt water better than other fibres. Jute is never used for this purpose as it has not sufficient strength nor does it stand up to immersion in water. Coir fibre is used for rope making locally. Cotton ropes are employed for diving wheels while iron and copper enter into the composition of ropes and cables for rigging and for electrical purposes. The process of rope making may be enumerated as hocking, spinning, tarring (where necessary), forming strands and laying the rope. The object of hocking is to separate the fibres in the tangled 'streak' and to lay them parallel to one another. The longer fibres are then spun together to form yarn. Spinning is now done by machinery, although formerly it was a manual process requiring much skill. Tarring which is necessary only for ropes which will become alternately wet and dry is done by passing the yarns through tar heated to about 220° F and afterwards removing the excess of tar by a squeezing machine. The yarns are wound on bobbins after being spun. The thread is passed from the bobbins through holes in a register plate so arranged that the threads intended to form each strand pass through holes disposed in concentric rings. From the register plate the threads for each strand pass into a funnel whose further diameter is that of the strand. Each group of threads is attached to a revolving hook on a machine called a 'traveller', which moves on rails at a uniform speed away from the bobbins, so that the three strands are twisted at the

same time. A carriage containing a 'top' is used for laying the strands together to form the rope, thus taking the place of the walking spinner. Driving ropes are usually of cotton or of plaited sisal hemp. Nylon (qv) ropes are now used in mountaineering, being exceptionally strong and light in weight. Nylon rope was used in the Second World War for towing gliders. Aerial ropeways are usually made of wire rope more or less flexible, according to the system adopted. The flexibility of wire rope depends upon the number of wires to the strand, and ropes are now made of such a degree of flexibility that they can be used for most of the purposes of humpen rope. Their great advantage is their greater strength in proportion to diameter and weight. See P J Stopford *Cordage and Cables*, 1925.

Roper, William (1496-1578) biographer of Sir Thomas More (qv), whose daughter Margaret he married. His biography, written 1535, was pub in Paris 1626. It is remarkable for its simplicity and pathos, and also for its well constructed language. There is an ed in Everyman's Library.

Rope trick, most discussed trick that Indian jugglers or 'magicians' are said to perform. It is supposed to be performed as follows: the magician takes one end of a coil of rope high into the air where it stays drops the rest of the coil on the ground, moistens his hands, climbs up the rope, and vanishes. While the onlookers are gazing upwards wondering what has become of him the juggler unconcernedly reappears amongst them.

Rogue, or Roch St (1293-1327) French saint, patron of those suffering from plague. He was born in Montpellier, France, and wandered through France, Germany, Spain, and Italy, ministering to the sick.

Roquefort, vil in the dept of Aveyron, France, 45 m NW of Beziers. It is 1970 ft above sea level. It is famous for its cheese, the vil lying among the limestone *causses* which provide rich grazing ground for the sheep, and there are natural caverns kept evenly damp by underground watercourses in which the cheese is matured. Real Roquefort is made of the milk of ewes (chiefly Lanza breed) only and has a blue in the white texture. The morning and evening milk is mixed with rennet from lambs' stomachs, and the cheeses are matured for from one to five months in the caverns at a temp of 41° F.

Roraima, Mount, flat topped mt mass at the boundary point of Brit Guiana, Brazil and Venezuela. It rises in terraces with perpendicular rocky walls from 1500 ft to 3000 ft high and the top is covered with irregular ridges and peaks, the highest reaching a height of 8740 ft above sea level. Numerous streams rise in the summit and make one of the highest waterfalls in the world. It was first scaled by E. A. M. Furn in 1885.

Rorke's Drift, place on the Rorke's, Natal, S Africa, 21 m from Dundee. At R. D. a handful of Brit troops made a stand against a Zulu army on Jan 22, 1879.

Rorqual, see FIN WHALES.

Rosa, Carl August Nicholas (1843-89), Ger.-born Eng. impressario, b. in Hamburg, his father's name being Rose. He studied at the Leipzig and Paris conservatoires, and became orchestral leader at Hamburg. In 1867 he married Euphrosyne Parepa, a fine operatic soprano. The Carl Rosa Opera Company, which he started in England in 1875, not only popularised foreign operas in England by producing Eng. versions, but also encouraged native talent by presenting Eng. works.

Rosa, Salvator (1615-73), It. painter, b. at Aronella, near Naples; he studied art under his uncle Paolo Greco, and his father-in-law, Francesco Francanzuro. It was in Naples that Lanfranco bought his 'Hagar,' and so started him on a career of success and prosperity, and it was here that, in company with his good friend, Aniello Falcone, he joined in Masaniello's abortive insurrection (1647). At Rome, on the other hand, he sang and acted in the Carnival (1639), and here he painted the great 'Battlepiece' for Louis XIV. and the famous 'Saul and the Witch of Endor.' His trenchant satires, including *Babylon*, which was obviously directed against Rome, were penned in Florence, where he lived from 1647 to 1652, secure from the terrors of the Inquisition, with which he was threatened for his *Wheel of Fortune*. His conceit is pardonable in view of the sterling merits of his historical pictures, and even portraits, no less than his romantic and picturesque landscapes. See life by B. Cattaneo, 1929.

Rosa, Monte, the highest mt. in Switzerland, the chief peak, the Dufourspitze, being 15,217 ft., and a second peak, the Nordend, 15,132 ft. in height. A third peak, Punta Margherita, is in Italy, and was once the site of an observatory. Ascent on the Swiss side is from the Bêteemps hut and on the It. from Macugnaga. It is situated on the frontier between the canton of Valais, Switzerland, and the It. provs. of Novara and Turin. The name M. R. means 'mountain of ice.'

Rosacea, see ACNE.

Rosaceae, large and widely distributed family of trees, shrubs, and herbs, among the fruits of which are apple, pear, plum, cherry, apricot, peach, strawberry, and raspberry, while many bear flowers of great beauty and fragrance.

Rosamond, Fair, see CLIFFORD.

Rosamund, see under ALBION.

Rosaniline (tri-aminotolylidiphenyl carbinol, $C_{20}H_{19}N_3.OH$), organic base forming salts of value in dyeing. The term R. is in commerce applied to the chloride, fuchsine, or magenta, which possesses a brilliant red colour, although the R. base is colourless. The chloride is formed by adding hydrochloric acid and nitrobenzene to a mixture of aniline, ortho-toluidine, and para-toluidine; the whole is heated to 190° C., small quantities of iron filings being added during the process. R. dyes silk, wool, and tanned cotton a brilliant red, but the colour is not very fast, so R. is generally employed as an intermediate in the manuf. of faster dyes, such as aniline blue.

Rosapenna, seaside resort of co. Donegal, Eire, with a golf course and excellent bathing beaches. Tranarossan Bay is 3 m. distant.

Rosario: 1. City and riv. port on the Parana, 175 m. by rail N.W. of Buenos Aires in the prov. of Santa Fé, Argentina. By riv. the distance from Buenos Aires is 203 nautical miles. R. is primarily a centre for the transport overseas of the agric. produce of the central and N. provs. The staple export is wheat, and after that flour, sugar, linseed, and cattle. The quays and wharves are used by ocean steamers up to 10,000 tons and by riv. boats, and there are excellent railroad facilities. R. has made great strides since 1854, and is now the second city in Argentina. It has large sugar refineries, and also grain elevators, flour-mills, saw-mills, furniture, packing works, tanneries, bricks, tobacco factories, and printing works. The streets are wider than those of Buenos Aires, and there are sev. imposing boulevards and fine open spaces. A concrete paved road, on the route to Cordova, joins R. to Buenos Aires via Pergamino. Pop. (urb.) 161,700; (with suburbs) 522,400. 2. Tn. of Mexico, with gold and silver mines, 40 m. S.E. of Mazatlan in Sinaloa. Pop. 7000. 3. Tn. of Uruguay, S. America, in the dept. of Colonia, 110 m. by rail from Montevideo and 40 m. by rail from Colonia del Sacramento holiday resort. Its products of wheat, maize, and dairy produce are shipped from the port of Juan Lacaze. Pop. 8000.

Rosary, or **Prayer-beads**, string of beads on which are counted the number of 'Hail Marys' and 'Our Fathers' which go to form the devotion also known as the R. This devotion consists of fifteen decades, each consisting of one 'Our Father,' ten 'Hail Marys,' and one 'Glory be.' The actual R. consists of five such decades of beads, and to complete the devotion it is said three times. The traditional ascription of the origin of the R. to St. Dominic has been controverted (see *Catholic Encyclopedia*, xlii. 184). Certainly beads were in use before his time, and the repetition of a set number of 'Our Fathers' and 'Hail Marys' was common. The number of 150 'Hail Marys' was chosen in imitation of the 150 Psalms. The devotion is popular in the Rom. Catholic Church but not used outside it. Similar methods of counting repeated prayers are found in other religions, e.g. the Buddhists.

Rosas, Juan Manuel (1793-1877), Argentine statesman, b. in Buenos Aires. He trained an effective fighting force on his cattle run at Los Cerrillos, and, by effectually employing it in political strife, at last became tyrant of Buenos Aires. He was dictator from 1835 to 1852. He failed to force the Plate R. states into the confederation which he had organised and, after he was defeated by Urquiza at Monte Caseros, he took refuge in Southampton (England), where he died. He had ruled with exceptional ruthlessness and cruelty.

Roscelin, or **Roscelin, Johannes** (c. 1050-c. 1120), Fr. theologian, b. at Compiègne.

He played an important part in introducing Nominalism into the medieval schools. R. was a follower of Abelard. His speculations led him into conflict with the Church, and in 1092 his teachings on the Trinity were condemned by the council of Soissons. See study by F. Picavet, 1911.

Roscius, Quintus Gallus (d. c. 62 B.C.), Rom. actor, a slave of Solonum. A past-master in gestures, enunciation, and grace, he was in comedy the equal of Æsopus in tragedy. Sulla gave him a gold ring, the symbol of knightly rank, and Cicero was his devoted friend, pleading for him in a lawsuit. R. was noted for the naturalism of his art.

Roscius, Young, see BETTY, WILLIAM HENRY WEST.

Roscoe, Sir Henry Enfield (1833-1915), Eng. chemist, b. in London, and educated at London and Heidelberg Univs. At Heidelberg he formed a lasting friendship with Bunsen, whose associate he was in the development of comparative photochemistry. He was prof. of chem. at Owens College, Manchester, from 1857 to 1887. R. represented a Manchester constituency in Parliament from 1885 to 1895, and was vice-chancellor of London Univ. from 1896 to 1900. Besides making researches on vanadium, he was joint-author with Schorlemmer (d. 1892) of a standard treatise on chem. (1877-84). R. was knighted in 1884. He pub. an autobiography in 1906.

Roscoe, William (1753-1831), Eng. historian, b. at Liverpool. He practised for some years as an attorney, but in 1774 abandoned the profession of law for that of literature. His prin. works were *The Life of Lorenzo de' Medici* (1795) and *The Life and Pontificate of Leo the Tenth* (1805), both of which achieved remarkable success. He also wrote the nursery classic *The Butterfly's Ball and the Grasshopper's Feast* (*Gentleman's Magazine*, Nov. 1806), which inspired Beau Brummell to write *The Butterfly's Funeral*. See life by Henry Roscoe, 1833.

Roscoff, fishing vil. of Brittany, France, in the dept. of Finistère. It has a zoological laboratory, and is also a seaside resort. The church of Notre-Dame-de-Croaz-Baz (1550) has an unusual tower, like a minaret. There is a ruined chapel to St. Ninian (1573) built by Mary Queen of Scots in commemoration of her landing at R. Pop. (com.) about 4409.

Roscommon, Wentworth Dillon, Earl of (c. 1633-85), called by Dr. Johnson one of the benefactors of Eng. literature, was b. in Ireland. He was the first critic who publicly praised Milton's *Paradise Lost*. His chief work was *Essay on Translated Verse* (2nd ed., enlarged, 1685).

Roscommon, inland co. of Eire, in the prov. of Connaught, bounded on the N. by Sligo, S. by Galway, E. by Longford and Westmeath, and W. by Mayo and Galway. It was estab. as a co. about 1580. It is 60 m. long and 37 m. broad, with an area of 990 sq. m. and a pop. of 77,500. There are some extensive bogs and numerous lakes, Loughs Boderg, Allen, and Ree being the largest. Agri-

culture is the leading industry. R., the cap., is a mkt. tn., 92 m. W. by N. of Dublin. At Castle Strange is a sculptured standing stone of the Early Iron Age. R. contains the remains of a Dominican priory and a castle dating from the thirteenth century. Pop. of tn. 2,000. Other important tns. are Castlerea, Elphin, and Boyle.

Roscommon Breed, see SHEEP.

Roscrea, mkt. tn. of Tipperary, Eire, 32 m. N. of Cashel. In the seventh century St. Cronan founded an abbey at it. It contains the ruins of sev. eccles. structures and castles, besides a round tower, an anct. cross, and other historical relics. There is also a large modern Trappist monastery here, with a school and agric. college attached. Pop. 3000.

Rose, Hugh Henry, see STRATHNAIRN, BARON.

Rose, John Holland (1855-1942), Brit. historian, b. at Bedford and educated at Owens College, Manchester, and at Christ's College, Cambridge. He became first Vere Harmsworth prof. of naval hist. at Cambridge in 1919, and was a leading authority on Brit. hist. of the Napoleonic period. His publs., of which sev. have become standard works, include *Life of Napoleon I.* (1902) and *William Pitt and the National Revival* (1911). He bequeathed a sum to Christ's College for the endowment of a scholarship to encourage the study of recent Brit. imperial hist.

Rose of Lima, Saint (1586-1617), S. Amer. Rom. Catholic saint, patron saint of S. America and the Philippines, b. at Lima, Peru, of Sp. descent. She lived the life of a Dominican tertiary in her own home, her life being a replica of that of St. Catherine of Siena (q.v.), and she possessed, like St. Catherine, extraordinary mystical gifts. She was canonised in 1671, the first person of Amer. birth to be declared a saint. Her feast-day is on Aug. 30.

Rose (*Rosa*), large genus of flowering plants in the family Rosaceæ, unsurpassed for the beauty and fragrance of their blooms. In the culture of the numerous species and almost countless varieties for the sale of plants, the production of cut blooms, and the manuf. of attar of Rs. and other perfumes, many thousands of people are employed. There are ten to fifteen Brit. species, which hybridise with one another somewhat freely; the best known are the Dog R. (*R. canina*) and the very fragrant Sweet Briar (*R. rubiginosa*). Among the numerous cultivated species are *Banksia*, the white or yellow *Banksia*, it. valuable for walls; *bracteata*, the dwarf white-flowered Macartney R.; *centifolia*, the Cabbage R., with its many fine varieties, including the Moss R.; *damascena*, the Damask R.; *indica*, the China or Monthly R.; *hutea*, the Austrian briar; *moschata*, the Musk R.; *multiflora*, or *polyantha*, a group of valuable climbing Rs.; *rugosa*, the Jap. R.; *sempervirens*, the Evergreen R.; and *Wichuraiana*, another group of beautiful climbers. The latest development is the new race of Rs. known as the Hybrid Polyantha, a cross between

the Polyantha Pompon and the Hybrid Tea. This race is remarkable for its vigour and free flowering habit. Rs. can be planted from November to March, the earlier the better; they do best in a heavy loam or friable clay, the roots being spread out and covered with a few inches of fine soil, the hole being filled with ordinary soil well trodden in. Hard pruning in the spring after planting is advisable, and afterwards pruning is regulated by the amount of ann. growth. There are numerous methods of propagating Rs.: budding is the most frequently practised. Cuttings are easily struck in Sept., and many kinds can be increased by layering. Grafting and seed raising are methods more commonly practised

TYPICAL BUSH-RO-1
Rose acicularis, Lindley

by the R. breeder. See J. H. Pemberton, *Roses, their History, Development, and Cultivation*, 1908; G. M. Taylor, *Roses, their Culture and Management*, 1945; S. C. Bradford, *The Romance of Roses* (3rd ed.), 1947; publs. of the National Rose Society, London, S.W.1, issued to members, which deal with the various phases of R. growing. This, the largest specialist society of its kind in the world, the membership of which now totals 23,000, has as its object: 'To encourage, improve, and extend the cultivation of the Rose by means of publications, exhibitions, and other activities'.

See also BRIAR and ROSE HIPS.

Rose, in heraldry, charge appearing in the earliest period of heraldry (e.g. for the Lords Darcy, thirteenth century). Although often described as 'conventional' the heraldic R. is an exact reproduction of the wild rose of the hedgerows, i.e. with five petals displayed. Under Henry VII. it began to be shown with a double layer of petals, and in the later Tudor period was often blazoned as 'slipped and leaved' (with stalk and at least two leaves). When blazoned as 'proper' the R. is Gules with the centre seeds Or and the calyx Vert.

Rose Asacis, *Robinia hispida*, tree 5 to 6 ft. high, with rosy flowers in spring.

Thrives in most soils, if not stiff and damp. See ROBINIA.

Rose Apple (*Eugenia jambos*), Malayan evergreen tree of the Myrtaceae family. It grows between 20 and 30 ft. high, has oval, leathery leaves, and clusters of small, four-petalled, white flowers. The red berries contain one or two poisonous seeds, embedded in a rose-scented pulp.

Roseau, cap. of Dominica, Brit. W. Indies, on the W. coast of the is. From R. bananas, coco-nuts, limes, rum, etc., are exported. Pop. 9800.

Rose Beetle, or **Green Chafer** (*Cetonia aurata*), brilliant copper-green beetle, with pale creamy marks on the wing cases. It eats the petals and foliage of roses and other plants, and the grubs or larvae attack the roots. The beetles appear in May and deposit their eggs in the ground. The white grubs resemble those of the cockchafer, and they pupate in earthen cells. When they are present in numbers, the soil about the roots should be examined for grubs.

Rosebery, Archibald Philip Primrose, fifth Earl of (1847-1929), Brit. statesman, b. in London, son of Archibald, Lord Dalhousie (d. 1851), his mother being a daughter of the fourth Earl Stanhope, and educated at a preparatory school at Brighton and at Eton. In 1860 he entered Christ Church, Oxford. He succeeded his grandfather in the earldom, 1868, and he left Oxford in the same year without a degree. R. was a keen scholar, and was from youth a collector of books and MSS. His thoughtful speeches attracted notice, and in 1871 he was selected to second the reply to the speech from the throne; during Disraeli's last term of office he criticised Lord Salisbury and supported the cause of Greece. In 1878 he married Hannah, daughter of Baron Meyer Rothschild. The same year he was elected lord rector of Aberdeen Univ., in 1880 of Edinburgh Univ., and in 1899 of Glasgow Univ. He was under secretary to the Home Office from 1881 to 1883. In 1885 he was in the Cabinet as lord privy seal and first commissioner of works. He was foreign secretary for six months in the brief Liberal administration of 1886, and in that time he had to deal with three international crises. In Oct. 1888, at Leeds, he made a speech which laid down the principles of a Liberal Imperialism. In 1889, when the London Co. Council came into existence, R. became its first chairman. In 1892 he was invited by Gladstone to return to the Foreign Office, which with some reluctance he did. In March 1901, after Gladstone's resignation, he accepted the premiership as first lord of the treasury and president of the council; he resigned in June 1895, after defeat in the Commons over cordite. In 1896 R. resigned his leadership of the Liberal party, which the Radical wing had always disliked. The breach was widened by his attitude on the S. African war, when he declined to accept Campbell-Bannerman's policy. He was shocked by the Lloyd George budget of 1909, but took no definite position as to the policy of the Lords. In 1911 he

received the United Kingdom earldom of Middlethorpe. During the First World War he occasionally made patriotic speeches. It was as a maker of non political speeches that R. charmed everybody many such are included in his *Miscellaneous Literary and Historical* (1921). In retirement he devoted much time to literature. He had already pub *Pitt* in 1891, and other pubs include *Sir Robert Peel* (1899), *Oliver Cromwell* (1900), *Lord Randolph Churchill* (1906) and *Chatham* (1910). Among R. a wide interests was the turf, he did much to raise the prestige of Eng horse racing, and his horses won the Derby in 1894, 1895, and 1905. This interest was among others which made him unpopular among the rank and file of his own party. His imperialist ideas always rendered him suspect, and he had not the drive essential to the effective political leader. On politics his attitude was more that of the detached observer than of the urgent partisan, and though he could speak with effect in the House of Lords he lacked the manner to appeal to the crowd which Gladstone had made a part of the Liberal tradition. His real brilliance is to be found in his historical and literary pubs. See lives by J. L. Raymond 1923 E. H. Thurston 1928 and the Marquis of Crewe 1931.

Rose-coloured Starling, see PARSOR

Rosegger, Peter Kettenfeiser (1843-1918) Austrian poet, b at Alpl in Styria son of a peasant and largely self educated. He soon attracted notice by his poetry, which is of a romantic order and he attained great popularity in Austria and Germany as novelist poet and playwright. His finest work was the *Wald heimut* (1877). An Eng trans by M. E. King was pub in 1912. See lives by R. Huttensteiner 1924 M. Schwartz, 1935 and O. Janda 1943.

Rose Hips, fruit of the briar wild dog rose and cultivated garden roses are a rich source of vitamin C i.e. the most valuable being the large berries of *Rosa mollis*. For home consumption the berries are best left on the bushes until after the first frost has softened them. Care should be taken in handling and they should be kept from extremes of temp. and air and away from metal. The hips should be washed and may be made into a puree by cooking in water in a covered pan sieving adding sugar, re-boiling and sealing in jars the puree should keep for many months. If a syrup is required the puree should be diluted with water and strained through flannel. Raw fruit puree is richer in vitamins but not so reliable for keeping. The berries should be very ripe halved, and soaked till soft sieved and warm sugar well stirred in and the puree put immediately into jars and sealed. Dried or dehydrated berries are easy to store. They should be halved and dried, after which the hairs and pips may be easily removed. When required for use they should be soaked for two to four days, rubbed through a sieve, and sugar added. See Claire Loewentfeld, *Britain's Wild*

Jarder (London Health Centre, Leaflet No 3)

Rosellino, Antonio (c 1427-c 1479) It sculptor b at Florence. His master piece, a tomb for the young Portuguese prince and cardinal who died in 1459 is still in existence and undamaged. The carving on this beautiful monument like the marble medallion relief of the Virgin and Child now in the Bargello at Florence suggests that Rosellino had more refinement than Donatello.

Rose-Mallow, see HIBISCUS

Rosemary, or *Rosmarinus officinalis* labiate plant found in Britain. It is an evergreen shrub cultivated for its flowers and leaves, from which oil of R. is distilled in France and Spain. *Ledum palustre* a species of Ericaceae is sometimes called the marsh R.

Rosenberg, Alfred (1893-1946) Ger National Socialist politician and writer b at Rival (Lahn). He went to Munich in 1918 and was one of the first members of the National Socialist party, becoming editor of the *Volksischer Beobachter* in 1921. In books pamphlets and newspaper articles he built up a Nazi ideology founded on anti-Semitism and pagan Teutonic mythology and mysticism. In 1941 it was appointed Minister of occupied Europe. He was hanged for war crimes being a leading defendant at the Nuremberg trials. His most famous pub was *Der Mythos des A.A. Ten Jahrhundert* (1930).

Rosenberg, see SEW

Rosenheim, in of Bavaria Germany, on the Inn 40 m S.E. of Munich. It is much frequented for its saline and sulphur baths. Its architecture shows marked influence. Salt is produced. Industries include paper machinery and glass-making. Pop. 21,300.

Rosenthal, Moriz (1862-1946) Polish pianist b in Lemberg; he studied there and in Vienna. He gave his first recital in Vienna in 1876 and between 1877 and 1880 he visited Weimar, Rome, Paris and St. Petersburg with Liszt. Later to become the friend also of Brahms. In the technique of piano playing R. was unsurpassed; he could play all of Chopin's compositions from memory. Of his own compositions his *Pavillon* (1897) is exquisite.

Rose of Jericho, or Resurrection Plant (*Frankia heterochuntica*) small half hardy ann. (family Cruciferae) bearing small white flowers and sometimes grown in light garden soil. It grows during the rainy season in the sandy deserts round the Mediterranean and during the dry season shrivels up though retaining its vitality and being very light, is blown all at by the wind till it reaches a moist situation when it quickly recovers.

Rose of Sharon, or *Hypericum calycinum* low shrub with large handsome, solitary yellow flowers, sometimes grown as a cover plant for a garden. See also SHARON.

Roseola, term applied to any rose coloured eruption but often used as a synonym for Rubella, or Ger measles. See under MEASLES.

Rose, Roman de la, Fr allegorical poem written in the thirteenth century. The

first part was written by Guillaume de Lorris, and the latter and more extensive part by Jean de Meung, about 1275. It is over 23,000 lines in length. The poem is an artistic and quaintly beautiful description of the love philosophy of the troubadours. The lover walks in a park belonging to Pleasure, Delight and Cupid. He is admitted by Idleness, he is driven away from the Rose by Danger and Shame and especially Jealousy, leaving the lover disconsolate. Finally he wins the Rose. The latter part is more satirical than the former. It denounces the abuse of power, argues against women and against the clergy of the clergy, it denies all superstition yet still remains a beautiful romance. Its popularity in the Middle Ages was enormous, over 200 MSS. of the work have survived. Chaucer translated it into Eng. but our version is generally admitted to be by another hand. There is a modern Eng. version by I. S. Ills (Temple Classics) 1908.

Roses, Wars of the, civil wars of the fifteenth century in England when the rival houses of York and Lancaster struggled for supremacy. The name arose from the fact that the rose was selected as a badge: the adherents of York wearing white roses those of Lancaster red. The wars commenced in the reign of Henry VI. While the king was suffering from insanity (1453-54) Richard duke of York was Protector and when on his recovery the king resumed the head of affairs the Yorkist lords demanded that he should dismiss the Lancastrian lords from his council. On his refusal they at once armed and the first battle was fought at St Albans May 22 1455 resulting in a victory for the Yorkists. The king was now a prisoner York again became Protector, but four years later he was dismissed and a battle was fought at Blore Heath, Sept. 23 1459 the Yorkists under Salisbury being once more victorious. But their victory was of little use to them for when Henry VI. later marched to Ludlow they were panic-stricken and fled York (escaping to Ireland, and Salisbury and Warwick to France. At a parliament held at Coventry they were attainted and this added bitterness to the feud. In July 1460 at the battle of Northampton the king was again made prisoner. Attempts were made to bring about peace by Parliament which decided that Henry should be allowed to reign and that York should then succeed, but the Lancastrians influenced by Queen Margaret declined to accept these terms and at the battle of Wakefield, Dec. 31 1460 both York and Salisbury were killed. The Lancastrians with Queen Margaret at their head, then marched S. and succeeded in defeating Warwick at the second battle of St Albans Feb. 17, 1461, and rescuing the king. York's son, Edward earl of March had, however, not been idle and having won the battle of Mortimer at roses, Feb. 2, 1461, he joined Warwick and then marched to London, where he was proclaimed king as Edward IV., following up his proclamation by a decisive victory at Towton,

March 29 1461. Queen Margaret shortly afterwards was forced to flee to France, having been defeated by Warwick at Hedgely Moor and Hexham (April 25 and May 8 1464). At Hexham Henry VI. was once more captured and placed in the tower. For the next few years peace reigned until the powerful Warwick known as the 'kingmaker' started in fighting against Edward IV. and joined forces with the Lancastrians. Warwick was however, soon forced to flee to France but returned and Edward in his turn fled to Flanders. In 1471 however Edward returned with an army, landed in Yorkshure and defeated and killed Warwick at the battle of Barnet April 14 1471 a victory which he followed up by the defeat of Queen Margaret at Tewkesbury May 4 1471 capturing the queen and killing her son Edward. For some year after peace reigned but the final struggle took place at the battle of Bosworth Field Aug. 22 1485 which gave the crown to Henry VII. and established the throne on a firm foundation, his marriage with Elizabeth of York cementing the peace between the two parties. The wars were not fought on principles, but were founded on personal quarrels; the mass of the people were probably indifferent to the struggles which seem to have affected England extraordinarily little. The period they covered marks the beginning of the Eng. Renaissance, the flowering of Perpendicular architecture and the growth of the merchant class. But during the wars the old nobility was almost wiped out a larger class of property owners with smaller fortunes replaced the great magnates a sure basis on which Tudor despotism could be founded. See J. H. Ramsay, *Lancaster and York*, 1892, J. D. Thorns, *England under the Yorkists* 1920, and J. H. Fleming *England under the Lancastrians* 1921.

Rosetta (Arabic *Rashid*) decayed Muslim city on the Rosetta branch of the Nile in Egypt. The famous 'Rosetta Stone' (q.v.), which led to the deciphering of Egyptian hieroglyphs was found near here in 1799 by Bousard. Pop. 26,000.

Rosetta Stone, inscribed slab of black basalt which provided the key for the decipherment of hieroglyphic (q.v.) writing. It was discovered in Aug. 1799, in the fort of Saint Julien de Rosetta near the Rosetta mouth of the Nile (a few miles from Alexandria) by a Fr. artillery officer (Capt. M. Bousard). He reported the find to his superior Gen. Menou, who immediately realised the importance of the monument and had it taken to his home. When Napoleon heard of the discovery he ordered that it be deposited for study at the Fr. Institute in Cairo. On the capitulation of Egypt to the Brit., the stone, shipped in 1801 to England, passed into the Brit. Museum (where it is now deposited B.M. 960 No. 24), and came by good fortune under the charge of Sir Wm. Hamilton, whose interest in Egyptian antiquities was keen. The stone is a mutilated block, about 3½ ft. long, 2½ ft. wide, and 1 ft. thick. It is

covered on its one flat surface with inscriptions in three different scripts

It was immediately inferred that these inscriptions were but different forms of the same text. The upper version (fourteen lines) was given in Egyptian language and in hieroglyphic writing; the second text (thirty-two lines) also in Egyptian, and was written in demotic (*q v*) writing, and the

British Museum

ROSETTA STONE
(Upper left hand corner)

In the reproduction can be seen a part of the corresponding inscriptions in hieroglyphics, demotic and Greek

last (fifty-four lines) was written in Greek language and script. This last text was readily interpreted, and the monument proved to be a decree, drawn up on the 18th *meshir* (March 27) 196 B.C. by the priests of Memphis in honour of Ptolemy (V) Epiphanes (204-181 B.C.). Starting from the known, the hieroglyphic and demotic writings were slowly made to yield their secrets. The hieroglyphic text contains oblong rings, known as 'cartouches,' and already in 1797 the Danish scholar G. Zoega had recognised that such 'cartouches' contain royal names. Comparing the hieroglyphic text with the Greek

version the Cambridge scholar Dr Thomas Young (1773-1829) succeeded in the decipherment of a few letters in the name Ptolemy (Gk *Ptolmāis*). The first Egyptologist Jean François Champollion (1770-1832) recalled an obelisk with a bilingual inscription he had seen on the isle of Philae in the Nile, containing similar cartouches and, in its Greek version, the names Cleopatra and Cleopatra (Ptolemais *Kleopatra*). Champollion recognised how similar were the cartouches of the obelisk and on the Rosetta Stone, and that the cartouches of the obelisk containing two different names had some of the same symbols for instance what is now known as 'I'. Champollion thus found the values of thirteen characters. Next he identified (on other monuments) the name Alexander which supplied three more signs. Step by step he went through all the proper names he could find and at last he could read whole sentences. In 1822 Champollion announced the results of his studies to the Académie des Inscriptions and in his subsequent researches he laid the foundation of the modern science of Egyptology.

Rose-water, water scented with the distilled essence of roses. In the East it is sprinkled over the hands after eating and the custom is occasionally followed in Europe. See **Rose-dishes** for this purpose. It exists in England including one presented by Samuel Pepys to the Clothworkers' Company.

Rose-water Ointment, see **COLD CREAM**.
Rose Window, in Gothic architecture, circular window frequently placed over one of the large doors. It is usually filled with elaborate tracery.

Rosewood, wood of various trees, so called on account either of a rose-like fragrance or a rose colour. The best fragrant Rosewood often called Palisander wood is derived from *Dalbergia nigra*, a native of Brazil whence it is exported in large heavy slabs. The wood is chiefly used in veneer and cabinet work.

Rosh ha-Shanah (Heb. Head of the Year, New Year) is a main Jewish festival, celebrated on the first two days of the seventh month (*Tishri*) which was the beginning of the civil year in ancient Israel. Like *Lom Kippur* or *Lom ha-Kippurim* (*q v*) and unlike all the other Jewish festivals communion with God is sought not through joy but through solemnity. Rosh ha-Shanah being an occasion for solemn introspection and meditation over the year that has gone.

Rosicrucians, members of semi-secret, or secret fraternities who practised a system of mystical philosophy, intended to guide the expansion of inner perception. These societies first became widely known to the public in the seventeenth century through a series of publications, the earlier of which have been attributed to John Valentine Andrew, a Lutheran minister, who died in 1654. It seems clear that the movement had a much more ancient existence than this, one of these pamphlets, issued in 1607, contained references to Rosicrucianism in 1410. The name is

said to originate from the symbol comprising the cross with a single red rose in its centre, but another seventeenth century pamphlet ascribes the foundation and naming of Rosicrucianism to Christian Rosenkreuz a Ger nobleman of the fourteenth century, who gained his knowledge by long travel in the E. Early R practised alchemy extensively, and claimed magical and hypnotic power, but later societies bearing the name can have had little or no connection with the original ones. See H Jennings, *The Rosicrucians, their Rules and Mysteries* 1870 1887 and A E Waite *The Real History of the Rosicrucians* 1887.

Roskilde, see ROSKILDE.

Roslavl, tn of the Smolensk Region of the R S F S R, 70 m S E of Smolensk tn. Flax and hemp are grown in the dist. and there is trade in tobacco grain, and fat. Pop 28 000.

Roslin, or Rosslyn, vil on the N Esk, 7 m S of Edinburgh in Midlothian Scotland. It was made a burgh in 1436 but later became unimportant. There are remains of the fourteenth century castle of the Sinclair, which the Eng razed in 1544, but the chief glory of the vil is the chapel, described in Scott's *Tay of the Last Minstrel*. Its proportions are small (70 ft x 33 ft x 42 ft), but the delicate and beautiful carving on the

Prentice pillar on the clustered columns pinnacles and vaulted roof are outstanding. R gives the title of earl to the family of St Clair Erskine. Pop 2000.

Rosmead, Hercules George Robert Robinson, Baron, see ROBINSON.

Rosmer, Milton (b 1881) Brit actor, b in Southport, and educated at Manchester Grammar School. He made his first stage appearance in 1899, and from 1910 to 1915 was a leading member of Miss Hornmann's company at Manchester. His London successes include performances in *St Joan* (1921) and *Gas Light* (1939). R's fine character acting has made him equally at home in Shakespearean and modern drama. His interpretation of Cassius in *Julius Caesar* is especially noteworthy.

Rosmini-Serbati, Antonio (1757-1855) It philosopher and theologian b in Rovereto and ordained priest in 1821. He founded in 1828 a religious congregation known as the Institute of Charity. To comply with the wishes of Leo XII, and encouraged by successive popes, he undertook the reform of philosophy, but his works thereon provoked much opposition. Two of his books *The Five Wounds of Christ* and *The Constitution of Social Justice*, were placed on the Index, mainly on account of certain views in connection with the election of bishops. In 1888, after the death of R S forty propositions taken mainly from posthumous works, unreviewed by the author, were condemned. R S was a man of saintly life and his Institute has flourished. It has a college near Leicester in England. For an appreciation of his philosophy see T. Davidson, *The Philosophical System of Antonio Rosmini Serbati*, 1882.

Rosette Acid (C₂₀H₁₀O₂), coloured organic

compound formed from the rosaniline base by treating it with nitrous acid and heating, the product *trihydroxytolylidiphenyl carbinol* is unstable and loses one molecule of water to form R A. In commerce it is prepared by heating phenol with oxalic acid and sulphuric acid. R A possesses a beautiful red colour, but is not much used in dyeing, as it is difficult to fix. It is employed as an indicator for acids and alkalis, as acids decolorise it.

Ross, Betsy (1752-1836) semi-legendary figure in the early hist of the U S A b in Philadelphia. She is said to have made a Stars and Stripes flag from a pencil sketch by Washington as early as June 1776, but she changed the points of the stars from six to five. Historians doubt the story's accuracy.

Ross, Sir Edward Denison (1871-1940), Brit orientalist, educated at Marlborough School and Univ College, London, and studied oriental languages in Paris and Strasbourg. In 1906 he was curator of records for the gov of India. From 1914 to 1917 he was assistant in the Art of the E section of the prints and drawing dept of the Brit Museum. In 1917 he was appointed the first director of the School of Oriental Studies (see ORIENTAL AND AFRICAN STUDIES SCHOOL) and, at the same time, prof of Persian in the Univ of London holding both offices until his retirement in 1937. Among his various pubs were *The Heart of Asia* (with F H Skrine), a popular account of Persian art, trans of an Arabic hist of Gujarat, a polyglot list of birds in furki (Hindic), and *Manchu and the English Language* (1939).

Ross, Sir James Clark (1800-62) Brit sailor and explorer b in London. He made along with five voyagers in search of the N W passage and accompanied Parry in his effort to reach the N Pole (1827). Whilst with his uncle Capt John R. he discovered the N magnetic pole (1831). In his *Voyage of Discovery and Research to S and Antarctic Regions* (1847) he gives the results of his own experiences in the *Erebus* (1839-43). He was knighted in 1843. He named Mt Erebus and Victoria Land.

Ross, Sir John (1777-1856) Brit sailor b at Inch Wigtonshire. He made two important voyages of polar exploration, the results of which he narrated in his *Voyage of Discovery for the Purpose of Exploring Baffin's Bay* (1819) and *Second Voyage in Search of a N W Passage, including the Discovery of the North Magnetic Pole* (1833). For the first (1818) he was fitted out by gov, and for the second (1829-33) by private enterprise. During the latter he was for the most part ice-bound and suffered severe privations. Consul at Stockholm from 1849 until 1845, he led an expedition in search of Franklin in 1850.

Ross, Martin (1862-1915), pseudonym of Violet Florence Martine, Irish novelist, b in Galway and educated at Alexandra College, Dublin. With her cousin, Edith Cénous Somerville (q.v.), she collaborated in a number of novels.

Ross, Sir Ronald (1867-1932), Brit.

physician and poet b at Almora, India, and educated at St Rutholomew's Hospital, London. He entered the Indian Medical Service in 1881. He discovered the life hist of malaria parasites in mosquitoes (1897-98) though Lamin had already done much work on this subject. R thereby confirmed the theory which had been formulated by Sir Patrick Manson (q.v.) in 1894. For his work he received the Nobel prize in 1902. R led an expedition to malarial W. Africa in 1899. He was knighted in 1911. R was also a distinguished poet, and his pubs include *The Prevention of Malaria* (1910) *Memoirs* (1923) and *Studies on Malaria* (1928), also poems and one novel. See life by R. L. McGroz, 1931.

Ross, Sir (William) David (b 1877). Brit scholar b at Thurso (Caithness) and educated at the Royal High School, Edinburgh, Edinburgh Univ, and Balliol College, Oxford. He became prof of mental philosophy at Oxford in 1923. From 1922 until 1947 he was provost of Oriel, and was vice-chancellor of Oxford Univ from 1941 until 1944. His trans of Aristotle's works are now standard texts, and he has written many works on philosophy. He was chairman of the royal commission on the press (1947). R was knighted in 1948.

Ross, Earldom of, created Marquis in 1724 by George II. R was created earl in 1722 by Alexander II, king of Scotland. Both he and his descendants were prominent in the public life of their times. The third earl Hugh was killed in 1333 at the battle of Halidon Hill, where, as was the custom of the earls of R, in battle the shirt of St Duthac. His granddaughter, Euphonia, succeeded her father, Earl William, in 1372. She married Sir Walter Leslie of Aberdeen, a distinguished soldier, and on her death (c. 1395) the title passed to her son, Sir Alexander Leslie. He died in 1402 and his daughter, heiress Euphonia, died without issue (c. 1411). Thereupon her aunt Mary, wife of Donald Macdonald, Lord of the Isles, succeeded. The earldom remained with the Macdonalds until 1478. In that year the thirteenth earl, John, having been convicted of treason and having made his submission in Parliament, was created a peer of Parliament as Lord of the Isles. The earldom of R, however, was not restored. It was annexed by the crown not again to be granted to any but the only or second legitimate son of the Scottish king.

Rossall School, a pubic school for boys at Rossall, Lancashire, 3 m S of Fleetwood, founded in 1844. It was incorporated by royal charter in 1890 and is governed by a council. There is a junior dept and the school has accommodation for 550 pupils. The chapel contains a carved rosette by Eric Gill.

Ross and Cromarty, originally separate were united in 1891 and form a N. highland co. of Scotland. The co. includes the is. of Lewis (except the S. part called Harris) and many small is., mostly uninhabited. It is bound to the N. by Sutherland and the Dornoch Firth and in the S. by Inverness shire and the Beaulie Firth.

The coast line is long and much indented. On the L. coast are the Beaulie and Inner Moray, and Cromarty Firths (which together nearly encircle the Black Isle) and Dornoch Firth. The climate is varied, being moist and mild in the W. bracing and dry in the E. and cold in the uplands. Only about 7 per cent of the whole surface is arable, mostly along the S. seaboard and in the Black Isle, a considerable part is over 1000 ft. with many peaks exceeding 3000 ft. Best known peaks are Ben Wyvis in the N. E. (3429 ft.) and along the watershed Sgurr Mor (3657 ft.) Ben Dearg (3547 ft.) Sgurr na Lapach (3773 ft.) Mam Soul (3862 ft.) Ben Attow (3343 ft.) Ben Eite (3477 ft.) Ben Mohr (3570 ft.) by Loch Maree is Ben Shoch (3217 ft.) and at the head of Loch Duich the stately five sisters of Kintail. In Lewis the surface is featureless and mostly moorland. The watershed of the mainland runs roughly N. to S. and is in the W. half rising slowly. The longest of the prin. are the Oykel and Carron to Dornoch Firth and the Conon with its tails to the Cromarty Firth, flowing W. into the Shiel Loch. Carron, Ewe and Brigs. Many beautiful waterfalls include Clinnahassich (10 ft.) the highest in the Brit. Fresh water lochs are numerous the largest Loch Maree 13 km long is very beautiful. The chief industries are agriculture with afforestation, fishing, Harris tweed, munif. and whiskey distilling. Some of the richest agric. land in Scotland is in Easter Ross and Black Isle, and these are noted for breeding of pedigree Shorthorn cattle. Oats and barley are the prin. grain crops, and there is a large crofting pop. Since the Second World War much of what was deer forest land is now devoted to cattle and sheep grazing. The considerable timber area, included by two rivers, is being gradually replanted and there are hydroelectric schemes. Fisheries along both coasts are extensive, principally herring and white fish, with salmon from the rivers and estuaries. Chief fishing ports are Stormway in Lewis, Cromarty, Ullapool and Gairloch. Dingwall (pop. 3200) co. town and royal burgh, is important as a live stock centre. Stormway (400) the largest town is the centre of the Harris tweed industry with six mills. Laim with three medieval churches (one still used), and Portrose with a ruined cathedral, are royal burghs. Invergordon and Cromarty are seaports and S. rail offer a mineral spa and holiday resort. Hugh Miller, geologist, Sir Thomas Munro, trans. of Rablans, Sir Alexander MacKenzie, discoverer of the Mackenzie R., Gen. Sir Hector Macdonald who rose from the ranks, were natives of Ross-shire. Clan feuds apart, battles of national importance were Longside, 1481, Invercarion, 1600, at Glenochiel, 1719. The is. of Lewis provides one of the most striking monuments in Britain in the standing stones of Callernish (q.v.) (megolithic period), and in the Brooch of Carloway, an excellently preserved specimen of an inhabited tower of the Pictish period. Knockfarrel, near Dingwall, is an anct.

vitrified hill fort, good examples of castled ruins are Lochsln and Ballone Castles. There are a number of pagan and early Christian Pictish sculptured stones in the co. of which the Nigg Stone is probably the finest example of early Pictish art in existence. The mainland is a parl. constituency returning one member, Lewis is part of the W. Isles constituency. The railway runs along the E. coast of the mainland, with branches to Fortrose in Black Isle and to Kyle of Lochalsh to connect with the steamer service to Stornoway. There is a daily return air service from Inverness to Stornoway. Pop. (estimated 1949) 62,000 of whom 90 per cent in Lewis and 25 per cent on the mainland are bilingual in Gaelic and Eng. Area 3089 sq. m. See R. Bain, *History of the Ancient Province of Ross* 1899. N. Macrae, *The Romance of a Royal Burgh: Dingwall's Story of a Thousand Years* 1923. W. J. Watson, *Ross and Cromarty* (Cambridge County Geography Series) 1924. W. Macdonald and Pol on *The Book of Ross, Sutherland and Caithness* 1948.

Rossano, city of S. Italy in the prov. of Cosenza, once the Rom. fortress of Roscinum. 24 m. N.N.E. of Cosenza. It has a Byzantine cathedral and a library with valuable MSS. of the Gospels. Near by are marble quarries. Pop. 19,600.

Roszbach, vil. in the former prov. of Prussian Saxony in the dist. and 8 m. S.W. of the tn. of Merseburg. Here the Fr. and Austrians were defeated by Frederick the Great in 1717.

Rosberg, 1. Mt. (5174 ft. high) on the borders of the cantons of Zug and Schwyz in N.E. Switzerland. 2. In with lead and coal mines (in N.E. of Puthen (Bytom) in Silesia, Poland. Pop. 20,000.

Ross Dependency, terr. on the coasts of the Ross Sea in Antarctica which were proclaimed a Brit. settlement in 1923 under the control of the governor-general of New Zealand. It is an important whaling centre.

Rosse, William Parsons, third Earl of (1800-67). Brit. astronomer. b. at York and educated at Trinity College, Dublin and Magdalen College, Oxford. He represented Kings co. in Parliament from 1821 until 1834, presided over the Royal Society from 1848 until 1851 and in 1862 was appointed vice-chancellor of his own univ. of Dublin. In 1845 he constructed a giant telescope 76 ft. long with 46 ft. speculum, the largest that had ever been previously made. After 1848 it was used for many years specially for the observation of nebulae.

Rosseau, small tn. and lake port of Ontario, Canada, in Muskoka co. It is situated at the N. end of Lake R. which latter communicates in the S. with Lake Muskoka about 60 m. N.N.E. of Collingwood.

Rossello, Maria-Josepha (1811-88), b. at Albisola near Savona, Italy. In 1837 she became the foundress of an Institute of nuns, called the Daughters of Our Lady of Mercy, which rapidly spread through Italy and S. America. Canonised in 1949.

Rossetti, Christina Georgina (1830-94). Brit. poet, sister of Dante Gabriel and Wm. Michael R. (q.v.) b. in London. Even as a child she wrote verses and her first recorded poem was completed at the age of twelve. In 1847 a vol. of her verses was privately printed and in 1850, over the signature of 'Ellen Alleyne,' she contributed to the famous but short-lived periodical the *Germ*. In 1862 she pub. her best work *Goblin Market and Other Poems*. *Goblin Market* is the high-water mark of Christina R., and shows such originality and imagination as she in no other work gave proof of. In this and other vols. she printed many exquisite lyrical pieces. The touch of sadness that pervades her writing may have been partly due to an unhappy love affair in her youth and during her life she suffered constantly from ill health and a succession of family bereavements. She possessed a sensitive appreciation of natural beauty and her poetry has a unique simplicity and purity of tone. Christina R. ranks with Donne, Crashaw and Vaughan as one of England's great mystical poets and is, with Newman and Keble, one of the poets of the early Oxford movement. Though the theme of her poems is often sad, the poems are never morbid or utterly gloomy and her devotional poetry expresses an ultimate hope and realities. Critics have awarded her some of the insight of Shakespeare and fancifulness of Coleridge. Among her other books are *Prince's Progress* (1866), *Innus Domini* (1871) and *Pageant* (1884). A complete ed. of her works was issued with a memoir by her brother Wm. R. in 1904 and her letters in 1908. See lives by M. J. Sandars 1930 and D. M. Stuart 1931.

Rossetti, Dante Gabriel (1828-92). Brit. painter and poet. b. in London, son of Gabriele R., a Neapolitan refugee and brother of Christina and Wm. Michael R. (q.v.). He was prof. of it at King's College and educated at the school attached to the college. Like his sister Christina he exhibited a precocious taste for letters and in 1840 composed a ballad, *Sir Hugh the Heron* (privately printed, 1843). He studied drawing under John Sell Cotman and afterwards worked under Cary and at the Royal Academy schools. At this time however his literature was more attractive to him than art. He translated Dante, beginning his labours in 1845 and two years later wrote *The Blessed Damozel* and several of his best sonnets. *The Blessed Damozel* and his prose story, *Hand and Soul* appeared in the *Germ* (1850) which was ed. by his brother Wm. He had already sought instruction in art from Ford Madox Brown to whose influence he owed much, and he came into intimate relation with the Pre-Raphaelites (q.v.). Holman Hunt (with whom at one time he shared a studio) and Millais. He continued to work at literature and art but he made little impression on the public. Ruskin, however, had the knowledge and intelligence to appreciate R.'s work and his influence did much to establish R.'s reputation. Between 1850

and 1860 he produced many of his best pictures including 'Mary Magdalene' and 'Paolo and Francesca'. In 1860 he married Elizabeth Siddal who had sat to him for his *Beatrice* but she died within two years. In his grief he buried his MS poems in her coffin but yielding to the entreaties of friends he sanctioned their dissemination in 1869, and these and others were pub. in 1870. Unfortunately, after this he became addicted to the use of chloral which affected both his bodily and mental health though he continued to paint many wonderful works including 'Venus Astarte' (1877). He attempted suicide in 1872 and suffered from partial paralysis from 1881. R. was a great artist both with the pen and the brush and it is often disputed whether he is greater as a poet or a painter. It is said that he never mastered some of the technicalities of art but his imagination and his colouring lend a charm to his pictures that make them rank very high while the music and symbolical qualities of his verse place him among the great poets of the nineteenth century. His mysticism gives him an affinity with Wm. Blake. His poetical works were collected in 1886 and his letters with a preface by his brother Wm. were pub. in 1891. See lives by J. G. Stephens 1894, J. C. Benson 1901, J. Waugh 1928, J. C. Trowell 1930, V. Hunt 1936, Helen Rossetti Angell 1945, O. Doughty 1941. See also W. Gaunt *The Pre-Raphaelite Tragedy* 1912 and K. Preston *Blake and Rossetti* 1944.

Rossetti, William Michael (1829-1919). Brit. author and art critic, brother of Christina and Dante Gabriel R. (q.v.) b. in London and educated at King's College. He obtained a post in the inland revenue dept. but devoted his leisure to art and literature. He married Emma Lucy, a daughter of Lord Madox-Brown, one of the Pre-Raphaelite Brotherhood of which literary and artistic circle he became a member. For a short time he was editor of the *Germ* which was founded in 1850 as the official organ of the brotherhood and himself wrote the sonnet printed on the cover. He was probably the very last surviving close friend of Ruskin. R. is largely responsible for bringing about in England a true appreciation of the oriental especially Jap. as opposed to the Caucasian faculty in fine art. His best known poems were 'Venus in bluish verse of Dante's *Hell* I feel of Keats' (1887). *Memoir of Dante Gabriel Rossetti* (1891), *Reminiscences* (1906) and *Poems of Famous Poets* (1878).

Rossi, Francesco dei, see SALVATI

Rossi, Giovanni Battista (1136-1441). It. painter b. at Florence. He formed his style on that of Michelangelo and superintended the artistic decoration of the palace of Fontainebleau for his patron Francis I.

Rossi, Count, Pellegrino Luigi Edoardo (1787-1818). It. economist and statesman, b. at Carrara, and educated at Pavia and Bologna. He sought safety in Geneva after the fall of Murat, whom he had supported. Disappointed that his revised constitution, known as the 'Pacte Rossi,

was abandoned by the Swiss, he accepted in 1813 the chair of political economy at the College de France. He became Fr. ambas. at Rome and on the outbreak of revolution in 1848 he attached himself to Pope Pius IX. but was murdered by the Republican party.

Rossini, Gioacchino Antonio (1792-1868). It. operatic composer b. at Pesaro and studied under Mattei at Bologna. In 1810 he produced his first work, a comic opera *La Cambiale di Matrimonio*, in Venice. This was an immediate success. Of the thirty stage works he wrote during the following fifteen years the chief were *Tamcredi* (1813), *Il barbiere di Siviglia* (called *Almaviva* & first given in Rome 1816), *Otello* (1816), *Gazza Ladra* (1817), *Mosè in Egitto* (1818) and *Semiramide* (1823). In 1823 he visited England. In Paris he wrote *Guillaume Tell* (1823) considered by many to be his finest work. His remaining compositions included the *Stabat Mater* (1832-40) and *Messa Solenne* (1861). R.'s music shows vigour, vitality and true intoneness; the finest of it has spontaneity and charm and his handling of voices and orchestra alike is distinct for glistening effects in former his occasional musical vulgarity. See lives by L. Dufray 1905, A. de Cuz 1910, I. Love 1931 and R. Bichchi 1941.

Rossire, Robert (c. 1050-1100). Eng. 7 m. S.E. of Wexford. It extends along the coast one part putting out in a narrow peninsula and forming the S. boundary of Wexford Harbour. It was settled by King John in 1210. Pop. 100.

Rossiau in Germany in Anhalt on the Elbe 3 m. S. of Dessau. The mines are paper machinery wire goods chemicals etc. Pop. 12,000.

Rosslyn see ROSLIN

Rosslyn Earl of, see WEDDIBURN ALEXANDER

Ross on Wye, mkt. tn. and urb. dist. of Herefordshire, England, on the R. Wye 12 m. S.E. of Hereford. It has many associations with John Kyrie (d. 1721) described by Pope as the 'Man of R'. The church of St. Mary the Virgin is a fine Decorated and Perpendicular building. There are flour mills and agricultural implements and boot factories. Pop. 2,000.

Ross Sea, part of the Antarctic Ocean S. of New Zealand lying between S. Victoria Land and King Edward VII. Land. It is free of ice in the summer and was therefore used as a way of approach to the S. Pole by both Amundsen and Scott.

Ross-shire Buffs, see SEAFORTH HIGH LANDERS

Rostand, Edmond (1858-1918). Fr. dramatist and poet b. at Marseilles. His farcical *Les Romanesques* (1894) was followed in 1895 by *Le Prince de Montaner* in which Sarah Bernhardt interpreted the character of Mélissande, she also played Phœbe in his biblical play *La Samaritaine* (1897), and of the duke of Reichstadt in *L'Anglais* (1900). In this tragedy the pathos of the life of surveillance and misunderstanding which

Napoleon's son was condemned to lead is beautifully expressed. The heroic drama *Cyrano de Bergerac* (1897) in which Coquelin created the title role was an outstanding success in 1910 this was followed by the fairyland fantasy of *Chantecler* the production of which was a triumph of magnificent and artistic effects. *Les Musardes* (1911) was in the main a resume of his early poems. R's versatility is shown by the variety of his dramatic productions, but his best work was that done in the romantic tradition where fine prose, skilful characterisation and a vivid insight into human emotions particularly of the frustrated combined to produce masterpieces. In 1912 R pub his *Printemps de laide* See lives by G. Harcourt 1913. P. Apostolov, 1929 and R. Girard 1935.

Rostock, seaport on the estuary of the Warnow 8 m from Warnemünde on the Baltic in Mecklenburg, Germany. Once a Roman town possessed a fourteenth-century gate and Gothic town hall and five ancient churches. The only theatre in Germany was founded in 1418. Ship-building is the chief industry. Blücher was born in R. In 1942 R was one of the chief German bases of supply for the Russian front and the home of the Heinkel aircraft works and various chemical industries. It was therefore bombed heavily by the RAF. Many of R's oldest buildings were destroyed. R was captured by Rokossovsky's Second White Russian Army in May 1945. Pop. 122,400, including Warnemünde (93,000).

Rostov, tn of the Yekaterinograd Region of the RSFSR 35 m S.W. of Yaroslavl. It was founded in the ninth century, and its historic buildings include the Uspenski Cathedral and the Kremlin. Since 1917 it has become an industrial centre, with linen and cotton mills, flour mills and coffee and chicory manuf. Pop. 23,400.

Rostov-on-Don, tn in the Rostov Region of the RSFSR on the Don 25 m from its mouth. It is the gateway to the Caucasus and a focal point of communication between Moscow, Stalin, and the Volga and the Ukraine, on the one hand and the Caucasus on the other, besides being the great river port of the Don having access by the Don to the Black Sea. Its importance will be further enhanced when the Mynch-Kuma and Don Volga canals are completed. The significance of R's geographical position is reflected in its hist. After the laying waste of the ancient Greek colony of Tanais near the modern tn of Azov by the Huns the region between the lower Don and the sea of Azov remained largely uninhabited until the arrival of Russian settlers in the eighteenth century. In 1761 a fortress was built on the high bank of the Don, named after St. Dmitri of Rostov (the seat of the archbishopric near Moscow) and later named R. on D. in order to distinguish it from the older tn. Before 1917 R was the headquarters of the Don Cossack military organisation and the seat of a bishop.

After the revolution R was rapidly industrialised, and before the Second

World War possessed one of the largest agricultural engineering works in Europe, being favourably situated near the region which contained not only the largest coal-mining industry in Russia (the Donbas) but also some of the largest steel and chemical works besides being within convenient distance of the Caucasian oil wells. The city changed hands four times during the Second World War. Many of its public buildings and most of its industries were destroyed by the Germans when they were driven out in Feb. 1943 after their rout at Stalingrad. There is an important market gardening region around the city. R is one of the chief centres of such industries as flour-milling, distilling, vegetable oil production, fruit-canning, tobacco manuf. and the production of champagne and wines. An oil pipeline runs to R and beyond to Nikitova. This line is being continued to the Donets basin industrial region. The port is busily engaged with trade during the nine months of the year when it is free from ice. Grain and wool are the chief exports.

R was captured by the Germans under Kleist in the late autumn of 1941, being retaken by Marshal Timoshenko a week later. It was Hitler's first major reverse but it handed hands for the third time when the Germans recaptured it in July 1942 and finally when Gen. Malinovsky liberated it in Feb. 1943 on his retreat from the Don to Budapest. Pop. 10,300. See further under EASTERN FRONT OF RUSSO-GERMAN CAMPAIGN IN SECOND WORLD WAR.

Rostovzev, Mikhail (b. 1870) Russian scholar b. at Kiev. He held the chair of ancient hist. at St. Petersburg from 1901 to 1913. From 1920 until 1932 he was prof. at the Univ. of Wisconsin, U.S.A. Since 1933 he has held the chair of ancient hist. at York. His research work on the Roman Empire etc. has greatly influenced modern opinion on the subject. His publs. include the monumental *Social and Economic History of the Roman Empire* (1928) and *Economic and Social History of the Hellenistic World* (1931).

Rostra, famous platform of the ancient Romans from which public speakers used to address the people. It stood between the forum and comitium and was so called because it was adorned with prows of captured galleys. In modern English the singular form *rostrum* is used only.

Roswitha, or **Roswitha** see **ROSWITHA**.
Rosyth, naval base on the firth of Forth in Fife-shire, Scotland, is on the N. of the shanty at St. Margaret's Hope. Started in 1903 it was nearing completion at the outbreak of the First World War and soon became important as a repairing base and headquarters of the cruiser squadrons. It was reduced to a maintenance base in 1925 but reopened in 1939 on the outbreak of war and was the main port of assembly for the Norwegian expedition of May 1940. R. Castle is a ruin, 2 m to the W. of Inverkeithing. Here lived Queen Margaret, wife of Malcolm Canmore. In St. Andrew's Church in 1846 was dedicated a boat-shaped pulpit given

by R. Destroyer Command. In memory of the men of the 'little ships'.

Rotary, see ROUND

Rotary International, organisation aiming at establishing the principle of service international peace, and good fellowship as the foundation of all business transactions. R. I. consists of clubs which are composed of representatives—business and professional men—selected on a classification basis. The first club was started in 1905 by Paul P. Harris (*d* 1917), a Chicago lawyer. The name Rotary is derived from the early practice of holding meetings in rotation at the houses of the various members. The New York Rotary Club was founded in 1909 and there are now (1950) 496 clubs in the U.S.A. and 248 in Canada. Outside America the first Rotary Club to be formed was in Dublin in 1911 and in 1914 the Brit. Association of Rotary Clubs was established. In 1922 this association became known as R. I. Association for Great Britain and Ireland, the title R. I. being adopted for the organisation by all clubs in that year. In 1938 the Brit. and Irish Association changed its title to the R. I. in Great Britain and Ireland. In 1950 668 clubs, while the total number of clubs in the world is 6916 in over eighty countries with a total world membership of 150,000. The Rotary motto is 'Service above self'.

Rotation. A line is said to rotate when one point is fixed and the other points describe circles round it in the same plane or in parallel planes all maintaining the same relative positions. A plane may rotate about any point or line within it or on its boundary. A solid rotates when its parallel planes rotate round a series of fixed points within it forming a straight line. This series is the *axis of rotation*. The planets and other celestial bodies have their axes spinning about their axes. All particles not in the axis move in circles. Velocity of each particle is the product of its angular velocity (measured in radians per sec.) and its distance from the axis. Angular velocity is geometrically represented by a vector drawn along the axis of rotation, and of length equal to this speed. R. is thus change of direction of a vector. **See QUATERNIONS, VECTORS**

Rotation of Crops, system of growing crops in some particular order with the objects of utilising fully the plant foods in the upper and lower part of the soil, of checking insect and fungus pests by depriving them for a period of their essential food of distributing labour economically, and of providing a variety of food for cattle and other live stock. The most primitive R. is that of cropping the land annually with a cereal until it ceases to be profitable, and then allowing it to revert to weeds which ultimately form a rough pasture until in course of time the land has regained a certain amount of fertility. This wasteful system still prevails to some extent in the newer countries, where the virgin soil is exploited until it ceases to be productive and then allowed to revert to prairie. A great advance on this was the medieval

system of dividing the tillage area between a winter cereal (wheat or rye), a spring cereal (barley or oats) and bare fallow or beans. Various modifications were made with the introduction of new crops until in the first half of the eighteenth century the following famous Norfolk or four course R. was evolved. In the first year in autumn sown cereal—wheat in the second year roots—turnips, mangolds, potatoes, cabbage etc. third year spring sown cereal—barley or oats, fourth year leguminous crop—clover, peas or beans. Modifications of this and five, six and eight crop R.s have come into use in particular lists on special types of soil but the general principle remains. **See also under CROPS, LAY LAYING.**

Rotche, or Little Auk species of Alcid (*q.v.*) known technically as *Me. pus alle*. During the winter it frequently migrates to Great Britain and it breeds times it is often seen in great numbers in Greenland. Its length is about 84 in. Its bill is short broad and black the plumage is greyish black above white below and there is a small white spot above the eye.

Roter, or Rotten Turm, 155 in the Franconian Alps 17 m. S. of Sibiu. It takes its name from the square red tower, built in 1533 at the S. end.

Roth, Stephan Ludwig 1796-1849. Ger. writer and educational reformer b. at Medau. He was an enthusiastic follower of Pestalozzi and attempted to put his ideas into practice. **See A. Maly So. starb Ludwig Roth 1937**

Rothensted Park, estate 1 m. N.W. of St. Albans noted for the scientific experiments in agriculture which were carried on by Sir John Bennet Lawes (*d* 1900) and which owing to his munificent endowment of £100,000 are still being carried on under the Lawes Agricultural Trust. The station now receives gov. assistance and is one of the chief centres of agricultural research in the world.

Rothe, Richard (1739-1867) Ger. Protestant theologian b. at Posen and successively member, prof. director and *ephorus* of the Theological Seminary of Wittenberg. In 1837 he was nominated prof. of theology at the Univ. of Heidelberg. Vigorous grasp and independence of thought were his chief characteristics. His prin. production is the *Theologische Ethik* (3 vols. 1841-48 and ed. 3 vols. 1867-71) a complete system of speculative theology or philosophy. **See study by J. Happel 1909**

Rothenburg ob der Tauber, in (of Bavaria) Germany 1 m. W.N.W. of Ansbach, it stands high above the R. Tauber. It is a historical town with numerous medieval buildings and fortifications in good condition. There are many of baby carriages, (Christ) tree decorations, and so on products. R. became independent in the fifteenth century and was incorporated into Bavaria in 1802. R. is often referred to as the 'Franconian Jerusalem'. Pop. 9000. (**See illustration, p. 242**)

Rothenstein, John Knewstubb Maurice (b. 1901), Brit. art director and writer,

b in London and educated at Bedales School and Worcester College, Oxford where he read modern hist. and London Univ. He was prof. of art hist. at the Univ. of Kentucky and Pittsburgh but returned to England to become director of the City Art Gallery in Leeds and of the City Art Galleries and Ruskin Museum in Sheffield. In 1938 he became director of the Fitz Gallery showing enterprise and imagination in this post. His pub. on Eng. and Ir. painting include *The Life and Death of Corder* (1938) and *Augustus John* (1943).

Modern Art and in the Metropolitan Museum of New York. His Jews mourning in the Synagogue included in his series of Jewish pictures which began with *The Palmud School* is in the Tate Gallery which also has his *The Doll's House*. His visit to India to study the Durbar had a marked influence on his painting increasing his sense of light and colour and in 1910 he took an active part in the formation of the India Society to promote an appreciation of Indian art and letters. See collections of his lithographic portraits were pub. between 1897

D. M. Leish

THE PIONEER ROTHENBURG OB DER TAUBIR

Rothenstein Sir William (1872-1945) Brit. artist b. at Bradford and educated at Bradford Grammar Sch. He trained at the Slade School and in Paris at Julien's under Lefebvre and Constant but it was Degas and Whistler who really discerned the quality of his gifts. At nineteen he began a series of portrait drawings including numerous persons famous in literature such as Tennyson, Swinburne and Hardy. After 1900 his art was marked by an increasing seriousness and depth in place of the almost facile brilliance of its beginnings. In the First World War he served as an official artist in France with the Brit. and Canadian forces. He was principal of the Royal College of Art from 1920 to 1935 and prof. of civic art at Sheffield Univ. from 1917 to 1926. His work includes lithographs and etchings as well as landscapes and portraits and interiors in oils and is represented in the prin. galleries of Great Britain the Dublin Gallery of

and 1937. He completed over 200 portraits of armen during the Second World War which he presented to the nation. He wrote *Oxford Characters* (1896) *English Idylls* (1898) *Manchester Portraits* (1911) *A Life of Goya* (1900) *A Plea for Wider Use of Artists and Craftsmen* (1917) *A Cent. in India* (1926) *Men and Memories* (vol. I 1931 vol. II 1932 vol. III 1939). He was knighted in 1931. See J. Rothenstein *The Portrait Drawings of William Rothenstein* 1926.

Rotherham, a bor. of the W. Riding of Yorkshire, England, situated between Sheffield and Doncaster at the junction of the Rother with the Don 6 m. from Sheffield. It is a busy modern centre of industry and commerce. There is coal-mining in the vicinity and it is the railway clearing house of a large colliery area. There are large iron and steel and brass works. Iron and steel sheets, bars and rods etc. are made as well as a wide range of manufactured articles, such as

rills wheel disks cranks and piston rods. Other industries include general engineering glass blowing corn milling the manu of oxygen and of windows doors and staircases. R's most important architectural and historical building is the par church of All Saints dating back to Saxon times. The present building is a very fine specimen of the Perpendicular style and contains some fifteenth century stalls and benches and a fine pulpit (1603). The chapel of Our Lady (c 1483) on the old R Bridge is one of only four extant chapels built on bridges in England. The chapel was later used as the prison but in 1924 it was restored and rededicated. In 1930 a new bridge over the Don at this point was completed. Important modern buildings include the town hall the council offices and the central public library. The grammar school for boys was founded in 1483. There are eleven parks and open spaces covering 300 ac. In Clifton Park is the mansion house which has been converted into a museum. Places of interest in R include Cusworth Castle (mentioned in Scott's *Treasure*), Roche Abbey and Wentworth Woodhouse. There was a Roman post on the present site of the town and R in Dorsetshire B's is mentioned as possessing a church and a mill. The industrial list of R begins in 1716 when the first furnace for iron working was built by Samuel Walker. It became a corporation in 1871. It is a poor constituency. Pop. 81,100.

Rothermere, Sir Harold Sidney Harmsworth Viscount (1868-1940). But newspaper proprietor (younger brother of late Viscount Northcliffe *q.v.*) b in London. Became at twenty one partner in publishing business (known then as Harmsworth Brothers Ltd) is the *Amalgamated Press*. When the *Penny Press* was taken over by the Harmsworth house he recognised that paper and he assisted in the founding of the *Daily Mail* (1896). He founded the *Daily Record* Glasgow. In 1910 he founded the King Edward chair of Fine Literature Cambridge and received a baronetcy. From 1914 having already severed his connection with his brother's papers his organ was the *Daily Mirror* supplemented by his founding of the *Sunday Pictorial* a year later. On the death of Lord Northcliffe in 1922 R acquired control of the *Daily Mail*. Before his death R realised his holding of shares which gave him a controlling interest in the *Daily Mirror* on the Stock Exchange. Under his control it had reached even by 1922 a circulation of over 3,000,000 and had become well known for its pub of sensational pictures and articles. Its political views however did not become left wing until after R's connection was severed. R became Baron R in 1911 and received a viscountcy in 1919. During the First World War he was air minister (1917-18). See Viscount Camrose *British Newspapers and their Controllers* (revised ed.) 1948.

Rother, burgh of Morayshire, Scotland on the R Spey, 10 m S.E. of Elgin. It has distilleries. Pop. 1400.

Rothsay, David Stewart, first Duke of (1378-1402) son of Robert III of Scotland. He succeeded to his father's original title of earl of Carrick. Owing to the king's defects of character the management of the affairs of the kingdom devolved on his brother the earl of Fife, but the estates decided that David then earl of Carrick was heir to the throne should assume sovereign powers and at the same time David was created duke of R and his uncle Fife was made duke of Albany, these being the first examples of the dual title in the hist of Scotland.

Rothsay, royal and municipal bor and town of Butehire Scotland, on the is of Bute 30 m W of Glasgow. There is a good harbour fishing is carried on and it is a popular tourist centre and holiday resort. In 1816 the ruins of Bute restored the old castle (founded in 1098) (Craigmore adjoins P on the E and Port Bannatyne on the N. Pop. 11,000.

Rothorn, Swiss mit mass (77'14 ft) overlooking the N shore of Lake Brienz. The fine panorama from the top attracts tourists who can come by rail railway from Birmuz.

Rothschild, Jewish family famous for their immense financial transactions. The founder of the family was Mayer Amschel R (1743-1813) of Frankfurt on Main. There are various theories as to the origin of the surname some tracing it to a place name but it is most generally supposed to represent the red shield which was the sign of the house at Frankfurt. After the founder's death his eldest son Amschel Mayer (1773-1853) carried on the Frankfurt business the other four sons having opened branches. Solomon (1774-1826) at Vienna Nathan Mayer (1777-1836) at London Karl (1780-1853) at Naples and James (1792-1868) at Paris. One reason of their success was collaboration. In the London house Nathan was succeeded by Lionel (1808-79) who was returned to Parliament for the city of London in 1841 and 1852 but on account of his fifth was unable to sit until 1858. He was M.P. till 1874 and at his death was succeeded in the business by his son Nathan (1840-1911) who was raised to the peerage as Baron Rothschild in 1885. Nathaniel Mayer Victor R (b 1910) succeeded to the title as third baron in 1937. See Count Courti *The Rise of the House of Rothschild* 1938 and M. L. Ravage *The Men of Frankfurt* 1929.

Rothwell 1 Urb dist 4 m S.E. of Leeds in the W Riding of Yorkshire, England. There is a educational grammar school. The dist has coal mines and rhubarb is grown. Pop. 24,300. 2 Urb dist 4 m N.W. of Kettering in Northamptonshire England with manu of boots and shoes and agric implements. Pop. 1800.

Rotifera, or **Wheel Animals**, phylum of minute animal most of them about one hundredth of an inch and the largest not more than one eighth of an inch in length. They are mostly in fresh water, but a number of species have been found in the sea and others in damp moss. There are eighty four genera with some

700 species. Their distribution is very extensive, and experiments by James Murray, while in the Antarctic with the Brit. Antarctic expedition (1907-9), showed that 40 R. did not kill them, and they were able even to survive being raised from such a low temp. to nearly boiling point within a few hours. The fresh water forms which are numerous in the Antarctic were also able to endure a month's immersion in brine. R., in spite of their small size are fairly complicated in structure, they are triploblastic (three layered) and consist of head, body, and foot. The head bears a disk of cilia the movements of which suggest a rotating wheel. These wash the food into the mouth and also propel the animal through the water. The head contains a brain and in many species two or more

ROTIFERA

red or violet eyes though some are eyeless. The body varies in shape but is generally transparent and allows of easy inspection under the microscope of the digestive system, which consists of a gizzard or mastax and stomach. Though absent in some species in the majority there is a well developed foot which may be retractile or telescopic and is often furnished with a gland which secretes an adhesive material. A number are parasitic on water insects and worms. The females of all species greatly preponderate in numbers, and the production of unfertilised eggs is usual except in the autumn when special eggs are laid which hatch into males only. In a very brief life they fertilise the winter eggs, which are able to survive a variety of unfavourable conditions.

Rotomahana, small lake to the S.E. of Lake Tarawera, in a hilly country to the S.E. of the co. of Rotorua. N. Is. New Zealand. The pink and white terraces on the borders of R. were destroyed by the eruption of the volcano, Mt. Tarawera, on June 9, 1886, and the lake is now a deep crater, in which a new warm lake has formed, of 2 sq. m. in area.

Rotor, revolving part of an electric generator (*q.v.*), electric motor (see *ALTERNATING*).

TRIC MOTORS) or turbine (see *HYDRO-ELECTRIC POWER*, *TURBINES*, *STEAM*). See also *AUTOGRAPHS*.

Rotorua, name of a co. and of a tn. and lake in that co. in N. Is., New Zealand. The co. is inland and in the N. It is intersected by 176 E. and 38 S. The tn. is situated on the S.W. flanks of the lake and hills over 2,000 ft. in height. Tourists are attracted by the luxuriant and volcanic countryside known usually as the Hot Spring dist. (see *GISSERS*) and in this come for baths in the sulphurous alkaline and siliceous springs. It is a Maori centre and is owned and managed by the state as a health and tourist resort. Close by is the Maori vil. of Ohimotu. The inner shores and the lough is of Mokoro are only two features in the splendid scenery of the lake with which Lake Rotiti to the N.E. communicates. Apart from tourism, saw-milling is a basic industry. Pop. (co.) 10,000 (tn.) 7,000.

Rotrou, Jean de (1601-60) Fr. dramatist b. at Dreux where he became a magistrate. With Corneille he joined the brigade (cf. Richelieu (1639)) a society formed to give expression to the cardinal's dramatic ideas. A fertile writer, R. borrowed a great deal from Sp. plays and shows a strong bias towards romanticism. His best plays are the tragedies *Chagrin et Doristhe* (1630), *Symon et Jodan* (1646) and *Venceslas* (1641). See study by J. F. J. 1965.

Rotten Borough, see *ROTTERDAM*. **Rottenburg**, tn. of Württemberg, Germany, 6 m. from Ulm. There is a fifteenth century cathedral and a museum containing interesting Roman remains. Hops are grown in the vicinity, there are woollen and spinning industries. Pop. 7,700.

Rottenstone, reddish or greyish brown stone composed chiefly of alumina. It occurs in Derbyshire, England, and in Albany, New York. A soft yielding stone, it is useful for cleaning and polishing metals.

Rotterdam, the most important harbour tn. of the Netherlands and also the largest tn. but one of the country is situated in the prov. of S. Holland at the IJmeer estuary at a distance of 6 m. S.W. of Amsterdam. The New Waterway which is 20 m. long and well navigable for the largest sea-going vessels connects the tn. with the sea. The total length of the harbour quays is 17.2 m. The harbour basins have a total surface area of 1161 ac. The most important goods of supply are oils, cereals, mineral oils and wood, and mainly bulk products. Before 1910 the major export article was coal. The port owes its great significance to the transit trade to Germany and Switzerland along the Rhine. In 1938 the transit traffic of R. ran into a figure of 32,000,000 tons and the national traffic to a figure of 12,000,000 tons. More than half of the Rhine fleet then consigned, and has continued to consist, of Dutch vessels. Before the Second World War R. was the most important Atlantic port of the European continent. After the Second World War the traffic in the port of R. only slowly rehabilitated

itself. This was mainly due to impediments to transit trade. The transit trade of R reached only 30 per cent of that of 1938 during the year 1949. For the total port traffic this percentage amounted to 50 per cent. Prominent R industries are shipbuilding, machinery plants, margarine and soap factories, chemicals, and foodstuffs. R was given municipal status in the fourteenth century. Its importance does not, however, date earlier than the middle of the nineteenth century, when the increasing Rhine shipping made it into a busy port. At the Coolingsluis a statue of Erasmus who was born in R. Several buildings, such as the Delft Gate, the old E. Indies House, and St. Lawrence's church, were lost during the Ger bombardment of May 1940 which crased practically the whole centre of the tn. During the same bombardment more than 900 inhab were killed and 24,600 dwellings destroyed, 11,000 buildings, 2400 shops, 1200 factories and workshops, 69 schools, 21 churches, and 20 banks were ruined. Large buildings which are still in existence are the Exchange, the tn hall, the post office, the White House, the Boymans Museum and some big business houses. The suburbs which once were independent communities have been joined to the actual tn of R in the course of the years, e.g. Charluis Kraaijen, Delfshaven, Katendrecht, Hoogvliet, Pernis, Hillegersberg. The pop increased considerably as a consequence and amounted on Jan 1 1950, to 676,000. Reconstruction work was commenced immediately after the tn's liberation in May 1945. Apart from the reconstruction of the tn's centre, a long term project is planned for the construction of a dyke to protect a part of the tn which was formerly flooded at high tide, and a system of circular roads which will include the enlarged centre of which the Coolingsluis will be once more the prin thoroughfare.

Rotti, is of Indonesia. S.W. of Timor. Cotton, sugar, soybeans, indigo etc. are produced. Pop 7000.

Rotifera, genus of tropical plants belonging to the family Euphorbiaceae, and natives of Asia and Australia. *R. tinctoria* (or *Mallotus philippinensis*) from Malaya is important for two products, an orange dye and a remedy in cases of tapeworm.

Rottweil, tn of Wurttemberg, Germany, on the Neckar 68 m by rail S.W. of Stuttgart, manufacturing machinery, leather, gunpowder, and cotton. It was a medieval free city. There are sev fine Gothic and baroque buildings. The Ger Dye Trust had its main explosives factory in R. Pop 12,800.

Rotuma, is (14 sq m in area) of the S. Pacific, trading in copra, annexed in 1880 to the Brit colony of Fiji, which lies 300 m S.S.E. Copra is exported. Pop 3200.

Roturier (perhaps from Low Lat. *rup. tarus*, one who breaks the earth) in the days of feudalism a citizen who held his ground by allodial tenure as opposed to knight service. Thus any one who was

not noble came to be designated R. Unlike the knights, the Rs were obliged to serve in the militia, and were put to death by hanging instead of decapitation.

Roualt, Georges (b 1871), Fr painter, b in Paris. He served an apprenticeship under a painter of stained glass, and later studied at the Beaux Arts under Moreau. R belongs primarily to the Expressionist school, though his work possesses some of Rembrandt's mysticism. His tragic religious paintings set him apart from contemporary artists. He has illustrated many books. See study by M. Puy, 1920.

Roubais, tn in the dept of Nord, France, 6½ m N. of Lille. With Lill, La Madeleine, Croix, Tourcoing, and Wattrelos, it forms a busy industrial dist. Woollens and all kinds of textile fabrics are manufactured. It was a prosperous cloth making tn in the fifteenth century, under the dukes of Burgundy. There is communication by canal with the Scheldt. Pop 100,900.

Roubillac, Louis François (169-1762), Fr sculptor b in Lyons, and trained under Costou in France but worked in England. In Westminster Abbey is his monument to Handel, and in Golden Square stand his statues of Sir Isaac Newton and George I. He executed also a good bust of Pope and a statue of Shakespeare, now in the Brit Museum.

Rouble, unit of the Russian monetary system. The international value has been nominal since 1917, but the official exchange rate in 1950 was 11.20 roubles = £1. There are 100 kopecks in one R.

Rouen, city and port of France, cap. of the dept of Seine Inferieure, 87 m N.W. of Paris by rail and is an important railway junction situated on both banks of the Seine which is tidal above the tn and thus makes R an important port. The older part of the tn is on the N bank of the Seine, on the opposite side lies the manufacturing centre of St. Sever above which is the Ile Lavoie. Three bridges and ferries join both banks and outside the tn are important and growing suburbs and other tns, making R the centre of one of the chief manufacturing and industrial dists of France. The main industries are cotton spinning and weaving, dyeing flax, hemp, and jute spinning, petroleum refining, making of hats, boots, and shoes and soap making. There are also railway workshops at Sotteville and large machinery and chemical works. There is a large trade in armaments, timber, coal, etc., the docks are large and important, R clearing a total tonnage of over 3,000,000 in a normal year. Broad modern roads have been driven through the old tn, but it remains full of interesting and beautiful buildings though many suffered heavy damage and some were totally destroyed during the Second World War. The cathedral on the site of an old church (burnt 1200), was built from the thirteenth to the beginning of the sixteenth century, the W. façade, a fine example of Fr flamboyant style, has two towers of widely different dates, the N mainly of the twelfth century, the S. not completed till the sixteenth;

the central spire 48 ft. is modern. Despite the fighting in R. in 1944 the great W. façade remained intact but six chapels part of the ambulatory the vaulting of a portion of the nave and the stone work of the rose window of the N. transept were destroyed. The church of St. Ouen of fourteenth and fifteenth centuries with its octagonal central lantern is fine though spoiled by its modern W. front. More beautiful still is St. Maclois begun 1437 a perfect specimen of Br. Flamboyant architecture. Both contained fine stained glass but in 1914 the chancel of St. Ouen and the S. aisle of St. Maclois were reduced to ruins. The two upper storeys of the tower of St. Romain were badly calcined while the tracery of most of the windows was blown out. A number of minor buildings attached to the cathedral were also destroyed. The fifteenth and sixteenth century Palais de Justice where the *parlement* of Normandy once sat was totally destroyed. Buildings remaining include the Tour de Grosse Horloge with its neighbouring gate and the Tour de Jeanne d'Arc in which the saint was imprisoned before her burning in R. (this is the only remaining part of Philip Augustus's castle). Of the fine domestic architectural remains the fifteenth century Hôtel de Bourghéroutelle is the most remarkable. The library has a fine collection of antiquities and early illuminated MSS. Cornille Géricault and Flaubert were natives of R.

The Romans Latinised the Celtic name *Raduma* into *Rotomagus*. It became important ecclesiastically as early as the third century when St. Mellonius was its bishop. It was the cap. of Normandy and here William the Conqueror died. Arthur was murdered and John of Arc. was burned. The city underwent a protracted siege by Henry V. of England. At the end of the fifteenth century R. was the centre of the Fr. Renaissance. It was occupied by the Germans during the war of 1870. It was an important Brit. base during the First World War. It was taken by the Germans in June 1940 and recovered by the Allies in Aug. 1944, after heavy bombing attacks. It also suffered from Ger. demolitions. Pop. 107,700. See T. A. Cook *Rouen* 1918. A. Maurris *Rouen* 1929 and P. L. Cathoux *Rouen au temps de Jeanne d'Arc* 1932.

Rouge, red powder used as a cosmetic. It is prepared by rubbing up a base such as Fr. chalk with oil and a colouring matter. The colors used in the better qualities are carmine from cochineal and carthamine from the yashover. *Seueller's rouge* is a red powder used for polishing. It consists of the iron oxide obtained by calcining ferrous sulphate.

Rouge et Noir, or *Trente et Quarante*, see *TRIENT ET QUARANTE*.

Rougemont, Louis de, see *DE ROUGE MONT*.

Rouget de Lisle, Claude Joseph (1760-1836), Fr. author, b. at Louis-Saunier, famous for a single composition, the *Marseillaise*, which he composed at Stras-

burg in an outburst of patriotism. At the time he was captain in the engineers.

Rough Collie, see under *COTTIE*.

Rough Fell Breed, see *SILK*.

Rough-haired Pinscher, see *SCHNAUZER*.

Rough Riders, term originally applied to those who broke in horses. Later it was used for cavalry and artillery riders who trained the horses. Certain bodies of mounted men raised for military service adopted the name e.g. the regiment raised by Theodore Roosevelt during the Sp. Amer. war.

Roulaide see under *ORNAMENTS MUSIC*.

Roulers see *KOHSITARI*.

Roulette, in mathematics curve traced by any point in the plane of a given curve when the latter rolls without sliding over another fixed curve. The rolling curve is the generating the fixed one the tracing curve. The cycloid cycloid et al. are simple examples.

Roulette, gambling game played with the aid of a wheel (*roulette*) let into the centre of an oblong table covered with a green cloth. The table is divided into three columns of figures marked from 1 to 36 alternately in red and black. The six spaces at the two sides of the columns of figures are called respectively *rouge* to mark red numbers *noir* for black numbers *impair* for odd numbers.

ROULETTE WHEEL

manque numbers from 1 to 18 *pair* even numbers and *passé* all numbers from 19 to 36. The wheel itself contains a brass cylinder within a narrow inclined very little and is made to revolve on a pin by means of a cross head. The outer edge of this cylinder is partitioned into thirty-seven small compartments numbered irregularly from 1 to 36 and coloured alternately red and black the thirty-seventh space being the 0 or 00. The object of the game is simply to win money by placing stakes on a fancied number. The players having put their stakes on that portion of the cloth which represents the chance selected, the *tourneur* or croupier throws a small ivory ball round the ledge of the wheel, at the same time

revolving the cylinder in the opposite direction. When the wheel stops the ball drops into one of the little compartments, the number of which is the winning number. If for example it is 27 the croupier announces, 'Vingt sept, rouge impair et passe' rakes the lost stakes into the bank pays the winner, and goes on again as before. There are different methods of staking and the greater the odds, the smaller is the maximum stake allowed.

There is a simple form of roulette called *petits chevaux*. It is a species of race game the horses which are numbered being fixed on to some contrivance which enables them to be sent twirling round a model course. The horses are fixed in different relative positions and the one that is nearest the winning post when the wheel or other rotatory contrivance stops is the winner.

Roumania, see ROMANIA

Roumelia, see RUMELIA EASTERN

Round, or *Rota* kind of canon (*q.v.*) best defined by saying that its successive entries consist of complete melodies rather than mere phrases. The entries are thus apt to be further apart. Unlike canons its melodies, with the theme in its original position or in the octave never at other intervals. An older name for the R was *rota*. *Sumer is i-cumen in* known as the reading *rota* is a typical early R. A familiar later example is in the second finale of Mozart's *Così fan tutte*.

Rounds, or **Roundels**, country songs of the fourteenth century so called from the Fr *roundel* because their words returned to the opening lines again and again also round dances.

Roundels in heraldry general term for circular charges of various tinctures those coloured gold are called bezants silver plates, gules torteaux azure hurts sable pellets. Bezants and plates are shown flat the others spherical. A roundel blazoned Barry wavy silver and azure is known as a fountain.

Rounders, Lug ball game. It became popular in the eighteenth century, and at first had only a vague form on which players grafted their own individual rules. The R Association of Liverpool and Vicinity and the Scottish R Association were formed in 1889. Specific rules were fixed. The pentagonal field was changed to a diamond and a definite number of players and a fixed length of bat were established. The Amer baseball (*q.v.*) is founded on it.

Roundheads, nickname for the Parliamentary party during the 17th Civil War. It appears to have been used first in 1641 during the rioting which took place outside Parliament. It was a term of abuse referring to the close cropped hair style affected by some of the extreme sectaries. Misunderstanding has been caused by its application to the whole party. During the 1630s a number of Puritans had declaimed against the exaggerated court fashions. Prynne wrote a number of pamphlets specifically against 'love locks'. Surviving portraits however, show little fundamental difference

in hair style or costume between prominent Parliamentarian and Royalist leaders. Hyde Pym, Falkland Hampden and the Vanes had a similar background and shared a common code of manners. Sobriety of dress was adhered to by some of the sectaries who were frequently of the commercial classes. Roundhead was strictly applicable only to a few enthusiasts its application to the whole party was an attempt to brand them all as fanatics and upstarts whereas in fact the Parliamentarians included as the detailed list of the Civil war shows a variety of types. Contemporary accounts for example give vivid pictures of the flamboyant fashions worn by Harrison the fifth Monarchist leader and the gaudy of dress and manners at Cromwell's court at Whitehall caused some comment. Originally used derisively the word like Puritan was generally disliked by the people to whom it was applied. It never seems to have been widely used and only achieved respectability and fame in nineteenth century Whig hist. Its use since then has tended to the over simplification of causes and personalities in a highly complex and fluid struggle. The Civil war was political and economic as well as religious in origin. The broad group in opposition to the monarchy in 1641 cannot be symbolised accurately by such a restricted expression. See also WAR CIVIL.

Round Robin (Fr *round* round and *ruban* ribbon) petition signed strictly in a circular form so that no individual's name need appear first. A famous protest in this form was sent by Reynolds, Burke Gibbon and others to Dr Johnson imploring him to rewrite Goldsmith's epitaph.

'Round Table', political quarterly published in London at 24 founded in 1910 by a group of writers including Lionel Curtis R. H. Brand and other specialists on Imperial and international affairs.

Round Table Conference, name given to a discussion at a round table by groups representing different interests especially applied to the conferences held in London between 1930 and 1931 which resulted in the Government of India Act 1935.

Round Table, The. The exact origin of the R. T. is uncertain. It appears to derive from the Brythonic or Breton group of the Celtic peoples. It is part of the tradition of the Arthurian romance in which it is asserted that the knights of King Arthur's court quarrelled for precedence and that a cunning workman from Cornwall designed a table round in shape where all could sit equally. Wace is the earliest recorder of this tradition and Iavamon who trans his works gives a picture of the fight among the knights and tells us how the great table was built and that it could seat 1600 knights. In another version Merlin made the table for King Pendragon and another states that it first belonged to the father of Guinevere king of Cornwall. The literary development started in Breton France whence it passed to France Italy Spain and Portugal. The earlier legends are connected with that of the Holy

Grail, some persons asserting it was built as a copy of the table used at the Last Supper. In the Great Hall at Winchester is a R. T. which was presented to Henry VIII.; it was known to have existed in Henry III.'s reign, and was regarded as a great curiosity; it has seats for the king and twenty-four knights. The tradition of the R. T. is not common to all Celtic nations. It is not found amongst the Goidehc Celts (Irish, Gaelic, and Manx), and not amongst other, extinct, Celtic nations (those of 4. France, N. Italy, etc.).

Roundway Down, hill, 2 m. N. of Devizes, Wiltshire, where the Royalists under Sir Ralph Hopton, aided by reinforcements of Prince Maurice, defeated the Parliamentarians under Waller in July 1643.

Roundworms constitute the group (phylum) of Nematoda. They are unsegmented and thus distinct from the ringed worms (Annelida). R. have no true body cavity, blood, or respiratory systems, and are mainly parasitic. Species of *Tylenchus* and *Heteroda* attack cultivated plants. 'Hoose' or 'husk' of cattle is caused by *Dictyocaulus* (*Strongylus*) in the bronchioles of the lungs. R. parasitic in man include *Oxyuris* (thread-worm), hook-worm (see *ANKYLOSTOMIASIS*), *Dracunculus* (guinea-worm), *Filaria* (see *FILARIASIS*), and *Trichina* (see *TRICHINOSIS*). See also NEMATODES.

Roup, common contagious disease of poultry, game, and cage birds, characterised by a thick discharge from the eyes and nostrils which makes breathing difficult and gives rise to an offensive odour. It is generally traceable to dirt and overcrowding, and is accentuated by cold and damp. When an outbreak occurs healthy birds should be immediately removed to cleaner surroundings, and those attacked should be placed in a warm, dry enclosure. The head should be frequently cleansed with a disinfectant such as hydrogen peroxide. For the prevention and cure of R. and all allied diseases certain preparations are available which, added to drinking water and soft food are very effective.

Rouse, William Henry Denham (1863-1950), Eng. classical scholar and linguist, b. at Calcutta, and educated at Haverfordwest Grammar School, Dorseton College, Calcutta, and Christ's College, Cambridge of which he was later a fellow. From 1902 until 1928 he was headmaster of Perse School (q.v.), Cambridge, which became widely known under his influence. He will be chiefly remembered as a Gk. and Lat. scholar, though he also had a wide knowledge of Sanskrit and of modern languages.

Rousseau, Henri Julien (1844-1910), Fr. painter, b. at Laval. He never studied art, and became a customs official in Paris after the Franco-Prussian war. His pictures in his stationer's shop drew the attention of many famous artists, and between 1886 and 1910 he exhibited at the Salon des Indépendants. R. reacted against the fashionable Impressionism and Cubism by his simple rendering of natural objects, painting realistically, but without criticism. His bold, vivid jungle scenes are especially well known. See study by P. Courthion, 1944.

Rousseau, Jean Jacques (1712-78), Fr. writer and philosopher, b. at Geneva, his father being a watchmaker. His education was a poor one, and he received no teaching but that which the vil. school could supply. He was then apprenticed to an engraver, by whom he was very badly treated. His own behaviour was not exemplary, and he ultimately fled into Savoy, where he was taken under the protection of Mme de Warens, who procured admission for him into the College of the Catechumini at Turin, a seminary for the training of Rom. Catholic clergy. Since he did not wish to take orders, he was compelled to leave this establishment and took up his residence with Mme de Warens.

JEAN JACQUES ROUSSEAU
Engraving after a picture by Latour

near Chambéry. He left her in 1740, and after following a variety of occupations became acquainted, in 1748, with Mme d'Épinay, who proved one of his truest friends. Diderot, with whom he became acquainted, invited him to contribute to the *Encyclopédie*, but it was not until he was thirty-seven that he first made a name. The Academy of Dijon offered a prize for an essay on the progress of civilisation on morals and R., in his *Paradoxical Oration on the Arts and Sciences* (the earlier of his two *Discourses*), developed his famous paradox, probably suggested by Diderot, of the superiority of the savage state, winning the prize (1750). The second of his *Discourses* was the much less successful but equally meritorious one on *The Origin of Inequality* (1753). It was at Mme d'Épinay's house at Montmorency, where he had taken up his residence in 1756, that he commenced *Julie, ou la nouvelle Héloïse*, which he finished in 1759. This was surpassed by *Émile*, which appeared in 1762 and expounded a new system of education, based on natural development and the power of

example, which was to have a widespread effect upon European educational theories. In 1762 he also pub. *Contrat social* (q.v.) in which he expounded his theory of the surrender of the individual's natural rights to the whole society under the sovereign direction of the 'general will' (see under POLITICS). His writings equally offended the gov., the clerics, and contemporary philosophers, and later works such as *Lettres de la Montagne* increased the feeling against him. R. left France to avoid arrest, and on being ordered out of the republic of Berne, in 1766 he came to England at the invitation of David Hume, but quarrelled with him and returned to France in 1770. In 1778 the marquis de Guardin offered him a permanent home at the Château d'Ermenonville. Here he died. There is a collected ed. of R.'s works by V. D. de Musset-Pathay (1823-1826), and trans. in Everyman's Library of *The Social Contract and Discourses* (1913), *Confessions* (1931) and *Emile* (1911).

See lives and studies by J. Morley, 1873, 1886; H. G. Graham, 1882; F. Macdonald, 1906; A. L. Selig, 1929; C. E. Vulhamy, 1931; and R. Rolland, 1948. also T. Rousseau, Pierre Étienne Théodore (1812-67), Fr. landscape painter, b. at Paris, and studied under Rémond and Guillon-Lethière. He led the movement against the then prevailing classical style, and was the founder of modern Fr. landscape. The salon was hostile to his work for a long time and that of the other Romanticists, so in 1833 he retired to Barbizon, where he spent the latter part of his life. His work combines excellence and minuteness of detail with breadth and harmony of colour. See study by A. Sienier, 1872, and R. Huyghe Millet et Rousseau, 1912.

Rousselaere, see ROLLERS.
Roussillon, former prov. of France, corresponding in the main to the modern dept. of Pyrénées-Orientales. Its cap., Ruscino (from which the prov. derived its name), was the place of gathering for the Gallic chieftains in the days of Hannibal. Later Perpignan became the cap. Until the seventeenth century Spain and France disputed the ownership of R., but the prov. finally passed to France in 1659.

Roussy, Anne Louis Girodet de, see GIRODET-TROISON.

Routledge, George (1812-88), Eng. publisher, b. at Brampton, Cumberland. He served an apprenticeship to a bookseller in Carlisle, and later started in the publishing business on his own account (1813). See also next article.

Routledge and Kegan Paul Ltd., firm of Brit. book publishers, founded in 1834 by George Routledge (q.v.) as Routledge & Company, the name being later changed to Routledge & Sons. The firm made a great success of its *Railway Library*, and was also noted for its outstanding illustrators. In 1911 the firms of George

Routledge & Sons Ltd., and Kegan Paul, Trench, Trubner & Company Ltd., were amalgamated, and completely fused as R. and K. P. L. in 1947. Nicholas Trubner, an orientalist, had founded a firm specialising in oriental pubs. In 1851. On his death this business was bought by Kegan Paul, Trench & Company Ltd., founded by Charles Kegan Paul and Alfred C. Trench, and famous for its theosophical and poetical works. The firm, as constituted in 1947 publishes all types of literature, and especially works of a specialist character, and novels of international appeal.

Rouvroy, Claude Henri de, see SAINT-SIMON, COMTE DE.

Roux, Cesar (1857-1934), SWISS surgeon, b. at Mont-la-Ville. In 1890 he became first prof. of the surgical faculty at Lausanne. His research did much to reduce the danger from operations on the appendix, and he also contributed improved methods of treatment for tuberculosis of the lungs. See study by P. Decker, 1935.

Roux, Pierre Paul Emile (1853-1933), Fr. bacteriologist, b. at Confolens, Charente; he studied medicine at Clermont-Ferrand, and in 1878 he entered Pasteur's (q.v.) laboratory, becoming its director in 1904. With Yersin he demonstrated that the toxic fluid free from bacteria will produce the symptoms of diphtheria, and that the so-called Klebs-Löffler bacillus is the true cause of that disease. He further designed a bacteriological incubator (manufactured by Lequeux of Paris) with a bimetallic thermostat to control the temp.

Roux, tn. in Hainaut, Belgium, 4 m. N.W. of Charleroi, on the canal to Brussels. It has coal-mines and manufs. of iron goods, mirrors, and cement. Pop. 9500.

Rovere, Giuliano della, see JULIUS (popes), Julius II.

Rovereto, or Rovereto, tn. of Italy, in the Trentino, 134 m. S.S.W. of Trent. There are sev. medieval buildings. Antonio Rosmini-Serbati (q.v.) was b. in R. It is the industrial centre of the Tyrol, has a silk industry, and manufs. of leather and violin strings, etc. Pop. 16,000.

Rovigo: 1. Name of a prov. and its cap. in Venetia, Italy, which cultivates cereals, vines and the silkworm. The prov. has an area of 685 sq. m., and a pop. of 316,800. The tn. is situated on the Adige to Canal, 27 m. by rail S. of Padua. It is noted for its library, picture gallery, church of La Madonna del Soccorso, and cathedral (1696). Manufs. include textiles, leather goods, and candles. Pop. 15,700. 2. Vil. 16 m. S. of Algiers, in Algeria. Pop. 12,000.

Rovinj (It. Rovigno), Yugoslav seaport, 75 m. by rail S. of Trieste, in Istria, Italy. Surrounded by olive gardens, hazel-trees, and vineyards, it is itself the centre of sardine and tunny fisheries, and has also cement and marble works. Formerly in Austria-Hungary. R. was ceded to Italy after the First World War. In 1947 it was ceded to Yugoslavia under the peace treaty. Pop. 11,000.

Rovno, tn. and region of the Ukrainian S.S.R. The tn. is 110 m. from Zhitomir and is an important railway junction. Its prosperity was founded by Jewish merchants, who built up a large agric. trade. In 1920 R. was ceded to Poland and reverted to its Polish name of Równe. It was in ter. occupied by Russia in 1939 and was the centre of local Ger. administration after 1941. The Russians recaptured it after a spectacular advance in Feb. 1944, and in 1945 it was ceded to Russia under the terms of the Russo-Polish treaty.

Rovuma, riv. (475 m. long) of E. Africa, with two head-streams, the Lujenda and Rovuma, rising E. of Lake Nyasa, and flowing E. to the Indian Ocean, which it enters 22 N.W. of Cape Delgada. It is not navigable.

Row, John (c. 1525-80), Scottish reformer; won over to Protestantism by Knox's preaching, he was four times moderator of the General Assembly, and assisted in drawing up the Scottish Confession.

Rowallan, Thomas Godfrey Polson Corbett, second Baron (b. 1895), chief scout of the Brit. Commonwealth, b. at Gourrock, W. Renfrewshire, and educated at Eton. R. succeeded to his father's title in 1933. He served in both world wars and commanded a battalion of the Royal Scots Fusiliers from 1940 until 1944.

Rowan, see MOUNTAIN ASH.

Rowe, Nicholas (1674-1718), Eng. dramatist and poet, b. at Little Bardford, Bedfordshire, and educated at Westminster School. He was called to the Bar, but abandoned his profession to become a playwright. His dramatic works were mainly tragedies, and include *The Ambitious Stepmother* (1700); *Tamerlane* (1702); *Ulysses* (1706); *The Royal Convert* (1707); *Jane Shore* (1714); and *Lady Jane Grey* (1715). From 1715 he was poet laureate in succession to Nahum Tate. R. enjoyed a tremendous vogue during his lifetime; he possessed a keen sense of the dramatic, a grip of situations, and was a master of pathos.

Rowing. Eight-oared and four-oared R. originated in England and was practised principally on the Thames in the eighteenth century. At that time it was usually associated with fêtes, galas, and ceremonial occasions. In the early years of the nineteenth century this processional and ceremonial emphasis gave way to the competitive element which culminated in the first Oxford and Cambridge boat race in 1829.

At the present time the practice of R. is world wide and the most important racing events take their place in the Olympic games which are held every four years. The Olympic regatta comprises seven events: eight-oar; four-oar with and without coxswain ('cox'); pair-oar with and without cox; and double and single sculls. The European championships, open to the world and including the same events as the Olympics, take place annually on various European courses, while similar championships are held each year in the Americas.

Regattas, held at four-yearly intervals, are usually included in the programmes of the Empire games, which in recent years have become increasingly popular events in the sporting curriculum. Henley regatta has for long been recognised as the world's most famous regatta; with the exception of intervals created by two world wars, it has taken place annually since 1839. The programme includes both open and closed events. There are four eight-oared challenge cups; the Grand which is open to the world; the Ladies' Plate which is confined to schools and colleges; the Thames cup, an open race for second-class crews, and the Princess Elizabeth cup which is confined to schools and intended to encourage school boat clubs who do not consider themselves of Ladies' Plate standard. There are three four-oared events: the Stewards' challenge cup, with the same qualifications as the Grand, and the Visitors' and Wyfold challenge cups, corresponding to the eight-oared events of the Ladies' and Thames cup respectively. In addition to these there are three other open events: the Goblets for pair oars, the Double Sculls, and the single or Diamond Sculls. Neither fours nor pairs with coxswains are included in the Henley programme. Other ann. regattas are held at most of the Thames-side tns., such as Marlow, Reading, Staines, Kingston, and Molesey, while great energy and initiative have been shown in the provs. in the organising of a large number of regattas. At such centres as Chester, Newcastle, Edinburgh, Glasgow, Nottingham, York, Bristol, Norwich, Bedford, and Burton-on-Trent, and in the many clubs situated on tideway waters, R. is practised with enthusiasm and keen competition. Most oarsmen attaining international distinction come from the univs. of Oxford and Cambridge, from Leander, or the prin. Metropolitan clubs, London or Thames.

In Britain the most popular ann. R. event is the Oxford and Cambridge boat race. It is rowed in late March or early April (depending upon a suitable tide) from Putney to Mortlake, a distance of approximately 4½ m. In spite of its many twists and turns this course, except in abnormal conditions, is a very fair one. The start is made on the flood tide, about 1½ hrs. before high water at Putney Bridge. The training for this race occupies from nine to ten weeks. Each univ. crew starts practice on their home waters, and after a further period on adjacent waters they move to Putney for the final three or four weeks. In the first half of this century Oxford lost the substantial lead they had held in this series of races and finished the half-century nine victories in arrears. On approximately the same date as the boat race there is held annually the most popular race in the world—the Head of the River Race. This is rowed on the ebb-tide over the boat-race course from Mortlake to Putney. Each crew starts from and finishes at the same point, and results are judged by an efficient system of electrical timing. Over 200 eights

have been known to compete in this gigantic event. This form of competition has been followed up and down the country wherever a suitable course is available.

At Oxford and Cambridge R. is organised on an inter-college basis. The main eight-oared events are bumping races, and all other events are time races. Crews start a certain distance apart and row to finishing posts the same distance apart, the result being judged on a time basis by signals lowered at the respective finishes. Bumping races are held at both univs. in the Easter and summer terms. At Oxford these are called the 'Torpids' and the 'Summer lights,' and at Cambridge the 'Lents' and the 'Mays.' The boats, manned by eight oars, start approximately a length apart at Oxford and a length and a half at Cambridge, and row over the course, the order is decided by the previous year's results. There is racing for four nights at Cambridge and six nights at Oxford and a boat touching the one above it precedes it in the following day's racing. Besides these events there are inter-college four-oared events, and pair-oar and double- and single-sculling trophies.

The world's governing body for amateur R. is the Fédération Internationale des Sociétés d'Aviron, *F.I.S.A.*, abbreviated to F.I.S.A. This body, with its headquarters in Switzerland, has a code of rules and regulations based on the original English conception of amateur oarsmanship. Each subscribing country sends delegates to its congress each year, which is held at the centre chosen for the European championships. Olympic regattas are held under the auspices of the F.I.S.A. In Great Britain the main governing bodies are the Amateur R. Association (A.R.A.), the National Amateur R. Association (N.A.R.A.), the Scottish Amateur R. Association, and the Women's Amateur R. Association. Of these the A.R.A. and the N.A.R.A. control the vast majority of oarsmen in this country. They owe their separate origins to a different conception of what constituted an amateur oarsman. These differences have now been eliminated and a desire has been expressed for an amalgamation of the two bodies under the title of the Brit. Amateur R. Association. With the Scottish Association they have already formed a joint committee for the consideration of international R. affairs in so far as they affect Great Britain. See also SCULLING.

See R. P. P. Rowe and C. M. Pitman, *Rowing* (Badminton Library), 1903, S. Fairbairn, *Rowing Notes*, 1928, *Some Secrets of Successful Rowing*, 1930, and B. Cross (ed.), *Chats on Rowing*, 1918; G. O. Nickalls and P. C. Mullan, *Rowing*, 1939, 1949; B. C. Fisher, *Rowing and Athletics*, 1948, and A. H. Grubb, *Rowing, Sculling, Canoeing, and Punting*, 1949.

Rowland, Henry Augustus (1848-1901), Amer. physicist, b. at Ilondedale, Pennsylvania. He graduated from Rensselaer Polytechnic Institute, Troy, in 1870, and was appointed to the chair of physics at the Johns Hopkins Univ. in 1876. Two of his most outstanding

achievements were the determination of the value of the ohm and his method of making diffraction gratings for use in spectroscopy. His pubs. included *Studies on Magnetic Induction* (1875) and *On Concave Gratings for Optical Purposes* (1883).

Rowland, James Peter (1875-1948), Eng. meteorologist and astronomer, b. at Blackburn, and educated at local Roman Catholic schools, Stoneyhurst College, and London Univ., where he took a science degree in 1906. He joined the Society of Jesus in 1894. After teaching mathematics and physics for some years he became assistant director of Stoneyhurst College Observatory in 1919 and its director in 1932. He developed the magnetic, meteorological, and seismic work of the observatory until it closed in 1947, and also carried out a number of important astronomical observations, especially on sunspots and the determination of the rotation period of Saturn from observations of the white spot discovered by Huy in 1833.

Rowlandson, Thomas (1756-1827), Eng. caricaturist and painter, b. in London. He studied art in London, and in 1777 settled there as a portrait painter. Later, after 1781, he inclined towards caricature, and it is in this branch of pictorial art that he did his best work. He satirised society in all its aspects, and his drawings are invaluable as casting a light upon the age in which he lived. He contributed to Ackerman's *Poetical Magazine* (1809) to accompany Wm. Coube's *Tour of Dr Syntax* (pub. in book form, 1812-21), and illustrated many books, including *The Microcosm of London*, the topographical plates of which were executed by Fugin. See studies by J. Grego, 1880, A. P. Oppé, 1923, B. Falk, 1949, and A. McIntzelman, 1950.

Rowley, William (c. 1585-c. 1642), Eng. dramatist. He served sev. companies of actors, including the king's servants, as a comedian. He claimed to be sole author of *A New Wonder, a Woman newly Deceid* (1632) and *All's Lost by Lust* (a tragedy, founded on a Sp. text, 1633).

Rowley Regis, municipal bor., comprising the tns. of Cradley Heath, Old Hill, Blakheath, R. R. and Tirdale, in Staffordshire, England, 5 m. W. of Birmingham. There are ironworks and potteries. R. R. forms, with Tipton, a bor. constituency. Pop. 49,400.

Rowne, see ROWNO.

Rowntree, Arthur (1861-1949), Brit. scholar and educationalist, b. at Scarborough, of Quaker parents, and educated at Bootham School, London Univ., and Heidelberg Univ. From 1899 until 1927 he was headmaster of Bootham School, which under him became well known. He pub. numerous pamphlets on education, hist., and literature.

Rowntree, Benjamin Seebohm (b. 1871), Brit. sociologist, b. at York, of a prominent Quaker fam., and educated at the Friends' School, York, and Owen's College, Manchester. He became a director in his father's chocolate firm, and was chairman from 1925 until 1941. In his own

business affairs he has applied many of the reforms which he advised in his books which include *Poverty a Study of Town Life* (1900) *Unemployment* (1911), *The Human Factor in Business* (1921) *Poverty and Progress* (1911). R was chairman of the National Institute of Industrial Psychology.

Rowntree & Company Limited, cocoa chocolate and confectionery manufacturers of York. Overseas companies in the Canada, S. Africa and Australia. The business dates back to 1723 when Mary Tuke, a Quaker, opened a little shop in York to sell groceries. By 1753, this shop had become Wm. Tuke & Sons, and was dealing in cocoa. In 1862 the cocoa side of the business was taken over by Henry Isaac Rowntree. Partners in 1883 leaving Joseph in sole control until joined by his sons, John Wilhelm and Benjamin Seaborn. In 1897 the firm became a limited liability company with Joseph Rowntree as chairman. In 1890 land on the outskirts of York was bought and the first of the present factory buildings erected. Since then there have been many extensions and the factory now covers approximately 20 ac of the 100 ac estate which includes recreation grounds and many other facilities for the welfare of the employees.

Rowton Heath, open heath 3 m S.E. of Chester, it was the scene of a Royalist defeat in Sept. 1645.

Rowton Houses are registered lodging houses where bachelor working men at a nominal inclusive charge a night can obtain a night's lodging and the use of a reading room. The first R. house was founded by Lord Rowton in 1892 and similar houses have been erected in London by the R. H. Company Limited and the London Co. Council. The plan has also been followed in various European countries and in the U.S.A.

Roxana, daughter of the Buthian Prince Oxyartes. She fell a captive to Alexander, who married her for her beauty (327 B.C.). After Alexander's death she gave birth to a son (Alexander IV.) and after a life of persecution and wandering was finally murdered in 311 B.C.

Roxburghe, Duke of, see **KIRK FAMILY OF Roxburghe Institute**, see **BOOK CLUBS**.

Roxburghshire, a shire (county) of Scotland, sometimes called *Teviotdale*, is bounded N. by Berwickshire, W. by Selkirkshire and Dumfriesshire, S. and E. by the Cheviot Hills and is part of the Scottish Borders. Its greatest extent from W. to E. is about 40 m. and from N. to S. 30 m. The surface of the co. is diversified with hill and moor interspersed with well watered and fertile valleys. The highest peak in the co. is in the Cheviots (Auchopeclairn, 2380 ft.) but there are several hills with over 1000 ft. elevation. The co. is watered by the Tweed, the Teviot, the Liddel, and the Bowmont, with their numerous tributaries. It is a fine grazing country, thousands of sheep and

cattle being supported on its grassy slopes. Agriculture flourishes, other industries being the manufacture of woollens and tweeds, farm tools, hosiery and coaches. Horticulture is also engaged in. Jedburgh is the co. town but Hawick is the most important; others are Melrose, Kelso, Newcastleton, St. Boswells and Ednam. With Selkirkshire it returns one member to the House of Commons. It derived its name from the city and castle of Roxburgh, which once stood between the Tweed and the Teviot. The city is now only a ruin and of the castle there remain only green clad mounds and fragments of walls. James II. of Scotland was killed at Roxburgh Castle (1460) through the bursting of a cannon. Among the medieval buildings are the ruined abbey of Kelso, Jedburgh and Melrose which are very much visited by tourists on account of their historical interest. Chief among the castles of the border clans are those of Branxholm, Ferniehirst (now a Youth Hostel), Hardren, Smulholm (essford) and Hemmings, which figured largely in the border forays although no very important battle has ever been fought within the limits of the co. Floors Castle and Abbotsford are noted residences, the former being the seat of the duke of Roxburgh, who owns much of the land and the latter being famous as the home of Sir Walter Scott. It is situated on the right bank of the Tweed about 3 m. from Melrose, near the road leading to Selkirk. Area of R. 666 sq. m. Pop. 48,600. See J. Robson *Illustrated Scottish Borders* 1892. Sir Walter Scott *Waverley of the Scottish Borders* 1839 and Sir George Douglas *Roxburghshire* 1898.

Roxbury, originally a city of Suffolk co., Massachusetts, U.S.A. absorbed in Boston in 1867.

Royal Academy of Music, London, the senior school of music in the British Empire, founded in 1822. It was under the direct patronage of His Majesty King George IV. who granted a royal charter in 1830. The present building in the Marylebone Road with a fine concert hall was opened in 1911. Fellows (F.R.A.M.) and associates (A.R.A.M.) are elected by the directors, and honorary members (Hon. R.A.M.) by the committee of management. Besides tutorial work in all branches of music, speech and drama, and teachers' training courses, it carries on examinations for the F.R.A.M. diploma. Many scholarships are offered for competition periodically.

Royal Academy, The, see **ACADEMY, Royal**.

Royal Aeronautical Society. This society was founded in Jan. 1866 under the title of the Aeronautical Society of Great Britain for the purpose of increasing by experiments the knowledge of aerodynamics. Its first president was the eighth duke of Argyll. From the first the society concentrated on the possibility of heavier than air flight. In 1868 it held the first aeronautical exhibition at the Crystal Palace. Over 700 lectures on aviation have been read before it and to it belong all the leading aeronautical engineers in Great Britain, America and other parts

of the world. The society holds examinations and publishes technical information of direct use to aircraft designers. Medals for designing and technical skill are awarded, and the society possesses an extensive library. It has many branches in Great Britain and Canada and divisions in Australia, New Zealand and South Africa. The membership (1950) including branches is 12,000. The headquarters of the R.A.S. are at 4 Hamilton Place, London, W.1.

Royal African Colonial Corps of Light Infantry, see under WEST AFRICAN FRONTIER FORCE THE ROYAL

Royal Air Force Regiment see under AIR FORCE ROYAL

Royal Army Medical Corps, see under MEDICAL SERVICE ARMY

Royal Army Ordnance Corps. The Board of Ordnance is one of the oldest departments of the military administration of the Crown, but it did not establish its own factory until 1716. The corps was formed in 1841 primarily as a body of military storekeepers. It became Royal after 1914. Armourers of the corps are attached to regiments for the immediate repair of small arms, but its main function is the initial supply of stores and equipment of all kinds to garrisons and expeditionary forces.

Royal Army Pay Corps, corps of officers and men whose duties are divided between

Royal Army Chaplains Department, see under CHAPLAIN

Royal Army Dental Corps. Dental care did not exist in the British Army until after the South African war. In 1910 it was realised that wastage of manpower through dental unfitness was too high and eight civilian dentists were attached to home commands. In 1914 thirty-two dental surgeons were given 1st A.M.C. commissions and attached to the expeditionary force. By 1918 their number had increased to 850. The Dental Corps as such was formed in 1921 and the prefix 'Royal' granted in 1946. The corps now consists of officers who are qualified dental surgeons and other ranks who are orderlies and dental mechanics. They are organised in static and mobile dental units and are also attached to field ambulances where their task is to assist in the treatment of facial and maxillary injuries.

Royal Army Educational Corps, see under ARMY, Educational Training

command pay offices and regimental pay offices. The former are located with military commands at home and abroad and their functions are to receive and disburse public moneys in respect of military services to afford technical advice on questions of pay and allowances and to cost certain military establishments. The regimental pay offices at home are affiliated to record offices and are responsible for the audit of the pay accounts of soldiers of the regular army, supplementary reserve and territorial army, and for the payment of reservists and service pensioners.

Royal Army Service Corps. The Corps of Wagoners formed in 1794 had a short existence, and in 1799 the Royal Wagon Train was formed to perform transport work. This corps went through Wellington's campaigns in the Peninsula and at Waterloo and was disbanded in 1833. The Transport Corps was formed in 1855 during the Crimean War as the direct forerunner of the R.A.S.C. In 1866 it was merged into the Military Train and in 1870 became the A.S.C. In 1877 the A.S.C. was divided into two branches

(a) the Commissariat and Transport and (b) the Ordnance Store Branch. In 1880 these branches were formed into separate corps. The Commissariat and Transport Corps (men only) was officered from the Commissariat and Transport Dept. In 1889 the officers and men were amalgamated in the second A.S.C. The corps has a distinguished hist., having been represented in almost every campaign fought by the Brit. Army. During the First World War the corps fulfilled its duties under enormous difficulties, and was a model for all such work. For its services it was granted the title of 'Royal.' As a result of the mechanisation of the army the Horse Transport companies were disbanded in the '30's. In the Second World War the R.A.S.C.'s maintenance of supplies to the Allies' invading armies in Normandy was a triumph of organisation, particularly after the fall of Caen when the allied armies advanced rapidly to the Seine and Belgium with ever-lengthening lines of communication.

Royal Army Veterinary Corps. In 1796 a permanent veterinary service was estab. in the Brit. Army. It consisted only of veterinary officers under the prin. veterinary officer, but all attached to units. In 1903 the corps was formed and its senior officer designated director general, Army Veterinary Services, with the rank of major-general. In general its organisation is parallel to that of the R.A.M.C., but as the use of horses and mules by the army has greatly decreased since its peak in 1918, the R.A.V.C. is now responsible for the supply of remounts and for the procurement and training of all animals in use by the army. The title 'Royal' was granted in 1918.

Royal Assent, see ASSENT. ROYAL.

Royal Australian Air Force. This was estab. at Point Cook, Victoria, as the Australian Flying Corps, in 1911. It became the R.A.A.F. in 1917. In the First World War squadrons were sent to France and Palestine. Between the two world wars considerable expansion took place. The R.A.A.F. distinguished itself in the Second World War in the Far. E. campaigns. During the Second World War the R.A.A.F. had a strength of approximately 124,000. *See also under AUSTRALIA History during the First World War and History during the Second World War.*

Royal Australian Navy. This was estab. in 1909. Previously a R.N. squadron had been stationed in Australian waters, its cost being shared from 1882 by Great Britain and Australia jointly. It is administered by a naval board under the federal minister of defence. In the Second World War its strength was 20,000. *See further under AUSTRALIA, History during the First World War and History during the Second World War.*

Royal Bank of Scotland, The. Scottish bank. Its head office is in Edinburgh, and it was incorporated by royal charter on May 31, 1727, and commenced business with a capital of £111,000. In 1798 the R. B. made a notable contribution to banking practice by inaugurating the

'cash credit' system. In 1864 the business of the Dundee Banking Company was acquired. Drummond's Bank in London (estab. 1717) was acquired in 1924 and the business of the W. branch of the Bank of England taken over in 1930, by which date the R. B. had over 200 branches. In 1930 the whole capital of Williams Deacon's Bank Ltd. was acquired, and in 1939 the whole capital of Glyn Mills & Co. The R. B. and these two banks constitute the 'Three Banks Group,' each bank continuing as a separate entity. The R. B.'s capital is £4,250,000, with a reserve fund of £4,559,706 at Oct. 1948, when its total assets were £153,175,898.

Royal Berkshire Regiment, see BERKSHIRE REGIMENT. THE ROYAL.

Royal Bounty, item of the civil list, fixed at £13,300 per annum in 1837, from which the Brit. sovereign makes official subscriptions and donations to charities. Subjects whose wives are delivered of three or more children at one birth receive the king's bounty, paid out of the R. B.

Royal Burgh, see BURGH.

Royal Canadian Air Force, see under CANADA, Defence.

Royal Canadian Mounted Police, name given to the former N.W. Mounted Police (q.v.) in 1920, when its jurisdiction was extended over the whole of Canada. It is administered by the Canadian minister of justice, and comprises some 4800 officers and men, divided into thirteen divs. It is now largely mechanised. The uniform consists of gold-striped blue breeches, scarlet tunic, and stetson hat. The R.C.M.P. has been responsible for enforcing the customs and excise Acts since 1932.

Royal Cape Coast Militia and Volunteer Force see under WEST AFRICAN FRONTIER FORCE. THE ROYAL.

Royal College of Music, London, institution for musical study and training, founded in 1882 by Edward VII. as Prince of Wales. It succeeded the national training school. It was opened in May 1883, with Sir George Grove as director, and was incorporated by royal charter on May 23, 1883. Among the distinguished students of the college have been Vaughan Williams, Holst, Ireland, Bridge, Walford Davies, and Leopold Stokowski. Sir Hugh Allen was director from 1918 to 1937. He was succeeded by Sir George Dyson. The qualifications of the R. C. M. are considered distinctive, and the Associated Board of the R. C. M. and R. A. M. conducts local examinations ranging from elementary to advanced grades. Buildings were opened in Kensington in 1894, a concert hall being added in 1901.

Royal College of Organists, the central organisation in London of the profession of organist. It was originally founded on the initiative of R. D. Limpus, and incorporated by royal charter in 1893. Examinations are held in organ-playing and the theory of music, and diplomas granted for associateship and fellowship. There are also examinations in choir-training, and the college awards sev.

scholarships and prizes. Address: Kensington Gore, S.W.7.

Royal College of Physicians, incorporated medical body in London, founded by Thomas Linacre, who with the help of his friend, Cardinal Wolsey, obtained letters patent from Henry VIII. in 1518. The object of the society is to guard the profession from men 'who profess physic rather from avarice than in good faith to the damage of credulous people,' and its gov. is vested in the president and fellows only. Linacre was the first president (1518-24). The fellows are elected from the members of the college. The college first held its meetings in Linacre's house in Knight-riding Street, until it moved in 1614 to larger premises in Amen Corner. These were burnt down in the fire of 1666, and new buildings were opened in Warwick Lane in 1671. The college moved to its present site in Pall Mall in 1825. The R. C. of P. of Edinburgh, incorporated in 1681, has combined with the Royal College of Surgeons (Edinburgh) and the faculty of Physicians and Surgeons (Glasgow) in granting a triple qualification by a single examination. The college grants a diploma of L.R.C.P. and of M.R.C.P.

Royal College of Science, *see under IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY.*

Royal College of Surgeons. The practice of surgery was in the Middle Ages chiefly in the hands of barbers, and in 1460 a company was incorporated to protect the interests of London barbers who practised as surgeons. In 1511 surgery was restricted by Act of Parliament to persons qualified to practise that art, and a Company of Surgeons arose who amalgamated with the Company of Barbers in 1540. In 1800 was estab. the R. C. of S. of London, which became reconstituted in 1813 as the R. C. of S. of England. The estab. of the General Medical Council in 1858 helped to regularise the two professions of physician and surgeon, and the work of the two colleges has from that time been co-ordinated. The college grants diplomas of membership (M.R.C.S.), jointly with the licentiatehip of the Royal College of Physicians, L.R.C.P., the two together constituting a legal registrable qualification to practise medicine and of fellowship (F.R.C.S., the hall mark of the successful surgeon), and a special licentiatehip in dental surgery. The building in Lincoln's Inn Fields, which possesses an excellent museum of anatomical specimens and other material cognate to the work of surgery, based on John Hunter's collection, was badly damaged during the Second World War. The R. C. of S. of Edinburgh was incorporated in 1505 and has buildings in Nicolson Street. In 1948 the degree of F.R.C.S. (Fellow of the Faculty of Anesthetics, Royal College of Surgeons) was instituted.

Royal Commission, *see COMMISSION.*
Royal Corps of Military Police, *see MILITARY POLICE, ROYAL CORPS OF.*

Royal Corps of Signals. Up to 1920, when this corps was formed, all arms of the Brit. service except the Royal Artillery

were communicated by means of the signals service of the Royal Engineers. The R. C. of S. absorbed the Indian Signal Corps in 1927, and was completely mechanised by 1939. All communications between headquarters above regimental level are handled by detachments of the R. C. of S., whether by dispatch rider, telephone, radio, or teleprinter. *See also SIGNALING, Military.*

Royal Courts of Justice, *see JUSTICE, ROYAL COURTS OF.*

Royal Dragoon Guards, 4th/7th, *see under GUARDS, DRAGOON.*

Royal Dragoons, The 1st, oldest line cavalry regiment in the Brit. service; raised in 1661 by the earl of Peterborough for service at Tangier, and known as 'Tangier Horse' (*see also WEST SURREY, QUEEN'S OWN ROYAL*). On returning from Tangier in 1684 it was regimented with other dragoons by Col. John Churchill, later the famous duke of Marlborough. The regiment served under William III. in Flanders and Ireland and again in the Low Countries; fought at Dettingen, 1743, where it captured the standard of Fr. Mousquetaires Noirs; and was in the Peninsula under Wellington and covered the army's withdrawal on Torres Vedras in 1810. The regiment distinguished itself at Waterloo and captured the Eagle (standard) of the 105th Fr. Line Regiment. It formed part of the Heavy Brigade that made the famous charge at Balaklava during the Crimean war. During the First World War the R. D. took part in the Ypres battles from 1914 to the end of the war. The regiment was still horsed in Sept. 1939. It was then part of the army stationed in Egypt and the Middle East, and, as an armoured car regiment, subsequently fought in all the battles from Alamain to Tunis.

Royal Dutch Shell, *see under SHILL TRANSPORT AND TRADING COMPANY.*

Royal East Kent Regiment, *see BUFFS.*
Royal Electrical and Mechanical Engineers. The greatly increased use, from 1916 onwards, of internal combustion engines and electrical gear by the army was not accompanied by the growth of a central organisation for the repair and overhaul of this equipment in the field. It led to a steady increase in the number of technical N.C.O.s, and other ranks such as fitters, motor mechanics, artificers, and armourers in fighting units for first-line repair work, and apportioning out of this work at rear echelons between the R.E., the R.A.S.C., and the R.A.O.C. (*see separate articles*). In 1942 this service was centralised and a new corps built up by drafts of 'craftsmen' (the lowest rank in the R.E.M.E.) from the specialist corps. To-day the R.A.S.C. retains its own motor repair service, but R.E.M.E. workshops (normally one for each brigade) repair weapons, vehicles, and technical equipment in use for fighting units, which also have attached to them light air detachments under the command of a W.O.2 from the R.E.M.E.

Royal Empire Society, Brit. organisation founded as the Royal Colonial Institute in 1868 to combat the separatist school,

to promote unity of the empire, to increase knowledge and mutual understanding of its many countries and peoples, and to provide a centre in London. The Institute received its royal charter of incorporation in 1882 and, by its supplementary charter of 1922, following its absorption of or amalgamation with various other societies with objects resembling its own, its name was changed to the more comprehensive R. F. S. Its motto is 'United Empire,' and the qualification for membership is Brit. citizenship and an acceptance of the society's objects and policy. The membership numbered on Jan. 1, 1950, 26,055 fellows, associates, and companions. The society's imposing new home in Northumberland Avenue, London, erected to the design of Sir Herbert Baker, was opened in 1936. Every one of the public rooms was panelled and decorated and in part furnished with materials, especially timber provided by the govts of the dominions and the colonies, and by individual donors. During the air raids on London in the spring of 1941 the unique empire library lost 32,000 vols, some probably irreplaceable. The building contains, besides the library of more than 250,000 books and pamphlets a bureau of information on matters relating to conditions and prospects in empire territories overseas, a newspaper room with a complete collection of the press from every part of the empire, an assembly hall in which are held regular meetings for addresses, discussions and cinema shows, and many other amenities. The jour. of the society is *United Empire*, pub. bi-monthly. Local branches are estab. at Bath, Bournemouth, Bristol, Cambridge, Dover, Liverpool, and Oxford, and at Adelaide, Auckland, Brisbane, Christchurch (New Zealand), Colombo, Hobart, Jersey, Melbourne, Montreal, Sydney, and Wellington (New Zealand).

Royal Engineers, Corps of, see **ENGINEERS, CORPS OF ROYAL**

Royal Family, term used in Great Britain for the sovereign and members of his or her family. Where the sovereign is a king the first person of the R. F. after the king is the queen who may be either regnant (when she has the same powers and prerogatives as a king), dowager (i.e. widow of deceased king), or consort. The life and chastity of the queen consort are protected by the Statute of Treasons, 1552. She has her own attorney- and solicitor-general, but though she pays no toll and cannot be amerced (fined) in any court she is the king's subject, and hence liable to criminal process, and can be guilty of treason against her own husband. She formerly held certain reservations out of the royal demesne lands, and a due called 'queen's gold' payable by any person in return for acts of royal grace extended to him. Apparently it is for the king to decide whether his consort shall be crowned or not; if she is to be crowned the archbishop of York performs the ceremony, which is, of course, separate from that of the king's coronation. On the king's death she becomes queen-dowager, and is

then outside the protection of the Statute of Treasons. But no one can marry her without the licence of the sovereign, and if she marry a subject she does not forfeit her royal dignity. A prince consort has no special privileges apart from those that may be specially granted by statute or letters patent. Both Philip II. and William III. enjoyed the title of king. Prince Albert was given precedence next to the queen and allowed to attend Privy Council meetings. The life of the king's eldest son is protected by the law of treason. At birth he becomes duke of Cornwall. When he succeeds to the throne the duchy of Cornwall vests in his eldest son. The king can, if he chooses, and always does, make his eldest son Prince of Wales and earl of Chester by letters patent, but other titles are *inheritable* by the heir apparent. The sovereign can control the custody and education of the children of his heir, and the custody of all princes and princesses of the blood royal except the issue of princesses who have married into R. F.s. Both the chastity and life of the Princess of Wales during marriage are protected by the Statute of Treasons. Princes and princesses of the blood royal take precedence of all peers and public officials (see **PRECEDENCE**). The king, queen, and certain members of the R. F. have a sum awarded to them, called the civil list (*q.v.*) in consideration of the king assigning to the nation his life interest in the hereditary revenues of the Crown.

Royal Flying Corps was formed on May 13, 1912, and developed out of the Air Battalion of the Royal Engineers formed on April 1, 1911, as the first step in creating a Brit. Army air arm. The air battalion, which was absorbed into the new corps, consisted of two companies, one dealing with airships, the other with aero planes. Similarly, the R. F. C. was divided into two wings (a naval wing and a military wing) and officers who were seconded to the corps retained their existing naval or military rank. The naval wing carried out flying training and experiments with seaplanes and airships, as well as with landplanes, while the military wing concentrated on landplanes only. In July 1914 the naval wing separated from the R. F. C. and became the Royal Naval Air Service. And on April 1, 1918, the R. F. C. and the R. N. A. S. (*q.v.*) merged to become the Royal Air Force. Among the army officers seconded to the R. F. C., on its formation was Maj. Hugh Trenchard of the Royal Scots Fusiliers (later marshal of the Royal Air Force Viscount Trenchard), who commanded the corps in France, with the rank of major-general, and who on the formation of the R. A. F. and the air ministry, became chief of the air staff, and is generally regarded as the 'father' of the R. A. F.

Royal Free Hospital, Gray's Inn Road, London, W.C. 1. General hospital for all type of illnesses and under the National Health Service designated as an undergraduate teaching hospital in association with the R. F. H. School of Medicine formerly the London School of Medicine for Women. The hospital was originally

founded in 1828 by Dr Wm Marsden, and incorporated by royal charter in 1892. The R F H group also includes the Elizabeth Garrett Anderson Hospital and the Hampstead General Hospital, as well as the former N W Fever Hospital and London Fever Hospital.

Royal Fusiliers (City of London Regiment), whose first dates from 1685, was raised in the time of Monmouth's rebellion. In its early years it was an ordnance corps charged with the duty of protecting the ordnance. Soon after its formation it received the designation of 7th (Royal Fusilier) Regiment of Foot, which title it retained until the territorial reorganisation of the army in 1881, when the name was modified to its present form. Like the Rifle Brigade (q.v.) and a few other regiments it was one of the few line regiments which had four battalions or more than the customary two of the Cardwell-linked system. In the First World War the regiment was augmented comprising besides many special reserve and service battalions over thirty affiliated territorial force battalions of the London Regiment. Like the Rifle Brigade and other large regiments the R F were represented in practically every important battle of the First World War. At Mons the 4th Battalion was conspicuous near Namur bridge, and again later in 1914 near Givenchy. In 1915 the service battalions fought with distinction at Hohenzollern Redoubt while the 2nd Battalion won honour at Suvla Bay in Gallipoli, at Beaumont on Ovillers and especially at Delville Wood where a number of R F battalions were heavily engaged including the 3rd Public Schools Battalion which also fought in the Ypres area in 1917. Other battles in which the R F took part included Cambrai (Nov. 1917), Bapaume (Aug. 1918) and they also took part in the advance of Gen. Allenby in Palestine in 1918. The regiment's most outstanding service in the Second World War was in Italy in 1943-44.

Royal Geographical Society, The, was founded in 1830 to advance geographical knowledge by exploration and research. In the nineteenth century it contributed to opening up Africa by supporting Livingstone, Speke and Grant (Ameron) and others and revived British interest in the Antarctic, sharing in the organisation of many expeditions from Capt Scott's to the present Norwegian-British-Swedish expedition to Queen Maud Land. The society also initiated the reform of geographical education in Britain including the establishment of the first university school of geography at Oxford in 1899. Two gold medals for outstanding work are awarded annually by his majesty the king on the recommendation of the council which also makes grants and awards. The society is supported mainly by subscriptions and donations of fellows; it maintains also a library and a map room the latter open to the public, and publishes results of original research in the *Geographical Journal* and other publications. Its address is Kensington Gore, where there is a map room open to the public.

Royal Horse Guards, see HORSE GUARDS

Royal Hospital, institution in Chelsea for invalid soldiers which was opened in 1694. It is the most notable building of Chelsea and was built by Wren (1682-92) probably at the instigation of Charles II, although the actual founder was Sir Stephen Fox (1627-1716) who contributed £13,000 towards it. It stands in extensive grounds which include the former Stanclagh Gardens and is built of brick with stone quoins, cornices, door and window dressings being an excellent example of Wren's power to produce a monumental effect with simple materials. The hospital accommodates upwards of 500 men and a system of out-pensioning relieves large numbers throughout the empire.

Royal Humane Society, The, see HUMANE

Royal Hussars, 10th (Prince of Wales's Own), were raised as dragoons in 1711 but were first in action against the Jacobites in 1743. Served in Germany in the Seven Years war. The Prince of Wales, who the name they bear was their colonel in 1743 and became George IV. He also conferred the designation 'Royal' in 1811. They took part in the Peninsula campaign of 1808 and embarked at Corunna having shot all their surviving horses. From 1814 to 1818 they fought on the Continent mostly dismounted but at Austerlitz they made one of the rare cavalry charges of that campaign. Mechanised in 1939 they formed part of the 2nd Armoured Brigade and fought in France, North Africa and Italy. See also REGIMENTAL HUSSARS.

Royal Hussars, 13/18th (Queen Mary's Own) Both regiments amalgamated in 1922 were raised as dragoons the 13th in 1711 and the 18th in 1759. The latter were Light Dragoons from their formation, the former became so in 1783. Both regiments fought in the Peninsula and at Waterloo. The 13th were in the Light Brigade at Balaklava. Both regiments went to South Africa in 1899 and remained in that theatre until 1902 and both were engaged on the Western front in the First World War. In 1916 the 13th was sent to Mesopotamia where it fought at Kut al Amara, Bagdad and elsewhere. The combined regiments were mechanised in 1933. See also HUSSAR REGIMENT.

Royal Hussars, the King's 15/19th The 15th Hussars (then Light Dragoons) were raised in 1759. The title 'The King's' was conferred in 1766 for services in Germany during the Seven Years war. During the Napoleonic wars they served in the Low Countries, the Peninsula and at Waterloo. The 19th Hussars were taken over from the old Bengal Army of the East India Company after the mutiny but also inherited the traditions and some of the battle honours of a previous 19th Light Dragoon regiment which had been

disbanded in 1822. They took part in the two Egyptian campaigns and the S African war. Both regiments served on the W front throughout the First World War. They were amalgamated in 1922 and mechanized in 1939. See also **HUSSARS, REGIMENT**.

Royal Inniskilling Fusiliers, see INNS KILLING FUSILIERS THE ROYAL.

Royal Institution of Great Britain, The, organisation for the promotion, diffusion, and extension of science and useful knowledge, founded in London 1799 incorporated by royal charter 1800 and enlarged 1910. In its laboratories F Young H Davy M Faraday J Tyndall J Dewar and others conducted their researches. The idea originated with Benjamin Thompson Count Rumford (d 1811) and was carried out with the help of Sir Joseph Banks (d 1820). There is a fine library a laboratory and a museum. Public lectures are given. There are four professorships of natural philosophy, chemistry, physiology and astronomy. Ludwig Mond endowed the Davy Faraday research laboratory in 1906.

Royal Institute of International Affairs, organisation for the study and discussion of international problems originating at the peace conference held in Paris in 1919 ended the first World War. The foundation was originally intended to comprise two branches which have however, since developed independently: the one into the Council of Foreign Relations in New York, the other into Chatham House, London. Between 1919 and 1936 Canada, Australia, New Zealand, S Africa, and India all established their own institutes of international affairs in close relation with that of Great Britain. Chatham House maintains not only a fine library of vols related to its sphere of interest but a unique collection of classified cuttings from the world's press accumulated since its foundation. The institute has sponsored individual works which have exercised a decisive influence upon policy, such as Lord Hailey's *An African Survey* (1938). But its most active life is in the frequent addresses always followed by discussion in the lecture room in Chatham House.

Royal Institution for the Preservation of Life from Shipwreck, see under LIFESBOAT.

Royal Institution of Chartered Surveyors, see under QUANTITY SURVEYING.

Royal Irish Fusiliers, see IRISH FUSILIERS THE ROYAL.

Royal Irish Fusiliers, 8th King's. Like the Inniskilling (old 6th) Dragoon Guards the R I F were raised from Protestant partisans of William III in his Irish war against James II (1693). They fought in the Sp campaign under Peterborough (1710). The title 'Royal Irish' was conferred in 1777. The regiment formed part of the Light Brigade at Balaklava, and fought in the S African war and on the W front in the first World War. Battle honours include Leewarde (1803), Somme, Cambrai, and Bapaume. See also **HUSSARS, REGIMENT**.

Royal Irish Regiment, see IRISH REGIMENT THE ROYAL.

Royalists, term frequently used of monarchist parties in England. It is applied especially to the party which supported Charles I and after 1649 Charles II during the civil wars. The R appear as a distinct group in Parliament during the 17th and 18th centuries on episcopacy in the House of Commons in 1661. A strong minority emerged who though generally opposed to Arminianism were also opposed to the eradication of episcopacy from Anglicanism. As the war progressed it was obvious that the R were strongest in the NW and the Parliamentarians in the SE though there were few exceptions to this such as Royalist Colchester in the SE and Parliamentarian Gloucester in the NW. R were drawn from all classes though their aristocratic support came from the lesser squires. They embraced a wide range of religious opinions. Catholics and Arminians were universally Royalist but the party included moderate Anglicans and, after 1649, many Presbyterians and some of the sectaries. This diverse group was, in fact, welded together by its allegiance to the king alone. One of the best explanations as to what constituted a Royalist was given by Sir Edmund Verney who fell during the royal standard at Newbury. On the constitutional questions and the scope of his sympathies were really with the Parliamentarians. He supported Charles I however for he declared that having enjoyed the king's favour and kindness for many years he could not be so base as to desert him now. See I Hyde and Clarendon *State Papers* 1621 onwards. Lord Clarendon *History of the Rebellion and Civil Wars in England* 1702. A G Dunning *History of My Own Times* 1723. 1731 (ed O) Ailes, 1897. 1900. *Verney Papers* ed by Francis P and Margaret M Verney, 1892. 99, W A Shaw *History of the English Church during the Civil War* 1900. Royal Lancers, 12th. This regiment was raised as dragoons for the 1711 rebellion. It was not again in action until 1793. The duke of Wellington served in the regiment as a lieutenant from 1789 to 1791. During the Napoleonic wars it served in Egypt the Peninsula and at Waterloo, which is its earliest battle honour. It was put of the Light Brigade at Balaklava and fought in the S African war and on the W front in 1914. With the 11th Hussars it was the first cavalry regiment to be converted to armoured cars (1928). They went to France in 1939 and to the W desert in 1941. They fought throughout the N African campaign and in Italy in 1944 and 1945. See also **LANCERS, REGIMENT**.

Royal Lancers, Queen's 9th. Raised (as Wynn's Dragoons) to put down the Old Pretender's rising in 1715. Became 9th Dragoons in 1719. The queen from whom they take their title was Adelaide, consort

of William IV. During seventeen years' continuous service in India, which included the mutiny, the 9th Lancers won fourteen V.C.s. They fought in the Afghan war of 1875 and throughout the S. African war. They formed part of the original B.K.F. (q.v.) in 1914, and were engaged at Mons. They were converted to light tanks in 1935. In 1940 they arrived in France in time to take part in the campaign, were evacuated, re-equipped, and went to the W. desert in 1941. Also fought in the It. campaign from May 1944 onwards. *See also* LANCERS; REGIMENT.

Royal Leicestershire Regiment. *see* LEICESTERSHIRE REGIMENT.

Royal Lincolnshire Regiment. *see* LINCOLNSHIRE REGIMENT.

Royal Mail Lines, Ltd., incorporated as the Royal Mail Steam Packet Company in 1839 by a charter to carry mails to the W. Indies, and entered into the first contract with the gov. in 1841. The company was also the first to institute mail communication with S. America in 1851. In 1909 the Forward line was purchased, and in 1910 the whole of the share capital of the Pacific Steam Navigation Company. Under reorganisation in 1932 the fleets of the Nelson Steam Navigation Company and David MacIver & Company Ltd. were transferred to the Royal Mail Company. The main services are to S. America, Central America and W. Indies, and N. Pacific coast.

Royal Marines. *see* MARINES.

Royal Marriages. By the Royal Marriage Act, 1772, which was passed by reason of the marriage of the then duke of Cumberland with Mrs. Horton, and of the duke of Gloucester with Lady Waldegrave, no descendant of George II. other than the issue of princesses who have married into foreign families may lawfully marry without the consent of the sovereign signified under the great seal and declared in council. Marriages contracted without such consent are void wherever contracted or solemnised, and any person solemnising or consenting to such marriages incurs the penalties of perjury (which penalties now involve no more than inability to sue for any private injury). It seems, however, that a descendant of George II. over twenty-five years of age may marry without the royal consent on giving twelve months' notice to the Privy Council, provided Parliament in the interim makes no objection. *See also* MORGANATIC MARRIAGE.

Royal Military Academy. *see* SANDHURST. *See also* under MILITARY EDUCATION and MILITARY SCHOOLS.

Royal Mint. *see* MINT.

Royal National Lifeboat Institution. *see* under LIFEBOATS.

Royal Naval Air Service. developed out of the naval wing of the Royal Flying Corps and came into being on July 1, 1914. Its prin. duties were patrolling sea routes and attacking Zeppelin sheds, and particular exploits included the destruction of two Zeppelins at Düsseldorf and

Friedrichshaven (1914), the sinking of three ships in the Dardanelles by torpedoes launched from seaplanes, offensives against enemy bases in Belgium, further successful attacks on Zeppelins and sheds, bombing raids on Pola, Cattaro, Durazzo, and Constantinople. It also performed valuable anti-submarine work, and in addition operated scout airships, fifteen armoured car squadrons, and three armoured trains. By 1915 it possessed 2949 aircraft and ninety airships. The R.N.A.S. was amalgamated with the R.F.C. to form the R.A.F. on April 1, 1918, and was revived as the Fleet Air Arm (q.v.) in 1924.

Royal Naval College. *see* under NAVAL EDUCATION.

Royal Naval Division. formed in Aug. 1914, consisting of one R.M. and two R.N. brigades of approximately 3500 men each. Later were included R.N.R., R.F.R., and R.N.V.R. personnel for whom no ships were available. Originally it was intended to assist home defence in the early stages. The div. saw service in the defence of Antwerp (1914), Gallipoli (1915-16), and on the W. front (1916-18), and distinguished itself for tenacity and courage at Beaumont (Nov. 1916), Gavrelle (April 1917), Passchendaele (Oct. 1917), in the tier. offensive of March 1918 and in the subsequent allied advance. While in France it was brought up to strength mainly by recruits from army sources. The R.N.D. suffered 32,631 casualties, which amounted to over 163 per cent of the average numbers carried. It was disbanded in 1919.

Royal Naval Reserves. *see* under NAVAL RESERVES.

Royal Naval Scientific Service. *see* NAVAL SCIENTIFIC SERVICE, ROYAL.

Royal New Zealand Air Force. This was estab. in 1929, its foundation being two squadrons of fighter planes lent by the R.A.F. During the Second World War it reached a peak enlistment of 52,000. Its squadrons served on all major fronts. It is controlled by an Air Board under the chairmanship of the minister of defence.

Royal New Zealand Navy. Unit formed in 1941. Previously a R.N. squadron had been stationed in New Zealand waters, its cost being shared by the Brit. and New Zealand Govs. For its part in the Second World War *see* under NEW ZEALAND, Defence.

Royal Niger Constabulary. *see* under WEST AFRICAN FRONTIER FORCE.

Royal Norfolk Regiment. *see* NORFOLK REGIMENT.

Royal Northumberland Fusiliers. *see* NORTHUMBERLAND FUSILIERS, ROYAL.

Royal Numismatic Society. Founded in 1836 as the Numismatic Society of London, the society was granted its royal charter in 1904 for the study of all branches of coins and medals (*see* NUMISMATICS; MEDALS), and now applies itself with equal emphasis to the Gk., Rom., Eng., Brit. Im., Ital., continental, and oriental series. In 1836 the *Numismatic Journal* was first pub.; in 1838 this was renamed the *Numismatic Chronicle*, which has been in pub. ever since. The society

meets monthly in London for the transaction of its business and to hear papers read by its fellows. Fellowship is open to all with good amateur interest in numismatics. An annular silver medal is awarded for work of outstanding merit at home or abroad. Address: Brit Museum.

Royal Observer Corps, see OBSERVER CORPS, ROYAL.

Royal Opera House, see COVENT GARDEN THEATRE.

Royal Physical Society of Edinburgh, instituted in 1771 and incorporated in 1788. It is exclusively devoted to natural history and the physical sciences. With it were merged a number of other societies such as the Chirurgico-medical, Hibernian, Medical, Chemical, Natural History and Didactic, all between 1796 and 1813. The society's first *Proceedings* were issued in 1858.

Royal Pioneer Corps. The term 'pioneer' is a fairly ancient one in English military phraseology, where it is more or less interchangeable with the modern English term 'engineer' in its military sense of sapper and miner. In many foreign armies (e.g. German) troops which in England are called engineers are called pioneers. The employment of pioneers was not only in siege warfare but on the move on lines of communication where their task was to build and maintain roads and bridges. This task was sometimes entrusted to second line infantry (elderly slightly unfit or lightly armed troops) and from 1914 to 1918 every British division had a battalion of such troops which was raised from an infantry depot permanently employed in digging and repairing trenches in rear of the main defence system, hence their generic name of 'navvy battalions'. Work on roads and bridges was mainly entrusted to labour battalions and companies often of colonial or Asiatic origin, e.g. the Chinese Labour Corps. In Oct. 1939 about fifty labour companies existed and were formed into the Auxiliary Military Pioneer Corps which became the Pioneer Corps in 1940 and the Royal Pioneer Corps in 1946. By the end of the war the corps had a strength of over 250,000 including such diverse elements as cobelligerent Italians and companies of British subjects from Mauritius and native companies from Bechuanaland, Basutoland, Swaziland and Zululand.

Other pioneers in the older military sense forming part of regiments of infantry and engaged in clearing the way for the advancing troops are now represented by the pioneer platoon of the support company in an infantry battalion whose prime task is to remove or disarm wire and mines in the assault or pursuit.

Royal Regiment, The, see under ROYAL SCOTS, THE.

Royal Regiment of Artillery (see also ARTILLERY). Permanent units of field artillery were not maintained in the British service until 1711, though permanent garrisons of artillery had been kept up since Tudor times. Militia units of garrison artillery were known as 'fencibles'. The Royal Regiment was formed in 1722. It was at first organised in companies,

later known as batteries. Batteries were grouped in brigades until 1938, when the tactical unit became the regiment. Until after the First World War units were designated as the Battery, Royal Field Artillery or Royal Garrison Artillery.

Now the whole regiment is divided into two main branches: Field and Anti-Air and Coast and Anti-Aircraft. To the former belong the Royal Horse Artillery and the much older Honourable Artillery Company (q.v.)—so far as its artillery batteries are concerned. The Maritime Regiment RA belongs to the latter.

Royal Sanitary Institute, founded in 1876. Its object is to promote the advancement of sanitary science in all or any of its branches and the diffusion of knowledge relating thereto. It has a membership of over 8000 which includes members of the medical, engineering, architectural, veterinary, legal and other professions associated with public health.

Royal School, Bath, founded in 1664 for the education of daughters and granddaughters of army or Royal Marine officers who have held or hold permanent regular commissions and daughters of former pupils. There is accommodation for 246 boarders between the ages of ten and eighteen. The official title of the school is Royal School for Daughters of Officers of the Army.

Royal Scots, The, The Royal Regiment (Lothian Regiment), senior line regiment of the British Army and probably the only surviving regiment in any European army having a direct connection with the professional companies as opposed to feudal levies of the late Middle Ages. From the early fifteenth century the kings maintained large numbers of Scottish troops and their number was greatly augmented under Henry IV. When in 1633 Charles I of England and Scotland decided to intervene in the Thirty Years War he granted a warrant to Sir John Hepburn to raise men in Scotland for a regiment to be formed round a cadre drawn from the Scottish regiments still in the service of the Crown. Hepburn claimed precedence for the regiment and one of the senior Irish regiments named it 'Pontius Pilatus Bodyguard'. After the death of Gustavus Adolphus the Scottish regiments in the Swedish service were disbanded and those members of the thirteen Swedish-Scottish regiments who did not take service under sundry German potentates joined Hepburn's colours. This brought the regiment up to a strength of over 3000 or about three times the size of a normal regiment of those days (1633).

The title of Royal Regiment of Foot was conferred upon it for services in Flanders in 1680. Dismanded Oudenarde and conferred upon it for services in Languedoc in 1686. Dismanded Oudenarde and Cyprus in the sixteenth century are among the historic sieges in which it took part. Its battle honours before the First World War include also Aya, the Crimean battles of Peking (1860), Taku Forts and the African war. It was transferred from the

Scottish estab in 1914. In the 1914-18 War thirty eight battalions served the 2nd Battalion was at Mons and Le Catcau in 1914. Six battalions took part in the Somme and Amiens battles in 1918. Other battalions fought in the Brit advance into Palestine in 1917 and against the final Ger offensive in 1918. In the Second World War the 1st Battalion went to the W. front in 1939 and distinguished itself in the rearguard fighting across France the remnants being evacuated to Dunkirk. Other units including the 10thians and Border Horse a yeomanry regiment which was converted into a R.S. battalion fought on the It front in the battle of Normandy and in the advance to and across the Rhine. The 1st Battalion sailed in 1942 for India. In Burma it was flown into Kohima to assist in repelling the Jap advance in Assam. It incurred serious losses but later crossed the Chindwin R. at Kalewa and moved on through Shwabo to the Irrawaddy R. and on to the siege of Mandalay.

Royal Scots Greys see GRAYS SCOTS

Royal Society for the Prevention of Accidents, see under ROAD SAFETY

Royal Society for the Protection of Birds, founded in 1889 and incorporated under royal charter in 1901. The society is the national body responsible for the conservation of Brit birds more especially the rarer species. It maintains active liaison with regional bodies. It owns or administers a number of sanctuaries such as Grassholm, Minsmere and Havergate Is. It also employs a chain of paid watchers from Cornwall to Shetland. The society is also actively engaged in educating the younger generation into a fuller appreciation of the value of wild life. The Junior Bird Recorders Club formed by the society in 1943 to cater for young bird watchers now numbers over 2000 members. The society publishes a quarterly magazine *Bird Notes* and booklets and leaflets. Membership of the society is open to all persons in sympathy with its objects.

Royal Society of Arts (Royal Society for the Encouragement of Arts, Manufactures and Commerce) learned society founded in London in 1754. Its scope includes all the practical arts and sciences and the membership (1950) is 5300 fellows. The chief regular activities are the delivery of lectures (afterwards pub. in a fortnightly journal) on a wide range of subjects and the conduct of a large system of commercial examinations but the society's list includes many pioneering efforts such as the first Eng. exhibition of contemporary art (1760) which resulted in the foundation of the Royal Academy the first industrial exhibition (1761) the inauguration of the first international exhibition (1851) and the foundation of the National Training School for Music (1870). In the eighteenth century far reaching results were achieved in agriculture, forestry and mechanical invention, both in Britain and the colonies, by the award of prizes. The society's chief special interest is industrial design, which it fosters by exhibitions (such as the

Exhibition of Brit Art in Industry 1935, held jointly with the Royal Academy) competitions and the award of the distinction of Royal Designer for Industry (R.D.I.) to eminent designers. The patron is His Majesty the King and the president is Princess Elizabeth.

Royal Society of Edinburgh (founded 1783) Scottish learned society arose from the Philosophical Society of Edinburgh founded in 1731. It received a charter in 1783 and a second in 1811. The society was instituted for the promotion of science and literature but deals now almost wholly with science. It has a membership of approximately 770 fellows and a maximum of 22 Brit honorary fellows and 44 foreign honorary fellows. The society has pub. its *Transactions* since 1783 and its *Proceedings* since 1832. For fuller hist. see index vols of *Transactions* and also in *Proceedings* vol. v 1862 pp. 2-31.

Royal Society of London for Improving Natural Knowledge (generally known as the Royal Society), the oldest scientific society in Great Britain and one of the oldest in Europe. The nucleus of the society came into existence about 1645 but in Nov. 1660 the first jour. is recorded and in 1662 King Charles II who had previously become a member granted the first charter. Subsequent charters in 1663 and 1669 conferred further privileges on the society which numbered fifty five members at its inception. The origin of the society is to be found in a group of enthusiasts for the new experimental philosophy who were for gathering like a similar group in France and like them living down theological and political suspicion though political and religious topics were excluded from their weekly meetings for some time. Among these early associates were John Wilkins afterwards bishop of Chester Seth Ward, afterwards bishop of Salisbury Christopher Wren prof. of astronomy at Oxford but later and far better known as England's greatest architect and Robert Boyle author of the *Sceptical Chemist* and, soon afterwards is the band included men like John Evelyn and Henry Christiaan Wren was one of the new society's earliest presidents. Newton was elected a fellow in 1671 and in 1687 his *Principia* was pub. with the encouragement of the society. He soon became the central figure and served as president from 1703 until his death in 1727. He was succeeded by Sir Hans Sloane whose collections formed the nucleus of the Brit. Museum. It was not until 1818 that the control of the society's affairs passed wholly into the hands of men of science and election into its fellowship became a recognition of their high achievement. At the regular meetings at Burlington House scientific papers are read which are subsequently pub. in the *Proceedings* (dating back to 1800) or the *Philosophical Transactions* (which began in 1665) of the society. The administration of an ann. sum of £4000, granted by the gov. to promote scientific research is in the society's hands, it also awards annually the Copley,

two Royal, the Davy, and the Hughes medals, the Rumford and Darwin medals every second year, the Sylvester every third, and the Buchanan medal every fifth year. The number of fellows of the society is 500, and fifty foreign members. See C. R. Weld, *A History of the Royal Society*, 1848, and Sir H. Lyons, *The Royal Society*, 1941.

Royal Succession, see SETTLEMENT, ACTS OF AND SUCCESSION, ROYAL.

Royal Sussex Regiment, see SUSSEX REGIMENT, THE ROYAL.

Royal Tank Regiment. The first Brit. tank crews were known, for security reasons, as the Heavy Bianchi, Machine Gun Corps, and in 1917 became the Tank Corps, in 1923 the Royal Tank Corps, and in 1939 the Royal Tank Regiment (see also ARMOURD CORPS, ROYAL). Within the R.A.C. sev. regiments of the R. T. R. survive as distinct from converted cavalry regiments. Generally speaking the tradition of heavy 'infantry' tanks remains with the R. T. R., and its units are commonly found in army tank brigades rather than in the armoured brigades of armoured divs. (see also TANKS)

Royalty. Popularly it is synonymous with monarchy or sovereignty, and a king is styled monarch or sovereign irrespective of the fact that he may possess no more than a portion of the sovereign power in a state. R. properly denotes the status of a person of royal rank, such as a king, queen, reigning prince, or grand duke, or any of their kindred. But the possession of such status is in no way expressive either of the actual or *de jure* political powers with which the possessor may be invested. The powers possessed by persons of royal dignity have varied from the performance of purely honorary functions to the exercise of the most absolute autocracy. See further under CROWN; SOVEREIGNTY.

Royal Ulster Constabulary, police force of N. Ireland. In 1797 the first police force in Ireland was formed under warrant of the lord lieutenant. Co. grand juries were authorised to appoint a chief constable to each barony, and were given power to enrol sixteen sub-constables to assist each chief constable. In 1822 under an Act of Imperial Parliament in the reign of George IV., a permanent trained police force was set up for the whole of Ireland, commanded by four inspector-generals, one for each prov. In 1836 control of the four prov. forces was centralised under one inspector-general with headquarters in Dublin. In 1867 Queen Victoria granted to the force the title of the Royal Irish Constabulary. That force remained in being until disbanded under the Constabulary of Ireland Act, 1922, following the div. of the country into N. Ireland and S. Ireland (Eire). The R. U. C. came into being on June 1, 1922, under a Constabulary Act passed by the first Parliament of N. Ireland. Approximately one-half of the original estab. were members of the Royal Irish Constabulary, who transferred to the new force on disbandment. The R. U. C. has a maximum strength of 3000, and is commanded by an

inspector-general, assisted by a deputy inspector-general, with headquarters in Waring Street, Belfast. The regular police force is assisted by a part-time voluntary force of special constables, known as the Ulster Special Constabulary.

Royal Ulster Rifles, see IRISH RIFLES, THE ROYAL.

Royan, seaport of Charente-Maritime dept., France, on the Gironde (N.), 20 m. from Saintes. It was a Huguenot stronghold. There are naval ironworks and sardine fisheries. It is a sea resort. It was seriously damaged during fighting in April 1941, being a centre of German resistance in the Gironde. Pop. 9300. See further under WESTERN FRONT IN SECOND WORLD WAR.

Royat, tn. of Puy-de-Dôme dept., France, 2 m. W.S.W. of Clermont-Ferrand. It has an old church (eleventh to twelfth century) and mineral springs. It is a popular pleasure resort. Pop. 2300.

Royce, Frederick Henry, see under ROYLS-ROYCE LTD.

Royce, Josiah (1855-1916), Amer. philosopher, b. at Grass Valley, California, U.S.A. He graduated from the Univ. of California, and studied philosophy in Leipzig and Göttingen Univs. He held the chair of philosophy at his own univ., and then became a prof. at Harvard Univ. in 1892. As such he estab. himself as one of the foremost Amer. philosophers, influenced by Hegel in his objective idealism. His books include *Spirit of Modern Philosophy* (1892); *The Conception of God* (1895), and *The Conception of Immortality* (1900).

Royden, Agnes Maude (b. 1876), Brit. preacher and social worker, b. at Birkenhead and educated at Cheltenham Ladies' College and Lady Margaret Hall, Oxford. She did social work in Liverpool and elsewhere and worked for the women's suffrage movement. Though an Anglican, she was assistant minister of the City Temple from 1917 to 1920. With Percy Dearmer she founded the Fellowship Service at Kensington. Her pubs. include *Prayer as a Force* (1922); *The Church and Woman* (1924), and *I Believe in God* (1927). She pub. her autobiography, *The Threefold Cord*, in 1947. She was created C.H. in 1930.

Royde-Smith, Naomi Gwladys, Brit. novelist, critic, and playwright, b. at Liverpool, and educated at Clapham High School and Geneva. From 1912 until 1922 she was literary editor of the *Westminster Gazette*, and later did reviewing and dramatic criticisms. Her first novel, *Children in the Wood*, was pub. in 1928, her first play, *A Balcony*, in 1928. Since then her pubs. include eighteen long novels, and biographical studies of Mrs. Siddons and Mlle. de Lespinasse. Her novels are remarkable for their characterization, especially of sensitive characters.

Royer-Collard, Pierre Paul (1763-1845), Ir. philosopher and statesman b at Compiègne Marne. He was a member of the municipal council of Paris at the beginning of the revolution fled from Paris during the Reign of Terror and served on the Council of Five Hundred for a short time in 1797. In 1811 he was created prof. of philosophy at Paris, teaching the doctrines of Lacl and Stewart and originating the *doctrinaire* school which included among its disciples Jouffroy Guizot, Camille Jordan, P. J. H. de Serre, De Rémusat, Cousin etc. He was president of the Chamber of Representatives in 1828, presenting the address in 1830 which the king refused to hear. See life by Barante 1878.

Royston, mkt tn and urb dist in Hertfordshire, England 13 m SSW of Cambridge situated on the pnc Rm Lckneld Way. There is a thirteenth century church. A curiosity is the R Cavo (near the post office) discovered in 1742, it dates from pre-Christian times and was a Roman sepulchre and an oratory. It is dug out of the chalk (height 25 ft and diameter 17 ft) and contains rough figures and coloured reliefs of saints, kings, and queens of various dates, most of which were made about 1000. At the crusades Thorfield Heath to the SW of the tn is a rolling heathland of 416 ac open to the public here golf and other games are played. Hunting and coursing take place in the season. Pop 4600.

Royston, tn in Lancashire, England 2 m N of Oldham. It is engaged in cotton spinning. Pop 14,900.

RSFSR, see RUSSIAN SOVIET FEDERATIVE SOCIALIST REPUBLIC, and under RUSSIA.

Ruabon, or Rhiwabon, tn in Denbighshire, Wales 5 m SSW of Wrexham. Coal and iron ore found here and there are brick and chemical works. Pop 4000.

Ruanda-Urundi, dist of the Belgian Congo assigned to Belgium as a manditory of the League of Nations. It lies E of Mt Kivu and is bounded N by Uganda and E by Tanganyika. It formed until 1919 a part of Ger E Africa. It was united administratively with the Belgian Congo in 1925. It is a mountainous area volcanic in the N and is very rich in cattle. Usumbura is the cap. The dist covers 20,550 sq m and has a pop of 1,934,000 belonging to the Bakutsi, Bahutu, and Batwa tribes.

Ruaspehu, c 9100 ft volcano in North Is. New Zealand. It was in eruption in 1895 and 1945.

Ruatan, see ROATAN.

Rubasse, mineral (consisting of quartz or rock crystal, containing minute particles of red oxide of iron). The stone is valued for ornamental uses and is very rare. An artificial variety is prepared by plunging red-hot quartz into a coloured liquid.

Rubato (It. 'robbed') manner of performing music without adhering strictly to time. Various rules have been established at different times, e.g. that what is taken away by hurrying from the time properly occupied by a composition as written,

must be given back elsewhere by slackening or that in pianoforte music the right hand only may play R while the left keeps strict time, but R should be subject not to rules, but to feeling, and it cannot be taught to those who have either no sense or an exaggerated notion of it.

Rubber (Indiarubber, Caoutchouc). R latex is the milk like juice which is contained in numerous species of trees, shrubs, and plants and consists of R hydrocarbon together with varying amounts of other substances depending on source, in a dispersion in water. This latex can be coagulated and dried in various ways to give the raw R of commerce. It is called R because one of its earliest uses in Europe was erasing pencil marks and India from Julius the old Sp name for S America (caout houc is derived from the Caribbean word *cahuchu*). It is said that Columbus found the natives of Haiti playing with a ball made of the gum of a tree, that was lighter and bounced better than any known at home.

Before the beginning of the *Hevea brasiliensis* R plantation industry, and during the Second World War very large amounts of R were extracted from many different sources both in plantations and in a wild state in jungles. The most important source was trees *Ficus guayule*, which occurs in the Gold Coast and other parts of Africa. *Landolphia* vines of several species which occur in many parts of Africa, *Manihot* from the Ceara prov. of Brazil and some others as well as the *H. brasiliensis* from the Amazon dist. of Brazil. The prin shrub was the guayule, which grows principally in Mexico but which has also been grown in plantations in the U.S.A. Various plants including the common dandelion, also contain small amounts of R latex, and the *kok saghyz* or Russian dandelion was grown in the U.S.S.R., and experimentally in the U.S.A. during the Second World War for its R content.

Nowadays the chief source of R is the *H. brasiliensis* tree, grown on plantations (both large European managed estates and native smallholdings) in Malaya, Ceylon, the Dutch E Indies, and other places in the Far E. These supplied 98.7 per cent of all natural R produced in 1940. The R produced from other sources though chemically identical suffers from several disadvantages, e.g. the tree must be felled to extract the latex, the latex exists in systems which contain a high percentage of resin which contaminates the R when coagulated, or the R is produced under native conditions and is contaminated with grit, bark, and water, as is the case with all wild Rs. In the case of *guyule* the whole plant minus the roots and in the case of *kok saghyz* the roots have to be treated by mechanical means in order to extract the R from the plant tissue. In the case of *H. brasiliensis* and some other trees the latex is merely contained in special tubes in the bark and can be obtained by tapping the tree i.e. making an incision in the bark, whence a small quantity of latex flows.

HISTORY OF COMMERCIAL RUBBER GROWING—Although known in S. America from early times and mentioned in writings by Sp. travellers in the sixteenth century, R. did not begin to reach Europe and the U.S.A. in quantity until the early nineteenth century, coming at first solely from the Amazonas prov. of Brazil. Brazil exported 31 tons in 1837, and 2378 tons in 1853 in which latter year 247 tons were also produced by other countries. All this was 'wild' R., obtained from trees in jungles. Wild R. continued to be a major source of supply until about 1911, when it accounted for some 33 per cent (74,000 tons). The total amount of R. produced has risen enormously, e.g. in 1940 the U.S.A. alone imported 499,616

sew reasons the *H. brasiliensis* was found to be best, and Ceylon Malaya, and the Dutch E. Indies, and to a much lesser extent other places in the Far E. and Africa the most suitable places for growing it. They were more suitable even than the Amazon dist. of Brazil where plantations of *H. brasiliensis* were established where the trees were attacked and large numbers destroyed by a leaf disease.

The species can be raised from seed but bud grafting on to a young seedling is now preferred. The buds are taken from selected high yielding trees and in this way the characteristics of the 'mother tree' can be transmitted to an almost unlimited number of trees. The family of trees produced from one bud parent is called a 'clone'. When finally set out in the field there are usually about 140 trees per acre. The tree grows to a height of 100 ft. and has a diameter when fully grown of about 36 in. An intercrop of some kind is necessary between the trees especially with young trees and on hilly ground to prevent soil erosion under the tropical conditions. The trees are not tapped until they are some five to six years old. In tapping the cut is made deep enough to sever the latex tubes but not to damage the cambium, a paper-like skin between the bark and the wood. Many types of cut have been used in tapping. Perhaps the most popular is a slightly sloping cut made half way round the circumference of the tree. Tapping is done on alternate days and in the early morning as the flow of latex is then greatest. The yield of latex varies from tree to tree and according to the age of the tree, the climatic conditions and other factors. About 1½ oz. of latex per tree per tapping is an average figure. It produces about 600 gallons per acre per annum. This has been much exceeded with special clones. The bark which is cut away in tapping is gradually renewed, this taking from six to ten years. If left in the natural state for any length of time the latex coagulates naturally and becomes putrid. A little sodium sulphite may be added to the collecting cups to prevent premature coagulation.

The latex is collected and transported to central bulking stations. It varies somewhat in R. content and as coagulation takes place more uniformly in dilute solutions it is diluted to a standard sp. gr. proportional to R. content. It is then ready to be made into smoked sheet or pale crêpe. If smoked sheet is to be made acetic acid is added immediately. This causes coagulation, the milky liquid setting to a junket-like mass. The coagulation is usually carried out in partitioned tanks, so that the coagulum is obtained in strips 4 ft. by 1 ft. by 1½ in. thick. The coagulum is removed and squeezed between a series of rollers to consolidate into sheets and to remove water. The final sheet is about ½ in. thick. It is then allowed to air dry for a few hours and then hung up in special heated sheds filled with smoke from burning timber. The presence of smoke both aids quick drying and prevents fungus attacking the R. When

Camera Press

RUBBER TAPPING

The latex in spite of minor coagulation on the external bark of the tree runs down in the form of drops into the cup below. Each dot on the tapped portion represents one month's tapping.

tons of natural R. The amount used and the price of R. have varied very considerably over the last twenty years.

The plantation R. industry was effectively begun in 1876, when Sir Henry Wickham smuggled out of Brazil seeds of the *H. brasiliensis* which he had gathered on the Tapajos Madiera plateau, the export of all R. seeds and plants was forbidden by the Brazilian Gov. at that time. These seeds produced 2700 plants at Kew Gardens in London of which 1919 were transferred to Ceylon in 1876, all the R. trees on the vast plantations in Asia sprang from these. Once the advantages of growing R. on plantations were recognised other species of trees were tried, both in the Far E. and in Africa, but for

dry, in about ten days the R is baled and is then ready for shipment.

If pale crêpe is to be made sodium bisulphite is first added to the latex to prevent surface oxidation. When subsequently coagulated the latex thus retains its characteristic white to light yellow colour. Coagulation and squeezing are the same as for smoked sheet, except that stronger machinery is required as the R is eventually rolled out to about 0.04 in thick. The thickness required for a 1-crêpe is made by pressing thin layers together when warmed. In this way a smooth surface is obtained.

The latex which naturally coagulates on the tree which spills on the ground or which is contaminated in any other way is treated in various ways and sold as off quality R. A large amount of preserved latex is now also exported. In this case gaseous ammonia is added to the bulked latex to prevent putrefaction and coagulation. This latex is then either shipped direct or concentrated to remove part of the water content by centrifuging, creaming or evaporating before shipment.

CHEMISTRY OF RUBBER—Latex from *H. brasiliensis* consists of about 36 per cent solids in a water dispersion. Approximately 91 per cent of the solids is R, hydrocarbon, the rest being mineral matter, resins and proteins. Small amounts of many other organic substances have been identified in latex. Coagulated and dried R (both smoked sheet and crêpe) also contains about 91 per cent R, hydrocarbon. R, hydrocarbon is polymerised isoprene (C_5H_8) with a straight chain structure.

R is dissolved by benzene, carbon tetrachloride, and many other solvents. It undergoes all the reactions typical of a highly unsaturated organic chemical and it combines with hydrochloric acid to give a plastic material (pliolin) which is extensively used for packing foods. R reacts with sulphuric acid to give balata-like materials which are used for bonding R to metal.

By far the most important chemical reaction of R is that of R with sulphur. This reaction has come to be called vulcanisation. The importance of this reaction lies in the fact that although under certain conditions raw R is tough and elastic it becomes very hard in winter and soft and sticky at summer temps. In the early nineteenth century both Europeans and Americans found raw R suitable for making waterproof overshoes and other articles and as a solution in turpentine suitable for waterproofing cloth. These articles all suffered from the disadvantages above mentioned. Many attempts were made to overcome this thermal instability. For example, Macintosh in Glasgow put a R layer between two layers of cloth to produce the Macintosh raincoat. This overcame the difficulty in some measure. Positive success was obtained by Goodyear in America, who found that an intimate mixture of R and sulphur when heated for some time gave a material which maintained its flexibility at much lower temps and

did not become sticky in summer. Hancock in London also discovered this effect with the help of some samples from America and gave the reaction the now accepted name of vulcanisation. It was found that the product obtained depended on the amount of sulphur added and the time of heating. Addition of 8 to 10 per cent sulphur gave a soft flexible product while 30 to 40 per cent gave a hard brittle material (vulcanite), after suitable heating. This reaction with sulphur is the basis of nearly all the goods manufactured. The various types of material where a permanent stickiness is required and pure crêpe soles. Very thin articles can be vulcanised by sulphur chloride using either a solution of this in carbon disulphide or some other solvent, or sulphur chloride vapour in a heated chamber. There are the collench and vapour cure methods of vulcanisation. A relatively few other substances including selenium, tellurium and certain organic chemicals give a product similar to the R-sulphur reaction product. The vulcanisation with sulphur can be modified by the acceleration of activators (see below).

Vulcanisation is not reversible and the vulcanised R has never been made. Vulcanised scrap is however reclaimed on a very large scale. This is done by heating it up vulcanised scrap R with oils at high temps and in other ways. Scrap containing fabric (e.g. tyres) is usually digested with caustic soda to remove the fabric. The oils in which have a softening effect and a product is obtained which can be used as cheap substitute for new R, and which can be vulcanised in the same way as new R. The physical properties of vulcanised reclaimed R are much inferior to those of similarly vulcanised new R.

RUBBER GOODS MANUFACTURE—This can be broadly divided into two classes: that based on dry rubber, by far the larger, and that based on preserved latex.

Manufacture of Goods from Dry Rubber—Although goods based on dry R cover a tremendous range in consistency and uses there are relatively few different manufacturing processes. The main ones are extrusion, calendaring and press moulding. Many articles are hard built from sheets of R extruded R and R covered fabric. Vulcanisation with the exceptions given above is always one of the steps. It is mainly up to the addition of different ingredients and different amounts of the same ingredient that the manufacturer relies for obtaining different end products.

As the R as received is too hard for mixing with other ingredients it is first masticated. This is done either by passing the R many times through the nip between two revolving rollers or by feeding into very sturdily constructed internal mixers with strong blades. By this mechanical treatment the R becomes softer and stickier and more like putty, the degree of change depending on the length of time of mastication. This mastication reduces the R to a state in

which it will readily mix with other ingredients and also decreases the elastic properties of the R which is necessary to aid extrusion and calendaring.

The next operation is mixing, carried out on the same types of machine as is mastication. In the case of open mill mixing the masticated R is allowed to form a band round one roller with excess R forming a bank in the nip between the rollers. The other ingredients usually ground extremely fine are then added to the R in the nip, whereupon, by passing through the nip with the R, they become intimately mixed into it. In the case of internal mixers the masticated R is fed into the machine and the other ingredients added. These are then kneaded into the R by passing with it through the narrow clearances between the blades and the walls of the mixer. In either case the mixing operation is always finished by blending the plastic mass by passing it through the nip of a two roll mixer to homogenise it and obtain it in convenient sheet form. Internal mixing is much faster than straight two roll mixing.

Since Goodyear's day the art of R compounding has developed considerably. Modern compounding will be illustrated by giving a mix for a particular job, below is a typical first quality tyre tread compound

	Pts by Wt
Smoked sheet	100 0
Gas black	47 5
Fine tar	2 0
Antioxidant	1 5
Zinc oxide	3 0
Stearic acid	3 0
Vulcanisation accelerator	1 0
Sulphur	3 0
	<u>161 0</u>

The last four ingredients are grouped together as these form a modern vulcanising system. The vulcanisation accelerator greatly speeds up the rate at which the R and sulphur combine. A few inorganic substances such as zinc oxide and litharge increase the rate of vulcanisation, but certain complex organic chemicals such as mercaptobenzothiazole and diphenylguanidine have a much more powerful effect and are nowadays used almost exclusively. Certain accelerators are so powerful that they can vulcanise R in about 24 hrs at room temp. When accelerators are used much less sulphur is required than would otherwise be the case. Most accelerators function best when an activator (such as zinc oxide) and a fatty acid (such as stearic acid) are present. The stearic acid and pine tar aid the mixing and subsequent extrusion operations. Antioxidants are certain organic chemicals which have been found to prolong the useful life of R articles and reduce perishing. The gas black (made in the U.S.A. by the incomplete combustion of natural gas) greatly improves the abrasion resistance of the compound, as is required in a tyre tread. Many materials other than those in the above mixing are added to R compounds, either

to improve the properties of the finished article or to cheapen it. After mixing the compounded R is ready for either extrusion or calendaring.

Extrusion—An extrusion machine is somewhat similar in design to a household mastic machine, though much more strongly built and motor driven. It consists of a barrel containing a rotatable worm. At one end of the worm is a feed opening. The barrel is longer than the worm at the other end and at the end of the barrel is the die which shapes the plastic mass to the desired form. In operation the compounded R is wormed up on a two roll mill similar to a mixing mill, and then cut into strips and fed into the machine. When enough material has been accumulated to build up a pressure in the space between the end of the worm and the die the R extrudes through the die in the desired shape. A modification of the extrusion machine is used for covering wire and other materials with R. The extruded material is often placed in trays of tin or on a mandrel to help the plastic material retain its shape. After being placed in trays of tin many types of R goods such as gas tubing, all rubber garden hose and door seal sections are vulcanised in autoclaves, using steam at about 40 lb pressure as the heating medium. Unvulcanised extruded sections are also used as links for mouldings and as parts of hand built articles.

Calendaring—A calender is used to obtain a continuous long length of uncured R stock free from wrinkles and of uniform gauge. It consists of three or four hollow steel rolls similar to those on a mixing machine but placed one above the other. In operation the wormed up stock is fed into the nip between the top rolls forming a bank. The material which passes through this nip is then led through the nip between the third and second rolls. The nip openings are arranged so that a much smaller bank is formed here. By this decreasing size of bank air pockets in the stock are eliminated. The sheeted material is finally wound up on a metal drum some method such as interleaving with cloth being used to prevent the sticking together of the separate turns on this roll. Normally very fine sheetings are built up from a number of thin layers using special fittings on the calender for this. The calender is also used for impregnating fabric with R and for covering fabric with a layer of R. The calendered material may be used as 'blank' for moulding, or as part of a hand built article or be vulcanised as sheeting in steam heated autoclaves. Many types of gaskets, packings and so on are made by cutting or punching the desired shape from such vulcanised sheeting.

Spreading—Both raw and compounded (but unvulcanised) R disperses to form a colloidal solution (dispersion) in a number of organic solvents. Thick solutions or doughs can be made by soaking the stock in a solvent and then homogenising the mixture in a mixer which may resemble a baker's dough kneading machine, though other types are also used. Naphtha, a

solvent obtained from coal tar, is used almost exclusively for making doughs. These doughs are used for rubberising fabric by the use of a spreading machine. This consists of a rotatable roller with a fixed steel blade above the opening between the roller and the blade being adjustable. The cloth to be spread is drawn through this opening and the sufficiency of dough placed on the cloth in front of the blade so that by the wiping action of the blade a thin layer of R passes through the opening on the cloth. Very thin layers may be applied in this way. Usually six layers are applied so as to obtain a finished coating free from pin holes. For example a hunter-type raincoat usually consists of two layers of cloth each of which has been spread four times. The spread material is used for example for uncoated hospital sheetings, barrage balloons etc. It may also be used as part of such built-up articles as galoshes. The spread sheeting can be vulcanised directly by placing in steam autoclaves or by festooning in hot air chambers. Thin spread articles are sometimes cured by the cold cure method as this gives a pleasant velvety feel to the R. Vulcanisation using warm temp accelerators is now largely used for raincoat material.

Moulding—R cannot be cast like metals because it decomposes on melting. In the R industry moulding means placing a piece of compounded R of suitable size and shape in a metal mould. The mould is then closed in a steam heated hydraulic press. The pressure and heat cause the R to flow to the shape of the mould. The further action of heat vulcanises the R, so that on opening the mould the article is obtained in the desired shape and also vulcanised. Moulded goods include, for example, hot water bottles and also such things as tyres, in which case the blank is built up from extruded and calendered R and fabric.

Manufacture of Goods from Latex—The production of goods straight from latex is a much newer process than production from dry R. It is used to make many types of very thin articles such as surgeons' gloves and toy balloons. It is also used for adhesives in the footwear and flooring trades. The production of sponge for upholstery is also important.

In compounding the vulcanising and filling ingredients are made into water dispersions and then stirred into the latex. The chemicals used are the same as those for dry R. Seamless articles are made by dipping a former of the desired shape in compounded latex. On withdrawal a thin film of latex adheres to the former. After redipping if necessary, to build up a thickness, this film can be dried and cured in hot air. Latex sponge is produced by whipping the compounded latex into a foam. The whipped latex can then be poured into moulds and by the use of special chemicals gelled in the framed state when it is further dried and vulcanised.

SYNTHETIC RUBBERS—An enormous number of experimental polymers and copolymers have been produced in the last

sixty years and of these a few have been found, by a vast process of selection by trial to be suitable for use as synthetic R's and plastics. For synthetic R's polymers of butadiene (a chemical similar to isoprene) and copolymers of butadiene and other chemicals have been most widely used. Also important are polymers of chloroprene and to a lesser extent polymers of the poly-sulphides of such organic chemicals as ethylene. Some other polymers are also used to a small extent for special purposes.

General purpose Synthetics—These are synthetic R's intended to replace natural R for all purposes and have been produced by countries for national security reasons. Most important are copolymers of butadiene and styrene (Buna S in Germany, GR-S in U.S.A.). Both these countries have successfully produced this synthetic R on an enormous scale and it has been a reasonably successful substitute for natural R. It can be processed, compounded and vulcanised in the same way as can the latter.

Special purpose Synthetics—In certain applications natural R parts fail quickly. A most important case is where they come in contact with motor oils and fuels which cause them to swell and disintegrate. New materials have been developed to meet the need of an oil resistant elastomeric material for use in car and aeroplane parts. Butadiene acrylonitrile copolymers (HyCar OR, Perbunan in U.S.A., Bentan in Germany) and chloroprene polymers (Neoprene, N in U.S.A.) are the most widely used and most nearly resemble natural R in vulcanised properties including elasticity. They can be processed and compounded in the same way as natural R and the butadiene acrylonitrile copolymers can be vulcanised in the same way as natural R. The chloroprene polymers are however vulcanised by zinc oxide and magnesium oxide. The polysulphide polymers (Thiokol in U.S.A., Novolox in Great Britain) have excellent resistance to fuels but their general physical properties are poor compared with natural R, and their use is restricted to applications where their inability to recover from deformation quickly is not important.

RUBBER AND PLASTICS—There has been a great increase in the production of plastics (qv) of various kinds in recent years and they have been in competition with natural R in many fields. In the raincoat and vulcanite trades they have taken over a considerable amount of the demand formerly supplied by natural R. Their bright glossy finish is one great advantage but the generally higher cost per pound of plastics and their non-elasticity has so far limited their use.

See C. Goodyear, *Gum Plastics* 1855; H. Barron, *Modern Natural Rubber* 1937 and *Modern Synthetic Rubbers* 1942; A. I. Edgar, *Metals of Rubber Planting*, 1937; C. F. Flint, *Chemistry and Technology of Rubber Latex*, 1938; A. M. Laid, *History of Rubber Regulation* 1944, and *Fundamentals of Rubber Technology*, pub I.O.I. Ltd., 1947.

Rubble, form of stone used in masonry. In rubble-work the stones are of different sizes and are laid unevenly whereas in the other kinds of masonry such as coursed work and ashlar the stones are squared and dressed. See MASONRY.

Rubbra, Edmund (b 1901) Eng composer, b at Northampton and educated at Northampton Reading Univ, and the Royal College of Music where he was a pupil of Holst and of Vaughan Williams. His works include five symphonies, *I, A Belle Dame Sans Merci*, an opera *Beetle*, sev smaller orchestral works and a number of songs. His work is strongly individual and he makes skilful use of melodic invention and elaborate counterpoint.

Rubefacient, medicinal agent applied to the skin with the effect of reddening it by dilation of the superficial capillaries. The effect of such a remedy is to allay inflammation by counter irritation. The most commonly used are hot water mustard, pepper, turpentine and chloroform.

Rubella, see under MEASLES.

Rubens, Sir Peter Paul (1577-1640), Flem painter b at Siegen in Westphalia where his father Jan R. was in exile. At the age of sixteen he entered the household of the counts of Lalau as page, and later studied under Van Oort, Verhaeght and Otto Vennius. In 1600 he visited Italy where he finally took up his residence at the court of Mantua. His stay at Venice brought him under the influence of Titian and Paolo Veronese and affected his later development, probably teaching him much of the art of colour in which he excelled. In 1605 he visited the Spout, where he executed many portraits. Three years later he returned to Antwerp where he married Isabella Brant (1609). Here numbers of eager students flocked to his studio and of these he made use in the execution of the orders which flowed in without ceasing. Hence it is almost impossible to say how much of any of his work is his own. This may also account for the mediocrity of many of the paintings of his 'middle period'. In 1620 he received the commission for the series of paintings of the life of Marie de' Medici now in the Louvre and these were completed in five years. In 1629 he visited England where he was warmly received by Charles I. Having become a widower in 1626 he married Helena Fourment in 1630. She appears in many of his paintings. Charles I knighted him in 1632. P. is a master of those parts of his art which act immediately on the senses especially in the portrayal of the tumult and energy of human action in full power and emotion. He shows the early baroque period at its most human and at its richest. During the present century a growing number of critics have been questioning the aesthetic merit of Rubens's achievement as a whole. While his technical ability is fully appreciated by artists and critics he is now considered by many to be lacking in refinement and in much of his work in that spirituality of vision which has distinguished the greatest paintings of the past. His religious

paintings, of which 'The Descent from the Cross' is the most famous, are now generally thought to be his best work, showing not only great talent as a colourist but a deep understanding of the sacred and devotional. Other famous paintings of his are 'The Last Judgment' (1616 and 1618), 'The Battle of the Amazons' (1619), and 'The Garden of Love'. See lives by M. Rooses 1886 91, J. Burckhardt 1938 and I. Muls 1946, also K. Cammanns *Rubens Painter and Diplomat* 1932, K. R. Lehmann *Peter Paul Rubens Menschen und Mächte des Barock* 1936, C. Vaisnau *Rubens, das Spektrum flandrischen* 1938, I. van Puy *vide The Sketches of Rubens* 1945.

Rubiaceae (lat. *rubia* madder from *rubus* red) large family of plants indigenous to S.E. Asia the typical genus of which is the *Aniba* or madder. The plants are monopteleous with opposite leaves interpetiolate stipules, the stamens are inserted in the tube of the corolla alternating with its lobes. John Lindley (*q.v.*) divided the family into *Galacnaceae* and *Cinchonaceae* (see CINCHONA) but Joseph Hooker (*q.v.*) reverted to the old arrangement. Some of the chief species of *Rubia* are *R. peregina* a Brit plant with yellowish flowers, *R. tinctoria* or madder, *R. cordifolia* and *R. sikkimensis* which yields a dye. The family was classified by A. I. de Jussieu (*q.v.*) in 1789.

Rubicon, small stream of ancient Italy flowing into the Adriatic N. of Ariminum (Rimini) and forming the frontier between Italy and the provinces (Gallia Cisalpinus). It is the modern Fiumelione. It is noted for Caesar's passage across it at the head of his army (49 B.C.) this act amounting to a declaration of war against the Senate. Units of the famous British Eighth Army crossed the R. near San Angelo and Poggiorbino in Sept. 1943 forcing the crossings against Kesselring's Ger. troops. See *Suetonius Julius* xxxi.

Rubidium, symbol Rb atomic number 37 atomic weight 85.4 one of the alkali metals. It was discovered by Bunsen in 1840 by spectroscopic examination of the residue obtained by evaporating the mineral water of Durkheim. It also occurs in rare minerals as pollux and lepidolite and in tea coffee cocoa and tobacco. The metal is obtained by heating a mixture of the carbonate with carbon and calcium carbonate or alternatively by the electrolysis of fused R. hydroxide in a nickel crucible. It is a white chemically active metal melting at 39 and its properties are very similar to those of potassium.

Rubinstein, Anton Gregorovich (1830-1894) Russian pianist and composer b at Wschotyzmet Podolsk of Jewish descent. He studied in Moscow and Berlin. At the age of twelve he had already appeared as a pianist in various European cities. In 1858 he became court musician at St. Petersburg. In 1859 he became leader of the Musical Society in St. Petersburg and in 1867, with his brother Nicolai (1835-81), a pianist of great ability, founded the conservatory there. His chief tours took place between 1867 and

1873 in which period he earned a great reputation in Europe and America. The latter years of his life were devoted chiefly to recitals at Berlin and Dresden and to criticism. A composer of the Schubert Mendelssohn traditions R was autogenic to the Neo Russians and to the Wagner List cotene. He was a prolific writer of piano and vocal music and is remembered chiefly by his four piano concertos and the *Ocean Symphony*; he wrote also some operas and oratorios. He was a pianist of transcendent ability and the only serious rival to Liszt. See lives by J Rodenberg 1895 and N D Bornstein 1911.

Rubinstein, Artur (b 1890) Russian born Amer pianist b in Warsaw then in Russian Poland. He gave his first recital at the age of eleven and studied music in Berlin. He toured N America in 1906 and S America in 1918. He settled in Los Angeles in 1927. R has written some original compositions but is known primarily as a brilliant pianist.

Rublyov, Andrea (c 1370 c 1430) Russian artist, accounted the most famous of the Russian icon painters. His work was very similar to that of the Cretan school but the general tendency was for him and other Russian icon painters to paint pictures with a stronger emotional and religious appeal. What little of his work survives is to be seen in the Troitsa-Sergievskaya monastery now a museum near Moscow.

Rubrics (Lat *ruber* red) rules and directions for the conduct of the divine service laid down in the service books of the Church. They are so called because originally written or printed in red letters. The early service books contained very few directions for the guidance of the clergy but R were added at different times to assist them. In the Church of England there is greater flexibility allowed to the officiating priest than in the Rom Catholic Church and this applies more especially in the mass. Here nothing is left to the impulse or discretion of the officiating priest everything that he has to say and even the tone and gestures are carefully prescribed in the general R or in the running R which accompany the text. Anglo-Catholic clergy however are usually punctilious when officiating at the services. In the Church of England some of the R are tacitly ignored for instance the rubric that specifies the time of baptism of infants and the other rubric that lays down the rule for the number of godparents. It is seldom that these and some others are strictly observed.

Rubruquis, Guillaume, see RUYSBROECK WILHELM.

Rubus, genus of shrubs or herbs with white or pink flowers in terminal or axillary clusters followed by edible fruits. *R. idaeus* is the raspberry, *R. fruticosus* is the bramble or blackberry a collective name for a great number of distinctive forms. *R. chamaemorus* is the cloud berry, which occurs in peat bogs in the N, and bears fragrant fruit which is first red and then orange.

Ruby, precious stone of corundum and

thus of the same composition as sapphire, except for the substance probably chromium causing the red coloration. It crystallizes in the hexagonal system has a range of colour from pink to deep red or violet has a sp gr of 4 and a hardness of 9. The R is dichroic that is it exhibits two different shades when examined with a dichroscope and this property serves to distinguish it from garnet and spinel which are not doubly refracting. True or oriental Rs are found in greatest quantity in Burma and Siam the prin list being Mogok N of Mandalay they are found in smaller quantity and of poorer quality in Ceylon and Afghanistan. Many stones known as Rs are garnets or spinels. Small Rs used to be fused together to form a large or reconstructed R. Verneuil has succeeded in producing artificial Rs from ammonium and chromic oxide closely resembles the natural stone but its glass-like perfection lacks the colour nuances of the gem.

Ruby-Flies, or **Ruby-Tails**, parasitic family of hymenopterous insects named from the brilliancy of their colouring which shines with a metallic glow.

Ruby Spaniel, see under SPANIEL.

Ruby Sulphur, see RULGAR.

Ruceccellari, Giovanni (147-152) It poet b at Florence and sent as ambassador to Venice in 1500. Later taking an active part in the measures which led to the restoration of the Medici family. In 1522 he was sent as ambassador to France and subsequently Pope Clement VII appointed him governor of the castle of St Angelo. He endeavoured to make It poetry classical in form and was the author of two tragedies in the style of Euripides *Rosamunda* and *Oreste* but as in the plays of Trissino, Speroni and other lesser It tragic poets of the Renaissance the finer humanistic elements considered as a revelation of the world and mankind had no place. He also wrote a didactic poem on bees entitled *Le api* (1539) based on Virgil's *Georgics* book iv.

Ruckert, Friedrich (1788-1866) German poet and orientalist, b at Schweinfurt. He was prof of Arabic Persian and Sanskrit at Erlangen and then at Berlin. R who was a master of over twenty languages was chiefly known as a translator of oriental poetry and as a writer of poems inspired by the spirit of oriental mysticism. His best known works are his lyrical poems *Liebesfrühling* and his patriotic songs, *Gedemische Sonette* and *Spott und Ehrenlieder*. In 1834 appeared his beautiful *Kinderrolen* der inspired by the loss of his young son and daughter. Among his original poems on oriental themes are *Morgenland die Sagen und Geschichten* (1837), *Rost m und Suhrub eine Heldengeschichte* (1839) and *Brahmansche Erzählungen* (1839). His most elaborate work is *Die Wdhert des Brahmanen* pub in 6 vols in 1836-39. Among his translations of oriental classics is *Die Verwandlungen des Ats* and a rendering of Hagiri's *Makamun* (1826). See lives by C Beyer 1868 and F Golling 1915.

Rudbeck, Olaf (1630-1702), Swedish author and scientist b at Westeras. He studied medicine at Upsala where he later became prof of practical medicine and botany. R was the discoverer of the lymphatic glands. He founded a type of polytechnic school at Upsala, and pub poems music etc.

Rudbeckia, genus of composite plants. It received its name from Linnæus in honour of the Rudbecks who preceded him in the botanical chair at Upsala. The thirty species grow in N America.

Rudd, or Red Eye, fresh water fish, *Scardinius erythrophthalmus* allied to the roach. It is tinged with bronze and has reddish fins, the dorsal being further back than that of the roach. It is found in Brit and European lakes and sluggish streams. The largest run to 3½ lb and may be as much as 14 in long.

Rudder Fish, see *Pilot Fish*.

Ruddesheim, tn in the Rhineland, opposite Bingen on the Rhine. It is a noted place for wine. Pop 4700.

Rudock, tn of Tibet on the Kashmir frontier. It is situated 15,000 ft above sea level.

Rudolf I (1218-91) Ger king and Holy Rom emperor son of Albert IV count of Hapsburg and landgrave of Alsace. He succeeded his father as head of the family in 1239 and having become the most powerful prince in the country was elected king of the Germans in 1273. In 1278 he fought a successful war with Ottokar II of Bohemia who was killed in the battle of Marchfeld. In 1282 he invested his sons Albert and R with the duchies of Austria and Styria respectively. He had won these from Ottokar. He is chiefly memorable as the founder of the greatness of the house of Hapsburg. See life by O. Hedrich 1903.

Rudolf, or Rodolph, II (1552-1612) emperor of Germany, king of Bohemia and of Hungary, b in Vienna and educated at the Spicuit. R was the son of the Emperor Maximilian II and Mary of Austria. Throughout his life he showed a lack of will and a morbid timidity. R, however was a man of fine culture, devoted to the arts and sciences. He much improved the city of Prague during his residence there and patronised Brahe (q.v.) and Kepler (q.v.). He was much influenced by his favourites and appears to have been, in his latter years, mentally unbalanced. R was in part responsible for the violent persecutions in Bohemia and Moravia which characterised the Catholic reaction of the first years of the seventeenth century. He was compelled to abdicate the throne of Bohemia in favour of his brother Matthias May 23 1611. See life by A. Lindley 1863-6.

Rudolf, Franz Karl Joseph (1858-99) archduke and crown prince of Austria. Hungary only son of the Emperor Francis Joseph. He was a good linguist, and besides assisting in the pub of *Die Österreichische Ungarische Monarchie in Wort und Bild* (1886), he wrote *A Journey in the East* (1884) and *Fifteen Days on the Danube* (1885). He married Stephanie, the daughter of the king of the

Belgians in 1881, he committed suicide with the Baronsess Vrbas, in circumstances which have never been fully clarified, at Mayerling, near Vienna.

Rudolf of Ems (fl 1220-54) Austrian minnesinger. He wrote *Barlaam* and *Josephus Alexander*, and other epic poems, and a *Heilchronik* dedicated to Conrad IV.

Rudolph (Rudolf) Lake, African lake partly in Abyssinia but for most of its length in N W Kenya. It is 190 in long and 37 m wide at its widest point. It was discovered in 1881 by Teleki and von Höhnel who named it after Crown Prince Rudolf of Austria Hungary. It is the centre of an inland drainage system. The recession of the waters of the lake has left stretches of fine sand which are being deposited over the land by the strong S easterly wind with resulting erosion of topsoil. The area lying roughly between the lake and the Lukana Lake upland, known as Rudolf Froy was transferred from Uganda in 1926 to Kenya Colony.

Rudolstadt, tn and dist of Thuringia Germany. The tn is on the S side 18 m S of Weimar. Its prin buildings are the fifteenth century church, the castle, and the famous palace containing a natural hist museum gymnasium and an extensive library. The chief industries are the manuf of chocolate porcelain pianos artistic cabinet work chemicals etc. R was founded in the seventh century. Pop 18,000. The dist has an area of 229 sq m and a pop of 60,000.

Rudra, Hindu god in the Rigveda or Vedic mythology. It is the storm god or lord of the Maruts later identified with Siva. R is sometimes a collective name of the Maruts (gods of the tempests).

Rue, Warren de la, see *Dr T. RUE*.

MEADOW RUE

Rue, term applied in botany to species of the genus *Ruta* in the family Rutaceae, and also in compound words to the leguminous fodder plant *Galga officinalis*, the goat's R, and the ranunculaceous plant *Thalictrum flavum* the meadow R. R

graveolens, the common R., or herb of grace, is a shrub containing a volatile oil used in medicine as a narcotic and stimulant.

Rueda, Lope de (1510-65), Sp dramatist, b. at Seville. He was originally a gold-beater, but later organised a strolling company of players. He took a part in the secularisation of the drama, which was developing all over Europe in his time. His plays were acted at Seville, Cordova, and Segovia. His regular comedies are modelled largely on those of It. authors of the early sixteenth century. His pieces, which have the character of the coming comedy of intrigue, include such witty interludes as *El Convidado*, *El Rufian Coharde*, and *Los Aceitunas*. See study by G. Salazar, 1911.

Rueil, tn. of Seine-et-Oise dept., France, 5 m. N.W. of Paris, at the foot of Mont-Valérien. Its church contains the tomb of the Empress Josephine and her daughter Hortense, and the former's residence, Malmaison is near by. Buzynal, scene of the battle (1911), is 2 m. S. There are chemical and metal industries. Pop. 18,000.

Ruff, frill made from linen or lawn and worn on top of the neckband. It was popular with both sexes in the sixteenth and seventeenth centuries, and with the introduction of starch it greatly increased in width. It varied in length from one and a half to six yards and was drawn up by a string. The earlier form relied more on elaborate folds for its effect, but lace, gold and silver, and jewellery decorated the later type, or *whisk*. A suit of R.s. consisted of a R. with a pair of matching cuffs.

Ruff and Reeve (*Maculipes pugnat*), summer migrant to low lying, marshy districts of Britain. The polygamous males (Its) vary considerably in plumage, but during the breeding season the neck is surrounded by a ruff or frill of purple-black feathers barred with chestnut. These fall at the end of June, they are believed to act as a shield for the bird in their numerous fights with one another. The females (reeves) have no R.; they lay four spotted green eggs in a nest of coarse grass made amongst reeds or rushes.

Ruffe, or **Pope**, perch like fish known as *Acerina cernua*. It is a species of Percidae, is edible, and inhabits the fresh water of Europe. The dorsal fin is continuous in the R., whereas in the perch there are two separate fins.

Rufiji, or **Rufiji**, riv. of E. Africa, rising in the Livingstonia Mts. It joins the Suguli falls and the Pangani rapids, and flows E. to the Indian Ocean, discharging by a delta opposite Mafia Is. It is navigable in part. In July 1915 the German cruiser *Königsberg* was destroyed in the riv.

Rufisque, see under DAKAR.

Rufus, emperor of Germany, see OTHO II.

Rufus, William, see WILLIAM II.

Rug, see CARPET.

Rugby, tn. of Warwickshire, England, situated on the Avon, 13 m. S.E. of Coventry and 82 m. N.N.W. of London. In the early nineteenth century R. was little more than a vil. The tn. expanded

with the advent of the London and Birmingham Railway in 1838. It returns one member to Parliament, and is an important railway centre and mkt. tn., with textile, electrical, and engineering industries, but is best known for its famous public school (*q.v.*) Pop. 45,500.

Rugby League, see under FOOTBALL.

Rugby School, public school situated at Rugby, Warwick, founded by Lawrence Sherri, a native of Rugby, gentleman of the Princess Elizabeth, and member of the Grocers' Company, in 1567. The school is endowed with property in Rugby and London. The first buildings were near the par. church, but the school removed to the present site about 1750, and the existing buildings were begun in 1809. There have since been many modern additions. There is accommodation for 670 pupils, who are divided among eleven houses (sixty day boys, the rest boarders), and there are numerous entrance and leaving scholarships. R. S. is governed by a body of fourteen. Thomas Arnold (*q.v.*) was headmaster from 1823 to 1842, and it was under his guidance that the school became famous, and a pattern, both educationally and spiritually, for many Eng. public school foundations of the nineteenth century. Taft, Frederick Temple, and Percival were later headmasters. R. S. is the scene of *Tom Brown's Schooldays*. Rugby football was originated here in 1823.

Rugby Union Football, see under FOOTBALL.

Ruge, Arnold (1802-50), Ger. reformer, b. on Rugen Is. He studied philosophy at Halle, Jena, and Heidelberg. For his part in the Burschenschaft agitations (1821-24) he was imprisoned for five years at Kolberg. With Eckstein, he founded the *Halleische* (later *Deutsche*) *Jahrbücher* (1837), the organ of the young Hegelian school. This periodical was suppressed in 1843. R. shared in the revolutionary movement of 1848 but in 1849 with Giuseppe Mazzini and Ledru-Rollin fled to seek refuge in London, forming a European Democratic Committee. From this R. soon withdrew and went to Brighton in 1850. His *Gesammelte Schriften* were pub. in 1846-48. See his memoirs, *Aus früherer Zeit* (1864-67).

Rugeley, urb. dist. and mkt. tn. in Staffordshire, England, 9 m. S.E. of Stafford, on the R. Trent. It is engaged in coal mining and has iron foundries, tanneries, and mills. The grammar school was founded in the seventeenth century. Pop. 4,500.

Rügen, Ger. is. in the Baltic Sea, separated from the mainland by the Strela Sound. It is divided into the peninsulas of Wittow, Jasmund, and another in the S.E. The soil is fertile and produces good crops and fruit trees. Cattle are reared, and the fisheries are well worked. There are some ancient remains on the is. It has belonged variously to Denmark, Sweden, Pomerania, and Prussia. Cap. Bergen. Area 373 sq. m. Pop. 54,000.

Rühmkorff, Heinrich Daniel (1803-77), Ger. electrician, b. in Hanover. He went to Paris in 1819, and there set up a busi-

ness for the manufacturing of electrical apparatus. He was the inventor of the R induction coil (1851).

Ruhr, Ger riv which rises in the Winterberg and flows in a N and then a NW direction to enter the Rhine at Duisburg. The riv flows through an extremely rich coal field, and gives its name to the R basin (Ger Ruhrgebiet), one of the most important areas of heavy industry in Europe. Before the Second World War this area produced 75 per cent of Ger coal, 85 per cent of Ger iron, and 80 per cent of Ger steel. Length of riv 145 m. Area of basin about 1800 sq m.

Position of the Ruhr Basin in Modern Europe—By 1914 Bochum (q.v.) Dortmund (q.v.) and Essen (q.v.) had become the prin industrial centres in the R basin. Essen was the home of Ger armaments owing its industrial growth largely to Alfred Krupp (q.v.) and his son. After the First World War France (especially) feared the possibility of the R basin becoming an armaments centre once again. By the treaty of Versailles (1919) Germany undertook to disarm which meant the conversion of the R factories to civilian production and agreed to make reparations in money and kind to the Allies. In July 1922 Germany gave notice that she could no longer make the payments agreed upon. Under the treaty of Versailles such a situation was provided for, and the govs concerned had the power to take any action deemed necessary against Germany without Germany being entitled to regard such actions as acts of war. Belgian and Fr troops accordingly marched into the R and occupied certain areas in Jan 1923. The troops were preceded by engineers, custom house officials, and foresters necessary to work the area. The Gers however adopted passive resistance methods and obstructed the work as much as possible. This resistance was maintained until Nov 1923 when Germany began to co operate with the Allies in working the area. The R was evacuated during 1925. After 1933 the war industries of the R basin were re estab at first secretly Ger industrialists co operating with the National Socialist regime. During the Second World War the area was therefore an important target for allied bombers. The first R A F attack on Essen was made in 1940. From 1941 until the end of the war the R was constantly attacked the offensive reaching its height in 1944-45. On March 24 1945 the Allies made a crossing of the Rhine and the R basin was encircled by the Amers capitulating by mid April (see further under AIRIAL WARFARE EUROPE). **History** GERMANY, *History*, FRIEDR. MOHRER, etc. After the Second World War the R basin lay within the Brit zone of occupation. More drastic dismantling of its industries was determined upon than had been the case in 1919, but the unstable state of Ger economy and allied differences made a complex situation even more difficult, and dismantling was still taking place in 1950. Coal production was encouraged, and by the end of 1947 the R was pro-

ducing per month rather over half of the average monthly total for 1939. Its ultimate future remained undecided. Fr opinion favoured a separation of the area from the rest of Germany, under international control, but Britain and America wished it to remain a part of Germany, under allied supervision. In May 1946 the Fr foreign minister Robert Schuman suggested that France and W Germany should have a common coal and steel pool. The Ger chancellor welcomed this statement which seemed to mark a change in France's traditional attitude. It implied Fr acceptance that the R was Ger and a realisation that both countries were economically interdependent.

Ruhrort, formerly a separate tn in the Rhine at the junction of the Ruhr with the Rhine 24 m N of Düsseldorf. One of the chief riv ports of lower Germany, it exported coal and manufactured iron goods and machinery. In 1905 it was incorporated in Duisburg.

Ruislip-Northwood, urb dist of Middlesex, England comprising Eastcote, Northwood, Ruislip and S Ruislip. One fifth of its area is open space including three golf courses and extensive woodlands. It returns one member to Parliament. Pop. 66,000.

Ruiz, José Martínez, see MARTINEZ.
Ruiz, Juan (1283-1350) Sp poet and archbishop of Hita. He was imprisoned between 1333 and 1347 by order of the archbishop of Toledo for violation of eccles regulations. The poem *Libro de buen amor* by which he is remembered appears to have been founded upon episodes in his own life. His poetry is contemporaneous with and similar in character to the poetry of the troubadours. See also J. Puyol 1906 and O. Lake 1913.

Rule, or **Regulus**, 3c, Gk legendary monk in the fourth century who was said to have brought some of the bones of St Andrew to Muckross (now St Andrews) from Iatras, Greece. He may have been confused with St Rical, traditionally the Gk first bishop of Senlis.

Rule of Faith (*Regula Fidei*) short statements of belief which the early Church put into the mouth of those about to be baptised and which formed the safeguard and expression of the orthodox faith. A rudimentary specimen may be seen in 1 Cor. x. 3-4 and there is a reference to such a formula in 2 Tim. i. 13. They are the basis of the Catholic creeds. See A. Ruhn *Bibliothek der Symbole* 1842 3rd ed 1897.

Rule of the Road *On Land*—In England a vehicle or horse when meeting another vehicle or horse should keep to the left hand side of the road except when it is dangerous to adhere to the rule. When a vehicle or cyclist (a pedestrian where there is no side walk) meets a ridden horse the rider of which is also leading another horse the vehicle etc., should pass on the side of the ridden horse. The Rs of the R in Great Britain for motor drivers are (1) to drive on the left of the road and (2) to overtake vehicles on the right. Trams may be passed or overtaken on either side, which-

ever be safer (are) is to be taken in passing stationary trams and in some cases it is forbidden to pass them on the near side. Street refugees must be passed on the left, even if it involves taking a wide detour to go round a corner. As regards one way traffic and circulatory systems the rule of keeping to the left and over taking on the right is varied by the direction in which traffic is diverted at the outlets. As to crossing, the rule is to give way to main road traffic whether entering or crossing the road but this is not a law though it is customary for the main road traffic has no legal right to assume the precedence over cross road traffic. In crossing roads the 'off side rule' is that a driver need give way only to traffic on his right with no distinction as to main or side roads a dangerous option to exercise because the rule is by no means universally applied. Owing to the great increase in motor traffic and the rising mortality and accident rate special crossings for pedestrians were introduced in 1935 (see further under ROAD SAFETY, TRAFFIC REGULATIONS). In most countries of the Continent and in America the R of the R is exactly the opposite of that of England.

At Sea. When sailing vessels are approaching one another (1) the vessel which is running free must keep out of the way of a vessel which is close hauled, (2) a vessel which is close hauled on the port tack must give way to a vessel close hauled on the starboard tack (starboard denotes the right hand side looking from aft forward and port the left) (3) when both are running free with the wind on different sides the vessel which has the wind on the port side must give way to the other (4) when both are running free with the wind on the same side the vessel which is to windward must give way to the vessel to leeward and (5) a vessel which has the wind aft is running before the wind must give way to the other. When two steam vessels are meeting end on or nearly end on each must alter her course to starboard so that each may pass on the port side of the other. This rule applies only to cases in which in daylight each vessel sees the masts of the other in a line or nearly in a line with her own or, at night time, sees both the sidelights of the other. When two vessels are crossing the one which has the other on her own starboard side must keep out of the way of the other. A steam vessel must give way to a sailing vessel. Steam vessels, which are directed by the rules to keep out of the way of other vessels, must, on approaching if necessary slacken speed or stop or reverse their engines. A vessel overtaking any other vessel must keep out of the way of the overtaken vessel. In narrow channels a steam vessel should, when it is practicable keep to its starboard side of the mid channel. Sailing vessels under way must avoid sailing vessels or boats fishing with nets, lines, or trawls, but this rule does not permit vessels engaged in fishing to obstruct a fairway. In taking a course

under way must indicate her course by sound signals on her whistle or siren. One short blast means I am directing my course to starboard. Two short blasts mean I am directing my course to port and three blasts. My engines are going full speed astern. The above rules are subject to any special rules of local authorities relative to the navigation of harbours or rivers. The rules are contained in the general regulations for preventing collisions at sea and prescribing certain signals of distress (Order in Council dated Oct. 13 1910 S. R. & O. 1910 No. 1113 amended by Merchant Shipping (Distress Signals) Order 1932 S. R. & O. 1932 No. 915).

Rules of Court. The expression R of C denotes the body of rules or orders regulating the practice or procedure of the courts superior and inferior. The 'Rules of the Supreme Court' (to be found in the Ann. Practice and the Yearly Practice coll. qually known as the 'White Book' and the 'Red Book' respectively) which by the Judicial Act 1875 were substituted for the Chancery Consolidated General Orders 1860 and the common law *Regulae Generales* were framed by the Judges. The power to alter these rules from time to time in accordance with the wishes of the Lord Chancellor and a majority of judges of the High Court. The rules of court practice are made and revised by five of the court judges appointed for that purpose under the County Courts Act 1858 by the Lord Chancellor. Rules of other inferior courts are made subject to the concurrence of the R. Committee. All R. C. have the force of statute but most judges seem fully aware that many of the rules require correction and revision and hence interpret them as far as possible in accordance with the dictates of common sense rather than with the demands of forensic technicality.

Rum, is of the Inner Hebrides Invernesshire Scotland 16 m N. N. W. of Ardnamurchan Point. Its surface is mountainous the highest point being Huiskaval 2667 ft. It is 8 m long, and 7½ m wide, and covers an area of 42 sq m. Pop. 250.

Rum, spirituous beverage distilled from cane sugar or its products. The best known varieties of R are those of Jamaica and Demerara. The common clear R of Jamaica is distilled from a wash consisting of skimmings from the cane sugar juice and of molasses. The distillation is carried out in pot stills and unless rectifiers are connected with the still two distillations are necessary to produce the best spirit which is from 30 to 40 over proof. The dark colour of good R is due to its being stored in sherry casks but the colour may be acquired by the addition of animal (burnt sugar), flavoured or 'G.R.' R also made in Jamaica has an added flavour dependant upon the addition of materials obtained by the fermentation of cane trash. Demerara R is often the product of a patent stills and does not possess so strong a flavour as Jamaica R. Large quantities of spirit called R are

manufactured in Europe from beet sugar spirit, with the addition of artificial esters to imitate the flavour of the genuine article

Ruma Island, see under 109 ISLANDS

Rumania (Romania), republic of S E Europe situated on the Black Sea and bounded N by the Ukraine, W by Hungary and Yugoslavia, S by Bulgaria and the Black Sea and E by the Black Sea. The greater part of the S boundary is marked by the Danube. The boundaries of R have undergone many changes since the first decade of the twentieth century. By the treaty of Bucharest (1913) R gained a strip of ter. extending from Mangalia to Ikenne on the Black Sea by a line direct from above Iukhtikar on the Danube. By the peace treaties of 1919 R's right to Bessarabia, Bukovina and the Banat (the whole of Dobrudja and Transylvania) was recognised. In 1914 the area of R was 5710 sq m. In 1939 as a result of these additions the total area was 113,584 sq m and the pop. had more than doubled being 19,935,000. In 1940 R was forced to cede Bessarabia and the N Bukovina to Russia, S Dobrudja to Bulgaria and N Transylvania to Hungary. R was in fact ruled by Germany to enter the war against Russia in 1941 by the promise of Bessarabia, N Bukovina and in addition ter. between the Dniester and Dniipr called Transnistria. In 1941 the reduced R had an area of 102,547.77 sq m and a pop. of 13,551,800. In Feb. 1947 under a peace treaty between R and the Allies ratified the following: Aust. Transylvania was restored to R, Russia returned Bessarabia and N Bukovina and Bulgaria, S Dobrudja. The area of R was estimated in 1947 at 88,715 sq m and the total pop. at 16,400,000.

R is divided into six provs. These are based not on administrative divs. but correspond to historical tradition. The provs. are Muntania (Wallachia), Transylvania, Moldavia, Oltenia, Banat, Binat, Mar-marure, Bukovina and Dobrudja. There are fifty nine administrative cos. The chief tns. are Bucharest, the cap. pop. 984,600 (1949), Jassy, 109,000, Timisoara, 108,300, Iasi, 105,100, Galatz (Galati), 101,000, Cluj, 98,000, Braila, 97,200, Oradea, 92,900. Tns. of importance having a pop. of less than 90,000 are Brasov (Brasov), Arad (Orastia), Craiova, Sibiu, Satu Mare and Targu Mures. About a fifth of the pop. live in the tns. All the prin. rvs. flow into the Danube, one, the Pruth, being the boundary with the USSR. The Danube enters R through the Kazan Pass with the famous 'Iron Gates' at the E. end so named by the Turks because of the submerged rocks in the waterway. High rocky mts. overshadow the riv. on both sides, clad with pine and birch as it flows to the sea. It widens and gains in depth and the banks gradually level so that for 290 m the shore is flat, desolate, and marshy, varied by cities and chains of lagoons. The chief rvs. which join the Danube in Wallachia are the Jiu, the Olt, the Argesul, and the Jalomitza. The

Sereth rising in the Transylvanian Mts., flows 340 m through Moldavia and joins the Danube near Galatz. The Pruth rises in the extreme N of Moldavia, flows for 350 m and joins the Danube 10 m E of Galatz. The whole of the country lies in the basin of the lower Danube, and consists of a great plain stretching up from the E. of the riv. to the Carpathian Mts., beginning with mild flats and a level lowland which joins the lower ridges of the Carpathians and forms the most fertile part of the country. The remainder of the land is rocky with traversed valleys where alpine plants flourish. The climate is inclined to extreme cold in winter and great heat in summer; the spring is very short, the autumn forming the mildest season of the year.

Produce.—The country is naturally agricultural and about 45 per cent of the land is under plough; the fertile soil produces good crops of maize, wheat, barley, oats, millet and corn. Vine are grown extensively, the vit. acreage being 420,000 and a large quantity of red and white wine is made. Cattle breeding is on a large scale with the rearing of sheep and swine, tobacco, flax and hemp are also cultivated. 21 per cent of R is forest land and timber is an important product. In 1921 agrarian reforms transferred 85 per cent of the land in fully small lots to the peasants. Any remnants of feudalism were speedily eliminated after 1911. After the establishment of the People's Republic steps were taken to develop collective farming. The remaining landowners were dispossessed and disinherited. The most important mineral product is petroleum obtained chiefly in the dists. of Bacau, Buzau, Dimbovitza and Prahova. In 1947 3,810,000 metric tons of crude oil were produced, but before the Second World War ann. production had reached (1938) 6,864,000 metric tons, although the labour used was less (23,000 in 1938 and 50,200 in 1947). There is over 2000 m of oil pipeline in R. Before the Second World War foreign capital was largely responsible for the exploitation of R's oil resources, but the post-war Communist Gov. systematically took over the ownership of foreign companies. Other minerals include coal, salt, iron ore, gold and silver ore and mica. Industries of importance are flour-milling, brewing, distilling, furniture-making and the production of chemicals based on petroleum and lignite or coal. Before the Second World War Great Britain was R's biggest customer. In 1948 trade between R and Britain revived to some extent. R exported some 43,000,000 worth of goods to Great Britain and imported £1,000,000, but the bulk of her trade was done with the USSR and Bulgaria, Hungary, and Czechoslovakia. In June 1948 a law, effective upon pub., nationalised insurance, banking, mining, transportation, and telecommunication enterprises, as well as practically all manufacturing concerns of any importance. A state economic plan for 1949 envisaged an increase of 40 per cent in the total production of the country as compared with 1948, the development

of heavy industry being of prime importance. In 1941 an agreement between R and the U.S.S.R. provided for closer economic collaboration between the two countries. Rumanian Soviet companies called *Sovroms* were established. These gave the U.S.S.R. virtual control over all important Rumanian enterprises. In 1947 *Sovrompetrol* produced nearly 30 per cent of all Rumanian petroleum.

Race, Religion and Education.—Before the Second World War the racial divisions of the country were Rumanians (Vlachs) 72 per cent, Magyars 8 per cent, Germans 4 per cent, Jews 4 per cent, gypsies 12 per

cent. *Cernavita* (Cernowitz, Chernovits) had become part of the U.S.S.R. Church schools were put under state control in 1948. There were over 1800 primary and nearly 1000 secondary schools in R in 1945.

Constitution and Justice. The Rumanian People's Republic was proclaimed on Dec. 30, 1947. Elections for the Grand National Assembly in March 1948 gave 40 per cent of 415 seats to the Communist-controlled bloc. A new constitution was passed instituting gov. by a single chamber council of ministers and a

MUNTANIA. TIMBERYIELDS NEAR CURTADE ARCEPS

Rumanian Lignite

cent Rutenians, Russians, Bulgarians and Turks. During and after the war the number of Magyars, Jews and gypsies was considerably reduced in the case of the last two groups by persecution, and figures available in 1950 suggest that over 8 per cent of the pop. were Rumanians. About 70 per cent of the pop. belong to the National Orthodox Church. Of the rest the largest minorities are Greek Catholic 10 per cent, Roman Catholic 8 per cent, Reformists and Lutherans 3.3 per cent. In Aug. 1948 a law "concerning the freedom of all religions" put all religious and religious teachings under state control. The state pays the clergy of the leading Christian denominations and Moslems, and Jewish communities receive a state subsidy. Education is nominally compulsory and free, but the percentage of illiterates is still high in the remote parts of Wallachia and Moldavia. There are universities at Bucharest (founded 1864), Jassy, Cluj, and Targul-Mures. The last-named

presidium. Women voted for the first time in the elections of Nov. 1946. Justice is administered through three appellate courts, thirteen criminal courts, sixty-three tribunals, and some 100 justices of the peace.

Communications. The state owns and operates all the main railways, owning 9622 m. in 1945. Total rail mileage in 1945 was 13,163. In 1944 the Rumanian Airways Company was incorporated in a Russian-Rumanian joint company. It had transported more than 12,000 passengers in 1944. There are services linking Bucharest with Warsaw, Istanbul and Belgrade. In 1945 Rumanian mercantile tonnage amounted to 962 tons, being still reduced to below its pre-war strength by war losses and reparations. The State Navigation Society covering sea and Danube navigation was incorporated in a Rumanian-Russian joint company in 1945, called *Sovromtransport*. The peace treaty (1947) laid down that Danube

navigation should be free, equal, and open to all national mercantile vessels and trade of all states. Galati is the timber port. Braila deals primarily with grain and Constanta with petroleum.

Defence — Under the peace treaty of 1947 R. was allowed a land army not exceeding 120,000 men, anti-aircraft artillery up to 2000 men, an air force not exceeding 150 aircraft and a personnel of 8000 and a navy of up to 1,000 tons with a personnel of 500. In 1948 it was believed that the Rumanian army alone had a strength of 150,000. There is a naval school at Constanta.

History — The primitive civilisation of R. can be traced back to the Neolithic age. Remains have been found in great number at Vodastra. The Roman period left its mark deep on the country and many ruins have been identified. The period immediately preceding the conquest by the Romans belongs to those people known as the Daci or Getae (G.) who occupied the country until the Emperor Trajan defeated their king Decebalus in A.D. 106 and their country became a Roman province known as Dacia. Roman colonists settled in the country and it became an exceedingly flourishing part of the Roman Empire. About A.D. 270 the Emperor Aurelian withdrew his garrisons but the Roman civilians remained. From the sixth to the twelfth centuries the country was invaded by various barbarians: Goths, Latars, Huns, Bulgarians and Magyars almost obliterating the Daco-Roman inhabitants though remnants of Roman civilisation and the Roman language survived. The modern Vlachs are possibly a remnant of the original Daco-Romans mingled with the Latin body of immigrants from Trans-Danubia. At the end of the thirteenth century Wallachia and Moldavia were occupied by a mixed race of Latars, Vlachs and Slavs. These two principalities developed separately. The Wallachian state was, according to tradition, founded by Rudolf the Black known as the Black Prince in 1290 who finally established his cap at Curtea de Arges. Wallachia under Piodolph was still a vassal of the Hungarian crown but in 1330 the voivode or prince John Basserab the Great inflicted a crushing defeat on King Charles I of Hungary and enjoyed independence for just fourteen years, then Louis the Great asserted his supremacy. Of the more famous voivodes of Wallachia Mircea the Great (1366-1418) who fought so bravely against the Turks ended by being obliged to recognise their suzerainty. During the succeeding period the Wallachian princes became either allies of Hungary or under the rule of Turkey. For a short time the country became independent under Michael the Brave (1593-1601). Michael secured his own nomination as voivode and by his courage and genius united under his rule the three principalities of Wallachia, Moldavia, and Transylvania. For the first time since Trajan's conquest the whole of the original Dacia was complete as one kingdom. Subsequently, however, there was opposition to Michael's rule in Transylvania, and

the malcontents with the co-operation of the Imperial general Basta drove him out of the country. Michael appealed to the emperor who gave him funds and appointed him governor. In these circumstances Basta now helped him to expel Andrew Bathory who had secured control but later Basta treacherously murdered him. Matthias Basserab (1633-1644) established a certain amount of peace and prosperity and repulsed his rival Basil the Wolf of Moldavia. Basserab's illegitimate son Constantine Sciban (1648-81) was the last of the Basserab dynasty to rule Wallachia. At his death Turkish

Moldaviu Kuman in costume
at a festival in Maramures

rule again governed the country. His cap was moved from the old city of Fier to Bucharest which became the seat of government in 1698. The hist. of Moldavia had developed on much the same lines as Wallachia. The country recognised the suzerainty of Poland under the voivode Alexander the Wise (1401-11). His grandson Stephen the Great (1458-1504) defeated the Tatars (1461) the Hungarians (1467) and invaded Wallachia (1475) but his successor Bogdan acknowledged Turkish suzerainty. Dacianism (antiquism) was the hist. of the national princes (1709-11) then followed the Encastron period which lasted in both principalities till 1821. The voivodeship was sold to the highest bidder by the Turks and the holders were generally Fanariots (G.) often men of culture and intelligence, having most enlightened ideas. Nevertheless during this time the country suffered much misery and misrule both from its own princes and the greed of

Russia and Austria. In 1821 the Porte once more allowed them to elect their own rulers but Russia for a time prevented any serious reforms. The treaty of Paris (1856) gave the principalities the guarantee of the powers to preserve their existing privileges while still remaining under the suzerainty of the Porte. In 1858 it was decided that both Moldavia and Wallachia should have separate assemblies but that a central commission be established at Iocshani (Iokshany) for common justice and interest. Both assemblies were to elect their own prince—they chose unanimously Prince Alexander John Cuza (Jan 1859) and thus the union was satisfactorily accomplished. In 1866 Prince Alexander was compelled to abdicate his reforming policy being unpopular with the landowners. Prince Charles of Hohenzollern-Sigmaringen (b 1839) was elected in his place. Prince Charles (Carol) married (1866) Princess Elizabeth of Saxe-Coburg and Gotha. A new and more liberal constitution was adopted reforms were made in the army and railway construction was begun. An abortive rebellion broke out in 1870 due to R's sympathies with France and in opposition to a Ger prince further a financial crisis developed in connection with the railways and a failure to pay interest on the loan which was mainly held by Ger investors. Prince Charles threatened to abdicate but the elections of 1871 restored his gov to power and the crisis passed. R played an important part in the negotiations between Russia and Turkey which ended in the Russo-Turkish war of 1878 and finally threw in her lot with Russia. The treaty of Berlin (1878) gave R her independence (ceding Bessarabia to Russia) and gaining the delta of the Danube and the Dobruddja. It was formally recognised as independent in 1880 and in 1881 elevated to the position of a kingdom. In 1881 the church of R was declared a separate national church. Domestic politics continued to be disturbed by religious disputes and peasant grievances. During the Balkan war (1912-13) R played a strong waiting game and on the outbreak of hostilities between the former allies Bulgaria and Greece plus Serbia she mobilised her army and compelled Bulgaria to consent to the terms of the treaty of Bucharest by which she gained the S. Dobruddja.

At the outbreak of the First World War R declared neutrality. Prince Bratianu the liberal leader and chief influence in Rumanian politics between 1900 and 1927 cautiously favouring the Allies and the court of the Central Powers. In Oct 1914 King Charles died and was succeeded by Ferdinand. Regarding Transylvania and Bukovina which R wished to annex agreements were reached with Russia and R declared war on Austria-Hungary (Aug 27, 1916). The Rumanian troops won Transylvania, but the Ger Army advanced from Silistria and on Dec 6 entered Bucharest (see RUMANIAN FRONT FIRST WORLD WAR CAMPAIGN ON). In Dec 1917 it was included in the agreement between

Germany and Russia to suspend hostilities. In Jan 1918 friction between Russia and R in Moldavia led to a declaration of war from Russia but Russia was occupied with renewed hostilities with Germany. The Rumanian Premier Averescu signed the treaty of Bucharest with Germany, but later R declared war on Nov 10. Bratianu returned to power. Rumanian deaths due to the war numbered 325,000 soldiers and 27,000 civilians. On Aug 4, 1919 Rumanian troops entered Budapest retreating upon allied representations after much looting. Under the Populist Premier Averescu R signed the Little Entente (1921) with Czechoslovakia and Yugoslavia. There was drastic agrarian reform. In 1923 Bratianu was again in power and a new constitution was adopted attempting to establish fair elections by the introduction of the secret ballot. There was a treaty of friendship made with Italy in 1926. For him died in July 1927 and was succeeded by his five-year-old grandson Michael since his son Carol had renounced his titles in 1925 and renounced Bratianu's power was now apparently very great but in fact there was much unrest among the minorities and the peasantry and these factors contributed to the rise to power of the National Peasant party led by Maniu. Bratianu died in Nov 1927 and in the elections which followed Maniu's party was returned the liberal strength falling from 293 seats to 13. In 1930 with Maniu's help Carol returned and the Council of Regents resigned. Carol became king from June 9 his son Michael becoming Crown Prince. R was hard hit by the world economic crisis. Maniu soon quarrelled with Carol and there was a swift succession of four each arrangement in its own favour under the electoral laws of 1926. In 1933 a non-aggression pact was signed with Russia. Ger influence in R became more marked being exercised partly by the intervention in gov affairs of Codreanu's Iron Guard the Rumanian parallel to the Ger SS. This adopted antisemitism as a status not never far below the surface in R to gain popular support. When Iron Guard activities were renewed in autumn 1938 the king ordered the arrest of Codreanu and a number of other Iron Guard leaders and they were shot but this did not secure control of the guard's activities. In 1939 R remained aloof from the war but showed some pro-Polish sympathies. In March 1940 the Iron Guard was restored under Ger pressure. R was forced to cede Bessarabia and N. Bukovina to Russia in July 4. Dobruddja to Bulgaria on Aug 21, and N. Transylvania to Hungary on Aug 30. On Sept 6, following a *coup d'état* by the Iron Guard Antonescu with Ger support formed a gov and Carol was forced to abdicate in favour of his son and the country. Ger troops were stationed in R and the economy of the country was used to supply the Ger war machine. In revenge for the execution of Codreanu the Iron Guard arrested and executed a number of prominent Rumanians including Prof

Jorga (q1), and then carried out a merciless anti-Jewish pogrom. Antonescu was forced to disband the guard, doubtless with the consent of his German overlords. R joined in the German invasion of Russia in 1941. More than forty Rumanian divisions took part, serving in the severe fighting of the Crimean campaigns, where their losses were very heavy. For a time they reconquered Bessarabia and N. Bukovina, and in Oct. 1941 a decree was issued incorporating Odessa and an area beyond the Dniester in R. By the end of 1944 Russia had won back all this territory. R's brief successes cost her dearly. Ploesti, Bucharest, Jassy, and Constanta were repeatedly bombed by the Russians, and in Dec. 1941 Britain declared war on her. From 1943 allied bombers attacked Rumanian towns from Italy bases. The war became extremely unpopular and Antonescu was compelled to exercise severe repressive measures. At the same time desperate efforts were made by the Germans to increase production in the oil fields. In Aug. 1944 the Russian counter-offensive reached Jassy and Constanta and an armistice was signed on Russian terms. King Michael, although virtually a prisoner of the Germans taking a notable part in the events leading to the surrender (see further under EASTERN FRONT OF Russo GERMAN CAMPAIGN IN THE SECOND WORLD WAR), Antonescu was imprisoned. There were a number of attempts at coalition gov., but in March 1945 the National Democratic Front with Russian backing assumed power under Groza, leader of the Ploughmen's Front, a Communist offshoot of the Peasant party. The National Democratic Front was nominally a left wing coalition, but it was in fact Communist controlled. The Communists were a minority party in R., but Russian support soon assured them control of the country. Elections in Nov. 1946 at which the rogues were alleged to have been falsified gave 448 members to the Groza gov. and twenty-nine to the opposition groups. The opposition parties, the National Peasant party and the National Liberal party, were liquidated. Maniu was sentenced to solitary confinement for life. All pretence at coalition gov. ended when the Liberal members of the gov. were replaced by members associated with the Workers' party, the name given to the fused Social Democrats and Communists. The reconstituted gov. forced Michael to abdicate on Dec. 30, 1947. The National Assembly proclaimed it a republic on the same day. In March 1948 elections were held in which the Communists gained an overwhelming victory. A new constitution was passed, which by its terms consolidated the power of the Communists (see further under CONSTITUTION AND JUSTICE). A peace treaty had been signed in Paris in Feb. 1947. The frontiers were fixed as on Jan. 1, 1941 with the exception that Transylvania was restored to R. Reparations to Russia, to the value of 275,000,000, were to be paid over a period of eight years, but the Soviet Union later waived her claim to much of this. The

treaty contained clauses specifying that Rumanians should enjoy full personal liberties. In April 1947 the U.S.A. and Britain protested that the Rumanian Gov. had suppressed these liberties and had thus violated the peace treaty. R's foreign policy was closely in line with that of the U.S.S.R. and in 1949 she joined in the Soviet campaign against Tito. At home the gov.'s actions showed that it was the intention to establish a fully Communist R. and nationalisation on a large scale has been carried out. R. appears to be a complete satellite of the U.S.S.R. The regime has a powerful political police force at its disposal and W. observers reported the widespread and growing use of censorship and stern measures to enforce loyalty to the gov. It is certain that democracy as understood in W. Europe has never taken root in R. The condition of the peasant and of the urban workers had been improving steadily since the end of the nineteenth century, but much injustice and political corruption and discrimination had survived, and on these grievances the minority Communist party had thrived. The rapid collapse of the historical parties which had been based on W. European tradition was accomplished so easily, not only because Soviet power was available, but because so large a proportion of the pop. were politically ignorant.

Language and Literature—The Rumanian language is a Romance language (see under ROMANCE LANGUAGES), curiously isolated among the Slavonic and Magyar speaking peoples. Therefore words of Lat. origin mingle with Bulgarian, Russian and Hungarian intruders, and even with the Turkish, Gk., and Albanian, and the Romance character of Rumanian has been much modified, particularly by the Slavonic loan words. On the other hand certain characteristics of the Lat. language have been better preserved in Rumanian than in any other Romance tongue, both in the vocabulary and in grammar. Rumanian has retained for instance a separate nominative accusative and genitive dative, as well as occasional vocative forms. A special feature of the language is an article suffix added to nouns. The Lat. alphabet is used (the Cyrillic was used until the nineteenth century) with certain signs for borrowed Slavonic sounds.

Early Rumanian literature consists of texts from the Slavonic and from the sixteenth to the beginning of the eighteenth century Slavonic influence is supreme though under the pressure of the Reformation tendencies leading towards a truly national literature begin to appear. Of importance are the chronicles of Moldavia by Nestor and Grigorie I. reaching down to 1594 by Miron Costin to 1662, and by Nechulce Costin (d. 1715) to his own date, of Wallachia, by Capitanul to 1688, by Popescu to 1720, especially by Prince Demetrius Cantemir (1710). The first trans. of the N. T. from Slavonic, appeared in Belgrade (1648), the first complete Bible was pub. (1688) by Rado and Serban Grozeanu, at the order of

Prince Cantacuzene Under the influence of the Reformation a large mass of translations, sermons, verse paraphrases of the psalms, etc., was pub during the sixteenth century and seventeenth century. During this period the liturgies, which were all in Slavonic, began to be trans., though the Cyrillic alphabet continued to be used. Of importance and interest are the trans. from Gk. Slavonic, and Magyar of lives of the saints, maxims and ethical treatises. The Phanariot period (1710-1830) marks the rise of Gk. influence. By this time Rumanian had become the official language of the church, and in 1727 became the language of the law courts. Rumanian trans. of the Gk. fathers of the church and much theology appeared. During and after the Revolutionary period the growth of nationalism in it influenced and was influenced by a group of writers, who included Petri Maior, George Simca and George Lazar. They worked to latinise their language, and to incorporate much of the folk literature into forms which owed much to W. European and especially Fr. influence. Much imaginative literature of foreign origin, and modelled on Fr., It., and Ger., marks a transition. A great deal of foreign dramatic literature of Moliere, Schiller, Victor Hugo, etc., was trans. and staged. Of popular poets may be mentioned Vasile Aaron, Ion Barak, and the three Văcărescu, Enaki (Janache) Alcu, and especially Ioan, whose beautiful and mystical poems, pub in a collection (1938) marked a Rumanian renaissance. Vasile Călușariu is also one of the great Rumanian poets. The modern period dates from 1830, and begins with the adoption of the Lat. alphabet and the Neo Lat. movement to wipe out all Slavonic and other words, and the barring of the older literature. Of outstanding influence in this movement is Ion I. Iude Radulescu, whose disciples Bolintineanu and G. Alexandrescu are the most important of the patriotic writers of verse. Mihail Eminescu, the greatest of Rumanian poets, steeped in medievalism and mysticism, a master of the language and a lover of the popular folk songs and tales, was a leading figure in the literary circle called the *Junimea*. The naturalist novel never had a very strong hold on Rumanian literature, although I. Iliescu (1819-65) has found successors in Zamfirescu and the war novelist, Minulescu. Country and peasant life supply the chief stuff of fiction, and folklore remains the traditional source of Rumanian literature unaffected by war and invasion. Before the Second World War its influence on Rumanian literature had replaced the paramount Ger. influence of the early twentieth century. It revealed itself in a succession of psychological and symbolist novels and poems by a new school of young authors, few of whom had established an outstanding individual reputation by 1939. The sparse literature of the period after 1945 shows strong Russian influence, both in subject-matter and treatment. There has been an increase in sociological writing, fiction and poetry, where not

actively propagandist, show a greater reliance on folk literature than was displayed by writing done when contact with W. Europe was easier.

Art—Rumanian church architecture was until the nineteenth century, predominantly Byzantine, though in some parts of the country, such as Transylvania, Magyar and Ger influences have produced buildings with certain Gothic tendencies. The richly decorated interiors and the icon paintings, follow the Byzantine pattern. Metal work decoration is lavishly used and the general impression is one of brilliance and clarity. The eighteenth century interior of the monastic church at Văcărești and the impressive sixteenth century monastery church at Humorului are good examples of Rumanian art of this type. Ger influence where it exists is more noticeable in the

humanian Legation

III) NATIONAL THEATRE CLUB

exteriors of church buildings. It was affected by the classical fashion in architecture which spread across W. Europe in the early nineteenth century and her later buildings are largely copies of Fr and Ger styles. Building between 1910 and 1939 showed Amer influence. Rumanian painting also followed the Byzantine tradition until the late eighteenth century, modern Rumanian art owes much to I. Impressionism. The twentieth century produced a school of Rumanian painters who, while strongly influenced by Fr tendencies, combined these with ideas in styles taken from Rumanian peasant art which is notable for its exotic, almost oriental, colour combinations. Prominent modern Rumanian artists include I. Theodorescu, I. Andreescu and the sculptor I. Jalea. Modern Rumanian pottery and glass work is remarkably fine, and incorporates many folk designs.

Musica—R has a rich store of folk music, which is mainly Slavonic in character, but shows Magyar and Gk influence. In the nineteenth century a national school of music is growing up, which included G. Kiria, A. Castaldi, and G. Enescu. They followed the Fr tradition, but later composers, such as M. Mihailovici and I. Perlea were more individual in

their compositions and relied more for their inspiration upon folk music themes. It is one of the centres of gypsy music, and Rumanian light music in particular owes much of its charm to gypsy influence.

Rumanian Front, First World War Campaign on The sympathies of Rumania was with the Entente from the outset of the war but Ger successes on almost every front, and particularly within easy reach of her frontier imposed great caution upon her. However on Aug 27 1916 she declared war on Austria-Hungary. Rumania had coveted Transylvania for a long time and now her troops crossed the Carpathian Alps into the ter driving the enemy before them. The Bulgarians, however, were preparing for a descent on Rumania and on Sept 3 successfully crossed the Danube and captured over 21 000 Rumanians. The Rumanians were reinforced by a small body of Russians but they were not much help for the Bulgarians and were compelled to withdraw along their whole line. More trouble was in store for the Rumanians who had penetrated into Transylvania for a Ger army was soon concentrated against them. On Sept 25 a battle was fought at Hermannstadt (Sibiu) the Gers practically destroyed their enemies all their artillery falling to them. The remnant of the Rumanian force retreated hurriedly over the Carpathians. They were again defeated by the Gers when covering Bucharest. For all practical purposes the Rumanian Army ceased to exist at the beginning of 1917. The remnant was reorganised under the Br and later

fought more successfully in conjunction
with Russian forces See also WORLD
WAR FIRST

Rumba, dance originating in Cuba, deriving from the *habanera*. It shows Sp, negroid and Amerindian influence. In its primitive form it was in erotic dance. In ball room form it was introduced into the U.S.A. between the two world wars and became popular in Britain during the Second World War.

Rumbeke, small Belgian tn in the prov of W Flanders 9 m NW of Courtrai engaged in agriculture and manufs of linen. Pop 7700

Rumelia, Eastern, dist of S Bulgaria, created by the Berlin Treaty of 1878 which directed it to remain under the direct political and military authority of the sultan with autonomous administration. In 1885 however it was incorporated in Bulgaria. Its area was considerably increased on the termination of the Balkan war in 1913. It included the present dept of 1 lovdia, Stara Zagora and Burgas. The biggest tm in the dist is Plovdiv, Burgas is the chief port. It is the most productive part of Bulgaria, its crops being especially noted. Area 17,375 sq m. pop. 2,163,300.

Rumex, genus of herbaceous plants (family Polygonaceae). It includes a number of common and uncommon docks which hybridize freely with one another and also the Sorrels of which *R. acetosella* or Sorrel is cultivated as a pot herb and salad plant.

Ruminants, ungulate mammals which chew the cud. The paunch is filled with bulky food which is made into small pills or boluses and passed to the second stomach where the fine portions after sitting are carried to the third stomach, the rest being returned to the mouth to be masticated until sufficiently fine for assimilation. (attle, sheep, goats, deer, antelopes, giraffes and camels are among the R.

Rummy, card game played by several persons and has a large number of variations. It is always based on the principle that the player attempts to obtain from the hand dealt to him and from the pack certain scoring combinations (either of the same denomination (e.g. three or more kings) or in sequences of the same suit (e.g. 5 6 7 of hearts)).

Rumonsch, *see* ROMANSCH.

Rump Parliament, see LONG PARLIAMENT

Runciman of Doxford, Walter Runciman, 1st Viscount (1870-1949), British statesman and shipowner, *b* at S Shields eldest son of the first Baron R. After leaving Trinity College, Cambridge, he entered his father's shipping business. In 1899 he was returned as Liberal M.P. for Oldham. In the 'khaki' election of 1900 he lost his seat, but in 1902 was elected

for Dewsbury. In Campbell-Bannerman's gov., in 1905, he was parl. secretary to the Local Gov. Board. This was soon followed by the financial secretaryship to the Treasury. He entered the Cabinet in 1908 as president to the Board of Education. From 1911 until 1914 he was president of the Board of Agriculture and was then promoted to the critical position of president of the Board of Trade. When in 1921 he won the Swansea seat he and Lloyd George were the only two survivors on the Liberal side of the chief members of the pre-war Liberal gov. R. accepted a peerage in 1937 before the death of his father who had himself a peerage conferred on him in 1938. In the late summer of 1938 he was offered the responsibility of adjudicating on Ger. and Czech claims in the Sudetenland, a thankless and impossible task (see also *under* CZECHOSLOVAKIA). In recognition of his work, R. was readmitted to Cabinet rank as lord president of the council in office which he held until the outbreak of war in 1939. R. succumbed to the risks of politics; the certainty of eminence in business though his place in the latter sphere was recognised by his election in 1926 as president of the Chamber of Shipping. He wrote *Liberalism as it is* (1917).

Runcorn, port and urban dist. of Cheshire, included in the Mersey. 27 m. S.W. of Manchester. It is on the Bridgewater and the Manchester Ship canals, and has large docks, a commodious wharf, a number of vessels. It manufactures tin and leather and has shipbuilding works. The Mersey near this town is crossed by railway and transport bridges. Pop. 28,500.

Rundle, Elizabeth, see CHAKRAS, Mrs. ELIZABETH.

Rundstedt, Karl Rudolf Gerd von (b. 1876), Ger. officer descended from a Brandenburg family. R. first joined the 3rd Infantry Regiment and later the 171st. He served in the infantry up to the rank of captain. He then joined the general staff. In 1914-15 he was chief of staff of the 15th Ger. Corps, and then went to Turkey to help reorganise that country's general staff. These appointments though important did not carry promotion and he began and ended the war as a major. As *Oberst* and chief of staff to the 3rd Cavalry Div. he put down the Socialist uprisings of Nov. 1918 with machine guns and mortars. As military commander of Berlin he was instrumental in arresting Braun's Socialist gov. of Prussia. On July 20, 1922, is full general in charge of Corps Area I (Berlin). He carried out von Papen's coup d'état against that gov.

In 1939 R. was probably the only Ger. general who could capably handle a full army group and he proved that in Poland where he broke down the Polish triangular resistance at Kutno through his S. push. He commanded the central army group during the campaign in France (1940), and was the first to cross the lower Somme. In Russia he commanded the S. group, including Rumanian and Hungarian divs. in its speedy conquest of the Ukraine. When von Bock failed in front of Moscow R. was called

on to conduct the ensuing disengagement operations, and fall back on a stable winter line. The year 1942 saw him commander in chief in France, Belgium, and Holland with a certain amount of influence on the It. theatre (African) of operations. In July 1941 he took part in the Hitler ordered courts of honour which condemned a number of Reichswehr officers to death by strangulation for their part in the bomb plot against Hitler's life. The Ger. defence measures after D day cannot be regarded as his work, for his advice was to avoid defence from the beaches and to carry out prolonged resistance in depth with frequent counter offensives, but his advice was rejected and he was superseded by Rommel and von Kluge who failed catastrophically. The failure and suicide of both brought him back as commander in chief and his next notable exploit was his Ardennes counter offensive of Dec. 12, 1944, which however was soon defeated by E. M. Montgomery and Gen. Patton. Defeated both W and I, of the Rhine in 1945, he was superseded by von Kessling. In Aug. 1948 it was announced that R. would be tried as a war criminal, but on May 5 in the following year it was stated that owing to his illness the charge against him would be dropped and shortly afterwards he was released from custody. R. was the last military leader within the Wehrmacht who can be said to rank as a general with soldiers like Moltke and Schlieffen and the only Ger. general whom his operations in the Second World War adduced to the essence of Ger. strategy: the continuous offensive.

Runeberg, Johan Ludvig (1804-77), Swedish Finnish poet, b. at Jakobstad. He studied at Vasa and Åbo Univs. and in 1837 became lecturer in lit. and later in Grk. at Börsä. He founded the *Helsingfors Morgonblad* (1832), contributing to it many of his poems and tales. Among his finest works are the idylls *Fågelskyllarne* (1836), *Hanna* (1836), *Julqallen* (Christmas Eve 1841) and romances *Nadeschda* (1841) and *Kung Ulfar* (1844). His epic *Länrik Stål Sagan* (Stories of Länrik Stål 1818-1860), dealing with the War of Independence against Russia (1808-9) is perhaps his most famous work and the preface to *First Land* has been adopted as Finland's national hymn. His *Kings in Salamis* (1863) is a notable tragedy. R. is also famed for his psalm book (Lutheran) which contains nearly seventy of his own poems. *Selected Poems* in Eng. trans. by Magnusson and Palmer was pub. in 1878. See life by R. Hedvall 1951.

Runes. This term connected with the old Germanic root *ru* and the Gothic *runa*, meaning 'mystery', 'secret', 'secretly', indicates an ancient script which may be considered as the 'national' writing of the pre-Christian Germanic tribes though R. although in limited use, lingered on for a long time after the introduction of Christianity and their use for charms and memorial inscriptions lasted into the sixteenth century (in some outlying Swedish regions even 'down to our own

times'—O von Kreisen) The origin of the name is probably due to the fact that like all primitive peoples, the Teutons attributed magic powers to the mysterious written symbols.

The R were used chiefly for inscriptions (*q 1*) of which there are about 4000 extant notably the rock inscription at Oesterrotund (c. A.D. 900), on memorial stones, rings, medallions (the characteristic *bracteates* or circular pendants of thin gold), brooches, coins, hilts and blades of swords, perpetual calendars (known in Norway as *Primsstæle*) and in Denmark as *Rimsstæle*) crosses, etc. There is no certain evidence of wide literary use of R in early times, but some scholars hold that the R was widely employed for all kinds of secular documents. The MSS extant however are very rare and rather late. The earliest MS version of Old Eng. R is now MS 17 in the library of St John's College Oxford dated 1170, the Old Dan. *Codex Runicus* a legal MS dates from the end of the thirteenth century, the so-called *Iasti Danici* belong to c. 1345. Other important Runic MSS are the *Codex Sangallensis* 875 at St Gallen, the *Codex Salisburgensis* 110 at Vienna, a Runic prayer book, etc.

It seems most probable that the R derived from a N. Etruscan alphabet (see ALPHABET) and originated in the second or first century B.C. The following main varieties of R may be distinguished: (1) The Early or Common Teutonic or Primitive Norse—about 100 inscriptions, mainly from the third to eighth centuries A.D. the Runic alphabet also called *futhark* (from its first six letters) consisted of twenty-four letters divided into three groups known as *astur* and seems to have covered adequately the sounds of the early Germanic forms of speech. (2) The A.S. or Anglian R brought to these is in the fifth-sixth centuries. The Early Teutonic R were not sufficient to represent the rich O.F. vowel system and the *futhark* was first increased to twenty-eight letters and in the middle ninth century to thirty-three letters, also the phonetic values of some characters have changed. Two of the A.S. R (the *thorn* and the *wen*) lingered on in the O.L. alphabet. (3) Nordic or Scandinavian varieties—the parallel linguistic development of the Scandinavian languages produced a result directly opposite to that of O.F. from about A.D. 800 the Scandinavian R was reduced to sixteen letters, we can distinguish a few varieties such as the Dan. (also used in S.W. Sweden), the Swed. Norwegian, the Hælsinge P. the Mæra R (which was a sub-variety of the Swedish Norwegian short system, the Dotted R or *Stungnar kunnir*, etc.). There were also various Runic cryptic varieties such as *haldrunir* or 'tent runes', *kristrunir* or 'twig runes', various kinds of 'bind runes', and so forth.

See C. Stephenson *Handbook of the Old Northern Runic Monuments* 1884, L. E. A. Wimmer *Collectio Runologica Himmeriana*, 1915, M. Cahen, *Origine et développement de l'écriture runique*, 1923, B.

Dickins, *The Runic Inscriptions of Mac showe*, 1930, H. Sletting and H. Falk, *Scandinavian Archaeology*, 1937, L. R. Jacobson and others, *Runic Inscriptions of Denmark*, 1947, J. G. Lévyier *Histoire de l'écriture*, 1948, D. Düringer *The Alphabet* (2nd ed.) 1949.

Runge, Philipp Otto (1777-1810) Ger. painter, b. in Wolzst. Pomerania. He studied in Copenhagen and Dresden. Influenced by the Romantics, he is noted for the realism of his portraits, although his figure work was plainly classical.

Runjeet-Singh, see RANJIT SINGH.

Runner, long sub-aerial shoot rising in the axil of a radical leaf and producing a new plant at its extremity when the connecting shoot dies. A familiar example is the strawberry plant.

Runners, Scarlet, see RANJIT SINGH.

Runnimead, or Runnymede, meadow on the Thames near Igham in the co. of Surrey, England, where the barons forced King John to sign Magna Carta on June 15, 1215. It was presented to the National Trust in 1931.

Running and Hurdling—Running is divided into track and cross-country running. Track running can further be subdivided into sprinting, middle and long distance running. The two main sprints are the 100 and 200 yds. and in all-out effort during the whole of the race is necessary. The term 'sprinting' means the action of a runner when running at top speed, and can seldom be maintained for more than 300 yds. In such short races it is necessary to get a good start as possible and the quickest method is universally regarded as a crouching start, starting blocks being used to gain impetus. Middle distance running begins roughly with the quarter mile and extends to the 3 m. In the quarter mile race there are two differing points of view as to the way the race should be run. The first is that the runner should go almost all out for the first half of the race, then slow down to succeed in order to make a final effort over the last 100 yds. The second is to run in even paced race all the way with a strong finish. In the half mile a strong start and finish are very important factors and a fast but steady run in the intermediate stage. The quarter mile is the next popular of the middle distance events and the four main requisites are stamina, judgment, speed and style. A first class mile will do the first quarter in about 1 min. the next two quarters a few sec. slower and the last half is fast as the first. The ambition of every mile runner is to be the first man to do a 4 min. mile and the fastest time recorded so far is 4 min. 14.5 sec. Long distance running covers distances from 3 m. to 26 m. 385 yds. (the Marathon distance). A long distance runner needs a strong heart and lungs and plenty of stamina. The main object of style is to eliminate all unnecessary effort.

Hurdling—Although running and hurdling are mentioned in Walker's *Juniper Jereiser* (1834) the two sports were not combined into the one hurdling event until the first Oxford and Cambridge meet

ing in 1864. There was then a steepie chase, later replaced by a 2 m flat race, and also two hurdle races over 120 and 200 yds. The latter was abolished in 1865, but a 200 yds low hurdle race was introduced in 1922. World hurdling records are recognised for the 120, 220, and 440 yds, and the 110, 200, and 400 metres. The standard high hurdle for the 120 yds is 3 ft 6 in in height, and 4 ft in width, and the ten flights of hurdles are placed at intervals of 10 yds with 15 yds from scratch to the first hurdle, and from the last hurdle to the finish. The 220 yds low hurdle race is run over ten flights of hurdles, 2 ft 6 in in height, and spaced at intervals of 20 yds. The height of the hurdle in the 440 yds race is 3 ft, with a distance of 40 yds between each hurdle with 50 yds from scratch to first hurdle and 30 yds from last hurdle to finish. The straight leg method of hurdling is now universal the advantage being that it reserves the running attitude, and makes the hurdle race a sprinting more than a jumping race. There are two types of hurdles. In important events a heavy hurdle is used, while this hurdle is not used a competitor knocking down more than two hurdles is disqualified. For it and H records see J. AMERICANS and OLYMPIC GAMES.

See *Athletics* by members of the Achilles Club, 1938, 1945.

Runyon, Alfred Damon (1884-1946), Amer author and humorist b at Manhattan, Kansas. He became a journalist, but made his name in short story writing. He gave unique grotesque portrayals of the types of the New York underworld, using all the resources of New York slang to add humour and colour to his situations. His pubs include *Gyps and Dolls* (1932), *The Best of Runyon* (1935), and *More than Something* (1937).

Rupēs (Sanskrit *rupya* silver), standard coin of India worth 16 annas (1 anna 12 pies). The value varies, but from 1899 has been about 1s 6d. A *likh* (lac) of Rs contains 100 000 Rs, a crore 10 000 000 Rs.

Rupel, riv. of Belgium formed by the confluence of the Dyle and the Netmeur. Runs 120 m S. of Antwerp. After a short course of about 80 m it falls in the Scheldt opposite Rupelmonde. The R. gives access from the Scheldt to the maritime canal of Brussels. On its banks are situated Niel, Boom, and Icrhagen, all having important brick kilns.

Rupert, Saint (d c. 720). Ger saint possibly of Fr or Irish descent. As bishop of Worms he evangelised S Ger many. He founded the great abbey of St Peter at Salzburg, and was the first archbishop of that see. He is venerated as the apostle of Austria and Bavaria.

Rupert of Bavaria, Prince (1619-42) third son of Frederick V, elector palatine and titular king of Bohemia by the Princess Elizabeth of England, b in Prague. He served Charles I at Ledgehill and Chalgrove field and proved an ingenious but erratic cavalry leader. After taking Bristol he obliged the enemy to raise the siege of Newark and York,

but his impetuosity at Marston Moor and Naseby was disastrous. Shutting himself up in Bristol, after a short siege he surrendered, and was dismissed the king's service. After the death of Charles I he became commander of that part of the fleet which adhered to Charles II and, narrowly escaping Adm Blake, sailed to France and selling his ships, joined Charles II at Versailles. Later he served in the navy against the Dutch. His naval tactics, though less well known were superior to his military. Devoting his time mostly to scientific studies till the Restoration, many useful inventions resulted, among them the compound called Prince's metal he also introduced zinc into iron in England. He was an active member of the R and of trade and he was one of the chief founders of the Hudson's Bay Company. See lives by J. Clough, 1934, C Wilkinson, 1934 and M Irwin 1939.

Rupert's Land, see HUDSON BAY.

Ruphea (Ant. Alphæus), chief riv. of Peloponnesus rising in the S. M. of Arcadia and flowing through Elis westward past Olympia to the Ionian Sea. In its passage through the cavernous limestone of its early course it often disappears underground. The Greeks considered that it its mouth it again disappeared under the sea to reappear in the S. M. of Sicily in the fountain of Arctus. Hence arose the myth of the river god Alphæus pursuing the nymph Arctus beneath the water.

Rupia, form of skin eruption characterised by the formation of blebs containing a serous fluid which gradually becomes purulent the blebs dry up to form dark brown conical scabs. The crusts are easily detached and there is a tendency for blebs to re-form so that the scab ultimately takes on a stratified appearance. The disease is a manifestation of secondary syphilis and occurs especially in debilitated patients. Treatment consists of the administration of potassium iodide and generalised antisyphilitic measures such as injection of arsenic, bismuth and penicillin.

Ruppin, Neu, tn in the former prov. of Brandenburg Germany on Lake H. 48 m N.W. of Berlin. It is engaged chiefly in the cotton and woollen manuf. Pop. 18 000.

Rupture, see HERNIA.

Rupununi, dist of Brit. Guiana (area 472 sq m) lying S. of lat. 5° N. Area 40 772 sq m or 1 per cent of the total area of Brit. Guiana. The dist is named from the river which flows through the populated savannahs and is the connecting link to the coast. Except for the savannahs bordering the R. and the Takutu and Murrumbidgee, the whole dist is covered with dense forest. The savannahs cover about 6200 sq m. Generally speaking they consist of low gravelly hills and intervening flats of white clay or sand with occasional *pipe* swamps. The present so-called lake in the savannah known as Annuku, is said to be the site of the legendary El Dorado which fired the imagination of Raleigh and the conquistadors (see I. L. DOUGLAS). The main int.

ranges are the Pakaraima the Kanuku and the Akurai. The main rivers are the Essequibo Berbice and Corentyne (see BRITISH GUIANA). The Rupununi R. is a trib. of the Essequibo, flows through the populated area of the dist., and is not impeded by falls and rapids. Bon Succes is the gov. station in the savannahs. It has a small pop. of Amerindians, some Euro. and other ranchers and settlers, and a few migrant miners and workers of forest products. An Angl. m. mission was estab. in 1831. Settlers settled there late in the nineteenth century. A plan to settle Jews in the dist. as an alternative to the limited absorptive capacity of Palestine was examined by the Colonial Office in the early 1930s but proved unacceptable.

Rural Dean, see under DEAN.

Rural District see under LOCAL GOVERNMENT.

Rural Institutes, see under WOMEN'S INSTITUTES.

Ruremonde cf. ROUEN.

Rurik (d. 879) traditional founder of the Russian Empire. He is variously described as a Russo-Varangian or as a Viking from Sweden. With his followers he invaded N. Russia in 862. After the death of his two brothers R.'s power was supreme. He eventually estab. his cap. at Novgorod which became the centre of a strong state extending into central Russia.

Rurki (or Roorkee), tn. in the Saharanpur dist. United Prov. India (10 m. N.E. of Meerut). The mason Engineering College is situated here. Pop. about 20,000.

Rusadir, MICHIA.

Rusbrock, John, see RUSBROOK, JAN VAN.

Ruscus (Butcher's Broom), genus of evergreen shrubs with flattened leaf-like evergreen branches and daisy-like flowers followed by berry-like fruits. *R. aculeatus* is the only Brit. species.

Rush, see RUSSES.

Rush, seaside resort 15 m. from Dublin. It is also noted as a market gardening centre and for bulb growing. Pop. 16,000.

Rushden, manufacturing tn. and urb. dist. in Northamptonshire, England 4 m. E.S.E. of Wellingborough. Boots and shoes are manufactured. Pop. 16,400.

Rushen, par. in the S.W. of the Isle of Man, England 12 m. W.S.W. of Douglas. Pop. 4,000.

Rush Nut, see CYPRESS.

Rush Toad, see WATERJACK.

Rushworth, John (1612-90) Eng. historian. *b.* in Northumberland. He studied at Lincoln's Inn and was called to the Bar in 1647. R. is noted for his *Historical Collections* (1659, 1701) compiled from shorthand notes taken down at actual meetings of the Star Chamber, Exchequer Chamber and Parliament and covering the period down to 1648. In 1640 he became assistant clerk to the House of Commons and was frequently employed as messenger between Charles I. and Parliament. R. was secretary to Lord Fairfax (1641-48) and gave Parliament news of the army actions. This he continued to do until the end of Crom-

well's Scottish campaign. He sat for Berwick in Parliament five times and was agent for Massachusetts under Charles II.

Rusicada, see PHILIPPINES.

Rusizi, riv. of Belgian Congo which discharges the waters of Lake Kivu into Lake Tanganyika. It forms the W. boundary of Ruanda (Ruandi) (length 75 m.).

Ruskin, John (1819-1900) Brit. author and critic, son of an Edinburgh merchant in London. His upbringing was abnormally strict. From childhood he was

Press Portrait Bureau

JOHN RUSKIN

encouraged to read good literature and write and draw, and to appreciate the beauties of nature. Drawing he subsequently learnt under Copley Fielding and Harding. He studied at King's College, London and then in 1836 went to Christ Church, Oxford. Three years later he won the Newdigate prize for Eng. verse. Ill health in 1840 compelled him to go abroad but he returned to Oxford in 1842 and took his degree. He had already contributed articles to sev. magazines but first became widely known in 1843 when he pub. the first vol. of *Modern Painters* in which he came forward with a defence and appreciation of the later style of Turner. The second vol. pub. in 1846 attracted even wider attention. The third and fourth vols. appeared in 1856 and the fifth and last in 1860. He married in 1848 Euphemia Calmeyer Gray, but the

marriage was owing to the characters of both parties and the interference of R's mother, extremely unhappy. In 1855 his wife obtained a decree of nullity in an undefended suit and married Millais. R's pub. had already made him famous, he was on intimate terms with many great literary and artistic personages, including Millais, Watts, Carlyle, Trowide and the Brownings. In the autumn of 1853 R delivered a course of lectures at Edinburgh on architecture and painting. He had in 1849 issued *The Seven Lamps of Architecture* in which he laid down the laws that should govern that art. The seven leading principles he declared were sacrifice, truth, power, beauty, life, memory and obedience. In 1851-53 was pub. *The Stones of Venice* illustrated by himself. In this work R laid down the principle which colonised all his artistic criticism, maintaining that good architecture and art though it need not be works of religious inspiration. Other works of this period were *Notes on the Construction of Sheepfolds* (1851), *The Political Economy of Art* (1857), subsequently renamed *A Joy for Ever*, *The Elements of Drawing* (1857), *The Two Paths* (1859) and *The Elements of Perspective* (1859). He was by this time accepted as the greatest authority on art in England and his pronouncements undoubtedly hastened the recognition of the artistic value of the works of Turner and the Pre-Raphaelites. R at the beginning of the sixties was as much interested in economics and social reform as in art and devoted much time to these though his conclusions were rarely orthodox. He attacked materialism and the dismal science of political economy. He thus reinforced the philosophy of Carlyle. His next works were *Unto the Last* (1862), *Sesame and Lilies* (1863), *The Ethics of the Dust* (1866) and *The Crown of Wild Olive*. Three lectures on *Work, Traffic and War* (1866). In these pub. R showed himself in ardent critic of modern civilisation and the prophet of a spirit of regeneration. From 1853 he lectured all over the country on art and economics and architecture. On the death of his father in 1861 R inherited a fairly substantial fortune out of which he gave generously. He had many pensioners, he assisted struggling artists and gave money for Miss Octavia Hill's housing campaign as well as gifts of valuable pictures to institutions. In 1871 he moved to Brimwood, Coniston Lake, his last home. He pub. monthly for workmen *Letters to Laborers* in which much of his best work appears and in 1871 founded the Guild of St George. He was first Slade prof. of art at Oxford from 1870 to 1879 and he again occupied the chair from 1883 to 1889. From 1884, he pub. from time to time *Præterita*, an autobiography, which however was never carried beyond 1890. It throws valuable light on R's religious development. His health gave way in 1878, and after this year he had occasional attacks of brain fever. An ed. of his works was ed. by F. T. Cook and A. Wedderburn (1903-12). See lives by A. C. Benson, 1911, J. Morley 1917,

R. H. Wilenski 1933, D. Leon 1949, P. Quennell 1949, also *The Order of Release* (letters ed. by Sir W. James), 1910.

Ruskin College, Oxford, Brit. educational institution founded by two Amers., Walter Vrooman and Charles Beard in Feb. 1899. The college originally known as Ruskin Hall was designed to afford higher liberal education for working men and women and particularly for those associated with trade unions and other working class organisations and to be free from all sectarianism either in religion or politics. The college has two main groups of studies, the social studies course includes economics, politics and social hist. and the arts course is based on Eng. literature with subsidiary Eng. hist. and a foreign language. There are approximately 100 students (1950), the great majority of whom live in the college buildings. The main college building is in Wiltam Street, Oxford, and there is a hostel for first year men students and another for women students at Headington. There are numerous scholarships to the college provided by the college itself, by trade union and other working class organisations and by local education authorities. A correspondence dept. exists for the benefit of non residents who wish to take such courses.

Russell, Russell

Russell Family, famous Eng. family. The baronet dates back to 1330. Branches of the family held the titles of Earl Russell and Lord Amthill. In 1st the family is notable for its liberalism and besides those mentioned to whom special articles have been devoted mention should be made of the following: *Francis, fourth Earl of Bedford* (1533-1541), took part in draining the fens and built the square of Covent Garden; *Sir John* (fl. 1440-50), Speaker of the House of Commons and grandfather of first Earl of Bedford; *John, first Earl of Bedford* (c. 1480-1555); *William, first Duke of Bedford* (1613-1700), sat for 14 years in the Long Parliament. See Gladys Scott, *Thamesian Life in a Noble House 1611-1700* 1937. *The Russell* in *11 months 1600-1771* 1940 and *Family Back* in 1947.

Russell, Alexander (1811-76), Scottish journalist b. in Edinburgh. He became editor of the *British Liberator* (1839). In 1942 he went to China, there editing the *Life Herald* and a new year in Kilmarnock (1844). R joined the staff of the *St. James* under Mulart (1845) at Edinburgh becoming editor 1848. The paper began to appear daily for 1d (1855) instead of only twice a week. R was an ardent liberal and his paper championed the Anti Corn Laws League and helped to secure Macaulay's election to Parliament in 1852. He popularised journalism while maintaining a high literary standard.

Russell, Arthur, **Oliver Villiers** and **Odo William Leopold**, see ARTHUR BROWNS. **Russell, Bertrand Arthur William**, **Russell, third Earl** (b. 1872), Brit. philosopher and mathematician b. at Trelleck, second son of John Viscount Amberley,

and grandson of the first earl. Educated privately and at Trinity College, Cambridge, where he obtained a first class in mathematics and moral sciences. R served for a year (1894-95) as attaché at the Brit. embassy in Paris. In 1899 he was elected fellow of Trinity College and in 1905 he pub. *Principles of Mathematics*. Having been appointed lecturer in 1910, R collaborated with A. N. Whitehead in the pub. of *Principia Mathematica* (1910-1913). In 1914 his out-poken pacifism caused him to be deprived of his lectureship and refused a passport to the U.S.A. where he had been offered a similar post at Harvard. Four years later R was condemned to six months imprisonment for a pacifist article in *Tribunal* and while serving his sentence he wrote his *Introduction to Mathematical Philosophy* (1919). R succeeded his brother as earl in 1911 but his never used the title. Among his other pub. are *The Philosophy of Matter* (1900), *A B C of Things* (1923), *A B C of Relativity* (1925), *An Outline of Philosophy* (1927), *Seventy Essays* (1928), *The Scientific Outlook* (1931), *Power as a Social Analysis* (1938), *In Language into the Meaning of Truth* (1940), and *A History of Western Philosophy* (1945). R is an original and independent thinker with a fine literary style. He calls his own philosophy 'logical Atomism' in which he combines philosophy and mathematics. He is a psychological reformer stressing the value of creative rather than passive impulses. See also POSITIVISM, LOGIC.

Russell, Edward, see ORRIFORD, EDWARD RUSSELL JARVIS.

Russell, George William (E.) (1867-1935). Irish poet, b. at Lurgan co. Armagh and educated at Rathfriland School. He passed to the school of art and practised painting. R became leader of a circle that pub. the *Irish Theosophist* in which his first poems afterwards pub. as *Homeward Songs by the Way* (1894) and *The Earth's Breath* (1897) appeared. He attached to one poem the signature 'Fionn' which was printed Y and how was afterwards always known by this pseudonym. He and W. B. Yeats were known as the leaders of the Irish literary revival and though Yeats overshadowed him 'F' wrote a number of poems of remarkable lyrical beauty much influenced by his study of E. mysticism. In 1897 Yeats recommended him to Horace Plunkett and R, who was working as an accountant in Prim's drapery, gave up that post and went bicycling through Ireland interviewing the rural pop. He devoted a great deal of his life to the promotion of agric. co-operation. *The Irish Statesman*, a venture of his own, lasted from 1923 to 1930. Some of his pub. include *The Vates of Knowledge* (1903), *Deirdre* (play, 1907), *Ideals of the New Rural Society* (1911), *Salvation* (1916), *Standish O'Grady* (1920), *Enchantment and other Poems* (1930). R was a pioneer of the Dublin Abbey Repertory Theatre. See study in J. Eglington, *Irish Literary Portraits* 1937.

Russell, Henry (1812-1900), Eng. vocalist

and musical composer, b. at Sheerness. A pupil of Rossini in Italy, a singer on the London stage and organist at Rochester, New York. He travelled in U.S.A. and Canada (1833-41) teaching music and giving a series of recitals. Among his numerous popular songs are *Cher Boys Cher!*, *A Life on the Ocean Wave*, *The City Crier*, *O Woodman Spare that Tree*, *There's a Good Time Coming*. Sir London Ronald (q.v.) (really London Ronald R.) was his son.

Russell, Henry Norris (b. 1877) Amer. astronomer, b. at Oyster Bay, New York. He was educated at Princeton, New Jersey and later studied under Ball at Cambridge. R succeeded Young as director of Princeton Observatory in 1908. In 1913 independently of Hertzsprung he showed that the stars fall into two well defined classes, giants and dwarfs and outlined a new theory of stellar evolution. He devoted a considerable amount of time to the problem of the evolution of the solar system, the physical conditions of the planets and the composition of planetary atmospheres and in 1935 disproved Jeans's tidal theory of the origin of the solar system. Amongst his chief works may be noticed the following: *The Solar System and its Origin* (1935), *The Atmospheres of the Planets* (1935), *Present State of the Theory of Stellar Evolution* (1942) and (in collaboration with Dugan and Stewart) *A Revision of Young's Manual of Astronomy* (3 vols. 1926-27, 1945).

Russell, John (1711-1806) Eng. painter, b. at Guildford. He became R.A. in 1772 and R.A. in 1785. In 1785 R was appointed king's painter. He worked mainly in pastel and a number of his portraits hung in the National Portrait Gallery.

Russell, Lord John, first Earl Russell (1793-1878). Brit. statesman, b. in London the third son of John R. sixth duke of Bedford and educated privately, at Westminster and at Edinburgh Univ. He entered Parliament in the Whig interest and was an ardent supporter of reform. He first pressed for parli. reform in 1819 and supported the repeal of the Test Acts and Rom. Catholic emancipation. He became privy-seal and general of the forces in 1831 and led the House of Commons during Melbourne's short-lived administration three years later. When Melbourne again came into power in 1835 he was home secretary, but in 1839 went to the Colonial Office. He led the opposition against Peel and when Peel retired in 1846 he formed an administration. At the instance of Queen Victoria he insisted on the resignation of the foreign secretary, Palmerston, who had without authorisation recognised Napoleon III as emperor of the Fr. after the *coup d'état* (1851). In 1852 he was defeated and resigned but accepted a seat in Aberdeen's Cabinet. He was for a short time colonial secretary under Palmerston in 1855, but in 1859 went to the Foreign Office under the same leader. He was created Earl R. in 1861 and four years later on the death of Palmerston, again

became Prime Minister, with Gladstone as leader of the House of Commons but held office for only a few months resigning when his reform bill failed. Literature as well as politics interested R., and among his works are *A Life of Lord William Russell* (1819), an *Essay on the English Constitution* (1821) and *Causes of the French Revolution* (1832). R. came of a family all the members of which were versed in political matters and familiar with official and ministerial work. He was a good, but not inspired speaker, but at times he rose to a high level of eloquence. R. in fact anticipated to some of the policy usually associated with Palmerston which made Britain appear frequently in the role of the champion of continental liberalism. He had however less common sense than Palmerston and his policy frequently rested on the most delicate foundations. His greatest characteristic was self-conviction which nothing however untoward could undermine. He had an invincible belief in the advantages of an aristocracy, but at the same time was usually to be found in the van of the reform party. See lives by Sir S. Walpole, 1899 and A. W. Lilby, 1930.

Russell, John Scott (1838-87) Scottish civil engineer and naval architect, b. at Parkside near Glasgow. He studied at Edinburgh, St. Andrews and Glasgow Univ. and in 1842 became prof. of natural philosophy at Edinburgh. He began his famous series of observations on waves (1843) experimenting to ascertain the form of ships that will encounter the least resistance and to test the possibility of utilising steam navigation on the Firth of Clyde and other ships. R. was one of the organisers of the 1851 Exhibition.

Russell, Mary Annette, Countess, see ARNOLD MARY ANNETTE COUNTESS VON

Russell of Killowen, Sir Charles Russell, Lord (1852-1900) Brit. lawyer and lord chief justice of England, b. at Newry of Roman Catholic parents. He was educated at private schools and at St. Vincent's College, Castleknock, he was articled in 1872 and admitted a solicitor in 1874 and practised in the counties of Down and Antrim. In 1876 he removed to London and entered at Lincoln's Inn. He was called to the Bar in 1879 and was Q.C. in 1872. He sat in Parliament as member for Dundalk (1880-85) and for S. Hackney in 1885-86 and in 1892 and was attorney general in 1886 and 1892. A strong Home Ruler, he was leading counsel for Parnell before the commission was one of the Brit. representatives in the Boer War arbitration, made lord of appeal and given a life peerage in 1891, and made lord chief justice the same year. He introduced the Secret Commissions Bill in 1900. R. was one of the greatest of nineteenth century Brit. judges. Few have been able to equal the brilliant lucidity of his summings up and as counsel, his skill in cross examination was outstanding. In a private capacity R. played a large part in the Eng. Catholic revival.

Russell, Sir Walter Westley (b. 1867), painter studied at the Westminster School of Art, was elected A.R.A. in 1920 and R.A. in 1926. He became keeper of the Royal Academy in 1927 and 1938 trustee of the Tate Gallery, where his paintings are well represented.

Russell, Lord William (1639-83), Eng. politician third son of Wm. R., fifth earl and first duke of Bedford. R. studied at Cambridge. He represented Bedford in four Parliaments and was highly esteemed for his independence, being regarded as one of the heads of the Whig party. Becoming entangled with the Rye House conspirator, he was on very little evidence found guilty of high treason and beheaded in Lincoln's Inn fields. The Whigs regarded him as a martyr for religious and civil liberty, his real character is not well known but it seems probable that his actions were prompted, to a large extent, by personal ambition. See life by Lord John Russell, 1843.

Russell, Sir William Howard (1820-1907) Brit. war correspondent, b. at Lally, Co. Dublin and educated at Trinity College, Dublin. He was employed on *The Times* from 1841 and, though he was called to the Bar nine years later, he did not practise but continued to devote himself to journalism. He went to the Crimea during the war of 1854-55, and it was his letters to *The Times* on the condition of the Brit. Army that roused the public at home to a realisation of the shortcomings of the War Office and indirectly were responsible for the overthrow of the Aberdeen ministry. He was in India during the mutiny and in 1861 was in America during the early part of the war between the N. and the S. U. He was on duty also during the war between Germany and Austria and the Franco-Prussian war. He was the first as well as one of the greatest of war correspondents. Many of his contributions to *The Times* were reprinted in book form. See life by J. B. Atkins, 1911.

Russelia, small genus of stove evergreens, family Scrophulariaceae, of which the best known is *Tonina*, a hybrid with pendulous scarlet tubular flowers.

Russia, or the Union of Soviet Socialist Republics, federal state in Europe and Asia formed on the basis of a union of Soviet Socialist Republics comprising the Russian Soviet Federative Socialist Republic (R.S.F.S.R.) and fifteen others. It covers over one sixth of the earth's land surface. Its area in 1916 was given as 8,708,000 sq. m. and its total pop. is approximately 193,200,000. R. is bounded to the S. by the Black Sea, Afghanistan, China, Persia, Turkey and Mongolia; to the W. by Norway, Finland, the Baltic, Poland, Czechoslovakia, Rumania and Hungary; on the E. by the sea of Okhotsk (part of the Pacific Ocean) and on the N. by the Arctic Ocean. The Bering Strait (35 m. in width) separates R. from Alaska (U.S.A.). In the N.E. the S. reaches a lat. of 35° N., while its northernmost point is well within the Arctic Circle, reaching as far as 77° N. It extends roughly from long. 25° E. to 169° W.

Its immense size can be judged by such comparisons as the distances W to I between Minsk and Vladivostok (6000 m, a railway journey of at least ten days) and S to N from the Afghanistan border to Murnansk (1000 m, a railway journey of seven days). The Russian Empire which existed until 1917 had an area of about 8,500,000 sq m. In the period between the revolution and 1920 Poland, Finland, Lithuania, Latvia and Estonia established independent republics and the area of R was reduced to 8,173,500 sq m (1939). Between 1939 and 1945 however, R regained much of this territory and also acquired other territory in Europe some of which had earlier been ceded to Rumania and some which had formed part of pre-1938 Czechoslovakia. These cessions when added to acquisitions in Asia which had been gained between 1917 and 1946 made the total area in 1946 slightly larger than that of the old Russian Empire.

GEOGRAPHY—The basic geographical factor influencing all R's history is the great Russian plain. Within this framework P falls naturally into six divisions, the chief of which are the E. European Plain, S.W. R, the Lake Region, the Crimea, the Caucasus, the Caspian Basin, the Steppes, the Siberian Plain and the Pacific Slope. The main physical features of these divisions are as follows.

East European Plain—This slightly elevated plain reaches its greatest height in the Valdai Hills (1500 ft.) but has on the whole an elevation of less than 100 ft. On the N.W. it is bounded by two lakes and on the W. by Poland. It extends to the Ural Mts. whilst on the N.E. it has no natural boundary, but merges itself in the great Siberian Plain which stretches out to the E.

South-west Russia—This is the country between the Rumanian frontier on the W. and the R. Empire on the E. It is a low lying country. On the S. it extends to the Black Sea.

The Lake Region—This region lies in the N. of R. and includes the Leningrad and Novgorod areas. There are six lakes in the district the Novgorod area alone containing more than 3000. The lakes are usually joined one to another and the land is naturally low lying. However in some places a height of nearly 3000 ft. is attained. The chief of all the lakes is Ladoga. This lake is the fifth in size of all in R. and the largest in Europe in R. The greatest depth is about 300 ft. and the volume of its water is about nineteen times that of Lake Geneva. The temperature is low and for a third of the year the surface is frozen. The lake abounds with fish and has a peculiar species of seal. The R. Neva flows from it into the gulf of Finland. Lake Onega is joined up to the White Sea by means of a series of lakes and streams. The R. Svir flows out of it to the Ladoga. Onega is much deeper than Ladoga, the greatest depth being well over 700 ft. Lake Ilmen is formed by the meeting of a number of rivers in a shallow depression, the average depth does not exceed 30 ft. Lake Peipus (or

Chudskoye Lake) the S. part of which is called the lake of Pskov, divides the R. S. R. from the Estonian S. S. R. It connects with the gulfs of Riga and Finland. This lake also is very shallow, no where exceeding 90 ft.

The Crimea—The geological structure of this peninsula places it entirely outside R. proper. The climate is Mediterranean in type and the S. slopes of the Yaili Mts. are extremely fertile. The range culminates in an elevation of about 5500 ft. The rivers are few and short, the most important of them being the Dnieper. The whole peninsula may be regarded as a prolongation of the N.W. of the Caucasus.

The Caucasus—This is a mountain chain 750 m. long running N.W. to S.E. from the Black Sea to the Caspian. The range finds continuation on the E. side of the Caspian. The chain is divided into two divisions by the Dnieper Defile through which a great military road runs. Towards the E. the range has a width of 150 m. whilst to the W. of the defile the breadth is about 120 m. At the defile itself it does not exceed 60 m. The highest peaks are found in the W. division where they are five which are higher than Mt. Blanc. The highest peaks of the W. Caucasus are Elbrus and Koshkistan.

The Caspian Basin—This area consists of level plains and interspersed with salt lakes extending E. into Kazakhstan. It was the bed of the formerly calmed Caspian Sea.

The Steppes—The broad belt of plain land extends in a S.E. direction from S.W. R. into Asia. It lies S. of the deciduous forest area and verges on the desert in the E. The S.E. steppes are drier and more barren than the European steppes but all have a wide range of plants.

The Siberian Plain—This section of the Russian plain is divided from the E. Europe in plain by the Ural. It is low lying and level in the W. rising in the E. to plateau.

The Pacific Slope—From the mountain ranges which rise from the Siberian plateau the land slopes to the sea of Okhotsk and the sea of Japan both projections of the Pacific Ocean.

Seaboard and Islands—There is excellent fishing in the Arctic Seas but the ports are of little importance since for nearly three quarters of the year the outlets are frozen. The White Sea with its inlets Onega and Dvina and its port Archangel has regained much of its importance which it formerly possessed. During the Second World War it became extremely important being a harbour accessible to British and American convoys. Other inlets such as Ichesskaya and Ichchora are surrounded by waste frozen land and the Kara Sea is only open to navigation for a few weeks in the year. Of the 14 of the N. most are uninhabited. The Bering Sea and the coasts which border on the sea of Japan lose much of their value owing to the fact that they are bleak and inhospitable. The great gulf which has the town of Vladivostok as its

head is separated by miles of waste land from the interior and the value of one of the most magnificent harbours in the world suffers much from this fact. R has a Baltic seaboard and the Baltic Soviet Socialist Republics (S.S.R.) possess a number of good harbours, Leningrad is the port of the gulf of Finland. The Black Sea has gained in importance since the revolution. The coast lands are being developed and as the produce of the interior becomes greater so the importance of the Black Sea increases. The sea of Azov is the greatest inlet of this sea but the importance of the Black Sea is diminished by the fact that it has so few good ports. The Soviet Gov. has enlarged and modernised such ports as exist and has brought forward projects for the creation of new artificial harbours. Odessa is the second port of R and the greatest commercial port of the Black Sea. Sevastopol is the great naval station and Batumi owes its importance to the fact that it is the port of the oil fields of the Caucasus but owing to the Soviet restrictions on imports and exports its trade has declined. The great inland sea of R the Caspian forms a good means of communication from the Transcaucasian ports to central Asia and also between central Asia and Persia. Canals connecting with the Volga have established communications between the Caspian, Black, Baltic and White Seas. It is of great importance as a fishing centre and supplies almost the whole of R with fish. It is particularly noted for its salmon and sturgeon.

Orography. The main feature in the physical structure of Europe is the very low lying plateau which sweeps from the Urals to the plains of middle Europe and which seldom rises 800 ft. above sea level. It stretches from the N.E. to the S.W. To the N. and W. of it stretches a long strip of lowland whilst the S. and W. of it are bounded by low lying plains. The N.W. border of this plateau which includes the Valdey Hills and the plateau of Minsk is the highest part of it. In central R the plateau once again reaches this height on the banks of the Volga. The whole area is further marked by a series of deep depressions which follow the lines of the R., Dnieper, Don, and part of the Volga and there are traces of deeper depression of preglacial times. The Ural Mts. cannot be considered as a mountain chain. In the S. they consist of a series of parallel ridges which continue on the mts. of Fennoscandia and Lapland. Continuing N. they appear to be only a continuation of the central plateau whilst in the extreme N. they are simply low lying hills. Asian R.N.E. of the Ural rises to form a central mass of mts. and high plateaus. The Pamir Mts. include the Stalin peak (24,598 ft.) and the Lenin peak (23,390 ft.). Mts. of the Central Siberian plateau include the Yenisei heights (3,500 ft.), the outer highlands of the Sayan system (6,000 ft.) between the upper Yenisei and Angara Rs., the highlands on both sides of the upper Lena (1,000-4,000 ft.) the mt. and plateau region N. of Lake Baikal (1,000-6,000 ft.) and the Fungus Mts.

(rising to 3,500 ft.). The Sayanid system of highlands extends from the upper Darya basin in the W. to the watershed between the Aldan R. and the Zuya R. in the E. and separates R. from Mongolia. The Cherski range discovered in 1926 is the central range of a system of mts. running parallel to the Verkhoyansk Kolyma-Anadyr system. Two parallel ranges run in a N.W. direction through Kamchatka. On the E. side of the ranges overlooking the Bering Sea are seven volcanoes including Klichhevski (nearly 16,000 ft.).

Rivers.—The whole development of R. has depended to a very great extent upon her rivers and her watersheds. When it is realised that it is possible to take a boat from the extreme N. of R. and after carrying it across a low lying watershed launch it in another riv. that will bear it southward it can be seen that such an arrangement of rivers is of great importance. The chief rivers of Europe in R. have their source within comparatively few miles of one another to the N.W. of the central plateau. Some of them curve round the plateau flow S. and find their outlet in the S. e.g. the Dnieper the Volga and the Don. Others flow in a N.W. direction e.g. the Dvina the Onega and the N. Dvina. The rivers of Asian R. are important for their value as means of communication the most important are the Ob and its tribes the Yenisei and the Lena. R. in its deserts is a country of rivers and canals and the dependence which is placed upon these rivers and canals is of overwhelming importance. For example the Volga is connected with the Ural, Onega and Ladoga and has thus become a means of transit from W. to E. The Volga is also connected with the N. Dvina which enters the White Sea and with the Caspian. In the Dnieper is connected by canal with the Dvina the Niemen and the Vistula. The water discharge of the river is however comparatively small and during the winter navigation of the river generally ceases. See further *and* *for* the names of the rivers.

Climate.—The climate of Europe in R. is most easily described as continental. This is true of all save the Crimea and some small portions of the coast of the Black Sea. R. therefore on the whole gets an extremely hard and long winter followed by a cool pleasant spring, an excessively hot summer and a very cool autumn. The rainfall is on the average small and the rains take place chiefly during the summer and the autumn. The winter is hard and very cold everywhere. In the S. as late as May 6, the temp. is often only 30° F. and further N. often below 10°. Nearly every riv. in R. is frozen for at least a quarter of the year and in the N. for considerably more than a third. In summer however the temp. is correspondingly high rising as far N. as Archangel to a mean temp. of well over 70° for July. The mean rainfall differs from about 15 in the E. to about 24 and sometimes 27 in the W. In the winter time the country suffers greatly from blizzards. In Asian R., W. Siberia

has an extremely cold winter and a hot summer. In Siberia is even drier and colder the pole of cold around Verkhoyansk is the coldest place in the L hemisphere. The climate in Kamchatka is milder and wetter. Central Asian R is dry and has cold winters while the Caspian Basin is an arid region with extremely hot summers.

Flora—In the vast stretch of ter from E to W in R are tundras, steppes and forests. The last have been extensively developed especially in the W and S. Great clearings have been made in the forest lands of the W and corn and wheat are grown to a very large extent. The region which touches the shores of the Black Sea and the rest of the S of R produce much the same products as the rest of S Europe. Here is found the vine and maize is also very extensively cultivated. Tea is grown S of the Caucasus Mts and cotton is also cultivated chiefly in the extreme S. In the S of Asiatic R vegetation is scanty but the rich steppe land of the Amur region has a vegetation like that of both the desert and the E coast woodlands so that both deciduous forests and evergreen areas are found.

Fauna—In the Arctic regions the polar bear, Arctic fox, seal and reindeer are found and the waters of those regions abound with salmon, trout and cod. In the extensive forest are found the stag, fox, bear and wolf. The lynx and elk, which were originally found in great numbers in these regions, are gradually being exterminated. Cattle, sheep and horses are found on the grasslands which still cover much of R. In the forest region many varieties of birds are found the prin of which are the grouse and the partridge. Many of these animals are found also in the steppes of R but this dist abounds principally in hares and foxes together with the siskin, a great cause of destruction to the corn lands. The fish of the dist include the sturgeon and the sterlet of the Volga together with the carp and squal. The fauna of Siberia is similar to that of European R save that fur

bearing animals are found in far greater quantities. The tiger is occasionally met with in the dists of the S and E, and in the Pamir dist the most characteristic animal which abounds is the *Ovis poli* or the great mt sheep.

Races—R is inhabited by the descendants of many races. It is estimated that various branches of Slavs form at least 50 per cent of the total pop. These include the Russians themselves who number rather over half of the pop of R. About 200 different languages are spoken in R. The main racial groups apart from the Russians are the Ukrainians (making up about 20 per cent of the total pop.) White Russians, Poles, Lithuanians, Letts, Estonians, Moldavians, Georgians, Armenians, Lithuanians, Lithuanians, Turks, Tajiks, Kirghizians, Bashkirs, Kalmyks, Burjats, Yakuts, Uzbek, Ossetes, Jews, Moldovans, Chechens and Chechenets. Apart from the Ukrainians all these national groups are comparatively small. Before the revolution of 1917 they were not recognized as national groups at all and Russian was rigidly maintained as the official language. Since the revolution these nationalities have been allowed the official use of their own language and have been encouraged to develop their own cultures to varying extents. The federal character of the state emphasises the equality granted to all nationalities within it by the Bolsheviks in 1917. Within the constituent republics there are autonomous regions and republics created for smaller national groups. The use of S W Asiatic R has been much developed by the Soviet Gov. In the 17 the different nationalities have wide powers of self government. In fact, however Russian domination is complete and Russian dominance has continued.

Area and Population—The R S F S R (1926) extends for three quarters of its ter into Asia. It occupies about 75 per cent of the ter of the U S S R and contains over half the total pop. The area and pop of the R S F S R and the fifteen S S R's are estimated as follow:

Republ	Area in Square Miles	Population	Capital
I R S F S R	6,411,000	109,000,000	Moscow
II UKRAINIAN S S R	223,000	40,000,000	Kiev
III WHITE RUSSIAN (BYELO RUSSIAN) S S R	41,000	10,365,000	Minsk
IV AZERBAIJAN S S R	3,000	3,210,000	Baku
V GEORGIAN S S R	37,000	3,420,000	Tiflis
VI ARMENIAN S S R	11,000	1,300,000	Yerevan
VII TURKIC S S R	181,100	1,231,000	Ashkhabad (Politaratsk)
VIII LEBEK S S R	1,117,000	6,282,000	Tashkent
IX TAJIK S S R	5,000	1,481,000	Stalinabad
X KAZAKH S S R	1,041,000	6,146,000	Alma Ata
XI KIROVIZ S S R	79,000	1,500,000	Iruno
XII KARLO BYNISH S S R	71,000	900,000	Petrozavodsk
XIII MOLDAVIAN S S R	13,200	2,200,000	Kishinev
XIV LITHUANIAN S S R	31,000	2,879,100	Vilna
XV LATVIAN S S R	24,840	1,950,000	Riga
XVI ESTONIAN S S R	18,600	1,150,000	Tallinn

The S S Rs are in sev. cases subdivided into P'ss (P.), Regions (R.), Autonomous Regions (A R.) and Autonomous Soviet Socialist Republics (A S S R.)

XI XVI The Armenian Karelsk and Ist'mann's R have no administrative subdivisions such as the above

Chief Towns—Ins in R with an estimated pop in 1939 of over 100,000 were: Moscow (cap) 4,137,000; Leningrad 3,191,300; Kiev 816,300; Kharkov 833,400; Baku 509,300; Rostov 411,100; Odessa 604,200; Tashkent 380,000; Irfis 19,200; Rostov-on-Don 310,300; Dmitriyevsk 200,700; Stalin 462,000; Stalingrad 445,500; Sverdlovsk 47,000; Kazan 10,000; Kambishev 390,000; Voronezh 327,000; Yuzovsk 298,000; Zaporozh 259,000; Ivanovo 250,000; Archangel 281,000; Omsk 31,000; Chelyabinsk 273,100; Luliz 2,000; Melotov 2,000; Astrakhan 2,400; Ufa 24,900; Irkutsk 213,000; Makhovka 240,100; Minsk 213,000; Alma-Ata 230,500; Mirny 222,000; Kalinin 210,000; Voroshilovgrad 213,000; Vladivostok 206,000; Krasnodar 203,900; Priyan 200,000; Khabarovsk 199,400; Kirovograd 197,600; Krasnovodsk 190,000; Taganrog 188,800; Lihovsk 175,700; Chiklov 172,900; Grozny 172,000; Stalinsk 169,000; Vitebsk 167,400; Niko 165,100; Karaganda 165,900; Nizhniy 19,900; Lenza 17,100; Smolensk 17,000; Shakhty 15,000; Barnaul 148,100; Dneprodzherzhinsk 147,800; Magnitogorsk 14,900; Gomel 144,200; Kirov 143,000; Smolensk 142,700; Gorki 141,200; Pribinsk 139,000; Samarkand 134,300; Kemerovo 133,000; Poltava 130,300; Leningrad 129,400; Ordzhonikidze 127,200; Ashkhabad (Pollarat'sk) 126,600; Lumbok 121,300; Kostroma 121,200; Kursk 120,000; Murmansk 117,000; Sevastopol 112,000; Orel 110,600; Semipalatinsk 109,800; Gorlovka 108,700; Irokovyevsk 107,200; Kerch 104,500; Dzerzhinsk 103,400; Chita 102,600; Ulyanovsk 102,100; Kirovograd 100,300.

THE SOVIET ECONOMIC SYSTEM—The economic system of R is based on the Socialist system of economy and the Socialist ownership of the instruments and means of production. All the chief industries and large factories shipping air lines, docks and warehouses and banks are controlled by salaried managers appointed by and responsible to, the particular ministry or gov. dept. which administers the industry in question. The heavy industries are under the control of Union ministries. Individuals therefore cannot derive income in the form of profit interest dividend or rent (except interest on a savings bank account or state savings loan) and the *rentier* class has ceased to exist. The only way people can earn money in R is in work for wages or salary (e.g. authors may receive royalties based on the size of the book and artists may sell their pictures). But there are also a certain number of workers in small self-governing 'producers' co-operatives (*artels*) which are generally engaged in making artistic or speciality products unsuited to mass production methods in large factories. Thus there are co-operative fishermen's groups owning their own boats or trawlers and working for themselves on the coast and inland waters but deep-sea fishing is in the hands of the larger state-owned trawler fleets. Sometimes these co-operative workers work in their own homes merely selling their products and getting their materials through their co-operative society but mostly they work together in jointly owned workshops sharing the proceeds or co-operative dividend of the sale of their joint products. However only the agricultural co-operatives (i.e. the collective farms) are of major economic importance. In 1937 they owned 20.3 per cent of the total means of production in agriculture. In these farms sharing is on the basis of the Labour days contributed by each person to the work more responsible or skilled work being valued more highly in terms of Labour days than less responsible or less skilled work. Both farm products and cash proceeds are shared. Prior to the first five-year plan farming was still mostly done by individual owner-worker peasants there being relatively few collective farms in the first decade of the Soviet regime, but under the five-year plan the number of collective farms increased enormously and today the farms of the old order of individual peasants (or *kulaks* (q.v.)) now occupy no more than 1 per cent of the cultivated land of R. Collective farms manage their own affairs through elected committees but they are obliged to deliver an annual quota of specified kinds of produce to the state buying organisations at prices well below the ordinary market price the difference in effect representing rates and taxes. These deliveries go to provide supplies for towns and factories but the surplus may be sold for as much as the farm can get. Not all their working time is spent by members in the collective farm. Each member may have allotted to him a small 'farmstead' or allotment

up to 2 ac. and much of his time is passed in its cultivation. In the collective farm village each family has its own house and garden and 'farmstead'. The collective farm itself may have not only central offices and barns but also a kindergarten and a school club, and cinema. At harvest time the farm may have ploughing or harvesting implements from machine tractor stations which are state-owned stations for lending out machinery in exchange for a fixed share of the harvest crop. Besides collective farms there are

Soviet Wells

WHEAT HARVEST AT THE STALIN COLLECTIVE FARM IN THE STAVROPOL REGION OF THE R.S.F.S.R.

11. Grain of the new harvest is being prepared for delivery to the state.

a certain number of state farms generally larger than collective farms under managers of these farms appointed by the commissariat responsible for them. There is a more specialised type of farming thus there are a number of state live-stock farms and cotton-sugar beet and dairy farms, and on the Black Sea coast notably at Yalta there are state wine farms. Their chief function is that of research experiment and development.

State farming and industry do not come into existence or function in any haphazard manner. Industry is regulated according to an economic plan and worked out for the whole country, and managers are appointed to effectuate this master-plan. Their duty is to run the factory or industry with the maximum efficiency so

as to produce as much as possible with the minimum waste of raw material, wear and tear of machinery, or time. The plan is a vast programme or series of programmes, of production, setting out what the various industries and factories and farms shall turn out in the year and setting out the appropriate amounts of raw material to be allotted. The body that prepares this plan is called the State Planning Commission, or briefly, 'Gosplan,' a body of economists and engineers who advise the gov in all planning matters with branches in the various republics or dists and also in the groups of factories in each industry. After full discussion with the industry and all others concerned the draft plans and amendments and criticisms are referred back to Gosplan which then co-ordinates all the separate plans and meets (central criticisms) and it was in this way that the famous five-year plans were prepared. Within each five year plan there were fuller and more detailed annual and quarterly plans which filled out the general framework of the long-term plan (see further under HISTORY). The commissariats (ministries) are responsible for the implementation of the plans, either for a branch of activity throughout the whole Union or indirectly through the respective ministries of the constituent republics. The complete field of Russian life is covered by these ministries and their counterparts in the republics. The head of an industry or factory is responsible for what happens in the industry or factory and he must see that the workers obey his orders. The trade unions which are essentially state concerns have a voice in the appointment of managers in the sense that they are consulted before the appointment is actually made and the workers through their trade union may criticise a manager. Membership of trade unions is voluntary but most workers in view of the privileges of unions are members. Wages are fixed in consultation between the gov planners and the trade unions. Workers' factory committees supervise working conditions and the general discipline of the works. Social insurance is a function of the trade unions.

The leaders of the Soviet Gov were soon compelled to abandon the undiluted Communist idea of distribution according to needs and to accept the principle of 'from each according to his ability to each according to his work'. The incentive of personal profit for additional effort seeps through the whole system. First there came the so-called 'shock worker' system, and later, the piece work system called the Stakhanovite movement after its proponent, Alexei Stakhanov. A Donbas coal miner, who worked out a better method of hewing coal and so increased the amount he was able to hew in one shift. The wages earned by this piece-rate system are considerably higher than the time rates.

Great economic strides in R are assured by the enormous wealth and the undeveloped resources of the country. In agriculture and mineral wealth it will be

independent of import (or export) for many years to come. There may be and often is enormous waste through bureaucracy, incapacity, or unadaptability but nevertheless the net gain will probably be great enough to enrich the state and through it, really enhance the still low living standards of the people.

Finance—State control of the financial system is an essential instrument for the planning of Russian economy. Article 14 of the constitution gives to the central gov the supervision of the monetary and credit system of the country, the administration of the banks, the organisation of state insurance (etc), and empowers it to sanction the state budget and the revenues and taxes comprising the republic and local budgets. A unique characteristic is that the Soviet budget includes the major part of the resources accumulated by Russian industries. These are regarded as the difference between cost price and wholesale selling price; the latter is fixed by the gov and to surmount the former the financial authorities exercise a degree of control over the processes of production. Of the accumulated funds of each industrial establishment one part is passed to the state by the turnover tax, and the other remains in the factory and constitutes its profit. This too belongs to the state, but is handed over only in part in accordance with a special procedure. The variation in turnover tax rates enables the accumulation of reserves in industry to be controlled and a definite price policy to be carried out. In the period 1938-40 the total income of the Soviet state budget was 400 thousand million roubles, of this the turnover tax accounted for 80 thousand millions and profits from economic enterprises for 18 thousand millions. Thus 70 per cent of R's budgetary revenue was obtained from the economic activities of organisations within the Socialist system. Another characteristic is that the Russian national budget includes the budgets of the constituent republics and all local gov bodies and the financial resources of republics or dists are supplemented where necessary from the central exchequer to enable the requirements of the economic plan to be carried out. The table shows revenue and expenditure in 1940 for the U.S.S.R. and republics (including local budgets in thousands of millions of roubles).

The present Russian banking and currency mechanism was founded at the end of 1921 with the establishment of the state bank of the U.S.S.R. with the right of issue. Subsequently the bank became the sole repository for currency reserves and the regulating institution of the whole currency system. In 1930 the credit system was reformed upon two lines all short term financing became the exclusive prerogative of the state bank and bills of exchange were abolished; no public business concern being permitted to give credits to another. For short term loans all business organisations thus became clients of the state bank, and the other banks were restricted to long term financing. State bank loans, made as an

analysis of the client's economic and financial position have thus become a very effective instrument for the government control of state enterprises, which are all expected to be self supporting or to make a profit. The bank's resources are chiefly derived from the resources of the country flowing into it as the sole bank of settlement further supplemented by budget assignments and by its own profit.

Revenue	Union Budget	Republican & Local Budgets	Total
Turnover tax	95.6	10.3	105.9
Contributions from profits	12.9	8.9	21.7
Income of machine and tractor stations	1.0	1.0	2.0

Since foreign trade is a state activity the finance ministry is able to nominate a gold value for the external rouble and to maintain it without any variation against the dollar and the pound. The gold value bears no relation to the rouble purchasing power in the R.S.F.S.R. Gold backing for the rouble is unlimited. It is usually conducted through transactions abroad in foreign currency accounting being carried out by the state bank through its bank correspondents abroad. The exchange value of the rouble to the £ in May 1940 was 11.20.

Agriculture—Agriculture is controlled by the Ministry for Agriculture. The total area under cultivation, including individual owner peasant farms, collective farms, and state farms (see *The Soviet*

Economic System) was nearly 395,000,000 ac in 1941, before the German invasion. In the same year there were over 240,000 collective farms (a fourfold increase since 1930), 1,300,000 individual owners, 39,600 state farms, and 6,910 tractor stations. The black soil area of S.L.R. (about 270,000,000 ac) is the chief grain producing land. Cereals are the chief product and then follow flax, hemp, potatoes, beetroot and tobacco. In 1939-41 grain crops averaged 111,000,000 tons. It is famous for her cotton fields and cotton industry. The chief centres of cotton growing are the riv. valleys of central Asia in the Turkmen S.S.R. Under the five year plans prior to 1939 vast new irrigation schemes were undertaken to bring water along artificial channels to irrigate the desert and so open up new lands where cotton could be grown. About three times as much cotton is grown as under the tsars. Silk is more extensively cultivated than formerly not only in central Asia and Transcaucasia but in new areas, namely the Ukraine, Central and the areas around Voronezh, Stalingrad and Kursk. Wild rubber plants are being cultivated in various parts of the Union. In the S.S.R. no fruit trees and the vine are cultivated. Agriculture is being steadily electrified. But at the second World War 1 per cent of the collective farm and 25 to 30 per cent of the state farms had been electrified many by means of hydro electric power.

The raising of cattle also occupies an exceedingly important place especially in the neighbourhood of the grassy steppes. Sheep are largely produced also cattle, horses, camels and pigs. The rivers especially the Volga and the Siberian rivers give much opportunity for fishing whilst the top of the vast deserts of Siberia are killed in fur trappers.

Soviet agriculture suffered severely during the second World War. In the German occupied areas the collective farm system broke down, and the scorched earth policy of the retreating Russians destroyed thousands of acres of crops. The five year plan of 1946-50 therefore laid stress on the rehabilitation of agriculture and set the target "Total farm produce in the U.S.S.R. as a whole shall be increased by the end of the five year period 27 per cent above the 1940 figure. Wheat, rice and vegetables were to be especially increased. Collectivization was to be strengthened and the efficiency of machine and tractor stations increased. During the five year period the number of horses was to be increased 4 per cent, horned cattle 39 per cent, pig 450 per cent and sheep and goats 1 per cent. Dairy farming and market gardening in the vicinity of the large cities was to be encouraged. Afforestation, artificial fertilisation, drainage, homes and vast irrigation projects were to help the progress. Agriculture was to be a priority industrial product, and in the unions and territorial institutions agricultural research was to be encouraged. It was claimed that the gross output of agriculture as a whole in 1949 exceeded that of 1940.

Forestry There are nearly 2 500 000 000 ac of forest land in R, covering over 44 per cent of its total area. R contains about one third of the world's lumber supply. It has been estimated that Asiatic R contains about 78 per cent of R's forestlands. Because of the shortage of roads these forests are difficult to exploit though since the revolution a number of new roads have been constructed making forest exploitation easier. The forests of European R lie mostly to the N, declining towards the central regions and the S, with the exception of the Caucasus where there are over 15 000 000 ac of forest land which supply many valuable kinds of timber. The state administers and works the larger part of Russian forest land but about 72 000 000 ac are allowed to the peasantry for free use. Lumber felling and wood working are the main industries in the frozen region of the Arctic Circle and to the S of it. This forest belt extends N from Leningrad through Karcha and E into Siberia where it stretches across the rivers which flow N into the Arctic Ocean. Much of the timber here is fir and pine. In W K timber and resin are exported in considerable quantities. The huge paper industry of the RSFSR depends entirely on Russian timber.

Before the Second World War the Soviet Gov had pursued a policy of afforestation in certain natural areas of R, especially in the S, on a very limited scale but with marked success. The five year plan 1946-50 provided that 'the tree plantations laid out for the protection of collective and state farm fields in the steppe and wooded steppe regions shall be restored and new belts of rapidly growing trees (including fruit trees) and bushes (including berry bushes) planted; trees including fruit trees shall also be planted along rivers'. This clause was enlarged upon in a Gov plan of Oct 1948 called the Stalin Plan (see Politburo illustration p 302). This ten to fifteen year plan provided for the planting of a series of forest belts totalling 3300 m which would form a defence against the drying winds which normally sweep across the European steppes from central Asia. The greatest belt was to be planted from the Caspian Sea to the Urals. It was estimated that this policy would protect nearly 90 000 collective farms. Crop rotation with grasses and a scheme for building reservoirs and ponds in the steppes were an additional part of the scheme. In 1950 it was claimed that 370 000 1 trees had been afforested in 1949 and that 590 000 hectares had been afforested since the inauguration of the 1946-50 five year plan.

Electrification.—Lenin was convinced, even before the Oct Revolution that large scale electrification would provide the only basic technique adequate to the establishment of a Socialist economy. He emphasised the need for a rational distribution of industry 'with special attention given to the electrification of industry and transport and the adaptation of electricity to the purposes of agriculture, and

his tenacity enabled the many serious obstacles in the way of electrification to be overcome. A commission headed by G. M. Krzhizhanovsky the scientist submitted a plan in Dec 1920 which covered the restoration and reconstruction of the whole national economy with electrification as the indispensable basis. This Godro plan depended in the main upon scientific exploitation of low grade fuels. The actual working out of the plan, including the restoration of pre-war electric power economy, the extension and reconstruction of existing stations and the construction of thirty new power stations with a total capacity of 1 000 000 kw, was completed in the minimum time allowed, i.e. ten years. The total generating capacity of R increased nearly sevenfold and the total output of electricity more than seventyfold in the seventeen years between Dec 1920 the beginning of the Godro plan and Dec 1937 the end of the second five year plan. Under the 1946-50 plan the target for electric power was an installed capacity of 22 400 000 kw.

The largest hydro electric power station in pre-revolutionary R had a total capacity of 1 0 kw. The first Soviet hydro electric plant the Volkhov power station placed in service in 1926 had an installed capacity of 38 000 kw. By 1932 the first of a number of generating units each of about 62 000 kw was set to work at the Dnieper hydro electric power station. In 1933 this plant had a capacity of 60 000 kw and in 1941 was the largest hydro electric station in Europe and one of the largest in the world. In its vicinity a huge new industrial centre was created to use a large part of the power generated. This centre includes Greater Zaporozhe and a combination of enterprises producing aluminium and its oxides, electrodes, ferro-alloys, high quality tool steel and alloy steels. The reconstruction of transport in the Dnieper coal region was closely bound up with the Dnieper station which is the major source of power for the electrified railroads connecting the Donetz basin with the Krivoi Rog and Dnieper area (all of which industrial area was overrun by the Gers in Aug 1941 and to a great extent laid waste by the Russians when they withdrew). The Dnieper station also provides a basis for the gradual electrification of agriculture, electricity having become an indispensable part of the daily life of the collective farm villages in that region. Finally, a long distance transmission system with 160 m of high tension lines has been completed between the Dnieper station and the steam power station of the Donetz coal basin.

Among major water power resources the greatest in the European part of the Soviet Union is provided by the Volga and its prin tribes Oka and Kama. Utilisation of these resources is co-ordinated with river transport and irrigation projects. Recently completed is the upper Volga transport and power complex, which includes Uglich, Rybinsk and Ivankovo

hydro electric stations. The three stations together have a capacity of nearly 170 000 kw and an aggregate ann output of 1 400 000 000 kw. In the lower Volga region work is in progress on the largest hydro electric construction in the world the Kuibishev hydro centre on the Samara bend of the Volga a combination of two new power stations with a total capacity of 3 400 000 kw. In conjunction with the upper Volga developments the Kuibishev project will convert the Volga and its principal tributaries into a magnificent deep water transport system.

a few monopoly trusts combine all the enterprises of any given branch of industry in the whole Union e.g. the Urals Asbestos Trust the Rubber Trust the Silk Trust etc. In some industries there are even trusts in the oil and cement industries. In the majority there are a number of separate trusts in the various parts of the Union. About 10 per cent of Russian industry is run on co-operative lines (for details of the industrial organisation in Russia under *The Soviet Economic System*).

Russian industry had developed to a

THE REBUT DAM AT DNIROPETROVSK 1950

The largest power station in Azerbaijan is that of Mangishchaursk situated some 260 km from Baku on the Kura R. where it enters the Caspian plains. This station has a capacity of 300 000 kw. Irrigation for cotton growing is also associated with this project and industries in the Baku region utilise its power. Besides cotton growing there was just before the Second World War a vast development of new industries such as chemical machine building clothing food etc. Plans for Uzbekistan provide for a dozen plants with a combined capacity of over 1 500 000 kw. Several of the stations with a capacity of over 270 000 kw have been completed and serve as a foundation for the establishment of an electro-chemical combine the output of which after full development will almost entirely meet the fertiliser requirements of the cotton fields.

Industry—The Russian industrial system is based on the Socialist theory of state ownership of the instruments and means of production. In certain industries

considerable extent before 1917 (see *History*) but the Bolshevik regime completely transformed industrial organisation substituting state ownership for private ownership and under the N.E.P. (1917) and the five year plans (1928) industrial progress has been launched which have completely altered Russian economy. The capacity of the established industrial area has been increased by modernisation of equipment. Soviet productivity improvements and the building of many new factories etc. while industrial areas have been created in parts which until 1917 were purely pastoral or agricultural. Russian industrial progress after the revolution was planned on a system of natural priorities. The first five year plan produced electrification, some extension of internal communications and a considerable development of heavy industry. The second five year plan continued the development of heavy industry and began the expansion of the processing industries. The third five year plan paid considerable

attention to the armaments and chemical industries, but was intended to concentrate on the development of light industries. This plan was interrupted by the Second World War. The aim of the five-year plan 1946-50 was 'to rehabilitate the devastated regions of the country, to recover the pre-war level in industry and agriculture, and then considerably to surpass that level'. To achieve this it proposed to concentrate on the restoration and development of heavy industry and railway transport, to promote agriculture and industries producing consumer goods, and to promote technical progress in all branches of the national economy. Priority has, therefore, been given, since the inauguration of the first five-year plan, to the development of communications and heavy industry. There had been a considerable extension of light industry before the Second World War, but its quality and extent of modernisation were still uneven. The concentration on its development was delayed by the war and after it the devastation caused during the fighting had so affected those basic elements treated under the first two five-year plans (e.g. the first Dniepropetrovsk dam was destroyed by the retreating Russians as part of the 'scorched earth' policy in 1941) that the post-war plan had again to give priority to transport and heavy industry. The total volume of production of Russian industry as a whole for 1950 was fixed at 203,000 million roubles (on 1926-27 prices) as compared with 134,000 million roubles in 1940. This represented an increase in industrial output of 18 per cent, as compared with the 1st full pre-war year. In 1949 it was reported that industrial output was slightly above this planned level, though in some branches of industry the level set for the utilisation of equipment was not reached. The government stated that the labour productivity of manual workers in industry in 1949 was 13½ per cent above that of 1918. In several cases consumer goods were stated to be more plentiful in 1949 than they had been since the revolution. No impartial figures on output are available, but dismissals of high officials in certain industries suggest that the government has not in fact been entirely satisfied with the progress made.

In 1940 there were nearly 600,000 industrial enterprises, of which 10 per cent were large concerns. The industrial output of the R S F S R alone was 8.5 times as great as that of R in 1913. The principal industries of the R S F S R were iron and steel, textiles, engineering manufactures of agricultural and industrial machinery, rolling stock, building materials, and road vehicles, paper and timber products, ceramics and glass. After 1917 entered the Second World War, a number of new large industrial and transport undertakings were begun in the interior of the country. These included the blast furnace at Magnitogorsk and the Chelyabinsk iron and steel works, claimed to be the largest in Europe, and the rivet blast furnace at Chusovaya. Tanks and tractors were manufactured in Siberia, and sev-

new power stations were established in the Central Urals and in Krasnogorsk. New blast furnaces and steel works, and engineering and chemical works, were set up in a group of towns lying between the Ob and the Altai Mts. Novosibirsk, Leningrad, Kemerovo, and Stalinsk. Hydro electric stations have been erected to drive the saw mills, cellulose and paper mills, and the mining enterprises of this region. Iron and steel works have been established at Khabarovsk and Komsomolsk, close to the Pacific coast. These industries did not suffer destruction between 1941 and 1945, as did many of the older industries in the West, and were easily transferred to a peace time basis when the war ended. One of the most outstanding Russian industrial achievements outside the R S F S R since the revolution has been the creation of the cotton manufacturing industry in Uzbekistan, Tadzhikistan, and Turkmenistan, where irrigation has resulted in a great increase in cotton production and where modern cotton-mills have been developed near the cotton-fields in Tashkent, Fergana, Stalinabad, and Ashkhabad. For a list of the principal industries in each of the R S R's (excluding the R S I S R) see under AZERBAIJAN, ESTONIA, WHITE RUSSIA, etc.

Minerals and Chemicals.—R is very rich in mineral wealth. Soviet geologists claim that their country contains one-fifth of the world's coal deposits, nearly 60 per cent of its oil, over 50 per cent of its iron ore, and two-thirds of its apatite. No reliable information exists about uranium deposits. R has sufficient deposits of non-ferrous and rare metals and chemical ores to meet the demands of Russian industry for an indefinite period.

Coal and iron were extensively worked in tsarist R, but mineral resources in Asiatic R remained unexplored, and in European R mineral wealth was not fully exploited. Since the revolution the industrial basis of European R has been extended, and the production of coal, iron and steel has greatly increased. Iron ore deposits in the Urals and West Siberia are now fully utilised. The Altai Mts., the Urals, and the Sayan Mts. also contain gold, silver, copper, chrome, tungsten, nickel ores and magnesium etc. There are plentiful supplies of petroleum at Baku, Baku and Tama. Other minerals found in smaller quantities in the U S R include lead, platinum, tin, bauxite, and zinc. Precious stones are found in small quantities. In 1940 166,000,000 tons of coal were produced in R, 15,000,000 tons of pig iron, and 18,300,000 tons of steel. The five-year plan (1946-50) provided that the pre-war production figures for iron and steel should be increased by 35 per cent. It provided for further exploitation of iron ore resources in the Urals, Siberia, and the Far East. The plan set new targets for the production of other minerals, and stressed the importance of erecting new plants to deal with the new resources tapped, and of achieving the maximum technical efficiency. It was claimed in 1949 that all these aims were being achieved.

The Russian chemical industry has in the main grown up since 1917. Its most important products are synthetic rubber, fertilizers, soda, and plastics. The output of synthetic rubber in the Urals was, in 1950, greater than that produced in the older centres at Voronezh, Yaroslavl, and Ircumov.

Commerce—R's foreign trade is a state monopoly. Control of it is vested in the Ministry of Foreign Trade, which alone issues the licences under which goods are imported and exported. Trade delegations accredited to foreign countries purchase the necessary imports and effect the sale of Russian products. Under the control of these trade delegations, certain state and co-operative bodies can by special licence be selected to engage in foreign trade. Between 1934 and 1938 exports averaged 1570 million roubles, and imports 1038 million. In 1938 Britain exported 241 million roubles' worth of goods to R and received 375 million roubles' worth of Russian exports. In the same period the U.S.A. exported goods valued at 406 million roubles into R, and took Russian goods amounting to 97 million roubles. Other countries trading with R include Holland, Belgium, Germany, France, and Persia. Trade figures of commerce since the Second World War are incomplete. Board of Trade returns show that total trade between Britain and Russia in 1947 and 1948 was as follows: Russian imports to Britain 1947 £7,536,490. British exports to Russia, £12,272,396. Russian imports to Britain, 1948 £27,047,676. British exports to Russia £3,310,437. Machinery is (1950) the most important Russian import.

Retail internal trade in R has three forms: state co-operative and the free market. In 1940 rather more than 60 per cent of the retail trade was done by the state, roughly 20 per cent each by the co-operative organizations and in the free market. Until 1946 consumers co-operatives only traded in the rural areas but in that year they were permitted to develop their retail trade in the towns. As a result half of the retail trade within the U.S.S.R. was done by them in 1948. They had 220,000 stores, and an organization comprising nearly 6,000 societies.

Communications—The importance of the Russian rivers as means of communications is because of their divergence very great. It is however diminished to some extent because of the long season during which many of the rivers are frozen. Before the revolution the river and canal system of R was mainly used for carrying freight. Since 1917 the waterways have become important as a means of passenger transport. It is claimed that 3,000,000 passengers were carried in 1929 as against 11,000,000 in 1913. The Soviet Govt. has built many new canals and has widened existing canals and deepened rivers to take larger vessels. Soviet achievements include the White Sea-Baltic Canal (1933), the Moscow-Volga Canal (1937) and the Dnieper-Bug-Vistula Canal (1939). This last connected the Baltic and Black Seas

by water. In 1941 traffic on Soviet waterways amounted to 74,000,000 tons, and there were 63,125 m. of inland waterways in regular use. The five-year plan (1946-50) included plans for widening and deepening existing waterways and for building others, particularly in Siberia and the Far East. Canals were also to play a part in the steppe irrigation project.

A system of Russian railways had been built up before the revolution. Though uneven in quality, they did link together the different sections of the empire, though they were most numerous and efficient in Europe in R. The Soviet Govt. used the tsarist system as a basis for its railway plan. New lines were built especially in Asiatic R and modernisation of equipment began. Soviet lines built before the Second World War (including some begun under the tsars but unfinished in 1917) include the Murmansk line, the Kvan-Sverdlovsk line and the Irkutsk-Siberian line. In 1945 there were 66,000 m. of railways of which 30 per cent were double track lines. The Russian railway system in 1950 provided communications between Leningrad and Moscow and all the major cities of the U.S.S.R., though in some cases the journeys were still slow, and passenger accommodation comfortable. Electrification of suburban lines in Moscow, Leningrad, and Lillium and of main lines in Siberia, Transcaucasia, and the U.S.S.R. is in progress. Stress was laid on further railway development in the five-year plan (1946-50). Lines destroyed during the Second World War were to be fully restored and extended. Russian experts admit that the difference in gauge between R and W Europe is a major obstacle to direct rail communications between the U.S.S.R. and foreign countries.

Road communication was still of subsidiary importance in 1950. It had been extensively developed by the Soviet Govt. but only a few main roads outside the huge towns approached W European standards. In 1945 220,000 m. of roads could be used for motor traffic and roads were to be improved and extended under the five-year plan (1946-50). Civil aviation commenced in 1922 and civilian lines used in 1948 had a total length of over 13,000 m. Moscow is the centre of air traffic. Air lines are especially valuable in Siberia and the Far East. In 1940 civil airlines carried 390,000 passengers and 60,000 tons of freight and mail. Civil aircraft are also used in campaign against pest.

Post Office—Telegraph and telephone services have all been developed under the Bolshevik regime.

The Soviet merchant marine operates mainly in the Baltic and the Black Sea. In 1939 its gross tonnage was 1,150,000 gross tons, but later figures are not available. These are comparatively few for a world superpower.

CONSTITUTION AND GOVERNMENT—In 1922, after the last foreign invader the Japs had been expelled from Russian territory, an All Union Congress of Soviets was held at which the U.S.S.R. was formed.

by the union of four republics the R.S.S.R. (Russian Soviet Federative Socialist Republic), the Byelorussian (or White Russian), Ukrainian and Transcaucasian Soviet Socialist Republics. The Treaty of Union including the Constitution of the Union giving equality to all nationalities within the Union was adopted by the Central Executive Committee of the U.S.S.R. on July 6, 1923, and finally ratified the succeeding year. Later a number of other autonomous republics were declared constituent members of the Union. At the Eighth Congress of the Soviets in Dec. 1936 a new constitution was adopted known widely as the Stalin Constitution. According to the constitution (as variously amended) which is declared to be the fundamental

law of the Union, the Soviet Union is a socialist state of workers and peasants, the political units of which are the Soviets or councils of workers and peasants deputies. All central and local authority is vested in these Soviets. In 1936 the U.S.S.R. consisted of eleven republics, but by 1940 after the admission of the Karelo-Finnish, Moldavian and Baltic republics there were sixteen large Union republics, and within these another sixteen smaller autonomous republics, nine autonomous regions and six territories. For the Union as a whole the supreme law-making body is the Supreme Soviet of the U.S.S.R., which is divided into two chambers. The first is the Soviet of the Union elected by all citizens on the basis of one deputy for every 300,000 electors. It numbers about 600 deputies and elections take place quadrennially. The second chamber, the Soviet of Nationalities, is elected by the citizens of the U.S.S.R. according to Union and autonomous republics, autonomous regions and national areas on the basis of twenty-five deputies from each Union republic, eleven deputies from each autonomous republic,

five from each autonomous region and one from each national area. It thus affords a means of giving each of the large national republics an equal voice, irrespective of the population of each. It has some 570 members representing some sixty different nationalities. Either chamber can propose laws but any law must have the agreement of both chambers. The Supreme Soviet is normally convened only for two sessions each year. To carry on business in the interim and to work out the details of laws, it elects at joint sessions of both chambers a presidium of thirty-three members; the latter appoints the Council of Ministers. This council the highest executive and administrative organ of state power of the Union consists of the heads of each of the ministries

law of the Union the Soviet Union is a socialist state of workers and peasants, the political units of which are the Soviets or councils of workers and peasants deputies. All central and local authority is vested in these Soviets. In 1936 the U.S.S.R. consisted of eleven republics, but by 1940 after the admission of the Karelo-Finnish, Moldavian and Baltic republics there were sixteen large Union republics, and within these another sixteen smaller autonomous republics, nine autonomous regions and six territories. For the Union as a whole the supreme law-making body is the Supreme Soviet of the U.S.S.R., which is divided into two chambers. The first is the Soviet of the Union elected by all citizens on the basis of one deputy for every 300,000 electors. It numbers about 600 deputies and elections take place quadrennially. The second chamber, the Soviet of Nationalities, is elected by the citizens of the U.S.S.R. according to Union and autonomous republics, autonomous regions and national areas on the basis of twenty-five deputies from each Union republic, eleven deputies from each autonomous republic,

five from each autonomous region and one from each national area. It thus affords a means of giving each of the large national republics an equal voice, irrespective of the population of each. It has some 570 members representing some sixty different nationalities. Either chamber can propose laws but any law must have the agreement of both chambers. The Supreme Soviet is normally convened only for two sessions each year. To carry on business in the interim and to work out the details of laws, it elects at joint sessions of both chambers a presidium of thirty-three members; the latter appoints the Council of Ministers. This council the highest executive and administrative organ of state power of the Union consists of the heads of each of the ministries

Ten and village soviets direct the work of subordinate administrative organs and control local affairs. Run small local industries, schools, hospitals or clinics and the building of houses, do road and bridge repairs, conduct the administration of justice in the local people's courts, and maintain the children of poor families. Village soviets also regulate markets and supervise farms in the locality and woods and forests and the cutting of timber.

According to the constitution the economic foundation of the U.S.S.R. is the Socialist system of economy and the Socialist ownership of the means of production and the abolition of the exploitation of man by man consistently with the principle that he who does not work neither shall he eat. There are constitutionally two forms of Socialist property: state property or property of all the people and co-operative and collective farm property (*kolkhozy*). Natural resources, public utilities, banks, roads and railways, large specialist agricultural enterprises, machine and tractor stations, municipal enterprises and the main dwelling house properties in urban and industrial localities are state property (see further under the heading *Social System of Economy*). The right of personal property of citizens in their income from work and in savings in dwelling houses, furniture, utensils and objects of personal use as well as the right of inheritance of personal property of citizens are protected by law. The constitution affirms the right of all citizens to work, rest, leisure, education and maintenance in old age, sickness or incapacity without distinction of sex, race or nationality and provides that any restriction of the rights of, or conversely the establishment of privileges for citizens on account of race or nationality as well as the advocacy of racial or national exclusiveness or hatred or contempt is punishable by law. It provides for freedom of speech, press, assembly and

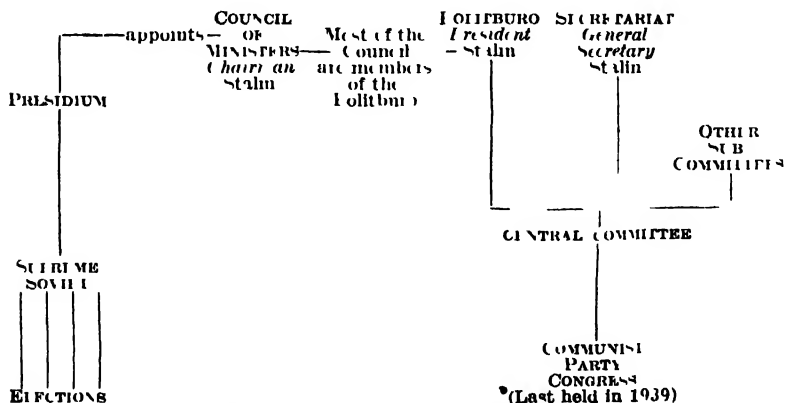

street processions. Military service is recognised as the sacred duty of the citizens and universal military service is the law of the land. Citizens of the Red Army have the right to elect and be elected to soviets on equal terms with all other citizens. The constitution also refers to freedom of conscience and 'of religious worship' (see further under *Religion*).

The constitution of 1936 was amended in 1944 by providing that each constituent republic of the U.S.S.R. should be entitled to have their own commissariats for defence and for foreign affairs but in matters concerning foreign affairs it is provided that the commissariat of the U.S.S.R. shall deal with all questions concerning the interests of the Union as a whole and at the same time that it should also have a voice in the general character of the foreign policy of the constituent republics. Thus this 1944 constitutional modification is more nominal than real and its true purpose probably was to secure for the sixteen seats instead of only one at the peace conference following the Second World War.

As in the 1923 constitution so in the new one the right of the constituent republics to withdraw from the Union was expressly recognised. Each constituent republic retains its own separate Supreme Soviet and Council of Ministers. Certain of the ministries, however, are the exclusive prerogative of the Union Government, who control such activities as foreign trade, heavy industries, etc. throughout the U.S.S.R.

It should be noted that the functions of judiciary, legislature and executive are bound to blend one into another in a system where no large body of case law exists to act as referee and where so much authority is delegated.

The Communist Party—The system of a jointly elected Supreme Soviet and the Presidium is, however, but a facile

THE ORGANIZATION OF POLITICAL POWER IN RUSSIA

of power and the gov. of R. in fact is absolutely controlled by the Communist party. The party is the sole legal party in R. Its divs. correspond to the territorial divs. of the state. Local conferences of the party members elect delegates to regional conferences and the latter send delegates to the Soviet Union Party Conference or Congress which last met in 1939. A central committee of seventy-one members is theoretically elected by the Congress. Since 1933 the committee has co-opted its members

receives instructions from the superior organs of the party and in every factory and collective farm there is a Communist cell which directs the technical administration of the factory or of the *kolkhoz*. In this manner the members of the party distributed over the whole state system represent the controlling power behind the state machine. The purity of the party policy and strict discipline are preserved by thorough investigation of the political and social activities of each member. Though much

THE POLITBURO (1939)

Stalin sitting to the far left illustrating the Stalinist method of the Politburo. From left to right are the tall Molotov, Shverdkin, Beria, Mikoyan, Kaganovich, and the thin figure of D. N. Ushakov.

Various subcommittees are appointed the two most important being the party secretariat over which Stalin as general secretary has presided since 1929 and the Politburo which holds the main threads of administrative power and the president of which is Stalin. There are (1930) about twelve members of the Politburo plus some associate members. Their decisions are carried out by the Council of Ministers promulgated by the Presidium and given retrospective legislative sanction by the Supreme Soviet. The diagram shows the twin popular and party structures and the supremacy of Stalin in his executive capacities. The party Central Committee, Secretariat and Politburo are the organs of real power in the U.S.S.R. The Communist group in every locality

freedom of discussion may be all well before a decision is taken once that is done absolute loyalty to the 'party line' is demanded and the decision on what is to be in fact the party line on any given subject at any particular time rests with the party leaders. The party can never be wrong in it is this attitude with the complete absorption in the party of a member's life which explains the confessions and expiations witnessed at the many trials of aging members who were thus performing one last service for party infallibility.

Security and Justice—The early difficulties of the Soviet state and the struggle within the Communist party gave a particular importance to the question of security and to those organisations con-

cerned with it. The tsarist Ochrana was restored as the (huk) reorganised in 1923 as the G P U (Ogpu). After the 1936-38 purges this was renamed the NKVD (qv) (People's Commissariat for Internal Affairs) which, after the Second World War, was divided into the MVD (qv) and M G B organisations which shared out the work in proportions impossible to define. State security is a Union-Republican ministerial concern. It would seem that the uniformed militia shades off from normal police work into the army and the plain clothes dept from detective work into the party. The MVD controls a large body of forced labour under the 'corrective labour code', by the use of which outlying regions have been developed and large projects carried out. Moreover every phase of Russian life is permeated by the activities of the MVD.

The criminal law is founded not upon Roman-Dutch law but in the words of an official statement upon 'a logical and consistent materialism'. It is an integral part of the policy of the workers' state and it serves as a weapon against the enemies of the proletariat whilst in the second place it is intended to foster a spirit of social discipline and self-discipline in the ranks of the working class. There are Union and Republican sections of the criminal code and crimes are categorised as against the Soviet system these being the more heinous and others. There have been many conflicts over judicial philosophy causing changes in the application of the law usually between extreme Marxism and the wider historical attitude of authorities such as Krimin.

The basis of the judiciary system is uniform throughout the Union but the constituent republics may introduce modifications. The supreme court of the U.S.S.R. is the chief court and supervising organ for all the republics and is elected by the Supreme Soviet of the Union for five years. Similarly supreme courts are elected for the constituent republics by their supreme soviets. In all courts cases are tried with the assistance of people's assessors except where otherwise provided. All cases are heard in public save where provided otherwise by law and the accused is guaranteed the right of defence. Broadly there is little difference between the code of laws and their application in the separate republics and the legal system of the U.S.S.R. may therefore be regarded as typical. The courts of the U.S.S.R. are divided into people's courts and special courts. The former consist of the people's judge and two assessors. They are courts of first instance for the trial of most civil and criminal cases except the more important cases some of which are tried before the regional court, while cases of the highest importance go before the supreme court. The regional courts exercise supervision over the people's courts besides acting as courts of appeal from the former. The supreme court exercises supervision over all the courts, and is an appeal court from the decisions of the regional courts. People's courts or courts of lowest in-

stance are elected by the citizens of each district for a term of three years and judges may be recalled for failure to perform their duties. Assessors are called upon from lists of persons elected by the citizens of the rural districts, industrial enterprises, collective farms, army corps and so forth. Those for the regional courts must have had experience in public work or in trade unions. The list of assessors for the supreme court is drawn up by the supreme court of the republic. Besides the people's courts there are special courts, labour courts for the supervision of labour disputes, working conditions etc., rural commissions for the settlement of agrarian disputes, arbitration committees for the settlement of disputes between the various state organs concerning property rights, military tribunals which deal with military offences, cases of espionage and other classes of crime, disciplinary courts for the trial of offences including neglect of official duties committed by members of the Central Executive Committee and similar state organs. These special courts are elected for a term of five years by the supreme court of the republic.

The state chief prosecutor is appointed for a term of five years by the Supreme Soviet. All the prosecutors of the republics, autonomous republics and regions are appointed by the procurator of the U.S.S.R. for a term of five years. The duties of the public prosecutors are the supervision of the faithful application of the law by all state organs. The prosecutors of the federated republics are subordinate to the state chief prosecutor whose duty is to see that acts of all institutions of the U.S.S.R. are legal and that the law is rightly interpreted and uniformly applied besides participating in important cases in his capacity of state prosecutor.

The independence of the judiciary was vitiated by a decree of July 1945 setting up disciplinary bodies to deal with and to impose penalties for judges' breaches of duty. Again in Aug 1948 a number of supreme court judges were replaced by an executive decree *a fait accompli* in violation by the Supreme Soviet until March 1949. The supremacy of the executive is established by the powers given to the security organisations to arrest and imprison without any interference from the ordinary courts and by its control over the expression of views which permits it to disregard the law without fear of criticism.

In two spheres important legal change was effected in 1944 and later. Marriages must now be properly registered and divorce laws were adapted to counter a frivolous attitude to family responsibility. In the sphere of private property the government has been to encourage its acquisition and several legal changes were made. *E.g.* inheritance law was abolished in 1942 the right of bequest and inheritance was enlarged in 1945 and in 1948 the citizen was given a perpetual right over land on which he had built a house.

DEFENCE—In 1925 a conscription law was passed by which all workers and

peasants underwent training at the age of nineteen, service with the colours at the age of twenty one, and subsequently two months' training a year. Other classes formed 'working battalions' or paid a military tax. The constitution of 1936 established universal military service. A decree of Dec 1941 by which all male citizens had to do 110 hours' military service per year, was still in force in 1950. Elementary military training is given in all schools to children between the ages of twelve and fifteen, and pre-army training to children between fifteen and eighteen in the secondary schools and in technical and factory training schools attended by young persons of corresponding ages. Students of higher technical institutions who have not served in the army, also undergo similar pre-army training. There are also officer cadet schools for regular officers. The strength of the army and of its reserves is not published. For further details about the army see under RED ARMY.

At the outbreak of war between R and Germany in 1941 the Russian Navy was believed to consist of 4 battleships, 7 cruisers, 3 destroyers, 170 submarines and 150 minor craft. According to the programme of construction announced in Aug 1939 the navy was to have been entirely reconstructed and considerably strengthened by 1942-3. It was also proposed to widen the canals to enable capital ships to pass from the White Sea into the gulf of Finland and the Black Sea. Kronstadt is a naval base was rebuilt. Subsequent naval strength is unknown, but in 1949 it was believed that at least 3 battleships, 10 cruisers, 60 destroyers, 250 submarines, 1 torpedo boat, and a number of auxiliary vessels were in service. In Feb 1948 R received 45 warships as the Russian share of the 1st Navy. There are naval dockyards at Leningrad, Nikolaev, Sevastopol, Molotovsk, Vladivostok, and Komsomolsk. The role of the Red Navy in the Second World War was primarily a defensive one fought in close co-operation with the Red Army. It played a part out of proportion to its size. The task of the Navy fleet in the White and Barents Seas was to keep open the sea route to Britain and the U.S.A. This fleet which consisted largely of submarines, cutters and seaplanes did valuable service in assisting convoys and in harassing Ger shipping; it is claimed that it sank 500,000 tons of Ger shipping. The Baltic fleet defended Leningrad and dominated the region of Hango in Finland and it assisted the Red Army in the drive to the Baltic especially at Tallinn and off the shores of E. Prussia. The Black Sea fleet distinguished itself before Odessa and Sevastopol and along the coast of the Caucasus region. In no instance did the Red Navy permit landings of hostile forces in the Black or Baltic Seas behind Russian lines. In the first three years of the war the Red Navy is said to have sunk 1 auxiliary cruiser, 2 armoured coastal defence ships, 37 destroyers, 50 submarines and numerous light craft. The Red Naval Air Force brought down more than 6000 enemy planes. In these

various operations, however, considerable losses were incurred.

There are air forces attached to the army and the navy but their strength and character is not known. It has been suggested that R possesses 15,000 war planes with a reserve of over 10,000. Jet aeroplanes were publicly demonstrated in July 1949.

RELIGION—Vladimir I accepted Orthodox Christianity in 989 and this remained the established religion of R until Jan 23, 1918. It was followed by the majority of the pop. though there were many religious minorities, some of them large: e.g. Uniates, Lutherans, Rom Catholics, Jews, Muslims. These suffered varied degrees of persecution from time to time. Intolerance was marked towards Jews, Uniates and Rom Catholics. In the case of the latter two groups this was frequently largely because Catholic elements were also members of one of the discontented national minorities.

In 1889 a Russian patriarch was consecrated by the patriarch of Constantinople, and the Russian Church became autonomous. After the fall of Constantinople R regarded herself as the champion of Orthodoxy and this attitude gave secular Russian designs on S.E. Europe a popular appeal. The Church became divided into 'Old Believers' and 'New Believers' after a liturgical quarrel in the seventeenth century. The close connections between Church and State led to some of the hatred felt by revolutionaries towards the Church. The Church had in fact frequently suffered from the State. Peter the Great had abolished the patriarchate and Rasputin managed Church affairs according to his personal whims. The Church was a very large landowner and undoubtedly contained many abuses, but elements within it were desirous of reform. The liturgical quarrel marks the date at which the educated classes began to despise the Church as an institution. But its essentially liturgical character preserved its general popularity and devotion to it prior to 1917 seems to have been wholehearted.

From the revolution of March 1917 all citizens might belong to any religion. The Bolshevik decree of Jan 23, 1918, disestablished the Orthodox Church. Its property was appropriated by the State. A limited number of churches, however, were loaned to their congregations which had to maintain them themselves though they were allowed the free use of the building. Religious teaching in schools giving general education was forbidden. The constitution of 1918 specified freedom of religious and anti-religious propaganda, but the former was omitted in a later revision. Between 1918 and 1941 the Church suffered under severe disabilities, and during the period 1929-35 was openly persecuted. Many priests were imprisoned, though the gov. stated that they were not imprisoned on religious grounds. The gov. admitted the continuance of religious faith, however, and the Stalin Constitution of 1936 enfranchised the

clergy and did not contain any anti-religious legislation.

The Orthodox Church and other religious groups wholeheartedly supported the Soviet Gov. during the Second World War, anti-religious activity apparently ceased, and the Metropolitan Nikolay was appointed member of a gov. commission to investigate war atrocities. Between March and Oct. 1918 the Church had considerably reformed itself and elected a patriarch, but upon his death in 1925 no successor could be chosen. In 1913 however the Metropolitan Sergei was elected patriarch and was succeeded by Patriarch Alexei in 1943. A Soviet Council for Orthodox Church affairs was established in 1943 while a separate council dealt with the affairs of other religious denominations. A monthly *Journal of the Moscow Patriarchate* was instituted. Church internal organisation was reorganised and expanded.

At the end of the Second World War an understanding seemed to have been arrived at between Church and State but the actual freedom of the Church would appear to be strictly limited, and the ban on members of the Communist party belonging to any religious community remained. Observers reported large congregations but the churches open were limited in number. In 1943 there were 20,000 Orthodox congregations with 30,000 priests, 87 monasteries and convents, 10 seminaries and 2 theological academies. The number of church members is not known. Information about other religious communities is small but Roman Catholics are known to suffer under great practical disabilities. In 1940 it was suggested that the attitude of the gov. to religion was hindering.

Education. To support the Soviet Socialist economy and way of life the Communist party and the gov. have developed an elaborate educational and propaganda system. In the early years of the regime there was much experimentation in methods of education which was regarded a duty as well as a right. Illiteracy was high amongst the lower classes under the tsarist regime even though a state system of education had been introduced in the time of Catherine the Great and large-scale and successful efforts have been made to reduce it throughout the territory of R. Asiatic and European. In 1913 sex changes were made in the light of the experience gained, e.g. the need for discipline was recognised and punishment allowed and coeducation for adolescents abolished. At the base of the system are crèches and nursery schools in towns and villages, parents paying as they can afford. Free universal, and compulsory education is provided in primary and junior secondary schools. Entering the former at the age of seven, children at twelve go on to the latter, or to occupational schools. One million boys each year undergo an industrial apprenticeship in the occupational schools. Most children leave school at fourteen, a minority continuing in the secondary schools till seventeen. From

the senior secondary schools and technical colleges are drawn the leaders of agriculture and industry. Working classes are widely organised and the party and the trade unions provide opportunities for adult education. In the higher schools and univs. the general standard has been raised in later years. The practical sciences have lost their former strong preponderance and a broader education in the humanities is now provided. However dialectical materialism is the accepted philosophy, the study of which with Lenin-Stalinism is compulsory. Fees are paid for higher education and scholarships and grants are restricted to exceptional pupils. Even before 1933 children from the professional classes comprised 40 per cent of the students. The Soviet Gov. has opened many new univs. throughout the Union, as at Khabarovsk and Ulanovsk in addition to those surviving from tsarist days such as the two in Moscow and those of Kazan, Leningrad and Tomsk. Higher education is dealt with by ministries in each republic. In 1935 there were 198,000 primary and secondary schools with 32,000,000 pupils and 860 higher educational establishments with 731,000 students. Technical institutes had 1,091,000 students. In addition there were Suvorov military schools, trade music art and theatre schools, higher medical schools and medical research institutions.

For young children from seven to fifteen there is a party organisation, the Pioneers, resembling the scout movement in some of its activities. For youths from fifteen to twenty-five there is the Komsomol, the real training ground of the party, whose seriousness of purpose does not attract all Russian youth. The state extends large sums to this organisation and it offers considerable advantages in educational facilities, etc. to its members.

History. Very little is known about the pre-history of R. There are vast expanses of territory which are as yet almost unexplored, and the official propaganda which permeates Bolshevik historiography has made it difficult to assess the real value of research done since 1917. Russian history before the coming of the Turk (7th c.) is also obscure and confused. Until the beginning of the ninth century the inhabitants of R. were mainly Slav, Finnish tribes who had entered R. from the W. and who were unable to maintain any order in the country in which they had settled. These tribes must have contained considerable Frank and Gothic admixtures, as in the fifth century B.C. for example advanced Scythian and later Sarmatian civilisations flourished around the Black Sea and had contact with Greeks. Almost all these civilisations were destroyed but they left traces in the Russian language and their peoples were absorbed by the invading tribes.

The Viking Settlements.—During the ninth century the Russian tribes gradually came under the influence and domination of invaders from the N. who for a time ruled them and demanded payment of tribute, and from this time the first clearly

denied period of Russian hist dates. But these Vikings were driven out of the country by a general insurrection of the Slav tribes who lived in the neighbourhood of Lake Ladoga and for a time the country again became Slav and Finnish. But the invasions of Magyars and Pechenegs from the E seem to have decided the Slavs of Novgorod to call back the Vikings who came from a country (possibly Denmark or even Normandy) called Rus. The chief of the Northmen who returned was called Rurik and many Russian nobles claimed descent from this ancestor. The Vikings settled in R ruled the country as military chieftains maintained order, estab a system of law which was strictly Scandinavian in derivation and were finally assimilated with the original inhab of the country itself. However they estab no kingdom and although they set up a number of principalities and for a time were regarded as a power in Europe there was no real unity amongst the various components of this strange conglomeration of states and disorganisation and anarchy soon prevailed. The principalities were split up into still smaller districts, the princes quarrelled among themselves, pretenders to the various thrones quickly appeared and civil war was the rule rather than the exception. Such is the general picture of Russian hist from the tenth century to the middle of the thirteenth. The Russians had however penetrated to the S and Kiev whose situation made it a focal point on the routes to W Europe, Novgorod and Constantinople became the most important Russian city. The early Russians practised various pagan religions. Queen Olga became a Christian in 957 but there was no national conversion until 989 when her grandson Vladimir accepted Orthodoxy Christianity and proceeded to enforce it on the country. The conversion was of great significance in the hist of E establisg a new set of new codes of morals and justice and setting new standards of art and learning. Yaroslav (1019-55) was the first of the great princes. He beautified Kiev and formed many foreign family connections by marriage alliance. But after him R became more and more involved in anarchy. Kiev was stormed and taken a time after time and the Russians gradually retreated northward to their original home at Novgorod. This had remained for a long the principal city of the N and had been on the main route between Sweden and Constantinople, one of the great trade routes of the E and Middle Ages and the type of gov in Novgorod a merchant city was more enlightened and in a sense more democratic than that of any other principality. The greatest rival principality was Moscow, with a system of gov which differed essentially from that of Novgorod and which was despotic in form. Continual warfare raged between these two states, to be terminated by the arrival from the E of hordes of Tartar invaders who threatened the safety not only of Moscow (which was directly in the line of invasion) but of Novgorod

also and through these states W. Europe.

The Tartar Invasions—The Tartar invasions mark a new phase in Russian hist. During this period R had degenerated since the days of Rurik and was now threatened with annihilation. Already the S portion of R had suffered from the invasion of the hordes of barbarians from the steppes now these swept down to the more civilised parts of R itself. The attention of the Russian princes had been drawn to the possibilities of invasion by the fact that the tribes on their E border had already suffered invasion at the hands of a Tartar enemy. These had applied for aid to the Russian princes pointing out that the fate which now threatened them would be meted out to R if the Russian princes did not come to the rescue. They were met with an overwhelming defeat in 1223 but the Tartars although victorious retired and for a time were not again heard of. In 1237 however they returned in greater numbers and ravaged practically the whole of E sweeping down to the boundaries of the S and penetrating almost as far as the Baltic. Finally however the leader of the Mongol and Tartar tribe settled on the banks of the lower Volga. But the Russian princes were held to be the vassals of the great Khan who ruled over an empire which extended from China almost to the Baltic and which whilst it had no unity was nevertheless held together by an immense army and had a intricate system of taxation. The Mongols interfered little with the religion of the Russians. They were themselves at first idolaters, but later became Muslims and as such did not import radically from their principle of taxation but the annual tribute which they exacted weighed heavily on the Russian princes. This system continued while the Mongolian Empire was kept together in its original strength by a single ruler but gradually the power of the great Khan began to decline. The empire began to fall to pieces, it no longer had a ruler capable of controlling so vast a realm and the result was that gradually the Russian princes began to assert their independence. Chief amongst the rulers of R was Dmitri Donskoi prince of Moscow, whose state had gained prestige when Moscow became the home of the heads of the Church in the fourteenth century. Organising the Russian princes he gained a great victory over the Khan of the 'Golden Horde' (the name given to that part of the Mongolian Empire which bordered on R) at Kulikovo (1380). The power of the horde was breaking up rapidly, and was soon nothing but a conglomeration of independent Khanates.

Russia in the Late Middle Ages—The leader of the coalition of the Russian princes who had overcome the power of the 'Golden Horde' now assumed the title of grand prince of R and with the beginning of his authority the third definite period of Russian hist begins. Dmitri, however had little, if any, real power over the princes of the other inde-

pendent principalities, but he was the founder of the family of princes of Moscow who were to establish a real sway over practically all that part of Europe which is now called R. By the beginning of the fifteenth century the power of the Mongols was virtually at an end and the Russian princes of Moscow were occupied in extending their own as far as they possibly could. The princes of Moscow were recognised as the grand princes of R, but were regarded simply as *primus inter pares*. They were soon, however, to show their greatness of their power. The first great ruler of R was Ivan III (*q.v.*). He and his grandson Ivan the Terrible were

Victor Ivanovich

IVAN IV

A scene from the film *Ivan the Terrible*. The tsar, who had turned to Muscovites after betraying Lithuania by his father, looks down from a hilltop on a procession of people from Moscow come to plead for his return.

responsible for the shaping of the empire of Moscow on which the later Russian Empire was established (*q.v.*). Until the accession of Ivan III, the power of the Dnieper boyars (*q.v.*) still remained great in Moscow. In 1462 Ivan III succeeded to the throne of Moscow. He immediately proceeded against the republic of Novgorod and was finally successful in completely overcoming it. He instituted a new form of government, being influenced very largely by Gk. ideas, since he married Sophia, a Byzantine princess and daughter of Thomas, brother of the Emperor (Constantine) Palaiologus, and in her train came a great number of Gk. followers. He depended for service in the state upon men whom he himself had raised from the ranks of the commons, and did all he could to destroy the power of the boyars. He extended the territory over which he ruled to

the Arctic Sea and to the Ural Mts., and he made Moscow the greatest city of R. During his reign the Tatars made their last attempt to re-establish their power over the Russian princes. But faced with an enormous army gathered together by Ivan, they withdrew (1480) and did not again attempt to invade R. Ivan again, influenced by the ideas of the Gk. court, took upon himself the position originally occupied by the khans: he demanded the homage of the Russian princes and surrounded himself with all the pomp of Constantinople. In 1497 he issued his *Sudobnik* or Book of Laws, the second Russian code after the *Russkaya Pravda* of Yaroslav. Ivan was the first of the rulers of R. to style himself 'ruler of all R'. The great enemy which R. had now to face was Lithuania. At that time joined to Poland. The policy of Ivan was continued perhaps even more severely under the rule of his son, Basil III, who won Smolensk from the Lithuanians, finally crushed revolt in Novgorod, and conquered the last of the independent republics in Pskov. He died in 1550 after a reign of twenty-eight years and was succeeded by his son Ivan IV (*q.v.*), surnamed the Terrible.

Ivan was only three years of age when he was proclaimed ruler of all R. The boyars seized the opportunity to revive their power. They had many supporters, for the princes who had been dispossessed by the growing power of Moscow and many of the Slav families who disliked the pomp of the Gk. court, helped to restore boyar power. The boyhood of Ivan was spent in neglect and humiliation. R. was again threatened with disintegration, but the power and strength of Ivan the Terrible saved it. Ivan recovered his power when he was sixteen and caused himself to be proclaimed tsar of all the Russians. The name had previously been adopted by Ivan III, but was not actually used by him except in his dealings with foreign states; it is a contraction of the name *Cesar*. Ivan realised that it was necessary to crush the strength and power of the boyars, and he immediately began to do so with a terrible vigour which increasingly varied on madness, and which was made worse by the religious fanaticism with which he pursued his ends. The boyars and their families were hunted down and killed without mercy, and the feudal nobility was broken completely. During Ivan's reign diplomatic and trade relations were established with England. Ivan the Terrible was the first really autocratic ruler of Russia and he established the power of the tsar and carried on a long war with Lithuania which was successful at first but which finally became almost disastrous. In this he was supported by the general assembly (*zemsky sobor*) which he first summoned in 1547. Ivan's cruelty, his violent overshadowing his great ability as an organiser. But his reign marked also a rapid growth in ecclesiastical corruption, owing to the immense wealth of the Church, and a further depression of the peasantry whose position had been deteriorating since the Tatar invasions.

An important development of this period was the gradual advance of the Cossacks into Siberia. The pop of the S dists of R had gradually acquired completely unique characteristics. They were continually pushing out eastward from the steppes in search of new lands on which to settle. These lands often swarmed with enemies and the settlers therefore took good care to defend themselves. The result was that a warlike and well trained race sprang up in the S and pushed them way eastward, establishing as they went Russian supremacy over Siberia. Ivan was succeeded by his feeble son Feodor, and real power passed into the hands of the tsar's brother-in-law Boris Godunov. Until the accession of Boris to power the Russian peasant had still in theory been quite free. Boris initiated the legalisation of a serfdom which had long been a fact in many dists. In religious affairs the Church in R had become more closely linked to the State when it appointed its own patriarch after Constantinople ceased to be the head of Orthodox Christendom.

The Accession of the Romanovs.—In 1583 Boris succeeded Feodor on the throne. He died in 1605 and immediately many impostors appeared who claimed to be Dmitri, the brother of Feodor who was supposed to have been put to death by Boris. Before the death of Boris a man calling himself Dmitri had crossed the Russian border and supported by Poles and the Jesuits had met with a good reception in the country. He was regarded by many as the real heir to the throne and was after the death of Boris crowned in Moscow. The boyars however declared that he was merely the tool of Poland and he was murdered by Prince Basil Shuiski who seized the throne and was proclaimed tsar. A new impostor however put himself forward as a candidate and was recognised by the people who caused Shuiski to abdicate. Sigismund of Poland then put his son forward as a candidate for the throne and he was accepted by the Russians when he had promised to safeguard Russian interests. Polish troops had already entered Moscow, when Sigismund made it apparent that he himself intended to be tsar of R. This proved extremely unpopular and R saved herself in this crisis by a national rising fostered by the patriarch Philaret Ponomarev which drove the alien troops from Russia and placed on the throne Michael Romanov, Philaret's son, the founder of the Romanov dynasty. The *zemsky sobor* had now lost the little power it had ever truly had. It did not even formally elect Michael who was acclaimed by a crowd in Moscow. Under the first of the Romanovs peace was made with Sweden but the war with Poland on spite of a short armistice dragged on until peace was made on terms which were not very favourable to R. The country during this reign had time to recover a little from the ravages which had been made during the previous period. Under Tsar Alexei who succeeded in 1645 serfdom was definitely established by a law promulgated in 1649. Many general risings

took place throughout R during this period and the Cossacks of the Volga also showed signs of unrest. Alexei himself did much to prevent the power of the Russian metropolitan from becoming too great. During his reign the metropolitan was Nikon who attempted to gain for himself the position which had formerly been occupied by the father of the first Romanov. He was among it the position of 'pope of the Greek Church' but his arrogance made him generally unpopular and he finally so exasperated the tsar that he was deposed. He had however done much to attempt to reform the Gk Church, although most of his reforms were regarded with horror by the majority of the Russian people and from this time the beginning of the isolation of the Church is an institution from the body of the people may be said to date. The struggle had not been one between the Church and the State but between extremely ambitious churchmen and the tsar nevertheless. Shortly afterwards during the reign of Peter the Great the patriarchate was abolished and the power of the patriarch placed in the hands of a synod. During his reign Poland was finally crushed by R and Smolensk became definitely a Russian town. The turn to the scales was given by the Cossacks who appealed for help against the Poles to the Russians and who finally recognised the supremacy of R. The final unification of Cossack and Russian gave R the predominance amongst the Slav races of Europe. As a result of the Russian claims on Little R during the next reign (Feodor II) war broke out with Turkey. R was finally victorious and in 1681 all Turkish claims on Little R were given up. On the death of Feodor Peter his half brother was proclaimed tsar by the Moscow mob influenced by the patriarch but Sophia his half sister for a time became the regent. She attempted to dethrone and ill-treatwards to assassinate Peter but was finally overthrown and exiled to a monastery.

The Westernisation of Russia. Peter (q.v.) was now fully tsar and although his half brother Ivan also received the title the real authority rested with Peter whom later ages summoned Peter the Great. For a time however Peter left the regency in the hands of his mother. He was however by his intimacy with foreigners and by his inquiry into their systems of government and administration promoting the way for that series of reforms which was to change the whole face of the Russian Empire. He realised that in order to become a power in Western Europe R must become a sea power. The only outlet which R had to the sea was in the N and Peter determined therefore to gain an outlet for R either in the Black Sea or the Baltic. He was successful at first in gaining a naval base on the shores of the Black Sea and he left the organisation of the fleet to a council of the boyars whilst he himself went on a tour throughout Europe which was to have such great influence upon the future of R. During this tour he visited Germany, Holland, England, France, and Austria.

Anything that he could learn or adapt, he assimilated without reference to the country or nation from which it was learnt. He was recalled from his tour by news of fresh rebellions in R and he returned to crush with renewed vigour a conspiracy which was practically at an end before he returned. He now devoted the rest of his life to R. He gained after a twenty years' war with Sweden an outlet to the Baltic, and although he was forced by a crushing defeat by the Turks to give up the fruits of his former victory on the shores of the Black Sea, nevertheless, on the whole his policy of expansion was successful. But his great work in R was the reform of the finances, the administration and the army and the founding of a navy. He introduced W. methods: he drilled his army on the W. model; he imitated many foreign institutions, disregarding entirely the prejudices of the people. When he died in 1725 the era of modern R had begun. He had planned at the beginning of his reign a great crusade against Turkey. The latter was the natural enemy of R; the Holy War the natural excuse, but he soon found that European politics did not allow of his interference with the Turk, and so he gave up that plan. But he took a legacy of the whole of the Russian administration, and though he tried to introduce W. ideas too quickly so that in many cases the customs of old R continued to exist under the veneer of a new civilisation, his reforms had lasting effect and R took her place as one of the great powers of Europe. All his reforms naturally did not please his people, who were by nature conservative, and this conservatism resulted in many of his administrative reforms proving unworkable in the hands of incompetent and predatory officials. He founded Peterburg at the mouth of the Neva, his window to Europe, and he proclaimed himself emperor of the Russians—a title which gave him place beside the ancient emperors of the Holy Roman Empire. Agriculture, mining and all other industries hitherto neglected were revived. Customs prevailing from the time of the old Mongolian rule were abandoned, the luxuries of the W. were introduced, and above all the position of the women of R was much improved. But the cost to R was great and the chief victims of the financial burdens were once again the peasants. The standards of the upper classes rose but those of the peasantry were further depressed.

Peter left the throne to his second wife, Catherine I, but she, after a short reign, was succeeded by Peter II (1727-30), a grandson of the great Peter, but a feeble ruler. The nobles regained some of their power and R began to lapse into her old ways. On the death of Peter II, the crown was offered to Anne of Kurland, the niece of Peter the Great, who succeeded on certain conditions and who for a time gave up the autocratic constitution. Her administration was directed principally by her incompetent favourite Biren on the lines of a petty Ger state. She

was succeeded (1740) by the infant Ivan VI who, however, only held the title for a year, and was then succeeded by Elizabeth, a daughter of Peter the Great and Catherine I. The main characteristic of her reign was her hatred of Prussia and to this end she devoted many of her best troops and very large sums of money. Her administration carried on by her favourites was based upon the methods of Peter the Great, and was national in tone. She was succeeded in 1762 by her nephew Peter III, who had married a princess of Anhalt-Zerbst and who was assassinated within seven months by partisans of his wife, who then succeeded as Catherine II (*q.v.*) and ruled until 1796.

Catherine II was a typical despot of an age when benevolent despotism was held to be the highest form of government. Catherine had usurped the Russian throne, but she did more than any other ruler to consolidate and further the reforms of Peter the Great. If Peter the Great had introduced in many of the customs and ideas of W. Europe into R, Catherine II went still further, and attempted to introduce the culture and civilisation of W. Europe. Immediate attention was paid to education. The philosophes of the French encyclopaedic school had great influence, and Catherine herself called together a great council at Moscow which was to decide and formulate the various reforms to be introduced. The ideas of Catherine, however, frightened conservative Russians, and the reforms had to be introduced by decree of the empress. Not only were great strides taken in education, but the administrative reforms also were very marked. The units of gov. set up by Peter the Great were still further split up. A certain degree of self-government was granted to some of the higher classes, and many of the estates of the Church were taken over by the State. Serfdom, however, increased and was in fact extended into some parts of R which previously it had not been known. The administrative reforms did not stop, administrative corruption, the financial crisis increased and the attraction which a brilliant court offered to the nobility and gentry drew them away from their estates and cut them off from their peasantry. Catherine was in theory anxious to improve the condition of the peasants, but her policy only succeeded in increasing their burdens. The tone of the Russian court improved greatly, and in fact was based upon the court of Versailles. But the reign was by no means peaceful. A pretender ravaged the border under the name of Peter III. This pretender had a great following and did considerable damage until finally defeated and executed. Catherine's foreign policy was devoted to pushing the frontiers of R southward and westward as far as possible. In this he prospered. She carried on wars successfully against Turkey, Persia, Poland and Sweden. She acquired the peninsula of the Crimea and thus accomplished Peter I's great aim of obtaining a footing on the Black Sea.

Also of great importance to R. was her participation in the partition of Poland, by which R. extended her boundaries greatly to the W. Encouraged by the success of this, she planned the conquest and partition of Turkey in much the same way. Catherine did all she could to combat the principles of the Fr. Revolution, although she took no active part in the coalition against France. She was probably awaiting an opportunity to attack Turkey and solve the questions of the Near E. whilst Europe was otherwise engaged when she died in 1796.

taken up with liberal reforms in which he himself took a great interest. The system of administration was again reorganised (educational schemes were discussed and the work of the emancipation of the serfs was begun, when Alexander's attention was drawn from internal reform to European politics. R. had for some time now claimed a position as one of the great powers of Europe. For a time in alliance with France, Alexander held a strong position in Europe, but he soon saw that the real strength of R. lay not in allying with France but in preventing that power

ALEXANDER I PRESENTS TO NAPOLEON SOME KAIMUKS, COSSACKS, AND BASKERS OF THE RUSSIAN ARMY JULY 1807

From the painting by B. R. in the Louvre

Catherine II was succeeded by her son Paul I. who had been kept in captivity during the greater part of her reign and who was capricious and arrogant and became extremely unpopular. His reign marks the beginning of an improvement in the condition of the peasants initiated by Paul probably mainly to spite their owners. Catherine's countrymen whom he hated. He did not immediately join the European coalition against France, but did so in 1798 and almost immediately withdrew having conceived a great admiration for Napoleon. He was on the verge of declaring war against Great Britain when he was assassinated. He was succeeded by his son Alexander I (1801-25), who at the very outset of his reign earnestly desired peace but whom European politics dragged into the vortex of war. The early part of his reign was

from becoming too powerful. The aggression of Napoleon in mid Europe caused Alexander to go to war, but the defeats at Austerlitz and later at Friedland led to the treaty of Tilsit. At the interview which preceded the drawing up of this treaty Napoleon and Alexander agreed to divide a world empire between them. Napoleon however had no intention of keeping his word. The vague promises made to Alexander were all broken. The long planned conquest of India came to nothing. Austria was crushed. Germany overwhelmed. Spain annexed. R. remained alone unconquered, and Napoleon now turned his attention to her. Between the years 1812 and 1815 Alexander was Napoleon's enemy and the disastrous retreat from Moscow had probably more effect on the ultimate overthrow of France than anything else.

Russia after the Napoleonic Wars — After the treaty of Paris Alexander departed entirely from his previous scheme of liberal reform and became one of the champions of political reaction. By the time of his death it was beginning to breed those secret political societies which played such an important part in her later history. Alexander was succeeded by his brother Nicholas I who made no pretence to any of the liberal sympathies of the late king. Autocratic government was at its height during this reign. Any attempts at revolution or at liberal reform which could only be obtained by revolution were crushed with great severity. Travelling and hence the importation of new ideas was made increasingly difficult, and this system was further aided by a strict censorship of the press. Progress, however, continued: the army was made efficient, the navy increased, commerce was fostered, and a good system of railways inaugurated. The work was carried out entirely under the auspices of the tsar and his personal government. During the thirty years of his reign (1825-55) wars were fought with Turkey and with Persia, both of which obtained for it an increase of territory and in the former case an over-whelming superiority. In the Black Sea Nicholas was a strong believer in the divine origin of kingship. For this reason he supported the emperor of Austria when the Magyars rebelled and was never friendly with Louis Philippe, raised to the throne by the people. He made Poland into a Russian province and finally went to war with Turkey and found himself involved with England and France in the Crimean war. Although the Allies gained but little, the loss to it was tremendous, and in the middle of it all Nicholas I died.

One of the first acts of his son and successor Alexander II was to make peace by which he lost the right of navigation on the Danube and a strip of territory on the Black Sea and this was no longer allowed to keep a navy in the Black Sea.

The early days of the reign were full of important liberal reforms. One of the most important of these was the creation of *zemstva* (roughly corresponding to local councils) in 1864. Their authority was limited; they took the decisions not the tsar as the unit of government for a long time they existed only in the Russian provinces, but they allowed some practice of the representative principle, and proved to be one of the most powerful of the constitutional organs of criticism of the regime. The *zemstva* (*zemstvos*) was a class in which constitutionalist liberals and conservatives were trained; it contained an idea which, if extended further, might have saved the Romanoffs, but they were incapable of requiring the necessary independence. Justice underwent complete reorganisation, serfdom was abolished and the reforms would probably have gone further had not a rebellion broken out in Poland and been crushed with a severity which restored more or less the autocratic system. Censorship was introduced in 1874. In 1868, as an immediate result of

the insurrection, Poland was incorporated entirely with the Russian Empire.

Seizing the opportunity offered by the Franco-Prussian war, it in 1870 repudiated the clause of the peace of Paris (1856) which forbade her to keep a navy in the Black Sea, and the Conference of London upheld the repudiation. Meanwhile it had made extensive conquests in the East and had established Russian supremacy over Turkistan. The frequent oppression of the Christians in Turkey and the suppression of an attempted rebellion by methods of barbarism, led to a conference of the powers whose overtures were rejected by the Turks and this in turn led to the declaration of war by it. When the Russians appeared to be on the point of entering Constantinople, the peace of San Stefano was signed (Jan. 1878). The powers, however, refused to recognise the terms of this treaty, and the early months of that year were passed in the fear of a general war. Finally a congress was held at Berlin and the treaty of Berlin was signed (1878) by which the powers came to general agreement as to the arrangements of the states in the Balkans.

Nihilism in it was on the increase at this time and finally, in 1881, Alexander II was assassinated by a Nihilist agitator. He was succeeded by his second son, Alexander III, whose reign was characterised by reaction. Jews left the country in vast numbers owing to oppressive measures. Many were annexed in 1884. The statesman whose views it might be said were embodied in his book, *Moscow Conversations*, he stated his conviction that Western democracy was rotten, and that it could remain so only by continuing her system of structural government. Nicholas II succeeded his father in 1894 and at the beginning of his reign the Russian sphere of influence was extended in the Far East. The Manchurian railway was completed and Port Arthur seized. Conflicting interests between it and Japan led to the Russo-Japanese war (1904) in which the Russian force was defeated on land and sea and their fleet annihilated while in it. If the government was paralysed, peace was signed at Portsmouth (U.S.A.) on Sept. 1905. It obtained, exceptionally, a *modus vivendi*.

Evolution in it. — *The Growth of Opposition Groups.* It was the monarchical and autocratic of Russian domestic policy between 1860 and 1876 which did much to encourage revolution. Repeatedly a few years of reform were followed by an interval of reaction and once again were frequent and all-around whole or in part within a short time of being granted. Thus the civil law of 1890 establishing the independence was regarded by the peasants as a partial redemption of their former total serfdom might if applied effectively have suppressed revolution at least for a considerable period. A steady issue of conciliatory reform might, if not too young, all discontent have prevented a final complete overthrow of the established system.

but the fluctuating policy which was instead pursued irritated the professional classes, the artisans and peasants, and the more intelligent of the landed gentry and aristocracy. The bourgeois and small landowners (who included some of the most enterprising of the peasants) were in the main the supporters of the Liberal and progressive (conservative groups such as the Cadets) which began to take party shape in the last years of the nineteenth century. These groups accepted and supported tsarism, capitalism and private ownership of land etc. but wished for a parliamentary administration and for responsible civil government on British lines. In waiting for an elected Duma they drew their inspiration from the British Parliament and their leaders visualised political reform on British lines. In the years preceding the revolution of 1917 these groups had support from the most influential interests in the country. They lost it gradually and the most idealist, desperate and ruthless turned to more extreme parties as it became clear that the Liberal and Conservative attempts to co-operate with the regime in order to reform it were unsuccessful. The tsar's administration could not be trusted to keep its word. Its disregard and contempt for the parties which might have been able to save it resulted in a loss of confidence in Western European democracy and in the possibility of reform without revolution.

Socialist groups began to develop at the end of the century based on the teachings of Marx (1) but they remained comparatively unimportant until it was obvious that the Duma experiment was a failure. Hence it was initially favoured by that of industrialism in Russia. Mining development created a vast industrial area in the Donetz basin, munuf. spring up in central and east Petersburg and Moscow and led to new towns such as Yuzovsk and Ivankovo. A proletariat was created which was at first much exploited, events which are those described in Gorky's *Diade*. It did not occur in fact. Between 1882 and 1886 a series of factory laws inspired by Bunge investigated these conditions but any reforms had to battle against the gov. reluctance to enforce the law and the incompetence and corruptibility of inspectors. In 1887 Bunge was driven out of office charged with being a socialist and his reforms were abandoned. Nevertheless factory conditions generally improved during the first half of the twentieth century and wages rose. There were opportunities for a limited education in the towns which awakened a political interest among the workers. In 1898 the Workers' Social Democratic party was formed which after the 1905 congress split up into the Bolsheviks and the Mensheviks. Both these sections sent their members among the industrial population in the idea which had been tried earlier by the less extreme groups but with less success. Bolsheviks and Mensheviks however, had the advantage of knowing exactly what they wanted, their belief in the dictatorship of

the proletariat was calculated to appeal to the class they addressed, and their uncompromising attitude attracted people exasperated by half concessions. When, owing to gov. obstinacy constitutionalism seemed a failure the Social Democratic party gained many supporters from the professional classes. Lenin was the son of a school inspector. Trotsky of a Jewish chemist.

The first Russian revolution (1905) showed that the Social Democratic party was able to command limited support in industrial areas enough to cause a temporary but significant demonstration. But the gov. was not yet dislocated enough by war (as it was in 1917) nor was support for the Social Democrats sufficient to make it anything more. Though caused by chronic discontent with prevailing conditions the demonstration was precipitated by the Russo-Japanese war and was tacitly supported by many Liberals and Conservatives. A general strike was called throughout Russia followed in Dec. 1905 by a military insurrection in Moscow. A Soviet (a council of elected delegates) of workers' deputies was formed in which Trotsky, then a Menshevik, was prominent. The Imperial Gov. under Witte capitulated (Oct. 30, 1905) promising reform of constitution and democratic franchise. In March 1906 elections were held for the Duma which opened on May 10 the Cadets being the strongest party. Revolutionaries and reactionaries had both been discredited, the Social Democrats which were under the leadership of Lenin had boycotted the elections until it was clear that all other parties were participating, they joined in a coalition to make up lost ground. The address to the throne was inspired by the Cadets under the able leadership of Nabokov. It marked a radical moderate programme of reform. The gov. pronounced this inadmissible and this resulted in moderate reform being abandoned. A violent vote of censure was passed. The Duma decided to publish an appeal to the country. But so it could do so (July) it was summarily dismissed. The Duma had conducted itself efficiently and moderately. Even though it had been goaded into violent criticism it had never been revolutionary. Cadets and Labour leaders went to Finland and appealed for a campaign of passive resistance to resist the Duma, but this met with no response in Russia. As a concession to the Liberals Nicholas II appointed Stolypin as Prime Minister who instituted agrarian reform aimed at encouraging the peasant proprietor. This was not popular with any section of the community. Stolypin claimed to be a constitutionalist and not a parliamentarian. He wanted a Duma which would give support to his acts. The gov. therefore did all it could to influence the elections for the second Duma which met in March 1907 and in the face of this the electorate behaved in a remarkably alert fashion. The results showed how much Stolypin's dismissal of the first Duma had strengthened the extremists. The constitutionalists who had appealed

to the nation from Finland were debarr'd from this Duma and they were replaced by left wing groups. This time I can did not boycott the elections his party secured fifty four seats. The reactionaries set out to bring the Duma into disrepute and in June the Duma was dissolved owing to an alleged plot against the emperor (the result of deliberate police provocation) but in Nov. 1907 a change in the electoral law (involving in some of its provisions a definite breach of the amended fundamental laws and thus showing once again that the gov. would not keep its word) produced a third and strongly conservative Duma which continued until 1912. The Octobrists led by Guchkov had a majority in a freely elected Duma the Cadets would almost certainly have been in control. Their political eclipse was a major tragedy for R. then policy was sound and moderate their members contained idealists and practical men and they showed fine political sense in the Duma and organising ability in the *zemstva*. The Octobrist group was liberal in attitude and contained many notable individuals but it was less firmly welded together than the Cadets and was an association rather than a party. It showed a much scope for individuality that it had no clearly defined policy. Its criticism of the gov. was telling but owing to tactical immaturity had less force than that of the Cadets. Gradually however the third Duma acquired political maturity and though it did not adequately represent the nation gained popularity in the country. It lived out its five year term and was successful in persuading the gov. to make several administrative reforms of varying importance. Had it had the power of the W. assemblies in which it was modelled it might have transformed R. The third Duma pursued the policy of testing satisfied with limited concessions in the hope of gradually achieving more but the fluctuations at court made this policy dangerous. To some extent therefore this Duma and its successor (1912) which resembled it in composition and temper was guilty of playing at parliamentarism in its position within its limits, was apparently so secure that it was tempted to lose its sense of urgency and became at times more like a debating society. Stolypin's position at court was meanwhile deteriorating and he was assassinated in 1911. Kokovtsev his reforming successor was dismissed in Jan. 1914 because he protested against Rasputin's (q.v.) influence at court. Though the permanent existence of a Duma now seemed assured it had not succeeded in gaining any legislative power. Moreover toleration of it had to some extent lessened its critical force and ardent reformers were being driven into the minority Social Revolutionary and Social Democratic parties which did not believe that real reform was possible without revolution. The fickleness and political stupidity of the court served to confirm this, and to accentuate the ineffectiveness of the Duma which at first (1905)

was practically elected by universal franchise. Constitutionalism was never really given a serious trial, its scabiancy merely served by its inherent incompleteness to discredit it. Internationally during this period R. was allying herself with France rather than with Germany, in the expectation of a loan and in the fear of R. was giving place to fear of Germany. An Anglo Russian treaty was signed in 1907 the signatories agreeing to respect the territorial integrity of Tibet and the suzerainty of China. Other conventions were signed (1910) between R. and Japan respecting the status of Manchuria and between R. and Germany (1911) respecting rights in Persia. The triple entente between France and England was powerless to resist the Austrian annexation of Bosnia but an anti Austrian Slav movement was stimulated.

Russia after the Outbreak of War

After the Austrian ultimatum to Serbia on July 23 1914 R. proclaimed Serbia and on July 29 a general Russian mobilisation was ordered but altered to a partial one on the assurances of the German emperor. On July 30 however a general mobilisation did take place and Germany declared war on R. on Aug. 1. The object of war was the liberation of the Slav peoples. In the first Russian offensives were started in Poland and in Galicia. The Germans retreated beyond the Vistula R. but at Tannenberg, Aug. 31 1914 Hindenburg defeated Samsonov (see TANNENBERG). The Russian Army was driven out of Poland but was more successful against the Austrians, occupied Galicia and also prevented an Austro-German army under Hindenburg from taking Warsaw in Oct. This relieved the pressure on the Allies on the W. front but R. was living beyond her military means. In the spring of 1915 Germany having lost the battle of the Marne concentrated against France and Poland Lithuania Courland and the W. Russian provs were occupied by the Central Powers.

The domestic situation in R. became complicated. To arouse patriotism and to avoid handing over the direction of the army to the Duma Nicholas II assumed the position of commander in chief. In the summer of 1916 the Russian military situation improved and Brusilov's (q.v.) offensive against Austria was successful. The Duma however regarded Nicholas as incapable of conducting the war vigorously and in this opinion France and England concurred. That it was isolated. Obvious gov. inefficiency responsible for many of the military disasters increased the Duma's prestige. The progressive bloc became more powerful achieved real influence at court and in the gov. and seemed about to begin the evolution into a legislative chamber on W. lines when the intervention of the Tsarina whose ideas on government were of a reactionary kind, caused the dismissal of the more liberal members of the gov. The emperor's presence at the front made his wife and Rasputin (q.v.) the real rulers of R. Gov. corruption became blatant there was a particularly unsavoury Church scandal in Oct. 1915. Nicholas himself was

acclaimed when he visited the Duma in Feb. 1916, but earlier in the same month *Stürmer*, one of Rasputin's creatures, was made Prime Minister. In July Sazonov, a prominent reformer within the gov., was dismissed after evolving a just and moderate scheme for granting autonomous gov. to Poland. The efforts of the army were thus being undermined by corruption and incompetence at home. Signs of dissension grew among workers and soldiers, and the anti-war propaganda of Lenin's followers began to take root.

The Prelude to Revolution—November 1916–March 1917—After the stormy meeting of the Duma in Nov. 1916 the Russian political situation seemed to be settling down again with renewed triumph for the autocracy behind the throne. But under the surface there was a gradual stiffening of all the better elements in every grade of Russian society and a gradual coalition of these elements against the secret autocracy which governed the court and suppressed free opinion through the terrorism of the secret police. In Dec. 1916 Rasputin was murdered. On Dec. 29 Prince Yusupov, who was a young connection of the imperial house, Purishkevich (a Conservative member of the Duma) and the Grand Duke Dmitri Pavlovich after an unsuccessful attempt to poison Rasputin, shot him and threw his body into the Neva. The news of his death was greeted with national enthusiasm. The emperor however acted as pall bearer at his funeral. The Grand Duke Dmitri and Yusupov were exiled. The emperor's decisions were now absolute. The meeting of the Duma arranged for Jan. 25, 1917, was postponed for a month, and the general congress of the Union of Tns and Zemstva (which existed for Red Cross work) was forbidden. The censorship was imposed with the utmost rigour, the secret police were greatly increased and machine guns, urgently needed at the front, were mounted on the roofs of Petrograd. It is clear that Protopopov, who was now in the emperor's confidence, hoped to provoke a rising which he would be able to crush and use as an excuse for negotiating a separate peace. On Feb. 9 without trial the labour group of Guchkov's war industry committee were imprisoned on a charge of conspiracy. The governmental chaos and irresponsibility, the war witnesses the dislocation caused in the army and police machine by the war and the exasperation of all sections of the pop. with the continual misgovernment, corruption and broken promises were welded together into revolution by the increasing famine in the country. The gov. could completely incompetent to deal with the grain shortage, and in Petrograd the bread ration seemed in Feb. likely to fail altogether.

The Revolution of March 1917—Outwardly public life seemed to be normal, but in the afternoon of March 3 there was some looting of bakers' shops in the poorer quarters, and a procession of students and workers' wives appeared in the Nevski Prospekt. On the 9th some

of the newspapers failed to appear. The food debate in progress in the Duma took a new turn and the gov. were appealed to to provide food for the cap. Cossack patrols fraternised with the people. There were scuffles between the crowds and the police. On the following day, Saturday, March 10, the trams ceased running and the workmen struck work. On Sunday Gen. Klabinov, the new military governor of Petrograd announced that demonstrators would be fired upon. During that day there was firing on the crowds, and some 200 people were killed. The Nevski Prospekt was put under military guard. A company of the Pavlovsk Regiment continued when told to fire on the people. The president of the Duma, Rodzinko, telegraphed to the emperor, who was at Gen. Russky's headquarters at Pskov, telling him that there was anarchy in the cap. and that the gov. was paralysed. He appealed to the emperor to invest some one who enjoyed the confidence of the people with powers to form a new gov. On the same day the Duma had refused to be prorogued and had elected an emergency committee which continued to meet. Rodzinko announced that the Duma was now the only constitutional authority in R. On March 12 the Jacobinskii Guards refused to fire on the crowds in the streets and instead shot some of their own more unpopular officers. The Volynski Regiment was sent to deal with them but instead joined the mutineers. The united troops carried the arsenal and provided the revolutionaries with munitions. Other regiments joined the insurgents. In Petrograd all pretence of gov. had now gone except the Duma which dispatched a still more urgent telegram to the emperor. News was received that the emperor was bringing troops to suppress the revolt. In the afternoon the Duma chose a committee of twelve to form a provisional gov.

Meanwhile a committee of workers and social revolutionaries had been formed separately and they had now more influence with the people and the incoming troops than had the Duma. On March 14 the Duma Committee through two of its members, Tchaidze and Kerensky, got into touch with the Council of Labour, which had been organised to represent the more extreme revolutionaries.

On Wednesday, March 14, the first step of the revolution in Petrograd was practically over and the main question concerned the relations between the Duma Committee and the Council of Labour, which had now been given the title of Council of Workers' and Soldiers' Delegates, called for short the Soviet. Power lay between the two, and it was becoming more difficult to keep the peace between their different adherents. Both sides issued large numbers of proclamations, one issued by the Duma Committee setting out a reasonable plan for the creation of responsible representative government. Meanwhile the emperor's position remained obscure. He had not been deposed, and had tried unsuccessfully to reach Petrograd on the 14th. On the 15th

he sent for Russky and signed a manifesto granting responsible government. There was at this stage no course for the tsar but to abdicate. Nicholas made no opposition. When he learned that his son's disease was incurable he abdicated in favour of his brother the Grand Duke Michael. Meanwhile however the position in Petrograd had grown more complicated. Most members of the Duma Committee wanted a constitutional monarchy, but the Soviet wanted a republic. On Thursday afternoon when the abdication of the emperor was still unknown, Miliukov announced in the Duma the names of the new ministers of the Provisional Gov. The gov. was a coalition of all the parties of the left and centre. Kerensky (q.v.) went to the Soviet meeting and persuaded its members that for the present the monarchy must remain. His appeal was successful and the Soviet passed a resolution giving conditional support of the Provisional Gov. by a large majority. The Soviet attempted to ensure the abolition of military discipline. This the Provisional Gov. refused to do, but the order circulated in the army is thought to come from the gov., and dissolution of morale the result. A deputation from the gov. called on the Grand Duke Michael and persuaded him to delegate all powers to the Provisional Gov. until the Constituent Assembly could be called. With the declaration which he pronounced the fall of the Romanov dynasty was complete.

The Provisional Gov. lacked a clear policy since it was composed of men of widely different points of view and it failed to secure the support of the people because its members were mainly 'moderates' who had failed in their previous attacks on the autocrats and had tried without success to cooperate with the autocracy for the country's service. The leaders of the Soviet on the other hand had consistently preached revolution, and had never been co-opted with the autocrats. In a very brief period it was natural that those with extreme views should attract their support. The Provisional Gov. saw the need of attempting to stabilise the situation in R. and of first finishing the war and then making a constitution. The members of the gov. were men of honesty and patriotism and represented the best type of Russian administrator, but they lacked the popular appeal necessary in the leaders of a revolution. The extremists of the Soviet were representatives of the working people of the cap. To a lesser extent they represented the industrial workers of the whole country, but the industrial workers in R. were themselves a very small proportion of the total pop. The many millions of the peasants were entirely unrepresented in the councils of the Soviet. The rank and file of their supporters were completely ignorant on all questions of government, but their leaders stood for a complete reversal of the old system of government in R., and they combined an appeal to the class interest of the poor with an appeal to idealism. Their creed

was a kind of Socialism but not of the kind familiar to W. Europe. The development of Socialist theory in R. in the generation before the revolution had been along two divergent lines, the one strongly influenced by the Russian Marxists and the other with the Gue Marx. In Marx's teaching there grew up the Social Revolutionary party, preaching a moderate Socialism which became prominent in R. about 1900. Kerensky was a representative member of this party. From the teaching of Marx which advocated the dictatorship of the proletariat, grew the Social Democratic party. Among the Russian industrial class at the date of the revolution the principles of Marxism were generally accepted. In 1907 the Social Democrats had split into two sections the Bolsheviks and the Mensheviks (see Bolshevism). The conflict between the two was increased by their different views on the war. The former regarded it as merely a distraction from the true purpose of all workers the revolution of the proletariat whilst the latter regarded Russian imperialism as the enemy and the allied cause as the cause of all workers. The Soviet of Workers' and Soldiers' Delegates represented both branches of the Social Democrats and contained also a few Social Revolutionaries. The majority of the council were anxious to bring the war to a successful conclusion, but Bolshevik leaders especially Lenin meanwhile were unwise in R. The pacifism and internationalism of the Bolsheviks found ready response in war torn R. The Russian people had suffered intensely. In the army itself the Soviet found still more ready material. The Provisional Gov.'s power was being continually disputed by local Soviets springing up all over R., and the internationalism of the Bolsheviks were accomplishing the break up of the empire into its innumerable component parts. There was no strong centralisedness in R. What industrial organisation there had been was rapidly overthrown as the workers asserted their new found independence. Much of the land had already passed to the peasants as a result of the legislation at the beginning of the century. The cap. is now acquired by them and the country ruthlessly expropriated. The army was depleted by men deserting to return home to claim land. The peasants also seem to have been not rested in the political aspects of the revolution. They were frustrated by the Communist regime was forced at first in practice to recognise their possession of the land and claiming the right to its produce.

The greatest difficulty facing any constitutional form of government attempting to set its own feet is in R. in the character of the Russian people with their infinite capacity for passive acceptance of events. Only an utterly ruthless tyranny could hope to drive them into action and in this quality lay the hope for the extremists who were prepared to stake everything on their chance. With the paralysis that fell upon the Russian

armies the frontiers were opened to Ger- agents who became busy among the soldiers and workers. They represented to the people that Russia's W. allies who were determined to compel R. to continue fighting were her real enemies. It would be wrong to assume that all the men who accepted this propaganda were pro- German. They were international in their aims and willing to accept money from any one who would co-operate with them. Hostility began to grow up towards the Allies and particularly towards Britain. But meanwhile the Lvov Gov. secured some success. All the army commanders with the excep- tion of Iw. Rts. had accepted the revolu- tion and with Alexeyev (g.) in supreme command discipline began to improve early in April. On March 30 the gov. had issued a proclamation to the Poles guaranteeing their independence. The Petrograd Soviet seemed willing to co-operate with the gov. On April 9 Iw. Rts. issued a proclamation setting out the objects of the gov. and reiterating support for the war.

First Meeting of All Russia Congress of Soviets—On April 13 there was held the first meeting of the All Russia Congress of Soviets. The majority were in favour of the continuance of the war on their own terms. The minority, chiefly com- posed of the Bolsheviks led by Lenin (g.) demanded an immediate cessation of hostilities since for them the enemy was the capitalist in all countries. On April 15 Austria made an offer of peace. The next move was the approval by the Ger. Austrian and Bulgarian Govs. of a Socialist conference to be held at Stockholm by which it was hoped that the Russian delegates might be entangled into peace. Early in May it became clear that the Lvov Gov. was losing ground. The continual interference of the Soviets with military discipline was making the task of the commander increasingly difficult. In mid May Guchkov and Milukov resigned. After a conference between the Provisional Gov. and the Soviets, a new gov. was formed including representatives of the left. Kerensky became minister of war.

The new coalition gov. issued a man- ifesto proclaiming their adherence to the allied cause. The Allies answered the manifesto cordially and sent missions to R. to establish contact with the new regime. But the situation was confused. The commanders in the field were con- tinually changing. Gourko who had re- placed Ewerts with the central armies now resigned and was replaced by Deni- kin (g.). On June 16 the second All Russian Congress of Soviets opened in Petrograd. Lenin bitterly attacked the coalition gov. The gov.'s hold on the people was weakening and extreme views in the Soviets were gaining ground. By the latter weeks of July the Russian troops had evacuated Kulish and were retreating all along the front while their armies in Galicia had become a disorderly mob.

The 'October' Revolution 1917—Mean- while, the Bolsheviks in Petrograd under

Lenin and Trotsky and supported by mutinied sailors and soldiers were striving to usurp the gov. Kerensky's vanity gave the opening for the Bolsheviks. Their military genius was Trotsky (g.) who had become president of the Petro- grad Soviet and now prepared a sort of general staff, called the Military Revolu- tionary Committee which organised the Bolshevik elements in the army and navy and in industry. On Nov. 5 this com- mittee ordered the Petrograd garrison to place itself under their instructions. Kerensky summoned the loyal troops to defend the gov. On the 7th Lenin arrived and the Bolsheviks made their headquarters at the Smolny Institute from which they issued a proclamation announcing the fall of the gov. and the transfer of power to the Soviets. The majority of the regiments went over to Trotsky and early on the morning of the 7th Kerensky fled. In the evening at a meeting of the Petrograd Soviet Lenin and Trotsky announced the success of the new revolution and next day an All- Russia Congress of the Soviets placed the gov. in the hands of a body called the Council of People's Commissars, with Lenin as president, Trotsky minister of foreign affairs and Kevlenko (g.) as commander in chief of the remnants of the army. The new gov. proceeded to consolidate all land not belonging to the proletariat. On the 28th the Ger. command in the E. agreed to negotiate for an armistice. Though the date accepted as the beginning of the Bol- shevik Revolution was according to W. European and Soviet calendars Nov. 7 the Gr. Orthodox calendar was still in use in E. at the time. The date old style therefore was Oct. 25. The name 'October Revolution' was retained after the calendar was changed. The Bol- sheviks were now firmly in the saddle but speedy action was essential in order to secure their position. They began by disbarring large numbers of Red Guards and founded their gov. frankly on force. Their main programme of the class war was embodied in the famous appeal of Karl Marx. Workers of the world, unite, you have a world to win and nothing to lose but your chains. The Bolsheviks were far from being anarchists since they aimed at a rigid system of government by one party and true anarchists became their opponents just as much as did the moderates and the reactionaries. The true Bolsheviks were a tiny fraction of the whole people but almost alone at this time in R. they knew exactly what they wanted and they set out with deter- mination to achieve their ends. Their teaching had led them to think that Marxism would not come into power first in R. which had not yet gone through a period of capitalism as W. Europe had and their leaders arrived in R. after the outbreak of the revolution. But the amazing energy and ability of Lenin and Trotsky enabled them to turn Kerensky's victory into their own. They showed great skill in gaining hold of every dept. of importance and in adding power during

the first years of their government. Their core of strength was among the artisans, especially in Petrograd, and on this basis they managed to establish control of a country in which industrial workers were very few. With the threat of force the Constituent Assembly, where the Bolsheviks were in a minority, was dispersed on Jan. 18, 1918. Their first object was to stop the war. Having brought about the disintegration of the Russian Army, they directed their propaganda at the masses behind all the other armies with the object of spreading the 'dictatorship of the proletariat' to all countries. In 1917 the Soviet Gov. faced with

Bolsheviks did not intend to continue the fight against Germany. England ended negotiations and set up a Social Revolutionary Gov. in Archangel and Murmansk. The imperial family were murdered at Ekaterinburg on July 16-17, a week before the Czechs occupied the place. Adm. Kolchak received allied support for the establishment of an I. front in Siberia. He set up a dictatorship and advanced almost to the Volga. Denikin headed the S. anti-Red forces. All these efforts failed. The Bolshevik Party was united round Lenin by the danger and the general rule of force enabled them to maintain an absolute dictatorship aided by ruthless

LENIN ADDRESSING A MEETING

of cultures

anti-Bolshevik volunteer armies with resistance from the Cossaks, and with a separatist movement in the Ukraine, ceased hostilities against Germany. On Jan. 28, 1918, the Ukraine proclaimed independence, but was occupied by the Soviet Army, which in turn was driven out by the Germans. It accepted peace terms, and on March 3 signed the treaty of Brest-Litovsk (*q.v.*).

History of Russia after the First World War, 1918-30—The allied powers, with the war against Germany still undecided, sought to build up a new I. front and to this end abandoned the Bolsheviks in favour of various anti-Red groups. Kornilov and Alexeyev operated in the S., and Chernov established a Social Revolutionary group on the lower Volga. Siberia set up an autonomous gov. and in Manchuria Vladivostok and Transbaikalia other opponents arose. Particularly remarkable were the exploits of the Czech Legion, who took control of the Trans-Siberian railway. When it became clear that the

terrorists Trotsky and others showed great powers of initiative and organisation. But in addition new men appeared from the lower ranks of the army and elsewhere, and such leaders as Budennyi, Frunze and Chapayev demonstrated their initiative and ability for the type of warfare required. Moreover there was a solid support from a peasantry who at last had gained possession of the land and were inclined to lose it again with the restoration of the old order. Amongst the anti-Red groups confusion and weakness were everywhere apparent. With the collapse of Germany the Allies lost interest and successively abandoned their protégées. Bolshevik propaganda was effective both abroad and amongst their Russian opponents. In May and June 1919, Kolchak failed to gain definite recognition, was driven back and finally shot on Feb. 10, 1920. The Brit. under Lord Rawlinson (*q.v.*) evacuated Archangel and Murmansk shortly afterwards. Denikin was defeated and succeeded by Wrangel, who

was eventually forced out of R on Nov 1920.

In the last months of 1918 popular risings in Germany and Austria's Polish provinces restored power to native hands and Pilsudski (*q.v.*) emerging from internment took over the reigns of government and declared a new Polish republic. Polish frontiers however had been left undisturbed and soon afterwards the Poles led by Pilsudski went to war with R. In 1919 what was called the Curzon line was drawn up by the Brit delegation to the peace conference and suggested as an enduring frontier but neither R nor Poland accepted it. The Poles succeeded in reaching Kiev but were driven back to Warsaw later however with the aid of the Ir general Weygand they drove the Red Army back. This defeat of the Russians led to the treaty of Riga (March 18 1921) which imposed a new frontier much more favourable to the Poles and corresponding roughly to that in existence before the partition of 1791.

New Economic Policy and the Five Year Plans—The civil war immediately following the Bolshevik seizure of power in 1917 had practically stopped productive work. The attempt to apply the principles of Communism to agriculture was bitterly resisted by the bourgeois peasantry or *kulaks* (*q.v.*) who 'struck' by simply failing to produce more than enough for their own needs. This brought famine to the tens. Trade in these conditions disappeared. Under stress of these conditions Lenin had to beat an economic retreat and in early 1921 evolved the N.E.P. The peasant farmer was allowed once more to trade freely in his grain selling either to a private merchant or to some gov. body. A few factories were leased to foreign companies and many smaller ones to co-operative groups of workers. Communist practice and the fantastic experiments of 1917 were thus abandoned though key positions such as control of trade prices and political power were maintained.

Though continuing to threaten the capitalist world the gov. sought its aid and a commercial treaty was signed with England in 1921 and trade missions exchanged with most European countries by 1924 in which year England, France and Italy recognised the Soviet Gov. A growing Russo-Ger rapprochement was signified by the treaty of Rapallo of 1922. Inside R the extreme slackened on an attack on all forms of religious worship between 1921 and 1923 but on the other hand a striking success was achieved in the introduction and development of primary education in a country with a very high proportion of illiteracy. There was a rapid recovery under the N.E.P. but it was along the lines of a return to the former economy and the peasants were for the time being victorious over the gov. R remained however poor and backward in the sense that it had too little industry and methods of farming too primitive to give the people more than a very low standard of life. The only

way to overcome this poverty and backwardness was to build more factories, to multiply the number of power stations, to mine more coal and metal ore. Already in 1920 Lenin had procured engineers to formulate a great electrification plan for the whole of R and great rivers like the Dnieper and the Volga were dammed and in other places power stations were built near coal and peat. By 1928 the country was producing two and a half times as much electricity as in 1918 but this was still inadequate.

The N.E.P. gave rise to a type of economic adventurer. Sincere Communists alarmed by this and by the whole compromise policy prevailed in 1923. Purges in the party and amongst the new bourgeoisie were six times affected.

On Lenin's death on Jan 21 1924 power was achieved by a triumvirate of Stalin, Kamenev and Zinoviev. The ruling power was Stalin who had profited greatly from his appointment in 1922 to the post of secretary of the party. Between him and Trotsky discussion soon developed partly as a conflict of character and temperament but also as one of policies. Trotsky still preaching 'permanent revolution' and the impossibility of establishing Communism in R without a world success. Stalin standing for a policy of Socialism in one country. Stalin gradually acquired the ascendancy until finally his rival was expelled in 1929. Kamenev and Zinoviev who had also fallen were reinstated after recanting their views. Stalin now put forward the policy that agriculture must be socialised if Socialism was to be a reality and carried it against the opposition of his recent allies of the right. Rykov, Bukharin and Tomsky who it defeated and Stalin became supreme. From about 1929 the policies of R became those of Stalin. He introduced his five year plans for the industrialisation of R both to raise the standard of living and for the defence of the country.

The first plan dealt with electricity the whole of industry transport and agriculture. Its intention was to cover the land with power stations and with new factories of every kind to build new railways and roads to open up new mines to start entirely new industries to produce things like motor cars aeroplanes and synthetic rubber. This plan gave special attention to heavy industry of blast and steel furnaces and new engineering plants. And to pay for the import of turbines electric transformers and scientific instruments and machine tools the other products of Russian factories including textiles had to be exported in return. Notwithstanding the great domestic demand and under the first five year plan enormous new plants were projected and new ones spring up. Huge tractor works were built at Kharkov automobile factories in Moscow and Gorky tractor plants in Rostov on Don and Stalingrad steel furnaces in the Donbas, fertiliser works in the Urals and enormous dams like that of Zaporozhe. This period (1928-32) was characterised by alternate

ruthless purges and conciliation policies for all of which Stalin was extolled because his plan was producing results. A new R of administrators and technicians was created and many characteristics of the country and its people were altered. After the first five-year plan came a second and by the end of the second at the end of 1937 Soviet industry had been so developed that the output of coal, steel and cement had quadrupled, that of oil, iron and paper had tripled while new railways had been built, existing lines doubled, trucked and some systems electrified. By 1938 R had become the largest producer of tractors and railways in the world. After the second five-year plan yet a third was launched to complete the work of construction that the preceding two plans had begun, but this third plan had run only three years of its course when the Gers launched their attack on R in June 1941. Great destruction was caused, amongst the many fine new towns and buildings and factories and power stations that the Russian people had built, it the cost of so much effort and sacrifice. For the execution of these plans demanded great courage and extreme ruthlessness and a general sacrifice of personal needs in the expectation of future benefits.

Simultaneously with the first five-year plan Stalin launched the enormous task of the socialisation of agriculture against the deep instincts of the peasantry. The programme of collectivisation and mechanisation of agriculture was ruthlessly carried out. Thousands of *kulaks* were liquidated. The industrial plan and the workers and indeed the government itself were alike dependent on agriculture for both food and the revenue for the creation and perfection of the industrial plants. The results of the first importances and the growth of tremendous out of life won. So Ferdinand Pearce puts the cost at a conservative estimate of 5,000,000 lives. A new attack on religion was launched in July 1929 but even in 1937 it was admitted that half the population believed. Communism was also compulsorily introduced into the education system and many fine scholars were imprisoned or exiled. Longues within the party were frequent.

In 1928-33 however, in slackening in an apparent parallel because of the necessity to unite the country in face of the growing threat from Germany with the rise of Hitler to power. Concessions were made to the peasants by allowing them to own private property and a larger share in the management of co-operative *collets*. In our argument replaced compulsion in industry and the Stakhanovite piece-work system was introduced whereby workers' earnings increased along with productivity. The family was raised to a position of honour, education became less violently Communist and the historical achievement of the old R were emphasised.

By 1936 the many gains and achievements had become a source of general pride and the basic principles of Communism secured

firmly rooted in the nation. In May of that year the new Stalin constitution was introduced (see under CONSTITUTION AND GOVERNMENT). Stalin was broadening his control of the nation and called for 'non-party Bolsheviks' under the slogan of 'the Union of Party and non-Party'.

Russia's Foreign Policy, 1917-1939 The years of civil war and foreign intervention had deeply impressed themselves in the memory of the Russian people who always feared that these attacks would be repeated. They knew that the Communist social system was feared in other countries who tried to set up a *cordón sanitaire*. Russian policy sought alliance or closer diplomatic agreements with any country which manifested any willingness to reciprocate these overtures. During the 1920s the two countries who held this P chiefly feared were Britain and France. Here she declined membership of the League of Nations because she deemed that body to be dominated by those two nations yet trade agreements were concluded with both countries. But at this period it was with the superficially democratic Germany and Mustafa Kemal's progressive Turkey that R had a much closer understanding as evidenced by the treaty of Rapallo (1922) and the treaty of Friendship and Neutrality (1925) with Germany and Turkey respectively. Also in 1921 she resumed diplomatic relations with China to counteract the aggressive power of Japan who still coveted Siberia. But with the advent of Hitler to power in Germany R realised that the age-old German dream of the *Danubian Osten* was revived. Hitler indeed did not conceal his ambition to set *Lebensraum* eastward first at the expense of Czechoslovakia and later into the Russian Ukraine and he began the devious policy of playing for the friendship or at least neutrality of France and Britain on condition that the two countries allowed him to pursue his policy of seizing territory to the East while not menacing France and Britain or their overseas empires. At this time Japan had begun her career of aggression in Manchuria and the five S. provinces of China and R now feared the possibility of attack on two fronts simultaneously, especially as Germany and Japan had now joined hands with Italy in their anti-Communist Pact (1937) directed against the Soviet Republics. R saw that it was a war race against time until she could strengthen her position by building up an efficient armament industry so as to equip her forces with modern tanks, planes and armaments capable of withstanding the weight of the Axis (1939) force. It was partly to that end that R had embarked on her five-year plans with all their attendant difficulties and suffering. In 1921 Litvinov, Soviet foreign minister, supported proposals for all-round disarmament at the Geneva Conference (1925) and concluded a series of non-aggression pacts with most of the countries bordering on R. The Soviet Gov. now made two offers of neutrality agreements with Germany in

1934 but Germany rejected both. In Sept 1934 R joined the League of Nations from which both Germany and Italy had just seceded and the following year concluded treaties of mutual assistance with France and with Czechoslovakia. In 1935 however R was not invited to the Stresa Conference. It vainly constantly strove for an Eastern part to the Locarno Pact and he called for strong 'sanctions' against Italy during the Ethiopian invasion and attacked weakness of the League when Germany reoccupied the Rhineland. During the civil war in Spain R endeavoured to counter the British and French policy of non-intervention and the dispatch of German troops to aid Franco by herself sending troops to aid the republicans. The capitalist countries saw in this move the revival of R's old policy of proselytising other countries to her own Communist ideology rather than a quest for an ally. With the defeat of republicans in Spain her intervention merely served to accentuate her isolation.

Treason Trials and Purges. In 1934 however Stalin's policy took a turn which much damaged R's reputation abroad. On Dec 1 1934 Kirov, one of Stalin's favourite lieutenants, was assassinated and in retaliation over one hundred members of the old Bolshevik party were shot. There followed a highly publicised series of trials and executions. Kamenev, Zinoviev and fourteen others were tried in Aug 1936 found guilty and shot on charges of planning the assassination of Stalin and others. In Jan 1937 there were seventeen defendants including half a dozen prominent leaders such as Pratakov, Sokolnikov and Radek accused of trying to sabotage the work of reconstruction on the instructions of Trotsky (who was assassinated in Mexico in 1940). All the defendants were adjudged guilty. Pyaytakov, Muralov and Serebryakov and eleven others were shot as organisers of the crimes. Tudek and Sokolnikov were sentenced to ten years imprisonment.

There was a greater crisis when the purge involved the Red Army nearly five months later. Marshal Tukhachevsky regarded as R's foremost general at that time and six other generals were shot on June 12 1937 though it was only during the Bukharin trial held in March 1938 that specific charges were made for the first time against the Red Army implicating some of its leaders in fifth column activities. The generals were court-martialed and there was no public report. The German and Russian Staffs had conferred together during the Rapallo period and it is probable that contact was continued after Hitler came to power and possible that there was some sort of plot the executions caused dismay in Germany.

In March 1938 Bukharin and Rykov were amongst the twenty-one accused. Nearly all of those tried in public admitted to plots against Stalin's life, contact with German and Japanese agents was alleged on some extremely doubtful evidence and was denied by Bukharin. The conduct of

the trials in which no documents were submitted and no outside evidence adduced was much criticised abroad. The startling confessions of many of the accused may well have been motivated by a desire to make one last service to the party and its infallibility by men whose whole life had been and was bound up in the party and to whom life in opposition to it was unthinkable. The trials were only the more public part of a vast purge directed against any possible opponents of the Stalin group whose real enemies were the old champions of world revolution. In addition there may be some truth in the plea that the purge broke up a potential fifth column. It was widespread throughout the whole of R the party, the army, the bureaucracy and the people at large. The number of victims is unknown. The party was now solely the party of Stalin.

The Approach to War. In the outside world war was approaching the international Communist but was concluded in 1938 in 1937 the Jap began the conquest of China. In 1938 Hitler seized Austria almost completely encircling Czechoslovakia. R's ally, France and Britain determined to avoid war at any cost to the Czechs carried through the Munich Agreement ignoring R. In the spring of 1939 Molotov replaced Litvinov the advocate of co-operation with the West. Following the German annexation of Czechoslovakia in March 1939 there were six months of negotiation between London Paris and Moscow. Chamberlain on Britain's behalf guaranteed the frontiers of Poland against attack. R asked for a similar guarantee of the three small Baltic states, because she feared that the Germans would occupy them for use as a springboard in an attack on her. It is generally understood too that R wanted unity of command between the nations allied against Hitler and the right to send Russian troops forward on to Polish soil if Germany attacked. But these conditions were rejected and the negotiations dragged fruitlessly on through the summer. Simultaneously R was negotiating with Germany from April 1939 motivated by suspicion of Britain and her intentions and by a desire if possible to forestall for some time the German attack which they probably expected sooner or later. Polish objections to Russian entry of their country in support were eventually overcome but Molotov broke off negotiations and announced on Aug 23 the imminent conclusion of a non-aggression pact with Germany. Poland was secretly divided. Russian interests were acknowledged in Finland and in the Baltic states. The references to SE Europe were left so vague in the secret protocol that they were later to cause trouble between the two parties. Neither side regarded the pact as a true alliance. Some deliveries of food and oil were made by R but defensive preparations and military production were developed.

In July 1940 following the defeat of France and the Low Countries and the entry of Italy into the war R's position

was clearly weaker. Hence Molotov's reiteration before the Supreme Council in Moscow of Soviet neutrality and his emphasis on 'the importance of the existence of the Soviet-German non-aggression pact and its further development'. He wanted to induce the world to believe that these Russo-Ger relations were founded upon the fundamental interests of the two parties. The world adopted no such interpretation and nine months later the hollowness of such contention was only too obvious. It is unlikely that the Russian Gov. which was taking no chances, really believed in them for a moment for in Jan 1941 the head of the State Planning Commission to Moscow announced that R must make every effort to increase production of tanks, aircraft and warships in order to keep the country in a state of readiness for any eventuality. This announcement came immediately after Berlin's announcement of Jan 10 1941 of the signing of the so-called Russo-Ger Pact of Friendship apparently designed mainly by German cunning in the hope of ending rumours of deterioration of relations between the two countries.

When Poland collapsed in September 1939 and there was talk of the country being completely overrun by the Gers, Russian troops marched into the I put up to the Is Bug and San. In the following two months the U.S.S.R. made pacts of mutual assistance with Estonia, Latvia and Lithuania. Preparations were made for Russian garrisons to occupy certain naval bases at the entrance of the gulf which forms the approach to Leningrad and Kronstadt. In the summer of 1940 the three republics were annexed to the U.S.S.R. But P's greater concern was over the Finnish frontier only 20 m distant from Leningrad. In the winter of 1939-40 the Russian Gov. made proposals to Finland for a revision of the frontier N. of Leningrad and for the lease of the promontory of Hangö as a naval base. Finland rejected these proposals and R declared war. At the end of three months Russian troops after many remarkable defeats broke through the Mannerheim line and occupied Vyborg (see under FINLAND Finnish Russian War, 1939-40). The war was ended by a treaty which recognised Finland's independence but stipulated for a revision of the frontier N. of Leningrad to satisfy the Russian desire for greater security in the approaches to Leningrad. R anticipated Germany in Rumania by obtaining Bessarabia and the Ukrainian areas of the Bukovina in June 1940. An official protest was made to Hungary when Ger troops arrived on the Black Sea coast and to Bulgaria when that country joined the Ger. New Order in March 1941. The anti-Ger Yugoslav Gov. was given a pact of friendship but too late for any practical result. On March 21 Turkey was given an assurance of Russian friendship. In Iraq however the pro-Ger Rashid Ali (see under IRAQ) was recognised. In Sept 1940 the Ger-It-Jap pact of Axis countries became an alliance but on April 13

1941 a pact of neutrality was signed at Moscow between Matsuoaka (Jpn) and Molotov. Molotov visited Berlin in late 1940 and the economic treaty was somewhat patched up with new promises. In Jan 1941 R seemed prepared to agree to a pact with the Axis but her proposed conditions never received a direct answer and the Ger occupation of Bulgaria followed is a pointer to the future. Stalin became Premier of the Soviet Gov for the first time in May 1941.

The Second World War. In the early hours of June 22 1941 without a formal declaration of war Hitler launched his ill-advised attack across the Russian

LININGRAD THE DVOITSOVAYA SQUARE AND THE ALEXANDRA COLUMN

The Winter Palace can be seen through the Alexander Arch

frontier. The endeavour to damp the ardour of the W. allies by the reiterated insistence on the nature of Communism and the Jews consistently characterised the propaganda of Goebbels. On the evening of the very day when Hitler launched his offensive Mr. Churchill made a broadcast promising what would Britain would give to R. A few weeks later a treaty of alliance between Ger, Britain and the U.S.S.R. was signed. Thenceforth the war became a united front of the peoples standing for freedom against enslavement by Hitler's armies (Stalin, July 3 1941). The Ger invasion had a remarkable effect in awakening to full force the national consciousness of the Russian people. As Napoleon's invasion had done more than a century earlier. Indeed patriotism and interest in their own history had for some years past been inculcated by the Soviet

Gov. and the war served to give a tremendous impulse to this process. Mr Churchill's offer of assistance was accepted at once by Stalin. A similar *rapprochement* took place with the U.S.A. and Litvinov, the persistent advocate of Russian co-operation with the W. democracies, who had fallen into disfavour on that account in 1939, was now appointed ambassador to the U.S.A.

The Ger. High Command endeavoured in the summer of 1941 to overwhelm by *Blitzkrieg* strategy. The Ger. armies soon penetrated the Ukraine, crossed the Dnieper, took Kharkov and Kiev, closely invested Leningrad, and advanced almost to the suburbs of Moscow. But the great Ger. attacks on Leningrad (*q.v.*) and Moscow were fought to a standstill, the celebrated Russian marshal Zhukov emerging as the saviour of the city. In the abnormally bitter winter of 1941-42 the Ger. armies ceaselessly battered by the Red Army and attacked by partisans, succeeded in to after disaster, but after their commander von Rundstedt (*q.v.*) they were extricated from their predicament, though only at enormous cost. As a result of this strain the Ger. had to postpone their projected spring offensive until the summer of 1942. In this they were forestalled by the Red Army, which launched an offensive round Kharkov designed to disrupt the Ger. preparations. As yet, however, the Russians were not equipped for any major operation going beyond a strictly defensive strategy, and their situation was serious in view of the loss of the Ukraine and of its industrial resources, though fortunately as a result of the five-year plans their resources in the Ural region were considerable and more over great quantities of plant in the Donbas had been evacuated by heroic exertions further to the E. The Russian Command was aware that the Ger. were preparing another crushing blow, a double attack comprising a lightning advance into the Caucasus to secure oil and a lunge across the Don to the Volga to outflank the armies defending Moscow, and then by a southward lunge to surround Moscow and cut the Red Army in two. They were the more emboldened to this great military gamble because there was still no resumption of any campaign on the W. front or as it was put no opening to a second front. The impetus of the vast weight of the Ger. armoured divisions, thrust the Ger. armies the Donetz and the Don into the E. cornlands of the Kuban and the N. Caucasus and almost to the oil fields of Mukov and Grozny. In the Crimea, however, they only took Sevastopol after virtually destroying the city by huge siege guns, a delay which greatly compromised their timetable. They were halted similarly at the Volga by the amazingly heroic defence of Stalingrad, a battle which marked the real turning point in the campaigns of the E. front. The end of Nov. saw the Russians counter-attacking both to the N. and S. of the city, driving the Ger. back and enveloping nearly 300,000 of

them in a remorseless trap, while the defenders of Stalingrad itself eventually flung the Ger. out street by street from the ruined suburbs.

Two main factors in the defeat of Ger. *blitzkrieg* methods were the Russian defence in depth and the scorched earth policy. The latter idea was not new in Russian history and it is significant that as early as 1917 organisations for civilian defence were being developed by the military authorities concurrently with their efforts to promote the military defence against air attack and chemical warfare. The Russian organisation which was functioning so effectively in the autumn of 1941 and later was undoubtedly the outgrowth of these preparations. Fought in 1911 and in 1912 by men who fought tenaciously for their homelands, the Ger. now resorted to brutalities unparalleled since the Dark Ages. In Kharkov alone 15,000 civilians were murdered in March 1942, 70,000 were machine-gunned in one day, and thousands were slaughtered in factories in batches of a hundred by automatic weapons. These outrages were not of the class of occasional atrocities inseparable from war; they were an integral part of a systematic war of extermination planned by the Ger. High Command. But the Ger. underestimated the qualities of the Russian people. In the first twelve months of what Mr Churchill aptly called the Russian story they showed themselves to be allies of which the W. democracies might well be proud and from whom they could learn many valuable lessons in the art of war.

On May 26, 1942, the alliance between Britain and R. was extended into a treaty of alliance and mutual assistance to last for twenty years in peace and war. It provided for mutual support of all kinds during the war and for 'common action to preserve peace and resist aggression in the post-war period and for close collaboration after the re-establishment of peace in the organisation of security and economic prosperity in Europe. At the same time a full understanding was reached with regard to the urgent task of creating a second front in Europe in 1942. That front, however, was not opened until mid-1944, but a premature opening would only have risked further defeat. At the beginning of Aug. 1942 the military situation was already looking very serious for the Allies and Russians and Communists, and it was expressing concern over the East and American delay in attacking in the West. Hence Mr Churchill himself went to Moscow to explain what had actually been planned in relation to the invasion of N. Africa and Italy. His visit produced a substantial advance in the co-ordination of the efforts of the allied forces. At the time of the alliance of May 26, R. and America concluded an agreement providing for extended Lend-Lease (*q.v.*) assistance to R. and mutual collaboration after the war in the spirit of the Atlantic Charter (*q.v.*). In May of the next year the Communist International was dissolved. In view of the continued delay due to military considera-

tions in opening the W. front President Roosevelt and Mr. Churchill met Marshal Stalin at Teheran late in the year. At this important conference military plans were fully coordinated.

In 1913 the Russians began the great series of counter-offensives which resulted in the overrunning of the great industrial region of the Donetz basin and the recapture of Kiev, Kharkov, and Khostov on Don. These victories were soon followed by the relief of Leningrad, the retaking of ruined Sevastopol, and the German debacle in the Crimea. The succeeding year was characterised by further great Russian advances, notably into White Russia involving the loss to the Germans of Minsk, Vilna, and all the great bastions from Kaunas and Brest Litovsk to Przemyśl. Within the same period Finland was invaded by the Red Army and forced to sue for an armistice, and the same fate befell Rumania. From the Baltic to the Italian the great and well-equipped Russian army groups were everywhere triumphant, apart from a decided if temporary check outside Warsaw. Before the close of 1944 they had won decisive victories in the Baltic states, which put them in possession of almost the whole of Estonia, Latvia, and a great part of Lithuania, and they had seized the greater part of Hungary and encircled Budapest. Throughout the late summer and autumn of 1944 and the winter of 1945, while the Anglo-American were advancing to the Rhine, the Russians maintained a huge offensive, reached Warsaw, put Rumania and Bulgaria out of the war and conquered all but a little of Hungary, inflicting enormous losses on the Wehrmacht. The turn of the year brought still greater success, victories under which the whole Reich reeled. The Russian capture of the indispensable islands of Silesia and of Prussia in Pomerania itself, and the outposts of Berlin and Saxony combined with the drive of the W. Allies made the end certain. Berlin was encircled on April 25, the W. Allies closing in from the W. The city fell to the Russians on May 2, and the war ended a few days later (see EASTERN FRONT OF RUSSO-GERMAN CAMPAIGN IN SECOND WORLD WAR).

Russian Relations with Japan. That R was as mindful of her Far E. boundaries as of her W. is shown by her decision taken at the Potsdam meeting of the Allies (July 26, 1945) to attack Japan, and indeed the denunciation of the Russo-Jap neutrality pact (on April 20) by R was a warning to Japan that R had the intention of seizing the most favourable opportunity of reversing the defeat of forty years back when Port Arthur and Sakhalin were lost (1904). Later in 1918-22, Japan taking advantage of the hostility of the W. nations to the new Soviet regime, again attacked it, plundering the Soviet Far E. Finally in 1938 Japan invaded Soviet Asia in the Lake Khasan area near Vladivostok, and the next year attacked in the area of the Mongolian People's Republic with the aim of cutting the Siberian trunk railway

and so securing the Far E. from Soviet R. On Aug. 8, 1945, R declared war on Japan, who was then at the lowest point of her fortunes in the war. In a fortnight the Russian forces of Marshals Vassilevsky and Malinovsky had completely defeated the Jap armies and overrun Manchuria and, as a result of this victory, Sakhalin and the Kuriles passed to R. See also PACIFIC CAMPAIGN IN THE SECOND WORLD WAR.

Polish-Russian relations in the course of the war always difficult, were exacerbated by the press through a German press agency of a report by the occupying military authorities that near Smolensk they had discovered a common grave with the bodies of more than 3000 officers who it was said, were murdered by the Russian security police early in 1940. The Poles fell into this German trap and invited the International Red Cross to investigate an affront to R which led to the Soviet Gov. breaking off diplomatic relations with the Polish Gov. in London. After the Russian conquest of Poland in 1944 to the frontiers of that country were once again the subject of a Russo-Polish crisis, which threatened to divide opinion seriously in Britain and in the U.S.A. against Soviet contentions. The Brit. Gov. had throughout the war recognised the Polish Gov. in London as the *de facto* if not the *de jure* gov. but the Russian Gov. suggested a committee that was formed at L. in soon after the Soviet forces had entered the city and this committee was installed in Warsaw as the Provisional Gov. It was the result of the discussions at the Crimea Conference held at Yalta in Feb. 1945 between Mr. Churchill, President Roosevelt and Marshal Stalin it was agreed that the Provisional Gov. should be recognised on a broader basis with the inclusion of democratic leaders from Poland itself and from Poles abroad and that the new Polish Provisional Gov. of National Unity should be pledged to hold free elections as soon as possible. The three heads of allied gov. also agreed that the L. frontier of Poland should follow the Curzon line with alterations from it in some regions of 20-30 kilometres in favour of Poland. They recognised that Poland must receive substantial concessions of territory in the S. and W. but that the final adjustments of the W. frontier must await the peace conference.

Results of the War on Russia. The material cost of victory to R was heavy in the extreme even though on the moral side the war had given the nation new strength, a far greater esteem in the world and internally a deeper sense of solidarity. In the devastated areas in early 1945, many hundreds of thousands of people were living in the most miserable state in the cells of ruins as it was at Sevastopol and Minsk in dug-outs in the earth along railway tracks and in windowless houses. They eked a miserable existence which the German armies had advanced and retreated was laid waste. The most austere standard of living faced the people for the period which would be required for the

rebuilding of basic industry, communications, and administration. It is generally supposed that R lost at least 8,000,000 men in battle or missing, and at least another 5,000,000 people through German oppression and starvation. The cost was to be seen in the countryside as well as in the towns. A high proportion of the machine and tractor stations which supplied mechanical labour for the collective or state farms was destroyed in the W, or used for tank production in the L, and the result was that agriculture in the W areas and part of the L reverted to a condition worse in some ways than it was in 1930. Restoration to anything approaching pre-war condition was estimated to require at least four years. Ten years was the minimum estimate given for the time required for basic reconstruction in the towns and industrial areas, and then only on the supposition that much German labour would be employed and that machinery and industrial products would issue in abundance from Germany in reparations, while long-term credit would secure from the Allies machine tools, locomotives and other apparatus. The havoc wrought by the Germans in life and property explains to a great extent the insistence of Russian post-war foreign policy on rigid security for the future.

As the war drew to its close, party in-stri-cution was intensified throughout the Soviet Union and greater emphasis placed on the predominant role of the Communist party under Stalin's leadership as the chief directing force within the state. The Politbureau had remained the real power in the state throughout. In emphasising anew the need for ideological training and understanding the Central Committee turned its attention first of all to the ranks of the party itself. Discipline was tightened. From 1939-41 to 1945 entry into the party was easier than at any time previously. Against the 1,600,000 members in 1939 there were nearly 6,000,000 in 1945 in spite of heavy losses in the war. In that year however, entry was once more to be gained as formerly, only after individual proof of powers of leadership and understanding of the Marx-Leninist political science. The party cadres were instructed to overcome 'any sentiment of bourgeois nationalism, private ownership and hostility to the collective farm system instilled by the German invaders' in instruction which obviously explains the critically hostile attitude manifested in the Soviet Union's normal channels of propaganda towards their wartime allies of the 'W bloc' in the period following the war. Love of country was and is strong in R and had been encouraged during the war, but afterwards *Soviet* patriotism was increasingly extolled devotion to a system as much as to country. The Communist party leaders as the war approached its end, were intent on ensuring that Soviet policy was fully grasped on ideological principles after the period of profound changes, which might well shake the outlook even of the most orthodox citizen of the Soviet Union. In the higher political

education of the people, the party leaders intensified their insistence on the superior adaptability of the Soviet system politically and economically, over any other system.

The chief requisite, according to their technique, was to ensure the removal of the last Fascist elements wherever they might appear which were denounced as potential disturbers of the peace and impediments to social progress. So bitter towards the Germans was the Russian sentiment inflamed by evidence of the tortures inflicted by them on Russian men, women and children that the whole German people was held indictable while those in allied or neutral countries who suggested more discriminating treatment engendered in the Russian mind suspicions as to whether Britain and America would be resolute in upholding the Yalta settlement. These suspicions unfortunately gained the greater prevalence in R from the fact that British and American war efforts were disparaged or forgotten in the Soviet press.

Russian Foreign Policy after the War
The determination that Germany should be deprived of any means of further aggression or of possible support of sympathy in other countries largely accounts for Soviet post-war foreign policy as expounded by M. Molotov, a policy which in the discussions between foreign ministers and in the United Nations assemblies of the requisites for a general European settlement not seldom bewildered and dismayed R's allies. Russian foreign policy after the war was directed in reference to Europe to ensuring every where a government friendly to the Soviet Union. This in Russian eyes meant the exclusion from power of all parties or groups which played a dubious part before or during the war, the divestiture of *kulaks* in favour of peasants or small holders, and a Communist political and economic system. Political liberty for all ranks (except for the proven collaborators with the enemy), which is the Western conception of democratic reconstruction finds no place in Russian policy. Democracy to the Russian publicist means democracy of the left, a conception which inevitably brought R ever more in collision with public opinion in the U.S.A. The creation, announced on Oct. 6, 1947, at Belgrade, of the Cominform or new Communist International was an attempt by R not merely to organise all Europe on a Communist basis, but to draw into the same affiliation France and Italy through the Communist parties in those countries. The Cominform moreover represented not merely a passive alternative to the Marshall Plan (see *History*) but an active and avowed attempt to frustrate the success thereof. Simultaneously in the United Nations R strove to prevent the election to the United Nations of a number of states eligible on every ground except that they did not enjoy her favour. In Berlin R deployed her propaganda in yet another form when Marshal Sokolovsky marked the eve of the foreign ministers' conference of 1947 by the issue

of a voluminous and completely unfounded set of charges against the British and American elements of the Control Council in their administration of W. Germany. At every point throughout 1946-47 the Russian view was opposed to the W. view. The crux at this conference on Germany was the Potsdam (q.v.) provision that Germany should be treated as a single economic unit. So long as R. chose to act in defiance of this agreement (see REPARATIONS) it was inconsistent in M. Molotov to insist on four-power control of the Ruhr. The W. Allies contended that there must be four-power control of everything or nothing.

Throughout 1948 R.'s control of her satellites was strengthened by the speedy dissolution of non-Communist parties and the socialisation of land and industry. Open support was given to the Communist coup d'état in Czechoslovakia. Some opposition was at first met in Poland, but the pro-Russian faction soon triumphed. In Yugoslavia, however, Marshal Tito refused to submit and drew upon himself the violent anger of R. In Germany a blockade of Berlin was established to attempt to force the W. powers out of the city, but was successfully lifted by its supplies. In 1949 R. seemed to become somewhat less aggressive towards the W. powers to concentrate on a firmer control of E. Europe. In May the Berlin blockade was lifted and in June there were delusive signs of progress towards a peace treaty with Austria at the foreign ministers' conference. At the United Nations R. continually denounced the aggressive intentions of the capitalist powers while stressing her own desire for peace. Her attitude prevented any progress towards disarmament and the control of atomic energy. In Sept. the Amer. and Canadian Govts. reported an atomic explosion in R. The latter claimed to have known the secret of the atomic bomb since 1947 and said that the explosion was connected with large blasting operations.

The chief concern of Russian policy was the defection of Marshal Tito from the Soviet bloc and it is possible that Molotov was held responsible for this. Vishinsky succeeded him as foreign minister in March 1949. An economic blockade of Yugoslavia was imposed by R. and the satellites, and in June Tito was accused of having slid into the camp of the foes of the Soviet Union. A threatening note was sent in Aug. and there were movements of Russian troops in Hungary. Elsewhere R. strove to prevent the growth of 'liberalism' among the satellites and a series of trials and purges began to eliminate those who refused to accept that Communism outside P. must be an instrument of Russian policy. Rajk in Hungary, Kostov in Bulgaria and Gomułka in Poland were among the victims. Marshal Rokossovsky (q.v.) a Pole by birth but one of the most famous Russian soldiers, became minister of defence in the Polish Gov. and commander in chief of the Polish armed forces. In Germany the Communist regime set up in the Russian zone was rigidly controlled by

Moscow. In China the newly established Communist Gov. was immediately recognised by R. and her satellites.

LANGUAGE — The Russian language belongs with White Russian (see WHITE RUSSIA) and Ukrainian (see UKRAINE), to the E. group of the Slavonic sub-div. of the Balto-Slavonic branch of the Indo-European languages. Russian is the chief language of the U.S.S.R. and is spoken by over 100,000,000 people. Russian is extraordinarily rich in grammatical forms, its noun still contains the locative and instrumental case forms which some Indo-European languages had eliminated three millenniums ago. It possesses three genders (masculine, feminine and neuter), there are two adjectival declensions (case and gender form of numbers and a great luxuriance of verb forms. It is extremely rich in sounds and its alphabet, known as Cyrillic, consists of forty-three letters (see under ALPHABET). The Russian alphabet is amongst the most complete systems of writing. It contains, however, too many letters, some of which have become redundant. In its reform (Nov. 17, 1918) some letters were dropped and replaced by others representing similar sounds.

LITERATURE — Russian was the official language throughout the old Russian Empire and exercised a literary supremacy. Vernacular literature existed in some of the W. provinces but it was in the main strongly influenced by Russian models and forms. In the E. the folk literature which existed was not encouraged by the authorities. The Soviet Gov. has encouraged national culture in all parts of the Union but in 1940 European R. still maintained the first place in literary achievement though here Ukrainian and White Russian literature (see under UKRAINE, WHITE RUSSIA) have since about 1860 and more especially since 1917, played a large part beside Russian proper.

The conversion to Christianity marks the real beginnings of Russian literature, though some of the legends of medieval R. probably have their basis in pagan mythology. This early literature consists of religious texts and legends or chronicles and Russian folk literature until the twentieth century continued to be founded on these early themes, though the characters altered in different regions and centuries so that the same plot might at varying times have its central character Vladimir I., Ivan the Terrible, Peter the Great, etc. Russian folk literature was first seriously collected together during the nineteenth century when it literary merit was first recognised and this work has been continued since the revolution in the *bylina* (q.v.) epic songs of popular Russian poetry were not collected in bulk until the beginning of the twentieth century. Of historical chronicles that of Nestor (d. c. 1114), which reaches down to 1113 is of great historical and literary value and the works of the annalists of Novgorod and Kiev etc. are still extant. The *igumen* Daniel described his adventures in Polesia during the first decade of the twelfth century and shortly afterwards Cyril bishop of Lvov wrote down

his sermons. Some indication of the progress of learning is afforded by the following dates which mark definite phases in Russian literary history. The MS of the *Ostromir Gospels*, which is the earliest in existence, was completed in 1057. The first complete Old Slavonic Bible was printed at Ostromir in 1581. The Academy of Kiev, where the talented poet and playwright Simon Polotski (d. 1680) was educated, and which in a dark age sustained literary progress, was founded in 1689. The first newspaper was established in 1703, and in the years 1746 and 1756 theatres were opened at Yaroslavl and St. Petersburg. Until the time of Polotski Byzantine influence greatly influenced Russian literature, but after his time Western European influences grew increasingly important. In the eighteenth century L. I. Kachkov (1696-1750) wrote the first national history as opposed to a mere chronicle of events, and Sumarokov (1718-77) introduced drama on the classical pattern. In the reign of Catherine II authors found it politic to please the Imperial court. Literature was written largely in French, plays in French were produced at the court theatre, and the form and mood of drama and poetry were French. Krashinsky (1749-1802) and Novikov (1744-1814), more independent and nationalist in their literary and political works, were both exiled to Siberia for their liberal ideas. The essentially national and greatest of all Russian poets is the brilliant Pushkin (1799-1837) whose *Prisoner of the Caucasus* (1822) is Byronian and whose tragedy *Boris Godunov* (1825) shows Shakespearean influence, though its tragedy is somewhat pompous and self-conscious. Yet his was essentially a creative genius as his lyrics and *Legend of Tzar Saltan* show. His fine prose style and delicate humour paved the way for the flowering of the Russian novel in the latter half of the century. Some of the splendour of his lyrics was maintained by Lermontov (1814-41) who owed much of his inspiration to Byron's influence and by the people's poet Kolstov (d. 1812). Nekrasov (d. 1877), strongly realist in tone, is the most noted of the modern poets. The Russian novel has taken deep root in Russia elsewhere. Gogol (1809-52), the author of the satirical *Dead Souls* (1842), *The Government Inspector* (1836), and the vividly vivid *Taras Bulba* (1834) and much to develop Russian satire and suggested a background of pre-revolutionary life later adopted frequently by Tchekhov, Turgenyev, and Saltykov (1826-9). He has found worthy successors in Turgenyev (1818-83), Dostoevsky (1821-81) and Count Leo Tolstoy (1828-1910) who were Russia's three outstanding novelists profoundly influencing the art of the novel in Western Europe, as well as in Russia. Turgenyev most affected the French novel, Dostoevsky's greatest successor was D. H. Lawrence. Tolstoy probably influenced the literature of his own country most and Soviet novelists of the period 1920-50 consciously followed the novel-pattern which he had laid. The *Crime and Punishment* (1866)

and *The Idiot* (1868) of Dostoevsky and the *War and Peace* (1869) and inimitable *Anna Karenina* (1877) of Tolstoy are landmarks in the history of fiction whilst the force of Tolstoy's personality in the fields of religion and economics has been felt in most corners of the Western world. Over the works of Turgenyev and Dostoevsky there broods a melancholy and a despairing sense of the futility of all effort to grapple with the present social and political wrongs. Goncharov (1812-1891) however, not concerning himself with these problems depicts in his masterpiece *Oblomov* (1859) the supreme domestic experience of the idle rich in pre-revolutionary Russia. Russian realism was continued by Anton Chekhov (1860-1904), and in its decline by Korolenko (1863-1921) but Chekhov's exquisite finitude gave place to Maxim Gorky's (1868-1936) civil and revolutionary fervour while his negation of life was emphasised in Andreiev's (1871-1919) morbidity. In the literature of Russia as shown in the group of writers born during the second half of the nineteenth century, moods of depression and gloom are still those which predominate. The main figures in this group are Chekhov, Kuprin, Merezhkovsky, Arshinov, Zinaida Hippus, Kamurov and Maxim Gorky. They show remarkable skill in rendering certain morbidities of individual characters at war with circumstances or with their fellows. Only occasionally are there moments in which these writers, even in their short stories, fasten on anything approaching joy. Their moments of optimism are scarce and even Merezhkovsky regarded the literature of his own country as decadent. He sought to inspire Russian writers through symbolism as a means to a Russian literary revival. Zinaida Hippus is one of the founders of Russian modernism of the period before 1914. Symbolist poetry reached its height in the work of Alexander Blok (1880-1921). The reaction against Symbolism produced some fine poems in Kuzmin (b. 1892), Guravlyov (1886-1921) and Anna Akhmatova (b. 1889).

The 1917 revolution produced a long overture to present poetry in which the movement of Iessenin (1891-1926) was prominent while poetry from and about the industrial proletariat was encouraged by Gorky who led the first proletarian anthology, *Our Songs* (1913). Gorky's reputation is based however on his vivid and sombre prose works. Generally speaking the literature of the early years following the revolution emphasised the revolution in an abstract quasi-philosophical manner. It included much poetry. Post-revolutionary literature, however, mostly took the form of prose, the realist novel underwent a remarkable revival. In the subsequent period of peaceful constructive effort notable works were produced by writers with established reputations before the revolution, such as Ilya Ehrenburg (q.v.), A. Tolstoy (q.v.), and M. Prishvin, while among young prose writers and poets of the "intellectuals" were N. Tikhonov, Boris Polniak (whose

sensational novel of starving Russia, *The Bare Year*, appeared in 1922) K. Fedin, and others. In this period the worker-writers formed a group called 'The Smithy,' the best known of whose members were Gerasimov, V. Kassin and I. Gladkov whose novel *Cement* (1925) took for its theme the struggle for the restoration of industry. Other novelists of this period are A. Serdymovich, V. Veresayev and V. Ivanov. But in this period and subsequently Maxim Gorky still overshadowed all his contemporaries with such works as *Stories of the Years 1912-21* (*Reminiscences*) (1924) his realistic novel *The Atomonoff's Business* (1925) on the degeneration of a bourgeois family during the war and the revolution and his great book *The Life of Klim Samguen* (Ling trans. *The Typhoon*) (1930) illustrating the life and psychology of the pre-revolutionary intellectuals. In the period of the first five year plan Soviet literature generally improved in quality and vividness. It was inspiring and was one more sought in the classical legacy of Russian and Western literature.

Among other writers of the period of reconstruction was Sholokov, the best known of all Russian authors, who achieved a worldwide reputation with his novel *Quiet Flows the Don* (the first vol was pub. in 1928, in Eng it appeared in two vols. *And Quiet flows the Don* 1934 and *The Don flows Home to the Sea* 1936 combined in one vol as *The Silent Don* 1942) an epic of Cossack life before and after the First World War. His second novel *Turn of Soul* (*Turned*) (1932) is a realistic description of the problems of collective farming and its effect on Russian village life.

The years following the revolution have also seen considerable development of the literature of the national minorities comprised in the Soviet Union particularly in the Ukraine (Gogol and Annina (see separate articles). Before the Second World War there was no particular emphasis in Russian literature on the decadence of the West exceptional attention was paid to Western classical and modern literature by the publication of collections of world individual novels and plays of Western authors while a number of critical writers particularly Rosanov devoted themselves to the study of Shakespeare. After the Second World War however there was an increasing tendency to more Western literature. Soviet literature during the Second World War was largely propagandist in character. War novels Wanda Wasilewska's *The Rainbow* (trans. 1941) was outstanding.

RUSSIAN ART Architecture. The conversion of Vladimir I to Christianity in the tenth century had much influence on Russian ecclesiastical architecture for it involved the introduction of the oriental glamour of Byzantium and the building of many churches in a barbaric land. Architects, artists, and workmen were procured and sent into Russia and Russians were sent to Ierograd (Constantinople), to be instructed in those arts of which they were ignorant. Painting,

wood carving goldsmiths work (enamelling, embroidery) grew from these Byzantine roots' (C. G. I. Bunt, *Russian Art from Scythians to Soviets*). The cathedral of St Sofia Kiev, founded in the eleventh century by Yaroslav son of Vladimir has in the course of centuries been so much restored and enlarged that its former appearance has been radically altered. The church was originally of the square Byzantine form the older portion forming a *chakirov*. But if the exterior has lost its original aspect the interior has kept its Byzantine character, the mosaics and frescoes (some actually date from the time of Yaroslav) having been restored with due regard to the spirit of the original and consistently with the conservatism of Russian religious art. St Sofia of Novgorod founded in 1045 was built at a time when the influence of Byzantium on Russia was at its zenith and it was not until the succeeding century that the earliest modification from purely Byzantine forms was introduced. This famous if architecturally unimpressive cathedral was partly demolished by the excavating Germans in the Second World War (see Novgorod). As originally built it was of the most square Byzantine form. The interior was mainly fresco, the cruciform plan ornamented with modern frescoes.

Not only at Kiev and Novgorod but at Chernigov and other places in the more southerly parts of Russia the early church building followed the Byzantine tradition in its simplest more severe form. In the more northerly districts however the influence of the wooden architecture of Scandinavia predominated. The well known church of the Transfiguration at Kiev is a fine example of the wooden style perpetuated so late as the eighteenth century (C. G. I. Bunt). Modification of the Byzantine style is also illustrated by the architecture of the Vladimir Suzdal period an important development which had its influence on later Russian design. In the late fifteenth century Russian architecture declined and lay made appreciable progress largely because the artists began to look to foreign architects, especially Italians, the Assumption Cathedral at Moscow was rebuilt under the direction of Bramante and another St Sophia design. The Grand Kremlin Palace the first palace building in the Kremlin (*gorod*) to be built of stone. The Piedmontese Aloisi was the architect of the Kremlin Palace (1499). Also built by Aloisi early in the sixteenth century was the cathedral of the Archangel Michael in Moscow and the cathedral of the Annunciation (Blagovestenskaya). The most remarkable indeed fantastic example of Russian architecture to be found anywhere in the country is the Vasil Catlin Palace (I. I. Iovskiy, Siber) (1554-1679), standing at one end of the Red Square Moscow. It is really a collection of chapels presenting the aspect of a jumble of pinnacles of all sizes, colours and shapes. Yet the ensemble conveys the effect of barbaric splendour.

which defies criticism according to Western standards.

Western ideas prevailed in St. Petersburg in the time of Peter the Great who wanted to endow his new city with the elements of European culture. He introduced foreign architects among whom was Trezzini whose chief work is the church of St. Peter and Paul (1711). The palace of Peterhof with white walls and gilded baroque domes was designed by Le Blond and altered in the mid-eighteenth century by the famous architect Rastrelli the younger who in 1741 built the old palace the famous Isarkoye Selo with the classical gallery of the Scottish architect

Soviet Weekly

VASILY ST. BASHIN CATHEDRAL, MOSCOW

Cameron, who became one of the foremost instruments of the Russian classical revival. As a building it is mainly remarkable as a compendium of rococo interior decoration on the most lavish scale in Russia. The famous Winter Palace was also the work of Rastrelli typical of the Russian baroque style with its impressive facade facing the Neva. The mid-eighteenth century saw the institution of the Academy of Fine Arts and with it the reaction to the Italian neo-classic of Catherine II's reign. The building of the academy was designed by its first president, the French architect V. de La Mothe, and has the precise characteristics of the French style. Starov the first Russian of the classical school to graduate from the academy designed the Lurids Palace of Prince Potemkin. Simplicity and sense of proportion are the distinguishing traits of the Alexander Palace near the Isarkoye Selo the work of Quarogni a pupil of Palladio. It is in fact at this period

of the establishment of the academy that we see the emergence of a school of modern Russian artists in architecture painting and sculpture although up to the October Revolution foreign influences continued to dominate the arts in Russia.

Architecture in the Soviet Union is one of the most problematical arts. In hardly any of the others is the uncertainty of styles the search for new forms of expression the desire for outward symbolism of an ill-defined mode of life more strongly pronounced and yet in none of them is the goal so distant. Russian architecture in the years immediately following the October Revolution adopted the slogans of functionalism and constructivism in its resistance to pre-war imitative styles. The pressing need of new buildings especially dwelling houses could be largely met by the application of functionalism in style though the results generally were primitive and deficient in architectural beauty. After the five year plans the situation changed markedly and the Soviet architects aimed at creating a new style which should be richer than any used before and at making Soviet architecture harmonious with the new political and economic order of the epoch. The general aims of construction and lay-out of the new cities are based on the principles of achieving the maximum harmony between interests of the people and the given enterprise the utmost development and of public institutions connected with the residential section. Soviet architects and artists generally hoped to break completely with pre-war ideas of Western art and yet to achieve a style in the utilitarianism of purely functional structures. Yet they sought inspiration from the classicism of the late eighteenth and early nineteenth centuries. Soviet House at Leningrad shows the classical influence in its colonnaded facade. The famous Moscow Metro also illustrates the tendency to hark back to classicism. Other examples of recent Soviet architecture are the Nizamiyevskiy Baku (1911) the Sanatorium at Sochi and the Lushinskaya embankment of the Gorky Park of Culture in Moscow. Gaudy taste seems to be often the proletarian's main concern. The walls of the vestibule of the Komsomolskaya Metro station are faced with marble glazed tiles and granite and the rest of the decorative scheme equally lavish and un restrained. The enormous Hotel Moscow is in its style debased by fancy flourishes with a facade of monumental character ornamented in pseudo-classical manner. Other specimens of recent Soviet architecture are further evidences of classicism misunderstood and conflicting styles. A pseudo-Roman style of arches spoils the State Theatre in Baku while the House of Science in Novosibirsk possesses illogical colonnades and absolutely symmetrical plan surfaces in the rear. The concrete building of the *Pravda* by Golosov is a much better example of Soviet architecture, though it makes an excessive use of glass surfaces which is really unsuitable to the Russian climate.

Painting—Although the foundation of the Academy of Fine Arts in the eighteenth century gave the first real impetus to Russian painting, court patronage as in the case of architecture continued to be given chiefly to foreign painters. In the eighteenth century Russian painting continued to be almost solely devoted to portraiture. The leading Russian portrait painters of that century are D. G. Levitski (1733-1822), father of the Russian school of portraiture, and V. L. Borovikovski (1757-1826), a pupil of Levitski, both of whom studied under Itor or its masters in St. Petersburg. Borovikovski's Princess Suvorov in the Irtakov Gallery is full of life and charm. In Moscow Tropinin (1776-1839) was also a portrait painter with ability in characterisation. Vrubel's (1791-1857) evolved his own naturalistic style as a genre painter. His pupil Aleksiev, the first Russian landscape painter of invited note, is outstanding as a colourist. His successors in landscape painting are Aiazovskii (1817-1900) and Lebedev (1812-37). It was strongly influenced by the work of Ivanov (1806-38), especially in portraiture and religious studies. Other religious painters are Ivan Kravskoi, Victor Vasnetsov, Nicholas Gay (of 1st descent), and Mikhail Nestorov (1862-1912). By this time Russian painting was reacting against the formalism and romanticism of the eighteenth and nineteenth centuries, the main factor in the growth of a truly national art being the establishment of the Society for the Encouragement of Artists in 1820. Petrov (1833-1882) is notable as a genre artist whose power is a portrait and is shown in his Fyodor Dostoevskii. Ilya Repin (1844-1930), one of the foremost historical painters, exhibits powerful dramatic feeling as in his Ivan embracing the Body of his Son. As a historical painter Vassili Vereshchagin (1812-1901) is celebrated for his world famous Retreat from Moscow.

Towards the end of the nineteenth century Russian art in most spheres was influenced by a modernist and impressionist World of Art movement. Of this movement A. Sicirov (1861-1911), whose portrait of Nicholas II is in the Tsarkoye Selo, I. I. Levtchen (1861-1900), and Vrubel (1866-1910) remarkable for his imaginative colouring, are the most notable. Ivor Gribun (b. 1851), one of the most famous painters of the pre-1914 war era, a pupil of Repin, was definitely influenced by the impressionism of Cézanne. After the revolution he turned chiefly to portrait painting, without however losing his former predilection for landscape. Also of the old or pre-Soviet generation are Samin whose landscapes are remarkable for their gay colouring, I. I. Mashkov, a strong colourist, and K. Petrov Vodkin, one of the few really original painters of this period. Petrov Vodkin's earlier pictures were strongly influenced by Im-

pressionism and his treatment tends towards decorative art. Alexander Gerasimov (b. 1881) shows the influence of Monet and Pissarro. In the years immediately before the Second World War his speciality was portraiture, his largest work completed in 1936, is the enormous picture The Founders of the First Cavalry Army. Today Gerasimov is one of the most favoured of Soviet painters.

Soviet painting in the years following the October Revolution was chiefly represented by the Leftist school which was directly influenced by the post-Cézanne European style. The chief artists in this group are Konechalovsky, A. Lentinov and I. Mishkov whose Cubist or Futurist tendencies are strongly marked, though the neo-primitive tendency also had its adherents in such painters as N. Goncharov and M. L. Lomonov. The traditions of the pre-Soviet epoch were maintained by the Right group, some of whom were attracted by subjects suggested by the revolution, the most prominent are A. Aikhipov, C. Meshkov, and K. Satkin. The period (1922-27) was marked by the growth in groups of painter seeking a new style, such as the Association of Russian Revolutionary Artists (A.R.R.A.) whose members depicted themes from the revolution and experimented in new methods of composition. Of these groups the leaders were K. Itzin, a founder of the A.R.R.A., a portrait painter and a psychologist of the realistic school, and I. Brodsky and S. Karпов. D. Karlovskii contributed a whole series of well executed illustrations portraying the life of the revolution, P. Kuznetsov took such subjects as the nation's birth and revolution, its struggle for the peoples of central Asia, while Samin (see above), an Armenian painter, depicted the rebirth in his country. In the 1930s the greatest changes were taking place in monumental works of art rather than in individual painting. The artist's most decorated one of the Moscow railway stations with paintings illustrating the work of Soviet construction, while A. Deynka (b. 1900) and F. Antonov painted frescoes in the Commissariat for Agriculture. Deynka is a prolific painter with a most realistic outlook.

Stark realism characterises the work of Soviet war artists generally. Some of the best examples of this realism are G. Pimenko's Shipholders, Domundontov's Times over Leningrad, and Samin's We shall never Forget. Other painters include Korn (b. 1902) and Lomonsky, both portrait painters, and Domergitsky and Bogayevskii. Landscape painters typical of the style of the younger generation is the work of Rybchenko, as illustrated by his Moscow underground station and Palace of Soviets' interiors. Painters of the revolution and the civil war like Brodsky, Grigoryev, and Lomonsky are numerous. Graphic art K. Roudakov is prominent among lithographers, and his book illustrations are everywhere popular. A. Verbitsky, another illustrator, shows delicate draughtsmanship. Nivinsky was a famous Russian etcher, but his

successors have not mastered his technique or developed one of their own of comparable merit. Although working mainly in France and Germany, the work of the surrealist Marc Chagall, a Russian Jew, must be mentioned since his subjects are taken from Russian life and folk lore.

Sculpture—The art of sculpture was never looked upon with favour in old time Russia since all graven or modelled images were taboo in the Orthodox Church as savouring of idolatry. It was not until, with the importation of Western ideas in the eighteenth century, there came about a broader spirit of toleration that the art developed on such the same lines as painting. French artists and French art providing the paramount inspiration' (C. G. F. Bunt). The earliest notable Russian sculptor was Count Carlo Mascheroni (d. 1741), father of Katsirelli, the famous architect to Elizabeth Petrovna, whose best works include the well-known equestrian statue of Peter the Great at Leningrad and a bronze bust of that monarch in the Winter Palace. Other noted sculptors of this earlier period include Giltz, prof of sculpture at the Academy of Fine Arts, Takanov, a Fr. sculptor who became the art adviser of the Empress Catherine and Goltz's best pupils Shubin (d. 1805) and Kozlovski (d. 1802). As representatives of the classic period may be mentioned Shchedrin (d. 1825), a versatile sculptor of statues, monuments and bas-reliefs whose dynamic statue of Marsyas is in the Academy of Fine Arts (Leningrad), Gordin and Prokoviev, Count Theodore Tolstoy (d. 1875), a romanticist, and Ivan Vitya (d. 1875) are among the better known of those who exemplify the national spirit. Among sculptors of the nineteenth century whose work reveals a naturalistic vein are Kamenski, Antolski and Dubovetskoi.

The main direction in Soviet sculpture since the early days of the revolution was in the direction of monumental works depicting episodes arising from the conflict between the Bolsheviks and the 'White Russians'. The most significant works of this time are the statue of Karl Marx (1918) by Matveyev in Leningrad and the statue of Liberty in Moscow. Monuments for streets, squares and parks are a somewhat crude edition of a kind of classical style which is devoid of either the beauty of the antique or the intellectual quality of the Renaissance. Even sculpture eschew the old ideals of grace and tenderness, as may be exemplified in the thick-set female figures wrought by Somov. Real grace and delicacy of line are found in statuette bronzes, or ceramics and may be illustrated by the work of Kardashov and Matveyev. Schadr's colossal Lenin Memorial in Tiflis is said to be the greatest sculptural work of the Soviet age, and in spite of his work is characterised by simple realism. Other Soviet sculptors of these years, notably Chaikov, were influenced by Cubist constructivism. A. Arhipenko (b. 1887) is one of the greatest exponents of Cubism. Sarah Lubedev's portrait

sculpture of revolutionary personalities is full of life and realistic beauty. Por trait heads by Ichaikov and Korolyov indicate perhaps that Soviet sculptors' talents lie rather in characterising personalities than in plastics generally. The semi-impressionist and later academic sculptor N. Andreyev (d. 1932), a sculptor of a series of portraits and statues of Lenin had no rival in the portrayal of Lenin from life. Iukh Khar, one of the most original Soviet sculptors, is best known for his works representative of central Asia.

Icon Painting—Icons (or ikons from Greek *eikon* image) paintings or mosaics of sacred personages and themselves regarded as sacred art which in former centuries might be considered to be the characteristic expression of Russian religious thought and popular piety, became in the later centuries the chief symbol of Russian faith. The art of the icon consists in painting on panels of one or more pieces of wood glued together, the panel being smoothed with pumice and primed with glue and chalk to receive the design either directly, or is often in the case of the more elaborate icons, through the medium of a kind of transfer used to ensure the right outline. The early eleventh and twelfth century icons were essentially Byzantine in inspiration and monochrome, whereas in the next two centuries brilliant colours are a quality of the icons of the Novgorod school which gradually evolved in individual style. The art reached its zenith before the end of the fourteenth century in the work of Andrei Rublev and for a century or more his influence was predominant. The early fifteenth century witnessed the development of the elaborate *iconostasis* (of the Church) or screen separating sanctuary from the main body of the church in which icons were placed. A new style in the art of icon was inaugurated by the Stragomay school in the late sixteenth century, the master of which produced highly elaborate and intricate icons, mostly miniatures, while the seventeenth century saw the decline of the art into mere virtuosity, and by the nineteenth century the art had degenerated into a mass production monopoly in Vladimir. The art is still surviving in some degree with its traditional methods and technique, but the expressiveness and quality of colouring characteristic of the works of the best periods have been lost.

Goldsmiths' and Silversmiths' Work—In the goldsmiths' and silversmiths' work is exemplified in museum or great private collections of pre-1918 times, or at the Brit and Victoria and Albert Museums is remarkable for splendour richness of colour through polychrome enamelling, and liberal use of jewels. In the seventeenth century the work was typically Muscovite, but the eighteenth and nineteenth centuries showed a revision to Fr. influences. Of all the decorative arts of R. that of enamelling is perhaps the most characteristic as well as one of the most ancient. Greek Scythian work found

in the tumult of S. R. affords evidence that Russian artificers were not exclusively dependent on Byzantine models though there are many fine Byzantine specimens in Caucasus. The long Mongol domination of R. had a strong influence on the art of canelling as it did on all other arts though at this time Western influences were also making themselves felt and the finest of Russian art is belonging to this period. The imperial orb from the old Russian capital of the seventeenth century shows no traces of that barbaric feeling which is predominant in much Russian art.

Music—Apart from the traditional music of the Gk Church and a very rich and varied folk art R. made no significant contribution to music before the nineteenth century. It opera had been introduced by the court and during the reign of Catherine II (1762-91) by the author of librettos G. G. P. (Parsell) Cimarosa, and other librettos produced operas in R. by invitation. Borotinsky (172-1825), a pupil of G. G. P., wrote choral music for the Imperial Chapel at St. Petersburg. The Napoleonic invasion of 1812 was followed by a great artistic revival led by the dramatist Pushkin in R. the connection between music and letters has always been close. The first Russian composer of distinction was Glinka (1801-57) whose operas *A Life for the Tsar* (1836) and *Ruslan and Ludmila* (1839) are landmarks. Their compound of folk convention with the vital strength of native folk music though not strictly as an artistic whole is the central root of later Russian music. His conscious nationalism was extended by Dargomyzhsky (1813-69) whose operas shunned melody and pursued natural speech rhythms and dramatic truth and by the St. Petersburg group known as the Five: Balakirev (1837-1910), Cui (1835-1918), Borodin (1833-87), Rimsky-Korsakov (1844-1908) and Mussorgsky (1839-1881). None of these was a professional composer by training. The leader and mentor of the group was Balakirev who was remarkable as much for his influence on the others as for the great harmony, originality and colour of his instrumental works. In 1862 he founded the Free School of Music at St. Petersburg in opposition to the conventional teaching of the official conservatories under the brothers Rubinstein. Cui, a general of engineers, served the cause more efficiently in journalism than in his music which is negligible. Borodin a prof. of chem. wrote little but nearly all of it especially his symphonies and quartets is of the highest quality and individuality. His unfinished opera *Prince Igor* has an epic grandeur. He was a great melodicist and the dark colouring and rich harmony of his music reflect his oriental ancestry (his father was a Georgian prince). Rimsky-Korsakov wrote the first Russian symphony as a midshipman on a naval cruise. His fifteen operas, mostly based on folk tales, show a stronger gift for fantasy than for characterisation, his orchestral works are marked by great virtuosity, he

was also important as a teacher. Of the five Mussorgsky had most genius and least training. Imperfect habits led to his early death and few of his major works were finished but his opera *Boris Godunov* (1874) is a national epic of great dramatic power and has deeply influenced modern music. Until recently it was known only in Rimsky-Korsakov's version which will with its harmony and orchestration. Mussorgsky was also a remarkable singer with a reciting speech rhythm of the Russian peasant in style. It is a realist and artistic.

The following composers in Moscow were: Tchaikovsky (1840-93) whose style though not without a national strain was more influenced by the cosmopolitan tradition. A strongly emotional and subjective element in his symphonies has won him friends in all countries in large numbers. He used nearly all the traditional forms, probably his excess especially *Tragic Overture* (1870) and his brilliantly scored and in his ballets represent him at his best. His successors Tchaikovsky (1866-1913), Arensky (1861-1906) and Rachmaninov (1873-1943) followed the cosmopolitan line. The last was a gifted writer for the piano (Grazynsky (1865-1930) originally a follower of the St. Petersburg nationalist wrote symphonies and chamber music in the traditional idiom. A more eccentric taste was steered by Scriabin (1872-1915) who passed through a phase of romanticism to a mysticism based on theosophy under the influence of which he united a synthesis of all the arts, not omitting colour and smell. Early in the twentieth century Russian national opera and ballet achieved worldwide fame and influence through the activities of the impresario Diaghilev who produced *Boris Godunov* in Paris in 1909, but the creative tradition was shattered by the revolution of 1917. Many established composers took refuge in exile. Including Rachmaninov, Glazunov, Albin (b. 1880) who has written mostly for the piano in a strongly German style and Stravinsky (b. 1882) a pupil of Rimsky-Korsakov. Stravinsky's early fullness is remarkable for their barbaric power and reckless experiments in rhythm, colour and orchestration have attracted Russian favour. His later work written in Paris in U.S.A. betrays the composer's arch conservatism. It is a neo-classical and a return to the traditional. Prokofiev (b. 1891) a pupil of Scriabin is a composer of more vitality than which was for some years in exile but returned to R. in 1931. The music of the Soviet era has been disappointing. Popular art has naturally been encouraged and valuable work has been done in the old style of folk music. In the many times cited. Then but the exercise of political pressure on composers to gratify the popular taste (in effect the taste of the Communist Party leaders) has led to a decline of standards especially as it has been accompanied by an extreme rejection of all modern Western music and a disingenuous manipulation of ideological jargon. Scarcely has the bankruptcy of applying external standards

to art been more convincingly proved Shostakovich (b 1906) whose first symphony (1925) showed great promise and originality has more than once been censured by the authorities for such crimes as 'anti people formalism' and his talent has been allowed little chance to mature. Similar strictures have (1948) been passed on Prokofiev Minskovsky (b 1881) a prolific composer of symphonies, the Armenian Khachaturian (b 1903) whose work has a strong folk element and others. For Russian ballet see under BALTIC

republic control distribution and exhibition save for the five largest Moscow cinemas which are directly controlled by the Committee of Arts

In the 1920s Vertov experimented in camera angles and Kuleshov in cutting. Theories of the film began to be closely studied and particular attention was paid to the work of D. W. Griffith. His art of editing was greatly developed and its potentialities as the fundamental principle of the film were consciously realised. As a result the silent film reached its highest development in such works as

FILM—In 1917 Lenin issued that for us the most important of all the arts is the cinema, and his successors valued the art not only for its entertainment value but also and in fact primarily as a vehicle for education and for the presentation of the Communist idea and achievements to Russia and the world. The industry was nationalised in 1919 and the State Institute of Cinematography established for research and to train technicians. By 1937 there were 21,000 silent and 300 sound projectors to serve a pop. of 160,000,000. The industry is controlled by the Committee of Arts. Each republic has a studio, and there are institutes in Moscow and Leningrad and a school in Moscow. Distribution trusts in each

Lenin's *The Battleship Potemkin* (1925), *October* (1928) and *The General Line* (1929), Pudovkin's *Mother* (1926), *The End of St. Petersburg* (1927) and *Strike* (1928) and Dovzhenko's *Earth* (1930). The later history of the film everywhere was largely influenced by the Russian contribution particularly in the documentary type and in the use of music and association. Pudovkin's *Film Technique* (Leningrad, 1933) was one of the first studies of technique and theories.

The introduction of sound was made only slowly owing to contemporary economic difficulties and to the enormous number of silent projectors in use. A change of approach was also effected in the 1930s the younger directors preferring realism to the older aestheticism the new

Russian Front (First World War), Campaigns on. On the outbreak of the First World War the Russians occupied the I front, and at once invaded I Prussia, their line making a salient in Poland. Being slow in movement the Russian forces were popularly named the 'steam roller'. Under the supreme command of Grand Duke Nicholas they advanced along the Kovno Posen railway and defeated the Gers on Aug. 16, 1914, at Gumbinnen, securing the junction at Insterburg and driving the remnant into Königsberg on the coast. The Ger. Gov. alarmed at this menace called up Hindenburg (q.v.) in retirement who was sent, with Ludendorff (q.v.) as his chief of staff to stop the Russians. The study of the Prussian frontier in this region had been Hindenburg's sole occupation during his retirement. He rapidly collected an army and occupied a line at Tannenberg (q.v.) and between Aug. 26 and 31 successfully defeated two Russian Army corps which he caught in a drile.

The S. portion of the Russian forces swung forward from victory to victory over the Austrians. Russky (q.v.) and Brusilov defeated them decisively in Aug. 1914 along the line of the R. Bug and by the end of the month Brusilov had entered Galatz at Larnopol. Pressing on the Russians invested Izmeyel (q.v.) towards the end of Sept. and made for the passes across the Carpathians. The Gers made a counter offensive across Poland in Oct. 1914, causing the S. portion of the Russian forces to withdraw beyond Izmeyel. When the Russians regained strength they attacked the Austro-Gers I of the R. San and defeated them driving them beyond the riv. They then moved against Lwow during the first week in Dec. 1914 but this move was successfully countered by the Gers causing the Russians to withdraw behind the R. Dunajec (see DECAJEC SAN BARTHELEMY).

The year 1915 opened with a battle for the Carpathian passes but the Austrians made no headway. Hindenburg made a determined effort to clear the Russians from Warsaw, in which he succeeded by Aug. Further S. the Russians also withdrew in the Gdno region and a Ger. advance towards Riga was also partly successful. In 1916 the Russians defeated the Austrians at I. Knowitz and gained ground between Dniebo and Kovl during the summer. Towards the end of the year they made strenuous efforts to link up with the Rumanians, but these failed.

The Russian Revolution broke out in March 1917 and though the Russian Army remained in the field for some months after that event no operations of importance took place there after (see also GALICIA, CAMPAIGNS IN WORLD WAR FIRST (under various sub headings)).

Russian Soviet Federative Socialist Republic (Rossiiskaya Sovetskaya Federativnaya Sotsialisticheskaya Respublika,

R S F S R), founded in Nov. 1917, largest of the republics of the Soviet Union, comprising 75 per cent of the area and 50 per cent of the pop. of the U S S R. On the N. it is bounded by Norway and the Arctic Ocean, on the E. by the sea of Okhotsk and the Pacific, on the S. by Manchuria, Mongolia, China, the Kazakh S S R, the Caspian Sea and the Caucasian republics of Azerbaijan and Georgia, and on the W. by the Ukrainian and Byelorussian S S R's, the Italian and Estonian S S R's, the Gulf of Finland, the Baltic Finnish S S R and Finland. For geography see under RUSSIA (GEOGRAPHY) and for administrative divisions under RUSSIA (ADMIN. AND POPULATION). The R S F S R is the most important republic economically, politically, and culturally. Its natural resources both agrie and mineral are immense; the cultivated area is some 250,000,000 ac. Over 100 nationalities are included in its pop. There are nearly 500 estates for higher education and many libraries, museums, theatres and scientific institutions. Communications in the republic have been extensively developed and many new cities built, such as Magnitogorsk, Stalinsk, Kirovsk. The cap. is Moscow. Area 141,000 sq. mi. Pop. 10,000,000.

Russo-German Campaigns in Second World War, see EASTERN FRONT

Russo-Japanese War (1904-5) The essential cause of this war lies in the conflicting interests of Russia and Japan on the mainland of Asia. Russia in her endeavour to become a great naval power sought a port in the P. O. which would be free from ice all the year round and which would form a good naval base. In 1896 she secured lease of Port Arthur from China and connected this port with St. Petersburg by means of the Trans-Siberian railway. She also sought to transform Dairen (Dairen) into a great Asiatic port. In 1900 Russia extended her power over the Chinese prov. of Amur and sought the recognition of her suzerainty over the country. Opposed by both Japan and England she finally agreed to evacuate the whole of the territory which she had gained from China. Beyond withdrawing her troops from S. Manchuria and Mukden she had to agree to carry out the terms of the agreement. Finally in 1903 a proposal emanating from Japan and suggesting that the integrity of China and Korea should be vouched for by the contracting parties, at the same time proposing that Russian interests in Manchuria and Japanese interests in Korea should also be safeguarded was refused by an optimistic and short-sighted Russian Gov. Japan withdrew her missiles from St. Petersburg (Jan. 26, 1904), and within two days had landed troops at Chemulpo, and a day later defeated the Russian fleet at Port Arthur. Admiral Togo inflicted heavy loss on a Russian fleet under Makhirov in Apr. Meanwhile a second Jap. army under Oku had landed on the Liaotung peninsula and had won many victories. The railway communication between the Russian army and Port

Arthur was severed. Kinchau was captured, and after the victory at Nanshan, Dainy was occupied by the Jap and made a new base of operations. The Russians were forced back until finally after three days' fighting Lunan tun fell into the hands of the Jap. The defeat cost the Russians nearly 15,000 men. The main result of the fifteen days' almost continual fighting which had started on Sept. 9 was the loss to the Russians of over 50,000 men. The investment of Port Arthur by the Jap had in the meantime begun. After strenuous fighting each step being keenly contested the main vantage points had been captured by the Jap. On Aug. 10 a naval sortie took place but was defeated broken up and driven back and the Vladivostok fleet came to the aid of the Russians at Port Arthur was also badly defeated. On Nov. 23 Meteor Hill was captured and the tin and rub. about 15% of the merv. of the big Jap guns. By the end of the year the chief fortresses were in the hands of the Jap, and on Jan. 2 Port Arthur surrendered and on March 10 Mukden was occupied by the Jap. In Oct. 1904 the Russian Baltic fleet had sailed for the Far E. It caused a diplomatic incident by firing on the Hull trawlers believing them to be Jap warships. It was surrounded on May 27 by the Jap fleet in the straits of Tsushima and practically annihilated, 4,000 men were killed nearly 8,000 captured and almost the whole fleet was sunk. This was the decisive battle of the war. In Aug. terms of peace were arranged at Portsmouth, U.S.A. and the Russians received not unfavorable terms. Russian rights in Port Arthur and Dainy passed to the Jap. Sakhalin was divided between the opposing countries, no indemnity was to be paid by Russia, the Manchurian railway became the property of Japan, Korea became a Jap sphere of influence. Manchuria was evacuated by both armies and referred to China whilst valuable fishing rights in the Beiping Sea were ceded to Japan. Japan lost roughly about 170,000 men whilst the war cost Russia about 400,000. See C. A. Court, *Rapington (The Times correspondent) War in the Far East 1904*; K. I. Asakawa, *Russo-Japanese Conflict 1904*; Hamilton, *Staff Officers Scrapbook 1904*; and A. N. Priboy, *Hyushima 1936*.

Rust, reddish brown hydrated ferric oxide ($2\text{FeO} \cdot 3\text{H}_2\text{O}$) or brown hematite which forms on iron or steel on exposure to moist air. Iron does not rust when in contact with dry air, but if a drop of water be placed on the surface the presence of a reddish substance can be observed in a short time. Again when iron has once commenced rusting, the process continues rapidly owing to the fact that R. is itself hygroscopic and absorbs water from the atmosphere. Crum Brown attempted to show in 1888 that carbon dioxide was necessary to the phenomenon. He held that ferrous carbonate and hydrogen were produced, the carbonate being then oxidised to form ferric hydroxide with the liberation of carbon dioxide. Later experiments, how-

ever, show that pure iron does not rust in contact with pure oxygen and pure water even when carbon dioxide is present. On the other hand the acids, other than carbonic commonly found in the atmosphere promote rusting. The evidence points to the phenomenon being partly a result of electrolytic action. Impurities in the iron render the metal liable to rust in the presence of water and oxygen, apparently because iron particles and impurity particles may form the poles of an electrolytic cell enabling ferrous ions to pass into solution; these are then oxidised to the ferric state. This fact has led to methods for diminishing the corrosion of iron by limiting the galvanic action to a more active metal. Thus by causing an iron surface to be closely adherent to a zinc coating the galvanic action is largely limited to the latter, the iron being thus preserved. The zinc coating also prevents contact with the iron so affording additional protection to the iron.

Rustehuk, Ruschuk, or Russe, tn. of Bul. 139 m. N.W. of Varna on the Danube. Its chief manufactures are earthenware and tobacco. It is the seat of a Bulgarian nobleship. Pop. 50,000.

Rustonburg, tn. of the Mansard 60 m. by rail from Pictoria built named by the Mag. 11112. Mts. (centre of a tobacco growing dist. Pop. (European) 300 (native and Asiatic) 3000.

Rust Fungi (Fungi) large and important section of fungi comprising about 1700 species all of which are obligate parasites on higher plants. The name rust refers to the appearance of the summer spores (macrospores) which are formed in tremendous numbers on the leaves or stems of the host. The R. F. are allied to the *Ustilaginaceae* (Smuts) and are included with them in the group of fungi known as Basidiomycetes, which also contains the common mushroom and the truffles. Many R. F. *utriculiferous* i.e. they alternate between two different host plants as for instance *Puccinia graminis* the black rust of wheat which occurs also on the barberry (*Berberis vulgaris*). This particular species is said to cause a reduction in the wheat crop of N. America and Australia of up to 50 per cent. See L. I. Brooks, *Plant Diseases*, 1928.

Rustless Steel, see STAINLESS STEEL.
Rutebeuf, or Rusteuf, (1230-80) French poet, he and Jean de Meung were the greatest of their time. His best works are short lyrical and mystical poems and satires, but he was exceedingly versatile and tried almost every form of poetry and prose. He is the oldest representative of personal poetry in lit. literature.

Ruth, George Herman (Babe), (1895-1948) Amer. baseball player, born in Baltimore and educated at St. Mary's Industrial School there. In 1914 joined the Baltimore Orioles as a pitcher and outfielder. He later proved himself an outstanding left-handed pitcher with Boston Red Sox. From 1920 to 1933 he played as an outfielder with the New York Yankees setting many records and his

outstanding play and colourful personality made him a national hero.

Ruth, book of the O.T. being the second of five of the 'Megillot' or 'Rolls,' is an anonymous work of great beauty giving an exquisite picture of the life of the time it depicts. The date of its composition is unknown but it belongs evidently to the period in which Heb. literature was at its best. It is laid by the author in the time of the Judges. The central figure is Ruth, a Moabitess who becomes the great grandmother of King David. In the Jewish canon it is placed between the Song of Songs and the Lamentations and in the Jewish ritual it is read on the Feast of Weeks or Pentecost.

Ruthenia, Sub-Carpathian Russia, or Trans-Carpathian Ukraine, area of central Europe formerly part of the Austro-Hungarian Empire. Between the two world wars it was the name of the most E. prov. of Czechoslovakia. From 1938 it was occupied by Hungary and became a centre of guerilla resistance in central Europe. In 1941 Czechoslovakia ceded this prov. to the Ukraine. Poland also ceded it and Rumania did so in 1947. The whole area was thus absorbed into the Ukrainian S.S.R. Covered by the Carpathians in the N. in the S. are fertile lowlands producing maize and vines. There are wide stretches of valuable forests. The chief mineral is rock salt which was here mined in the Stone and Bronze Ages and by the Romans. Uzhorod was the cap. of Czech R. which had an area of 4886 sq. miles. Pop. of the whole area is estimated at 1,500,000. The Ruthenians are a Slav people forming a branch of the Little Russians. By religion they are Catholics in communion with Rome retaining however their old Slavonic liturgy with Roman modifications. Married men may become priests but not monks (Basilians) or bishops. Since 1945, however it appears that the Ruthenian Church has suffered much persecution.

Ruthenium (symbol Ru, atomic weight 101.07) metallic chemical element. It is found in platinum ore and is usually obtained from the residues left when osmium is separated from osmiridium. It is a grey metal resembling platinum, has a sp. gr. of 12.5 in the electric arc and has the power of dissolving gases.

Rutherford, Daniel (1749-1819) Scottish scientist, b. in Edinburgh. He studied medicine at Edinburgh Univ. In 1772 he established the distinction between nitrogen (although he did not give it this name) and carbonic acid gas. He later discovered the presence of nitrogen in air. Subsequent study on the constitution of natural gases was founded on his work.

Rutherford Mark, see **WILLIAM HALL**.

Rutherford of Nelson, New Zealand, **Ernest Rutherford**, first Baron (1871-1937). b. at Brightwater, New Zealand and educated at Nelson College and Canterbury College, Christchurch, and later at Trinity College, Cambridge, where he did research work under J. J. Thomson at the Cavendish Laboratory. For a short

period he continued his work on Hertzian waves which he had started in New Zealand using a simple detector the core of which consisted of needles each 1 cm. long and seven hundredths of a millimetre in diameter with which he received signals three quarters of a mile away. He did not continue his researches on wireless waves having no interest in its commercial side and was soon immersed in the new research which was destined to open up enormous fields in which he afterwards attained world-wide renown. His work on uranium radiation was developing along very interesting lines when he was offered and accepted in 1915 the professorship of physics at McGill Univ. Montreal. During his nine years there he carried out his great work on radioactivity and the alpha particle and the

LORD RUTHERFORD
A. C. G. T. Spicer Sims

subject of radio activity took on an enhanced interest after it had shown the corpuscular nature of the alpha radiation. In 1910 he was appointed prof. of physics at Manchester Univ. where he developed the electrical method for counting alpha particles, which gave good agreement with Röntgen's scintillation method. In collaboration with Roys R. showed that alpha particles on which the positive charge had been neutralised were helium atoms. Soon afterwards he determined the number of alpha particles in unit volume of gas and the result 2.7×10^{10} atoms per c.c. conformed to Avogadro's law and provided a direct proof of the discrete nature of matter. R. took a prominent part during the First World War in organising research on underwater acoustics to combat the submarine menace but by the middle of 1917 when practical methods were proving successful he resumed his work on nuclear physics attacking by new methods the problem of alpha particle scattering. In 1919 he was elected Cavendish prof. of experimental physics in the Univ. of Cambridge,

and during the period 1925-30 great improvements were made by his colleagues in experimental technique. The harvest of such improvements was reaped in later years and 1932 has been truly described as the commencement of a new era in nuclear physics. In that year the disintegration of the nuclei of atoms was accomplished for the first time by means of charged particles which were accelerated by using high voltages in vacuum tubes. In addition the properties of the neutron which R had predicted some twelve years previously were verified. It died suddenly and his ashes were placed in Westminster Abbey near the remains of Newton Kelvin Darwin and Sir John Herschel.

Among the many honours conferred on him were 1903 Bressa premium of the Academy of Science Turin and in the same year the Nobel prize for chem. 1914, Knight Bachelor, president of the Brit. Association for the 1923 meeting, 1925 member of the Order of Merit, 1927-30 president of the Royal Society to which he was elected in 1902 and which afterwards awarded him the Copley medal for his work on radioactivity, 1930 chair man of the Advisory Council of the Department of Scientific and Industrial Research, 1931 elected a peer, 1933 director of the Royal Society Mond Laboratory. He was the recipient of a number of honorary degrees from various univs. and in addition to a large number of papers which appeared in different scientific pubs. he was the author of *Radioactivity* (1901), *Radioactive Substances and their Radiations* (1912), and *The New Alchemy* (1937). See A. S. L. V., *Rutherford, Being the Life and Letters of the Late Rt. Hon. Lord Rutherford* 1939, I. B. N. Evans *Man of Power, the Life Story of Baron Rutherford of Nelson O.M. F.R.S.* 1939, and *Rutherford Lord Rutherford* 1940.

Rutherford, Samuel (c. 1600-61) Scottish divine b. at Nisbet Roxburghshire. He graduated at Edinburgh Univ. in 1621 and was in 1623 appointed regent of humanity but was deprived of his office in 1626 and became pastor of Anwoth Galloway. In 1636 he pub. a treatise against Arminianism for which he was summoned before the High Commission at Edinburgh and forbidden to exercise his ministry, but he returned to Anwoth in 1638 and was made prof. of divinity at St. Mary's College St. Andrews the same year. He was one of the commissioners of the Church of Scotland to the Westminster Assembly (1643) and in 1651 was appointed rector of the univ. of St. Andrews. He joined those who condemned the treaty with Charles II as sinful and was deprived of his offices. His reputation rests chiefly upon his *Letters*, first pub. in 1661. See lives by A. Thompson 1884, and R. Gilmour 1904.

Rutherglen, royal and municipal burgh of Lanarkshire, Scotland, situated near the Clyde 2½ m. S.E. of Glasgow. It is the oldest royal burgh in Scotland, having received its first royal charter in 1126. In

the Middle Ages it was a town of considerable importance, but with the rise of Glasgow it declined. It is now, however, a thriving industrial community. Shipbuilding and coal mining were formerly the main activities but they no longer exist and they have been replaced by other important industries including iron and steel, chemical, paper, ropes, furniture and mining machinery. A minor industry is the making of oat cakes. R. was burnt down in 1568. It forms part of a co. constituency. Pop. 26,000.

Ruthin, or Rhuthyn, municipal bor. and market town of Denbighshire N. Wales 21 m. from Chester. The 'Red Castle' from which it takes its name was built about 1280, the present structure was erected in the nineteenth century on the same site. Pop. 4,000.

Ruthven, Baron, Scottish title borne by the family of Hore R. The first creation of the title was in 1187 when Sir Wm. I. was made a lord of Parliament. Wm. fourth lord who was made earl of Gowrie in 1551 was responsible for the seizure of the boy king James VI (see JAMES VI, RAYNOR). For a short time he held the land in the young king's name but after the latter's release, he was executed (1584) for treason. The title then became extinct but in 1651 it was granted to Sir Thomas R. from whom the present holder Walter Patrick Hore R. (b. 1850) ninth Scottish baron R. and second United Kingdom baron R. of Gowrie is descended. The heir to the United Kingdom title is Alexander Gore Arkwright Hore R. V. (first earl of Gowrie created 1944) and first baron (created 1935) of Culter and Duleston. He was governor of S. Australia 1928-31 (cf. New S. Wales 1931) and governor-general of the Commonwealth of Australia 1936-44.

Ruthven, Raid of, Scottish conspiracy which took place in 1582. The girls of Gowrie and Mar, Lord Lindsay of the Byres and the master of Glamis seized the person of the boy king James VI and took him out of the keeping of his guardians the duke of Lennox and the earl of Arran.

Ruthwell vil. of Dumfriesshire Scotland 10 m. from Dumfries and 7 m. from Annan by road or rail. Noted for world-famous eighth century runic cross which now stands in the par. church. It is 18 ft. 6 in. high with carvings of scenes from the life of Christ and part of the Decree of the Holy Rood attributed to Cadmon and is wonderfully preserved. The first savings bank was opened in the vil. by the Rev. Henry Duncan in 1810, the Savings Bank House is open to visitors. Pop. 700.

Rutile, mineral consisting of titanium dioxide (TiO₂) generally impure. It crystallises in the tetragonal system and twinning phenomena are frequent. The crystals range in colour from yellow to reddish brown and in size from 1/2 to 1/2 according to the amount of ferric oxide present, hardness 6. It is found enclosed in schist, ss. rocks and in clays and slates in the form of fine needles. It is used to produce a yellow colour in glass and porcelain.

Rutland, Duke of, *see* **MANNERS, JOHN JAMES ROBERT**

Rutland, Dukes of, king title borne by the family of Manners. Richard Plantagenet duke of York who was slain in 1461 was earl of Rutland and through his daughter he was ancestor of Thomas Mannors who was made earl of R. 1525 being granted estates in Leicestershire. A later earl married Dorothy Vernon and obtained estates in Derbyshire. John ninth earl, was made duke of R. in 1703. Charles fourth duke, was lord lieutenant of Ireland under Pitt. John James Robert seventh duke (*q.v.*), was succeeded by his son and then his grandson succeeded to the title. The tenth duke (b. 1919) Charles John Robert Mannors succeeded to the title in 1910. The duke's eldest son is called the marquis of Granby. The duke's seats are Belvoir Castle Leicestershire, and Haddon Hall Derbyshire.

Rutland, midland co. of England bounded N. and E. by Lincolnshire, S. and W. by Leicestershire and S.E. by Northamptonshire. Its surface is broken by low hills forming a series of which the chief is the vale of Catmose. Between Oakham the town and Uppingham the co. was at one time covered by Lyfield or Ickfield Forest part of which was Beaumont Chase. The principal rivers are the Welland, Wash Chuter and Eive. Almost the whole co. is under cultivation wheat forming the main crop, turnips and swedes being also grown. Numbers of sheep and cattle are reared and cheese is manufactured and known as Stilton. Limestone is quarried. The co. contains five hundreds and returns one member to Parliament. The castle has a good Norman hall. Area 110 sq. m. being the smallest co. in England except London. Pop. 17,400. *See* **Victory County History Rutland 1908**. *A Nice Leicestershire with Rutland 1912*.

Rutland, city and town of R. co. Vermont, U.S.A. 47 m. S.W. of Montpelier. R. is the centre of an agricultural district. It has milk dairies, a public shipping industry and a mill and cement works. There are also iron foundries and boiler shops. Pop. 17,000.

Rutland Isle, *see* **INDIAN ISLANDS**

Ruth, *see* **GRUTH**

Ruvo di Puglia, town in prov. of Bari, Apulia, Italy. 20 m. W. of Bari. Its cathedral dates from the twelfth century. Pottery is manufactured. Pop. 26,900.

Ruwenzori, or Ruworo, name of mts. of Central Africa between Lake Albert and Edward. It was discovered by Stanley (1857-8) and has a length of 63 m. with a breadth of about 9 m. The highest point is Mt. Stanley (16,800 ft.). The climate is very damp and the annual rainfall about 180 in. The vegetation varies with the zones which are well marked but owing to the amount of moisture mosses and lichens occur in some of the zones.

Ruysbroek, Jan van (1294-1381) mystic theologian, b. in Ruysbroek near Brussels. He was educated in Brussels and

became priest in the church of Saint Gudule in 1318. In 1343 he retired to the solitude of the forest of Soignes and six years later built a monastery there. His works written in Flemish, were translated into Lat. by Susmus in 1519. *The Adornment of Spiritual Marriage, the Sparkling Stone and The Book of Supreme Knowledge* have been translated into Eng. by Evelyn Underhill 1916 and *The Kingdom of the Powers of God* 1919.

Ruysbroeck, Wilhelm (**Rubruquis, Guillaume de**) (c. 1220 c. 1234) Flemish medieval traveller and missionary, b. in Brabant. He entered the Franciscan order and was sent to the Holy Land on a mission. In 1253 St. Louis IX. of France sent R. and two other friars on an embassy to the Mongol prince Sartuk and to the Mongol emperor, Mangku Khan. The return journey was made by way of China and Syria to Tripoli in N. Africa. He wrote an account of his travels in Lat. *See* H. H. Gilbert and others, *Der Bericht des Lanzesheims Wilhelm Ruysbroeck* 1934.

Ruysdael, or Ruysdael, Jakob van (c. 1625-82), Dutch landscape painter, b. at Haarlem. He studied surgery but, on Berchem's advice, took up painting. In 1649 he became a citizen of Amsterdam. But he never made even an adequate livelihood from his paintings. His favourite subjects were woodland scenes and he is especially famous as a painter of trees, but he also excelled in coast scenes and sea piece, as well as in painting cloudy skies. Some of his pictures are in the National Gallery London.

Ruyter, Michael Adrianzoon, *see* **DE RUYTER**

Ruzicka, Leopold (b. 1887) Swiss chemist of Czech origin, b. at Vukovar. He studied at the technical high school at Karlsruhe. He held chairs of organic chem. at Utrecht and Zurich. His scientific work was his research on polymethylenes and their character in compounds. In 1919 he was awarded with the Nobel prize for chem. He became a foreign member of the Royal Society in 1912.

Ryan, Loch, bay in Wigtonshire, Scotland, between 9 and 10 m. long and about 2 m. wide, forming an excellent harbour. The port of Stranraer is in L.P.

Ryazan, *see* **RIZAN**

Rybinsk, town of the R.S.F.S.R. region of Yaroslavl, on the Volga, 90 m. N.W. of the town of Yaroslavl. It was an episcopal see, had a cathedral and an arsenal and is the centre of the Volga transit trade. Ships and printing machinery are its industries and it is a centre of the cattle industry. Pop. 19,000.

Rydal Water, lake of Westmorland, England, at the foot of Rydal Mount in the valley of Ambleside. It is 4 m. long and 4 m. broad. Rydal Mount was the home of Wordsworth from 1813 to 1850. Rydal viaduct leads to the F. of R.W. *See also* **LAKES DISTRICT, III**.

Rydberg, Abraham Viktor (1828-99), Swedish author, b. at Jonkoping. He studied at Lund Univ. and afterwards became a journalist on a Liberal paper in Gothenburg. His novel *The Last of the Athenians* (1859) showed his sympathies

with an anti-theologian outlook, and his book *The Bible's Teaching about Christ* (*Bibelsk lär om Kristus*) (1862) was among the first works to place the aspects of modern biblical criticism before the Swedes. In 1882 his collected poems were published to a point R can be considered as the last of the Romantic school in Sweden. His poetry is profound and marked by his idealistic outlook. In his later years he was prof. of cultural hist. at Stockholm Univ.

Ryde 1. Seaside resort and municipal bor. in the Isle of Wight, England, 79 m from London. It occupies the site of a vil. called in Norman times *La Rye* or *La Rione*. Though in the eighteenth century it was merely a fishing vil. it has rapidly grown into a fashionable holiday resort. It has an esplanade nearly 2 m long on the pier originally built in 1813 but since then extended, forms a promenade half a mile in length. Near by is the twelfth-century abbey of Quarr. There are ruins of a secret abbey in the vicinity. Pop. 20,000. 2. Or **Kissim, Point**, a station of New S. Wales, 12 m S.W. of Sydney. It has three orange orchards. Pop. 100.

Rye, municipal bor. of Sussex, England, 19 m N.E. of Hastings on the R. R. It is originally a port town and dates from very early times as is shown

MERMAID STREET, RYE

by its large old church and Ypres Tower (twelfth century). There are six picturesque streets, a fourteenth-century Landgate, and the remains of other medieval fortifications. The Mermaid Inn is famous. Picoock's school was founded in the seventeenth century. John Fletcher, the dramatist, was b. at R., and

Henry James lived there from 1898 to 1916. Its chief industry is fishing, and it is one of the Cinque Ports. It is now 2 m from its new harbour on the estuary. The silting up of the old harbour caused the sea to recede, and destroyed the commerce of R., which was a flourishing port in Norman and Angevin times. There are the remains of Carmelite and Augustinian buildings. Pop. 4400.

Rye (*Secale cereale*) hardy grass, unknown in a wild state, and extensively cultivated in parts of Europe for its grain, which is somewhat similar to that of wheat. Its flour makes a dark coloured bread. It is rarely grown for its grain in Britain on account of its susceptibility to ergot, but is not uncommonly sown to produce a green crop for consumption in the spring. Its long, soft straw is used in harness making.

Rye Grass (*Lolium*) a native grass, perennial and temporary pastures flourishing in rich dry soils. It R. G. (*L. italicum*) a larger and more robust plant, grown only in temporary pastures and on ewage farms; it yields enormous crops of green food or hay.

Rye House Plot, The (1683) name given to a conspiracy to murder Charles II. and the duke of York. It was so named after the place at Holfordesdon in Hertfordshire where it was arranged to take place by some of the most distinguished of the Whig party. Though it was only a few desperate men who met at a session, yet indignation was most naturally felt against the whole Whig party. Wm. Lord Russell, Algernon Sidney and the earl of Essex were arrested and confined to the Tower where Essex died by his own hand and the other two were executed. See H. Arnold, *Russell and the House* 1919.

Ryeland Breed, see SHIRAZ

Rye Spurred, see SHIRAZ

Rykov, Alexei Ivanovich (1881-1938) Russian statesman, b. at Saratov, educated at the Univ. of Kazan. In 1901 he was imprisoned and expelled from the Univ. for revolutionary activities and became acquainted with Lenin. On the day Lenin joined the party he joined the Bolshevik section and was subsequently arrested and imprisoned on several occasions for political activities. He became a member of the Politburo soon after the revolution of 1917 and during Lenin's presidency R. was vice-president. He was president of the Council of People's Commissars from 1924 to 1930, when he was succeeded by V. Molotov. He became commissar of industry and transport in 1931. In 1933 he was compromised in the Zinoviev and Bukharin-Sokolnikov trials and was expelled from the Communist party. He was named in the Bukharin-Rykov treason trial of May 1938, being charged with betraying Communism, and was sentenced to death.

Rylands, John (1801-88), Brit. manufacturer and philanthropist, b. at S. Hildes. In 1819 he established a cotton-manufacturing business with his father and brothers at Wigan. He became sole proprietor in 1847, and the business was

converted into a limited company in 1873. R. spent large sums on charity and public services, and on printing religious works for free distribution at home and abroad. He was an original financer of the Manchester Ship Canal. The John Rylands Library, Manchester (opened in 1900), was erected as a memorial by his widow. See JOHN RYLANDS LIBRARY.

Rymer, Thomas (1641-1713) Eng. historian and critic, b. at Yafforth, York-shire. He was educated at Sidney Sussex College, Cambridge, and was called to the Bar in 1673. His first important works were *The Tragedies of the Last Age Consider'd* and *A Short View of Tragedy*. These were much discussed, especially as they contained criticisms of Shakespeare and Ben Jonson. He is chiefly remembered as the compiler of the invaluable collection of historical materials known as the *Fœdera* (15 vols.) 1704-13. He succeeded Shadwell as historiographer royal in 1692.

Rymill, John Riddock (b. 1903) see under WATKINS, HENRY GEORGE.

Ryssel, see LISSIE.

Ryswick (modern *Rijswijk*), tn. of the Netherlands in the prov. of S. Holland, 2 m. S.E. of The Hague. In the castle the treaty between England, Holland, Spain, France, and the Ger. Empire was signed in 1697, which put an end to the war between France and the Ger. Empire, England, Spain, and Holland. By it France gave up all tns. and dists. seized since the treaty of Nimègen in 1679, retaining only Strasburg, and undertook to recognise William III. as king of England, promising to give no further aid to James II. Thus Spain recovered Catalonia and Mons. Luxembourg and Courtrai, while the duchy of Lorraine went to Leopold Joseph and the Dutch regarrisoned Namur and Ypres. Pop. 5500.

Ryton, urb. dist. of Durham, England on the Tyne, 6 m. by rail from Newcastle.

Its industries are coal mining, sand and gravel quarrying and agriculture. Pop. 14,000.

Ryukyu Islands (called also *Riu Kiu*, *Luchu*, and *Loo Choo*), string of is. which stretch from about 50 m. S. of Kyushu, Japan, to a point 100 m. E. of Iornosa. There are four groups from N. to S., Tokara Gunto, Amami Gunto, Okinawa Gunto, Sakishima Gunto (*gunto* signifying a group of is.). There are about forty is. of any size and the total pop. is nearly 500,000. The cap. city is Suifu, in Okinawa, but Naha in the same is. is the chief port and trading centre of the is. The R. I. belong to Japan, but are peopled by a race distinct from the Jap. and allied probably with the Amis (*q.v.*). Originally independent, the Luchus acknowledged the suzerainty of China from the fourteenth century, and not until the nineteenth century did Japan lay claim to the is., which was disputed by China. But Japan established sovereignty when in 1894, Iornosa, a former Chinese possession, was also occupied. The main industries among the is. are the planting of sugarcane and the manufacture of lacquer. For the campaigns on Okinawa during the Second World War, see PACIFIC CAMPAIGNS OR EAST ASIAN FRONT IN SECOND WORLD WAR.

Rzeszow, tn. of Galici Poland, 41 m. E. of Lwow. It holds famous fairs, furs, and its staple industries are jewellery, cloth and linens. Pop. 27,500.

Rzhev, tn. in the region of Kalinin, R.S.F.S.R., 70 m. S.W. of Iver on the Volga and 150 m. from Moscow. It has machinery, oil pressing, leather, saw-milling and hemp industries. R. is an important railway junction and was a key point in the Ger. drive for Moscow in the autumn of 1941 and was captured by them in Oct. Pop. 34,000. See further under EASTERN FRONT OR RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

S

S, nineteenth letter of the Eng. alphabet and the eighteenth of the Gk. and the Lat. alphabets. The exact Semitic alphabet (which became the ancestor of all the existing alphabets including the Gk.) had four sibilants which still exist in modern Heb. *sayin* which became the Gk. voiced sibilant *z* *samelh* *Sade* (an emphatic *s*) and *shin* (*s sh*). The Semitic *ameth* which still existed in the Phoenician variety of the Gk. alphabet and in the Etruscan alphabet was also retained as *ei* (*i*) in the Etruscan alphabet while the name *samelh* became *sigma* and was transferred to the letter derived from the Semitic letter *shin*. The Gk. *s* was represented either by a sigma derived from the Semitic *Sade* or by *san* derived from Semitic *shin*. *Sade* and *san* do not appear together in any Gk. alphabet but they do appear in the Etruscan which on one hand was a descendant of the Gk. and on the other hand was the ancestor of the Roman alphabet. While *san* has become the classical *sigma* *sade* is found mainly in Coptic, Thracian, Melos, Phoenician, Pictish, and its colonies. The Lat. *s* (thus also the Eng. *s*) has descended from the Gk. *sigma*. *S* is the plain sibilant in the Eng. alphabet and represents two chief sounds. Its normal sound is the *s* in *this* for its sound in such a word as *these* would be more accurately denoted by *sh*. In the words *sure* and *sugar* it would appear to have the sound of *sh* but the intruding letter is in this case due to the vowel. It is interesting to note however that the Heb. alphabet has one symbol for *s* and *sh* a dot being added above this symbol (respectively to the right or to the left) to differentiate the sound *s* from *sh*. *S* generally remains constant through the classical and low Ger. groups of the Indo-European family. The High Ger. *s* becomes *sch* in Eng. as Eng. *under* High Ger. *unten* Eng. *that* High Ger. *das*. In chem. *S*, *Se*, *Sc*, *Si*, *Sm*, and *Sr* are the atomic symbols for sulphur, scandium, selenium, strontium and strontium respectively.

SA and **SS** (*Sturm- und Kampfschul Staffeln*) paramilitary organisations of the Nazi party. The SA (infantry and cavalry) was the storm troop or army of the early Nazi party. It was organised in 1923 ostensibly for the purpose of protecting party meetings, but in fact was intended as the army of the Nazi revolution. Estimates of its strength varied from about 500,000 to 2,000,000. Differing from his friend and adherent Rohm as to the function of the SA troops Hitler organised a special detachment to be his own political executive. This was the origin of the SS, i.e. 'protective squadrons' or blackshirts, formally organised in

1928 as an elite by the side of the SA. Their organisation was military like that of the SA, but included all services including artillery, and Hitler himself had an SS regiment of 1100 Guards. A few days of the SS were professional, but the remainder as in the case of the SA served in their spare time. They are believed to have numbered between 300,000 and 500,000. Police and executive functions of the SS were similar to those of the SA, but the SS were employed in the more responsible tasks. Chief of the SS was Himmler (1934).

Saadabad, Pact of (1934), see under **ARMENIAN LIAQ, PIRSA**

Saadia ben Joseph (Sa'id al Fayyumi) (b. 102-112) Jewish philosopher b. at Dilaz, Upper Egypt. In his twentieth year he completed his first great work, a Heb. dictionary. He next published a work in defence of traditional Judaism and against Karism and other heresies. He left Egypt at the age of twenty-three with the intention of settling in Palestine, but his contests against various innovators of the calendar brought him into such prominence that about 1025 David ben Zakkai, head of the Jewish community of Babylonia, appointed Saadia president of the school at Sur. The growth of the rival school at Tumbetha antagonized with the Khalifa and had Saadia disposed of then devoted himself to literary labour for four years. He wrote in Arabic into which language he translated most of the Bible. He dealt also with the Talmud and liturgies and he produced some works combining religion with philosophical reasoning showing a thorough acquaintance with Aristotle. The chief of these is *Kitab al Tanwil wal Ihtikad* or Book of Articles of Faith and Doctrines of Dogma known in Heb. as *Sefer Emunat David*. Saadia became reconciled to David and under a new Khalifa was reappointed to Sur in 1038. There is an extensive bibliography of Saadia in Singer's *Jewish Encyclopedia*. **S. J. Guttman**, *The Jewish Philosophical Saadia* 1882. **S. J. Guttman**, *Saadia* 1900 and **H. M. Miller**, *Saadia and his Life* and **H. J. S. 1921**.

Saale 1. Sixteen or Thuringian **S** river of Germany, tributary of the Elbe, rises in the Fichtelgebirge, Bavaria, and flows northward for 226 m. to join the Elbe 2 m. above Magdeburg. Length 275 m. 2. Franconian **S** river of Germany, tributary of the Main, which it joins at Gemünden. Length 70 m.

Saalfeld, tn. of Thuringia, Germany. The Saale 8 m. W. of Leipzig by rail. It is noted for manufacture of machinery, paints, oil cloth, and beer. It was probably founded by Charlemagne. The Prussians held it in 1806. Pop. 23,300.

Saar (fr *Sarre*), riv. of France and S.W. Germany, which rises in the Vosges Mts. and, flowing N.W. through Lorraine and the Rhineland, joins the Moselle 5 m. above Trier. Its middle course is connected by the Saar Canal with the Main-Rhine Canal. The Saar valley is noted for its wines and has coal mines and pig-iron works. Length 152 m.

Saarbrücken, tn in Saarland on the R. Saar 50 m. E.N.E. of Metz. It is the centre of a large coal-mining dist. which before the Second World War yielded annually about 8,000,000 tons of coal. Once an important industrial centre and a pleasant tn containing fine examples of Gothic and eighteenth-century architecture it was heavily damaged in the Second World War. It is noted for manufacture of textiles, chemicals, hardware, leather and furniture and large ironworks in the N.W. suburb of Burbach. It was the scene of the opening engagement of the Franco-Prussian war (1870) and also of the Second World War on the W. front. After the First World War it became the headquarters of the Saar dist. administration which was created on fr. the League of Nations as Germany's ex-territory. Early in the Second World War fr. troops threatened to cut off S. (Sept. 1, 1939) but operations were virtually suspended thereafter for many months until in June 1940 the Gers broke through the Magot line south of the tr. It fell to Amer. troops under Gen. Patch early in March 1945 following the annihilation of the 1st and 7th Armies in the battle of the Phine Moselle. Saar triangle (see WESTERN FRONT IN THE SECOND WORLD WAR). Pop. in 1939 with Sankt Johann and Malspitz Burbach (incorporated in 1900) 135,000.

Saarebourg see SARRBOURG.
Saareguemines, or **Saargemund** see SARRGUIMINES.

Saaremaa, see OISEL.
Saarländ, area of W. Europe formerly in the GER. FRONZ of the Bavarian Palatinate and Rhineland. It is watered by the R. Saar and lies in a coal and iron Saarbrücken Neunkirchen Dudweiler Sulzbach and St. Ingbert are the chief tns. Before the Second World War there were glass, metal, paper, furniture, manufs., etc. Under the treaty of Versailles it was placed under the control of the League of Nations for fifteen years from Jan. 10, 1920, France obtaining for that period the exclusive rights of exploitation of the coal mines as compensation for the destruction of the mines in France during the First World War, the value of the mines being credited to Germany in the reparations account. In 1935 the pop. of S. decided by plebiscite to return to Germany and in that year the tr. reverted to the Reich. The area was conquered by Amer. troops of the Seventh Army in the battle of Feb.-March 1945. After the Second World War the area was included in the fr. zone of occupation in Germany. Early in 1947 the fr. detached an area containing over 200,000 inhab. from S. proper. In Oct. 1947 a new *Landtag* was elected. The parties urging economic union with

France gained a large majority, and in Nov. 1947 a new constitution which made S. an autonomous state, politically separated from Germany but having economic union with France, was ratified with only one dissentient. After Amer. and Brit. agreement in principle the fr. national assembly ratified this in Feb. 1948. In March 1949 France subject to allied approval granted S. virtually complete self-government in return for its coal output (15,300,000 tons annually) for fifty years. In April '55 was invited by the W. Allies to become an associate member of the Council of Europe. Area 810 sq. m. Pop. (1945) 374,500. See A. Allot, *Le Bassin de la Sarre* 1924. A. Pappert, *berg Geschichte des Saargebietes* 1924. Dr. Klovick, *Das Saargebiet* 1929. B. I. Reynolds, *The Saar and the Franco-German Problem* 1931. M. and C. Lambert, *The Saar* 1931. M. Hlousky, *The Saar Struggle* 1934 and Smith Wainwright, *The Saar Erlebnis* 1940.

Saarlautern (fr. *Sarrelouis*) tn in Saarland on the R. Saar 31 m. S.E. of Trier. Noted for manufacture of leather, porcelain, and glass, and there are lead and coal mines in the vicinity. It was fortified by Vauban (1680-83) and ceded to Prussia in 1815. It was the tp. of Marshal Ney. It was involved in the battle of the R. Saar in 1914 and was severely damaged by the Germans. Pop. 36,300.

Saavedra Cervantes, see CERVANTES. **SAAVEDRA MIGUEL DE**

Saavedra Luján, Carlos (b. 1880). Argentine lawyer, diplomat and statesman. In 1912 at Buenos Aires. A conservative politician he became minister of foreign affairs in the constitutional regime of President Yrigoyen. In 1915 he presided over a conference in Buenos Aires which resulted in peace between Paraguay and Bolivia in the Chaco war (q.v.) (1912-35). In 1936 he presided over the League of Nations Assembly which condemned the aggression of Japan against China. In the same year he was awarded the Nobel peace prize.

Saavedra y Fajardo, Diego de (1811-1845). Sp. diplomat and author. b. at Algeiras in Murcia. He was the Spanish representative at the Diet of Ratisbon, which elected Ferdinand III, and at the Congress of Münster. His best work is found in his political essays *Las Impresas Polít.* (1840) (Eng. trans. *The Royal Lobby* in 1700. *Introducción a las Ciencias* (1840) under the name of Claudio Antonio de Cordero published as *La República Literaria* (1840) (Eng. trans. 1700) a criticism of contemporary literature and a list of the Gothic kings. *La Corona Gótica* (1639-1675).

Saaz, see SAATZ.
Sabat (Shabats), tn of Yugoslavia, on the Sava, 5 m. W. of Belgrade. It has a large trade in corn and cattle and an important factory for honey. It is the seat of a bishop. It was attacked by the Austrians in Aug. 1914, and in Oct. 1915 the attack succeeded. Pop. 18,200.

Sabadell, tn in Barcelona Spain, 11 m. N.N.W. of Barcelona, it has manufs. of textiles and paper. Pop. 52,000.

Sabadilla, see **CTVADILLA**

Sabaean Inscriptions, see under **MINFAN INSCRIPTIONS**

Sabaëans (Σαβαῖοι) and **S** Semitic people, of which inhabited S.W. Arabia. The Sabaean inscriptions are the main source for the study of the once flourishing kingdom situated in the ter. bordering the Indian Ocean and the Red Sea, and known from the Biblical Table of Nations (Gen. x) as Sheba. Other sources of information are cuneiform and Ethiopic inscriptions, the Gk. geographies and the record of Ptolemy's expedition. The date of the establishment of the Sabaean and other S. Arabian kingdoms cannot yet be determined with accuracy. It may be assumed, however, that S. Arabia became an important centre of civilisation in the 1st centuries of the second millennium B.C. The queen of Sheba who visited Solomon (1 Kings x. 1) is generally allowed to have come from this country, and not from Ethiopia as Josephus relates (*Antiq. Jud.* viii. 6 sec. 5). During the first millennium B.C. it was a highly civilised agr. region producing the frankincense so valued by anc. religions. In the Bible it is spoken of as rich in incense, spices, precious stones, and gold (1 Kings x. 1-20; Is. lxvi. 6, Ps. lxxv. 15) and as carrying on an extensive commerce with the other nations of Asia (Isa. lxviii. 22; Job. vi. 19; Eccl. ii. 8). It served also as the principal route by which goods from India were transported and carried overland to the ports of the E. Mediterranean. In the Rom. period the region was known as Arabia Felix. By the time of the establish. of Islam S. Arabia had lost its importance to N. Arabia. The later development wrecked the older civilisation and relegated these fertile lands to historical obscurity (see under **YEMEN**).

Sabaria, see under **SOEMBATHIA**

Sabah, see **POINTE D'AFRIQUE NOUVELE**

Sabaki, riv. in Brit. I. Africa rises about 1° 45' S. and under the name of Athi in its upper courses flows N.E. then S.S.E., and finally S., until it reaches the Indian Ocean about 5° N. of Malindi. Length 400 m.

Sabatier, Paul (1851-1911) Fr. chemist, noted for originating the method of hydrogenating organic compounds as to which see under **HYDROGENATION**. For this and his researches in catalytic action he was awarded (with another Fr. chemist, Victor Grignard) the Nobel prize for chem. 1912.

Sabatier, Paul (1858-1928) Fr. Protestant theologian and historian, writer, b. at Saint Michel de Chabailhanoux (Ardèche). He studied at the Univ. of Paris and ultimately became pastor of Saint Germain-la-Perre. S. did valuable work in the dept. of early Franciscan hist. His *Le de saint François d'Assise* (1892) is the best life of St. Francis yet written. His work, *L'Orientation religieuse de la France actuelle* (1911) was trans. by H. B. Burns as *France To-day its Religious Orientation*, 1913. *L'Influence de saint François d'Assise sur la civilisation italienne* appeared in 1926. See lives by P. G.

Little 1929, and G. Maugham and H. Leimaitre, 1931.

Sabatini, Rafael (1875-1950), Brit. novelist and dramatist, b. at Cors. Italy, of an It. father and an Eng. mother, and educated in Switzerland and Portugal. He wrote a number of popular historical novels including *Baruchus the Magnificent* (1906), *Inthony Widdow* (1910), *Sea Hawk* (1915), *Sarramuche* (1921), *Captain Flood* (1922), and *The Black Swan* (1922). He also wrote many plays and biographies of Cesare Borgia (1912) and Torquemada (1921). His best works were *King of Russia* (1914) and *Turbulent Times* (1916).

Sabbatai Zevi (1626-75) Jewish mystic and false Messiah, b. at Smyrna. Taking advantage of a prophecy which had long been extant among the Jews that the promised Messiah was to appear in 1666, S. proclaimed himself and kindled a furious enthusiasm of over 80,000 followers. The Sultan, Mohammed IV, several times called him to Constantinople, and having compelled him to embrace Islam, banished him to Albania.

Sabbath (from the Heb. *Shabbath* to rest, to cease, to end) Jewish day of rest, a covenant between Israel and God, enjoined seven times in the O.T. and to this day one of the cornerstones of Judaism. Its origin is much disputed. Nevertheless, in scholarship, trace the origin of the Heb. S. to Babylonian and base this suggestion on the hypothesis that the sacredness of the seventh day amongst the Hebrews arose all through the phases of the moon, seeing that in Heb. *Shabbath* is S. and new moon are both mentioned together. It may however be recalled as reasonably certain that the S. is as old among the Hebrews as their monotheism.

The proper observance of the S. was a point of much controversy and varied at different periods of the Jewish hist. Whereas the O.T. merely lays down the general law that no manner of work is to be performed on the S., which commandment is devoted to the study of what does or does not constitute a desecration of the S. Yet there is not the slightest uncertainty about the observance of the S. For instance, manifestations of mourning, which extend for a week after the burial of a deceased relative, have to be suspended on the S.

The Heb. S. falls on Sunday, but it is not at sunset on Friday and lasts through Saturday until three stars are visible. The early Christians observed the S. as Jews and the Lords Day as Christians, but Gentile converts were not compelled to observe it. The early church writers never identify the two, but medieval legislation shows a tendency to increase in strictness. The early doctors, Luther, Zwingle, Calvin, Beza, Knox, etc., all favoured the lax observance, and the same is true of the Eng. reformers. Strict Sabbatarianism began with the Puritans.

Sabbatical Year, institution of the anc. Hebrews, occurring every seventh year, based on Leviticus xxv. 2-7, and Deuteronomy xi. 1. It was rather of a civil and

social than a religious character. Indeed no particular religious services were prescribed for its celebration, but the land was to be left untilled, the vineyards were to be undressed and the spontaneous produce of both was to be enjoyed by all the people in common. Provision was made by the special interposition of God to supply the deficiency of food which this abstinence from labour for a whole year would necessarily cause. If a loan had not been repaid by the S. Y. it could no longer be claimed. Yet no person should for this reason refuse to lend to such as would borrow.

Each seventh year was proclaimed as a S. Y. In other words just as the weekly Sabbath (7) rest was to be a short cessation from the cares of ordinary life so that the individual could gather fresh strength and vigour for his weekly toil so on the greater Sabbath there was to be a universal cessation of national life as a means of restoring all the earthly constituents of God's kingdom (Israel) once again to their original and necessary purity, health and uprightness.

There is however no actual record of the practical observance of the S. Y. in the Heb. sacred books though it is frequently discussed in the Talmud.

Sabelianism, heresy preached by Sabellius an African bishop or presbyter about the middle of the third century. It was anti Unitarian, teaching that there is but one person in the Godhead, God the Father, that Christ was but a man, and that the Holy Ghost is an energy, not a personality. It became almost extinct by the fifth century.

Sabians (from Arabic *sabi*, pl. *sabi un* or *sabi ah*) term applied by the Muslims to a few religious sects. It is uncertain to whom the term applied in Mohammed's time. In post-Mohammed times, the name was given to a Hellenistic pagan sect of Mesopotamia centred on Harran (the Rom. Carrhae). The followers of this sect were star worshippers and apparently employed Syria as their liturgical language. In A.D. 50 they were identified by the Muslim authorities with the S. of the Koran and therefore could enjoy a toleration not granted to mere heathens. They survived until the eleventh century A.D. Some famous Arabic scholars such as Ishaq ibn Qurrah and his son Sinan, were S. of Harran. It is also the father of the great astronomer Al Battani.

Sabina (d. A.D. 183) Rom. empress the wife of Hadrian and great niece of Trajan. She married Hadrian about A.D. 100 but the marriage proved most unhappy and tradition reports that on his deathbed the emperor forced her to kill herself lest she should have the happiness of surviving him.

Sabina, Poppea, see POPPEA SABINA.

Sabine Dialect, see under LATIN LANGUAGE AND LITERATURE.

Sabine Pass, in Jefferson Co., Texas, at the mouth of the Sabine R. It exports cotton, oil and timber. S. P. is at the head of the Sabineaches waterways, a network of canals, making inland travel accessible to shipping opened in 1915.

Sabines, or **Sabini**, in ancient hist. an important people of central Italy dwelling in the mts. N.E. of Rome from the Mons Esquilus and borders of the Forum S. to the Anio and Fiducia on the Tiber. They were of Umbro-Sabellian stock, allied to the Oscans and the Samnites were their descendants. Raito (Rati) was their chief in the time of the S. women in the legendary list of early Rome is famous. The S. were finally subjugated by the Romans under M. Curius Dentatus (c. 290 B.C.). They received the Roman franchise (*sine suffragio*) in 268 and after the Social War of 90 became amalgamated with the Romans.

Sabis see SAMBRI.

Sable (*Mustela sabelina*), valuable fur-bearing animal which on account of excessive persecution is now restricted to a part of Siberia where it is captured in its winter coat for the lustrous fur of commerce. It is about 18 in. long exclusive of tail and the colouring is usually brown. Like other members of the marten family it is nocturnal in habit feeding on rodents and birds.

Sable Island, in N. Nova Scotia 100 m. S.E. of Cape Canso. Its sandbanks and prevailing fog have caused many shipwrecks. There is a wireless station.

Sables d'Olonne, Les, seaport in the dept. of Vendée, France on the Bay of Biscay 23 m. S. of La Roche-sur-Yon, is a favourite summer resort and the centre of sardine fisheries and a cunning industry. Pop. 17,600.

Sabotage, term used to denote organised hindrance to the normal efforts by employers who use this method of expressing the extent of their dissatisfaction. It can be violent, resulting in the destruction of machinery or in violent damage to the tools of the workers or those who take their places when a strike is in progress. A more subtle form of sabotage and one which is more general is that which causes delay in the process of production. 'Slow work' sometimes referred to as 'go slowny' or a meticulous observance of rules which are normally tacitly ignored, can be a serious embarrassment to the employer. Improved machinery of negotiation between employers and workmen has caused a diminution of this form of tactics. The term is very commonly used to describe the destructive attacks on communications and in factories or public or other works by 'underground' or clandestine resistance organisations against the Germans in the occupied countries during the Second World War.

Sabrata (**Sabratha**), coastal city of ancient Tripolitania in W. of Tripoli. It was originally a Punic settlement, later it became a prosperous Roman municipality, and early in the second century A.D. received colonial status. Its prosperity was based on the export of the olive oil for which Roman Africa was famous, and on a trans-Saharan traffic in gold, ivory, ostrich feathers, and slaves. Excavations have revealed an imperial city of considerable distinction, with basilica, forum, temples, churches, baths, shops, houses enriched by mosaic floors and walls and

a large amphitheatre A Brit expedition worked at S in 1948

Sabre, see **Sword**

Sabzawar, or **Sebzewar**. 1 Tn in Khorasan Persia, 115 m W of Meshed, has a large trade in silk, cotton, opium, dried fruit, and sheep's skins, copper is mined. Pop (estimate) c 15,000 2 Tn in the prov and 72 m S of Herat Afghanistan It has an important market and fortress

Sacæ, anct nomadic Scythian tribe of central Asia, probably dwelling near the sources of the Oxus (Amu Darya) and Jaxartes (Syr Darya), in the modern regions of Kashgari and Yarkand These 'Scythians of the Persian N frontier' served in Xerxes' expedition against Greece and aided Darius at Arbela (331 BC) against Alexander

Saccharimetry, the estimation of the strength of solutions of sugar It is frequently effected by observing the effect of the liquid upon the rotation of polarised light in a polarimeter or 'saccharimeter' Reducing sugars, eg glucose may be estimated by Fehling's solution

Saccharin or **Ortho-sulphobenzimide**, $C_6H_4(SO_2)(ONH_2)$ was discovered in 1871 by Remsen and Fahlberg It is prepared by the action of alkaline permanganate upon orthotoluenamide and treating the alkali salt of ortho sulphaminobenzoate with dilute hydrochloric acid S is a white crystalline solid melting point 220°C It is about 300 times as sweet as sugar and is used as a sweetening agent, particularly by diabetics and others for whom sugar is contraindicated

Saccharomyces, see **Yeast**

Sacchetti, Franco (c 1880 c 1890) It novelist b at Florence where he later held several official positions His most important work is a collection of *Novelle* written in imitation of the *Decameron* and first pub in 1924 Ten of them are trans in 1 Roscoe's *Italian Novelists* (1925) His *Opere* have been pub in 2 vols (1936-38) See K Tupper *Franco Sacchetti Burger von Florenz und Dichter* 1939

Sacchi, Andrea (c 1498 1661) painter though greater in the theory of the art than in its practice b at Nettuno near Rome He studied under Francesco Albani and imitated and taught after the art of Raphael Nicolas Poussin and Carlo Maratti were his pupils His two masterpieces *Visions of St Romulus* and *Miracle of St Gregory* (the latter in mosaic) are in the Vatican

Sacco and Vanzetti, Case of, see **Vanzetti**

Sacerdotalism (Lat *sacerdos* a priest) the name for the system of the priesthood with special reference to the claim to sacramental or supernatural powers by virtue of ordination See **Priest**

Sacher-Masoch, Leopold von (1836-95) Austrian novelist, b at Lemberg His *Gefährliche Geschichten* (Galkian Tales), pub in 1876, were penetrating studies of Polish-Jewish life Later he became a portrayer of sexual abnormalities From his name is derived *masochism*, sexual perversion

in which pleasure is got from being dominated or tortured

Sacheverell, Henry (c 1674 1724), Eng controversialist, b at Marlborough, and educated at Marlborough and Magdalen College, Oxford He became preacher at St Saviour's, Southwark, in 1705. In 1709 he delivered his two famous sermons at St Paul's, London, in which he expressed extreme High Church and Tory views These discourses, having been printed, were brought under the notice of the House of Commons, which passed a resolution denouncing them as 'injurious, scandalous and seditious libels' The author and printer had to attend at the bar of the House, and it was resolved that S should be impeached with high crimes and misdemeanours The trial commenced before the House of Lords Westminster Hall, Feb 27, 1710, and lasted till March 23 S was pronounced guilty and was suspended from preaching for three years It is asserted by Swift and other authorities that S's real offence, in the eye of the Whigs, was his having in one of his sermons pointed, as was conceived at the Lord Treasurer, Godolphin in a passage about the crafty insidiousness of such wily Volpones' Volpone was a popular nickname for Godolphin The popular celebration of this important conclusion of the trial, and, when S set out to take a living in Shropshire, his journey was a continued triumph It is probable that this affair contributed to the overthrow of the Whigs the following autumn On the expiration of the sentence (1713) S preached at St Saviour's church on the Christian triumph, and shortly afterwards Queen Anne presented him to the rectory of St Andrew, Holborn See 1 Madin *Bibliography of Dr Sacheverell* 1957

Sachs, Curt (b 1881) Ger musical historian b at Berlin He studied hist at Berlin Univ and composition with Hugo Schüttgenholz later theory with Kretschmar and Johannes Wolf In 1919 he became head of the state collection of old musical instruments in Berlin In 1933 he left Germany, settled in Paris, and later in U.S.A., where he became prof at New York Univ His books include studies of the hist of the dance, and music musical instruments (including *The History of Musical Instruments* 1940) the hist of music in Berlin etc and he is the editor of the Br collection of gramophone records of old music *Anthologie* see 11

Sachs, Ferdinand Gustav Julius von (1832-97) Ger botanist b at Breslau He was appointed prof of botany in the Univ of Freiburg im Breisgau in 1867 From 1868 till his death he was prof of botany in Würzburg, rejecting subsequent offers of chairs at still more important univs He is known chiefly for his investigation of the morphology and metabolism of plants, the influence of light and heat on plant growth, and the formation of flowers, but there were few branches of botany to which he did not make some material contribution His first pub work was the *Handbuch der Experimental-*

physiologie der Pflanzen (1865), and his next the well known text book *Lehrbuch der Botanik* (1868), a comprehensive work digesting botanical knowledge up to his time. This work was carried further in his very able *Vorlesungen über Pflanzenphysiologie* (1882), which, however, never attained the popularity of the earlier work. His *Geschichte der Botanik* (1875) is an erudite hist. of the development of the different branches of botanical science between the mid sixteenth and nineteenth centuries.

Sachs, Hans (1494-1576) Ger shoemaker-poet b at Nuremberg, Germany. He flourished at the time of the Reformation, to which he was converted and which he helped to propagate by his ready pen. His production was voluminous, and over 6000 different compositions are ascribed to him. Some of these are contained in the ed. of his works in 22 vols., pub. by A. von Keller and F. Goetze (1870-94). In his *Meisterlieder* he spread a knowledge of Luther's Bible among the poorer classes and even made use of classical subjects. All his compositions show great shrewdness, liveliness, and keenness of satire, together with a steady manliness of tone and in many of them give a vivid picture of sixteenth century Germany. S. is the central figure in Wagner's opera *Die Meistersinger*. See accounts of his life and work by R. Genée (2nd ed. 1902) and C. Schweitzer, 1889, M. Hermann *Die Bühne der Hans Sachs*, 1923, and H. Münch, *Die Sozialen Auswachen des Hans Sachs* 1934.

Sachsen, see Saxony

Sachtlevén (Sattlevén, or Zatchlevén), Cornelis, or Cornelius (c. 1606-1655) Dutch painter and engraver chiefly of low life subjects. His genre pictures are in the style of Brauwer and Teniers. Dresden Gallery and Amsterdam Museum have examples of his work.

Sachtlevén, Herman (1609-82) Dutch landscape painter and engraver brother of Cornelis, and pupil of Van Goyen. His pictures were chiefly of scenes on the Rhine and Maas and are mostly in Holland, Denmark, and Germany.

Sachu, tn and oasis in China 40° N. and 94° 5' E. The oasis is extremely fertile. Pop. 22,000.

Sack, name used for a favourite wine of the time of Shakespeare. It is only a 'dry' cherry as opposed to sweet wines but it was often used for Canary wine and was frequently flavoured with spices and mulled.

Sackbut, in scriptural times the instrument mentioned in Daniel iii (A.V.) the Heb. *sabza* is said to have been a huge harp, of which the word sackbut may have been taken for another form (Hastings). The old Eng. S. was in reality form of the trombone the name probably deriving from the Fr. *sacquebut*.

Sackett's Harbor, vil. in Jefferson co. New York, U.S.A. on Black R. Bay Lake Ontario, 11 m. W. S. W. of Watertown, it is a U.S.A. naval station and military post. Pop. 2000.

Sack Mead and Sack Metheglin, see under MEAD

Sackville, Charles, see DORSET, sixth EARL OF

Sackville, Lord George (1716-85), Brit. soldier b in London, younger son of the first duke of Dorset. During the reign of George II. he was employed both as a statesman and as a soldier, he served at Dettingen (1743) and Fontenoy (1745), and at the battle of Minden (1759) he commanded the Brit. forces under Prince Ferdinand of Brunswick. Having failed to execute the prince's order to charge by which default the victory was rendered less decisive than it might have been, he was by his commander and at his own request, recalled to England, where he demanded a court martial by which, April 5, 1760, he was adjudged incapable of serving thereafter in any military capacity. George II., who was highly incensed at S.'s conduct, took every means of rendering his punishment most galling. After the death of George II. he returned to public life and sat in Parliament from 1761 to 1782. Having attached himself to Lord North he was made secretary of state for the colonies in 1771 and had the direction of the Amer. war. In 1782 he with his father, retired from office having been raised to the peerage with the titles of Viscount S. and Baron of Islebrook titles united to the dukedom of Dorset by the accession of Lord George's eldest son to that dignity. See I. Carlyle *Frederick the Great* vol. viii, and I. Marlow, *Sackville, Lord of Drayton* 1918.

Sackville, Thomas, see DORSET, THOMAS SACKVILLE first EARL OF

Sackville, scaport in New Brunswick, Canada, at the head of the Bay of Fundy, 90 m. N. E. of St. John. It has stone townships paper box and concrete manufacturing, and the local agricultural producers strawberries and blackberries in large quantities of which are shipped from the port. S. has a Methodist college. Mt. Allison Univ. Pop. 1000.

Sackville-West, Edward Charles (b. 1901) Brit. novelist and biographer son of Sir Charles John S. W. soldier. Educated at Eton and Christ Church, Oxford. He was at one time literary ed. of the *New Statesman* and has pub. much literary criticism in other periodicals. His first novel was *Piano Quintet* (1922) and his others are *The Hunt* (a Gothic novel 1926), *Mr. Drake over the Water* (a novel 1928), *Soyuz* (1931), and *The Sun in Capricorn* (1934). In 1936 appeared his life of J. K. Quincey with the title *Flame in the Night*. As a member of the BBC lectures and dramatist (1911-4) he was in charge of most of the poetry programmes and wrote a large radio drama *The Lute* (1915), on the subject of the *Odyssey*.

Sackville-West, Victoria (b. 1892), Brit. poet, novelist and biographer, daughter of the third Baron Sackville. Married Harold Nicolson (q.v.) with whom she travelled in the Middle E. writing an account of her travels in *Passage to Icheran* (1926). She won recognition with *Heritage* (1919) a novel and *The Heart* (1922), short stories. Her verse, *The Land* (1926), on the year's cycle of an

Eng. farmer, with occasional lyrics, was awarded the Hawthornden prize (1927). Her chief novels include *The Edwardians* (1930), *All Passion Spent* (1931), *The Dark Island* (1934), *Saint Joan of Arc* (1936), *Pepita* (1937), and *Grand Canyon* (1942). Biographies: *Aphra Behn* (1927), and *Andrew Marvell* (1929). Other verse: *The King's Daughter* (1930), *Collected Poems* (1933), *Solitude* (1938), *Selected Poems* (1941), and *The Garden* (1946). With her husband she pub. in 1945 the anthology *Another World than This*. *Knole and the Sackvilles* (1923) is a narrative of her ancestral home and its occupants.

Saco, city of York co. Maine, U.S.A. on the Saco R. 12 m S.W. of Portland. It has mills of cotton goods, cotton machinery, bricks, belting and carriages. Pop. 8600.

Sacrament, religious rite serving as an outward sign of the grace it confers by virtue of its divine institution. Originally, *sacramentum* meant the Rom. soldiers' oath of fidelity. Christian writers have ever used it partly to mean a sacred mystery in general (e.g. the Incarnation) partly in the sense given above (e.g. Titian says of baptism: 'Blessed sacrament of water by which our sins are washed away and we are liberated into eternal life' (*De Baptismo*)). Later this ritual use of the word prevailed and seven SS were held of divine origin, viz. Baptism (confirmation, the Eucharist, Penance, Extreme Unction, Holy Order, and Matrimony). This is to day the doctrine of the Rom. Catholic and the I. Churches. The Protestant Churches for the most part reserve the word to Baptism and the Eucharist, which the Eng. catechism declares to be 'generally necessary to salvation'. But there is considerable variety of opinion in the Church of England in this admitting seven SS. See also BAPTISM, COMMUNION, EUCARIST, etc. See J. C. Lambert, *The Sacraments in the A.I.* 1905. A. Vomer, *The Sacraments* (theological) and P. de Parry, *The Roman Pontifical* (litual).

Sacramentarians, those of the reformers who declined to follow Luther in his doctrine of Eucharistic consubstantiation. The first of his followers to oppose him thus was Andreas Carlstadt and the latter's party presented the Tetrapolitan Confession at Augsburg in 1530. They agreed with the Zwinglian teaching as to the sacrament. See ZWINGLIAN HERESY.

Sacramento, 1. Cap. of California, U.S.A. and co. seat of S. co. 91 m N.E. (by rail) of San Francisco, on the 1 bank of the S. R. It possesses a fine state Capitol (1874) in a park, two cathedrals, a city hall, public library, and the Crocker art gallery. Fruit canning and preserving, meat packing and rice and flour manufacturing are important industries. There are railroad repair shops and S. is an important distributing centre. Furniture and pottery are manufactured. Gold, stone oil, and natural gas are found and farming is carried on. Pop. 106,000.

2. Riv. in California, U.S.A. It rises in the N. close to Mt. Shasta, and flows in a S.W. direction to Sacramento, it drains the W. slope of Sierra Nevada, and eventually empties itself, after a course of 400 m., into San Francisco Bay. It is navigable as far as Red Bluff. The industry of salmon fishing for export in tins is a great specialty on the river.

Sacramentum, oldest form of action known to the Rom. Law. See under FIDELITY, TABERN.

Sacred Heart of Jesus, Feast of the, festival of the Rom. Catholic Church directed towards God's love for man symbolised in the S. H. of J. The feast is celebrated on the Friday after the octave of Corpus Christi. It arose from a vision which a French nun, Marguerite Marie Alacoque (1647-90), claimed to have received and was finally approved in 1765 by Clement XIII. In 1856 the feast was instituted by Pius IX.

Sacred Music, see ANTHEM, HYMNS, MASS, MUSIC, ORATORIO, PATRISTON, PSALMODY.

Sacrifice, commonly an act of self-denial. More strictly the offering of a victim to a deity in testimony of his sovereignty. S. forms an important part of most religions. In patriarchal cultures the head of the clan or family was the correct person to offer public S., later these rights were reserved to a priestly caste while finally priests usually consecrated alone may offer S. The object sacrificed is usually something prized by its possessor and supposed to be appreciated by the deity, corn, oil, wine, incense, but, above all, living beings, birds, cattle and even human immolation or destruction of the victim is a consummation or a consequence of the sacrificial oblation (eating of the remnants is supposed to symbolise communion with the deity and procure benefits to come). The theory that herein lies the principal origin of S. is now being abandoned. The generally accepted view is that S. is a bilateral act on the part of God and man and consists in the threefold element of oblation, immolation and communion by participation. The chief ends to which S. is offered are placation and atonement for sin, thanksgiving for past and petition for future benefits and in its highest development, pure worship of the Supreme Being. A detailed scheme of SS was incorporated in the Moslem law while in the A.I. the Passion is regarded as the final and supreme S. According to Catholic theology the celebration of the Eucharist (Mass) is a renewal of this and therefore S. itself. See works on primitive religion especially of Andrew Lang and Sir J. Frazer, also M. de la Hille, *Myth and Ritual* 1921 and W. Schmidt, *Origin and Growth of Religion* 1931.

Sacrilege comprises the following offences: (1) breaking into any church, chapel, meeting-house or other place of divine worship and committing a felony of any kind there, (2) being there in any such place, committing a felony and breaking out. A vestry has been held to be a 'place of divine service' for this purpose. The punishment may extend

to penal servitude for life. At common law S seems to have denoted only stealing goods out of a church or chapel. It was the only felony which deprived the offender of the privilege of sanctuary. The articles stolen need not be such as are used for divine service. In theology S is distinguished as *personal* as when violence is done to a cleric, *local*, covering the legal offences mentioned above, and *real*, e.g. abuse of the sacraments and in the Rom. Church violation of a vow.

Sacristan, title given in the Rom. Catholic and Anglican churches to that officer who has charge of the vestry and the sacred ornaments. He performs sex functions on & belonging to those in minor orders. In Eng. cathedrals the S is one of the minor canons. In Rom. Catholic cathedrals and larger churches he is a priest, whilst at the Vatican the S is an Augustinian friar and a titular bishop.

Sacrum, compound bone at the base of the spine forming the back of the pelvis.

Sacrum Promontorium, ancient name of Cape St Vincent.

Saddle Origins of that part of the equipment of a horse known as the S are to be found in the F. The most primitive examples of the S generally consist of a seat and S bows. The seat covers more or less completely the back of the horse in the neighbourhood of the withers. The pommel extends in front the bows behind, each of these parts being shaped in some measure like an arc. The Gks were often in the habit of riding bareback π & σ & ο & π & ο though they also used a S which was called *ephippion*. The word passed into Rom. usage slightly altered as *ephippium*. This S of the Romans was a leather covering fastened to the middle of the back of the horse by straps on either side. The S as it was used in the Middle Ages is better known to us from examples of the war or jousting S than the S for peaceful equitation. The Ss of the sixteenth century are not very different from those in use during the fourteenth and fifteenth centuries. War Ss had their pommels covered with steel and were raised to afford the rider protection from the thrusts of weapons. As horsemanship rather than any necessity for such protective devices became the ideal of S makers the S grew less cumbersome till it approached the modern use to day. Its balance and proportions must be very accurate if neither rider nor animal is to suffer discomfort. For Ss see under HORSES (DETAILED).

Saddleback, or **Blenethra** mt of the Skiddaw group, Cumberland, England, 44 m N.E. of Keswick. Height 2847 ft.

Saddleworth, urb. dist. in the Colne Valley parli. div. of the W. Riding of Yorks. shire, England. It is situated on the W. of Stanedge, some 14 m N.E. of Manchester. Cloth, woollen and cotton goods are manufactured. There are prehistoric barrows and earthworks in the dist. Pop. 16,700.

Sadducees (Gk Σαδδουκαί) one of the leading Jewish sects at the time of Christ. Rabbinical tradition traces their origin to Zadok, the disciple of Antigonous Saecho,

but little credence can be attached to this. They were materialistic in teaching and represented one aspect of old Jewish thought. They denied the immortality of the soul and the existence of angels or spirits. They also rejected the Pharisaic tradition. Most of the high priests of the first century B.C. belonged to this party. After the final destruction of the temple the Ss died out. The modern Kabbites bear some resemblance to them.

Sade, Donatien Alphonse François, Count, usually called **Marquis de** (1740-1814), Fr. writer b. in Paris. He entered the army and saw a considerable amount of service. His practices were vicious, and for an unnatural crime he was condemned to death. He escaped from prison, was imprisoned and committed to the Bastille. Here he wrote obscene and degrading novels and plays and attempted to set out a philosophical basis for his sexual practices. He died in the Charenton lunatic asylum. The word 'sadism' for a sexual perversion of cruelty was added to the language by himself. See F. Dubien, *Der Marquis de Sade und seine Zeit* 1927 and I. Klossowski *Sade mon poëme* 1943.

Sa de Miranda, Francisco de, see MIRANDA, FRANCISCO J.

Sa'adi, or **Sheikh Moshli Eddin Saadi al-Shirazi** 1181 (1201) Persian poet b. at Shiraz in Persia. S. led the life of a dervish and passed his early years in wandering. In the course of these journeys he was taken by the crusaders and put to labour on the fortifications of Tripoli. He was redeemed from this slavery by a rich merchant who gave him his daughter in marriage with a dowry of 100 pieces of gold. S. died tragically in 1291. The works of S. collected by Ahmed Nasik Ben Sa'ad consist of the *Gulistan* (Rose Garden), *Tushtan* (Jeweled Garden), *Dereh* (divine poetry), *ghazals* (ode), *Kasidat* (or elegies), *Mahataat* (fragments), *Kubayat* (quatrains) and essays. Famous knits in prose. Of all these the best known are the *Gulistan* and the *Tushtan*. Of the *Gulistan* there have been many trans. The works of S. in the Persian and Arabic were printed at Calcutta in 2 vols. (1791). See H. Misse *Tissa sur le poète Sa'adi* 1911.

Sadiya, vil. of Lakhimpur dist. 1 Ben. island Assam, India on a branch of the Brahmaputra 46 m from Dibrugarh. Pop. 3,000.

Sadler, Michael (b. 1888), Brit. biographer, novelist and publisher, son of Sir Michael Sadler (q.v.). He was educated at Rugby and Balliol College, Oxford. He entered the publishing firm of Constable and Company (1912) of which he became a director in 1920. He is chiefly known for his commentaries on Trollope, the revival of whose novels in popular favour is due largely to S. These works are *Trollope: a commentary* (1927, new ed. 1945), *Trollope: a bibliography* (1928). His other chief works on literary hist. include *Bulwer and his Wife* (1931) and *Blessington D'Orsay: a Masquerade* (1933, new ed., 1947). His novels which portray the scumier side of life in Vic-

torian London, include *Lanny by Gaslight* (1940) and *Forlorn Sunset* (1947).

Sadler, Sir Michael Ernest (1861-1943), Eng. scholar and educationist *b* at Burnley, and educated at Rugby. He was scholar of Trinity College Oxford 1880-1884. He had a long and distinguished connection with Oxford and other univrs in England, Canada and the U.S.A. He studied and wrote authoritatively on secondary higher, and commercial education in England, Germany and Belgium while from 1894 to 1897 he was a member of the royal commission on secondary education, and from 1897 to 1903 he ed. the special reports on educational subjects issued by the Board of Education and contributed many papers himself to this series. In 1903 he became prof. of the hist. and administration of education in the Victoria Univ. of Manchester, a post specially created for him, and had a most valuable influence on education in that city. In 1911 he became chancellor of Leeds Univ. at a time when that univ. was little known. In the next decade it developed into a great institution. He was president of the commission on Calcutta Univ. 1917 and played a large part in preparing the great report on Indian education which was issued after his return. He retired in 1921 and in 1923 as master of Univ. College returning in 1934. In recognition of his services to Indian education he was created K.C.S.I. in 1931. See memoir by his son M. Sadler 1943.

Sadler, Michael Thomas (1780-1851) Brit. social reformer *b* at Snelton, Derbyshire. He was ardently interested in Ireland and having entered Parliament in 1829 in the Irish interest was active in his support of measures for the bettering of the condition of the working classes by Factory Acts and other legislation.

Sadler's Wells, London the site in Redcubery Avenue, Islington. On its site in 1683 a surveyor named Sadler discovered chalybeate wells. Previously the site had been used as long ago as Elizabethan times for entertainments. But it seems that the theatre was built by Sadler as a music house, his intention being that people might drink in agreeable surroundings and to soft music. This music house or hall was replaced in 1760 by a theatre under the management of the comedian Thomas King, the original Sir Peter Teazle, King who was (1) part proprietor and sole manager of the Bristol theatre, subsequently became owner of three-fourths of S.W. which he so extended and improved that it became a place of fashionable resort. His gambling losses however compelled him to sever his connection with both theatres, and he was succeeded in S.W. by Charles Dibdin Junior as manager and owner, and the theatre concentrated on lavish aquatic spectacles. Later with the appearance of the clown Gamaldin it went back to theatrical presentations, and Samuel Phelps (between 1844-62) created a still unbroken record by producing every play contained in the first folio of Shakespeare. The theatre (which was rebuilt in 1879) then declined, but under the inspiration of

Laban Baylis (*q.v.*) the famous Vic Wells partnership was inaugurated and the theatre was reopened in 1927. The theatre was last rebuilt in 1931, and has since then been run jointly with the Old Vic specialising in productions of opera and ballet. When the theatre closed the newly formed Council for the Encouragement of Music and the Arts arranged a tour of Great Britain for the S.W. company. From 1940 to 1943 the theatre was used as a rest centre and was reopened in June 1945. See 1. J. Dent *A Theatre for Everybody* 1941, and C. W. Beaumont, *Sadler's Wells, Wells* 1946.

Sado Island, is in the sea of Japan off the W. coast of Honshu (Honshu) 25 m. from Nagata in Honshu. There are gold and silver mines in the N.W. Aikawa is the chief settlement. Area 337 sq. m. Pop. 109,000.

Sadoletto, Jacopo (1477-1547). It. humanist and divine *b* at Modena and educated at Ferrara. He was an outstanding classical and philosophical scholar. S. became bishop of Carpentras in 1517, and Leo X. made him one of his secretaries in the same year. He was created cardinal in 1536. He made frequent efforts to reconcile the Protestants to the Church. See 1. Campaigne and K. L. Rice *Sadler's Education* 1916, and J. Benoit *La Formation de Sadler* 1928.

Sadowa vil. of Bohemia Austria S.W. of Králové Hradec (Koniggratz), scene of the battle of Königgratz in 1866 when the Prussians defeated the Austrians. See SEVEN WEEKS WAR. Pop. 2000.

Sretabacula see ARCHES.

Sretabris see JAVIA.

Safad vil. of N. Galilee Palestine 12 m. N.W. of Tiberies, the largest tn. of Galilee. An earthquake nearly destroyed it in 1837. It was surrounded by the Templars to the Egyptian Mamlukes in 1266. Like Tiberies S. is a Jewish holy tn. which it became after the expulsion of the Jew from Spain and Portugal. It then developed as a centre for the study of the Talmud (*q.v.*) and the first printing press in Palestine was set up in S. in 1675. S. contains the remains of a Templar castle and looks out on Mt. Hermon and the N. Mt. Melton N.W. of S. are the tombs of Hillel and other famous Jewish teachers. See further 1. J. ALTSCHUL, *Vol.* 1900.

Safe-conduct, see PASSPORT.

Safed (Safid, Sufed, Seid) Koh (Kuh) vil. White Mountains 1 km. E. of J. Afghan. (tn. extending 100 m. W. to L. (toward Peshawar) India. S. is the Kaabul R. Siknam (Sitarum) is the highest peak (15,600 ft.) 2. Runge further W.

following the course of the J. Heri Rud.

Safeguarding The Safeguarding of Industries Act 1921 (Part I) put protective duties on key industrial products from outside the empire, and Part II provided for the imposition of duties against dumping or other unfair foreign competition, after public inquiry in the case of each industry claiming protection. 1922 saw successful applications for duties against

Ger currency depreciation in favour of fabric gloves and glove fabric domestic and illuminating glass ware domestic hollow-ware and gas mantles. In 1924 Lord Snowden allowed the duties to lapse, but the next year the Conservative Gov. with fresh committees of inquiry and new legislation gave protection to lace and embroidery cutlery, leather and fabric gloves and gas mantles, followed by wrapping paper (1926) translucent or vitrified pottery (1927) buttons and enamelled hollow ware (1928). Some of the duties lapsed before 1931-32 when general protective measures were taken. The key industries duties are still in force, and cover optical glass and optical elements, optical instruments scientific glass ware laboratory porcelain, scientific instruments, gauges and measuring instruments, etc. compounds of rare earth metals and synthetic organic chemicals etc. See PROTECTION, DUTIES also CUSTOM DUTIES.

Safety Glass, see under GLASS

Safety Lamp, see DAY LAMP

Safety Valves, see VALVES

Safflower, see CARTHAMUS

Saffron, or **Crocus**, *Crocus sativus* bulbous plant which has been introduced from Asia Minor to many countries of the world where it is or has been grown for commercial and ornamental purposes. The extract is now used only as a colouring and flavouring substance but in medieval times it had great reputation as a stimulant and its production in the Netherlands was a considerable industry. It is prepared from the stigmas of the flower about 4000 being required to make one ounce. The flowers are purple and are borne in late autumn. It belongs to the family Iridaceae. The so-called bulb is strictly speaking a corm. For meadows see COLCHICUM.

Saffron Walden, municipal borough and market town of Essex, England 16 m S.E. of Cambridge and 46 m N.E. of London. Its church the largest in Essex is a fine example of fifteenth century work though the tall spire is modern. The museum was built in 1884 and houses an important collection of local and other antiquities. Close by are the remains of a Norman keep. There are many old houses one of the most interesting being the Sun Inn now kept as cottages with its curious plaster front. It was the headquarters of Cromwell and Fairfax in 1647. The grammar school was endowed in 1425 and re-established by Edward VI. The town takes its name from the saffron crocus which was once cultivated here. The Guild of Our Lady of Pity one of whose main objects was the foundation and management of an almshouse for thirteen inmates was granted a royal charter in 1400. In 1514 Henry VIII replaced this by a charter giving wider powers to the Guild of the Holy Trinity renewed by Edward VI in 1550 by James II in 1685, and by William and Mary in 1694. About 1 m from S.W. is Audley End, a property including 100 ac of parkland and gardens, together with a sixteenth-century house, enlarged in the reign of James I,

which takes its name from Sir Thomas Audley, Speaker of the Commons from 1529 to 1532, and later lord chancellor, to whom in 1538 Henry VIII granted the manor of Walden. This property was purchased from Lord Braybrooke by the Ministry of Works in 1918 for preservation as an ancient monument. There was formerly an abbey (founded c. 1130) near the house but probably no part of it survives. Apart from the beauty and dignity of its exterior Audley End, as it now exists, has many striking internal features. Pop 7000. See 1. Addison 1956c *Herald*, 1948.

THE TOWN HALL SAFFRON WALDEN

Safi, or **Asfi**, seaport of Morocco on the Atlantic coast 10 m W.N.W. of Morocco City. It was fortified and held by the Portuguese until 1611. It exports maize, almonds, wool, goat hair and skins, and imports sugar, candles and provisions. Pop. 78,000 (2500 Europeans).

Saffleben, **Cornelis**, see SACHLIVSEN

Saga (optical *sagm* in Icelandic word meaning both story and history). In the early Middle Ages the literature society of Scandinavia recognized among the accomplishments of a gentleman (*idrottir*) the ability to narrate a story accurately and entertainingly together with decent familiarity with the poetic arts (see also SKALLS and SKALDIC POETRY). This faculty was still cultivated in the isolated communities of Icelandic farmers and fishermen long after it had ceased to resemble a continental aristocracy. The earliest named author whose work survives is Ari Thorgeirsson the Learned (d. 1143), his *Islandsgætt*, like *Landnám*

book written down about the same date, is essentially a nominal roll of the 'four hundred families' who were the original settlers of Iceland, their provenance, and the site of their estates. From this period (back to 874 and forward to about 1040) date a great mass of S. of Icelanders of varying length and anonymous authorship, probably all committed to writing by about 1200. To this group belong the most famous tales such as *Lyrbyggja*, *Lazarus*, *Njáls Saga*. Of similar form and antiquity are *Kareyingsaga* and the *Saga of Eric the Red* (the story of the Greenland settlements).

No distinction is made between history and biography, and a group of historical S. comprises chiefly *Ólafs saga* and *Heimskringla*, the latter the compilation of Snorri (c. 1179) Sturluson. A series of lives of bishops (*biskupa sögur*) cover the period 1100-1331. The greatest of the later family S. is *Sturlunga saga*, a compilation based on the Icelandic S. of Sturla Thordsson (c. 1190) nephew of Snorri the historian. After 1300 though the name and something of the external form of the S. continues to be used, the matter consists either of lives of saints imported from Britain, Germany, and Iceland, or thinly disguised romance, or prose retellings of Celtic legends, some not now extant in their earlier form (eg *Lofsungasaga*).

Printed texts in Icelandic are available for nearly all the extant S. (see hundreds), a large number have been rendered into German (Thule series, Teut.). The Rolls series, ed. by C. V. G. Andersen and Sir C. D. Bant, prints English versions of S. relating to the history of Britain. There is a list of texts and translations in *Heimskringla Sagas of the Norse Kings*, trans. by S. Ljung (Lacryminal Library No. 847). See B. Philpotts *Fiddle and Surt* (1931) and W. A. Craigie *The Icelandic Sagas* (1931).

Sagaing, 1. Ancient city of Burma in a div. of the same name on the Irrawaddy opposite Ava and 10 m. W. S. W. of Mandalay. It was captured by the Brit. Force 10th Army under Lt. Gen. Slim during the battle of Mandalay, when the city was taken from the Jap. in March 1945. Pop. 15,000. 2. The div. has an area of 26,152 sq. m., and grows large crops of rice, sesame, millet, peas, and cotton. Pop. 2,323,000.

Sagan, see *ZAGAN*.

Sagar, or **Saugor**, 1. Is. at the mouth of the Hugli R. Bengal India. The Hindus regard it as sacred and it is much visited by pilgrims. Area 22 sq. m. 2. District of Sagar dist. (400 sq. m.) Central Prov. India, 90 m. N. N. E. of Bhopal, on Sagai Lake (altitude 1940 ft.). It has a fort, barracks, and a large park. Salt, sugar, and cloth are exported. Pop. 14,800.

Sage, dwarf evergreen plant of the genus *Salvia* and order Labiales, bearing blue flowers. It is grown as a pot herb, requiring a light rather dry soil. *S. officinalis* or garden S. is used in cookery as a flavouring agent, and *S. terbenaca* or herb clary as a flavouring ingredient in

liquors. The essential oil from *S. officinalis* is used in perfumery. *S. tica* is a medicinal infusion of S. leaves.

Sage-brush, *Artemisia tridentata*, growth of alkali plants which cover some thousands of sq. m. of sterile deserts of the U.S.A. especially Nevada and Utah. Nevada on the account has long been nicknamed 'the sage brush' state. See also *SAGE GRASS*.

Sage Grouse, or **Hen** (*Centrocercus urophasianus*) large grouse which inhabits the sage brush dist. of the W. U.S.A. It has soft dense plumage, is mottled yellowish brown in colour, with a long, twenty feathered tail. At each side of the male's neck is an inflatable air sac, distended during the mating season.

Saghalien, see *SAKHALIN*.

Saginaw, a city of S. Mich. on the U.S.A. on the S. R. 16 m. from the mouth. S. has many industries including the manufacture of automobiles and automobile parts, machinery, railroad shop products, radio cabinets and other furniture, and phonographs. Dairying is carried on. It is noted for bituminous coal and beet sugar industries, and also has salt mines and oil wells. Pop. 92,800.

Saginaw Bay, W. inlet (60 m. long 25 m. extreme breadth) of Lake Huron off the coast of Michigan U.S.A.

Sagittarius (Archer) 1. zodiacal constellation (the ninth in order) representing a centaur drawing a bow. Many novae (q.v.) and planetary nebulae have been discovered in S. star clusters are numerous in the direction of this constellation and faint stars are very crowded in this region, as are also cepheids (q.v.). It is believed that in this region the mass centre of our galaxy lies, the sun being about 30,000 light years from this centre.

Sago, starchy food obtained from the soft inner portion of the S. palm (*Metrosylon Rumphii*) and other trees. The trunks are cut into sections and split the soft centre being removed and pounded in water till the starch separates.

Sagrara, Guillen (d. 1436) Sp. Gothic architect. The strength and clarity of his lines makes his work distinctive. His masterpiece, in which his son Francisco co-operated, is the cathedral of Lima de Majorca (begun in 1420).

Saguache, see *SAWACHA*.

Saguenay, riv. drains the shallow Lake St. John famous for its salmon and running for 100 m. N. E. into the St. Lawrence at a point 115 m. N. E. of Quebec, Canada. In its upper reaches it flows through hilly country whilst further down, gaint ch. often 1600 ft. high confine its bed. From Lac Ha Bay a favourite summer resort the riv. is open to draft of all sizes. Father DuRoi, S.J. was the first white man to ascend the S. to Lake St. John in 1647, and T. DuRoi, a 1st Canadian vicar at the mouth of the S. has, since the seventeenth century, been the headquarters of the Jesuit and Franciscan missions. See W. R. Harris, *The Cross-sealers of the Saguenay*, 1920.

Sagunto, or **Murvielro**, modern name of Saguntum. It is situated in the prov.

and 20 m N of the city of Valencia Spain. In 219 B.C. it offered an heroic though ineffectual resistance to Hannibal. Under the empire it flourished as a romanised native tn, and many Rom. ruins remain. The walls were strengthened in 1812. In 1874 it was the scene of the pronunciamiento which restored Alfonso XII to the throne of Spain. Pop. about 11,400.

Sahara (properly *Sahra*, 'wilderness') largest desert of the world covering about 3,500,000 sq. m. of N. Africa from the Mediterranean southward to the Sudan and from the Atlantic eastward to the Red Sea. Yet the actual waste land even including the Libyan and Nubian deserts is not 2,400,000 sq. m. The Sahara is an elevated plateau with a mean altitude of

the wind into high dunes continually shifting and changing contour. Oases occur wherever there is water and these tropical fruit trees, palms and cereals grow in plenty. The oases of Ghadames, through which pass the caravans from Morocco to Cairo is due to a natural spring; certain oases in Kazzan and Algeria are caused by underground reservoirs reached by means of artesian wells whilst those of the wadi Draa depend on the waters brought from the Atlas Mts. Ancient watercourses prove that rivers formerly flowed through the desert and the presence of salt (salt is the currency of the Sahara) and of marine shells proves that parts of it were once under the sea. That the process of drying up is still continuing

IN THE SAHARA DESERT

L N 1

1,000 ft. and practically never sinks below sea level. The *hafra*s (hollows) of Fezzan and Fuserbo in the N.E. etc. being only relative depressions. Its surface is diversified by lofty tablelands and mts. the summits of the central Ahaggar highlands and of the Tibesti mts. further to the E. rise as high as 8,000 ft. and are snow-capped for several months of the year whilst to the N.E. and N.W. of the Ahaggar peaks extends the ridge of the Moudir plateau (200 m.) and that of the Tash of the Ajer (300 m.), which has an altitude of 4,000 ft. S. of the Ahaggar are the mts. of Air (6,000 ft.). The Erg which with the W. and E. Erg stretches from Cape Blanco to the S. of Tunisia (1,300 m.) is a vast belt of sand hills. But these do not account for more than a ninth of the Sahara. The *hammada* al Hamra and the *hammada* al Murzuk etc. are vast, undulating granite strewn surfaces, and there are also interminable tracts of stones and water-worn pebbles called *serir*. Other areas, e.g. the Libyan desert, are covered in soft sand, sometimes blown by

is shown by the presence of deserted or semi-deserted cities, e.g. Agades and Tadmah and of deserted caravan routes and by the fact that areas inhabited fifty years ago are now deserted. In the past 1,300 years vast tracts of N. Africa have become desert. Man and beast (i.e. the nomad and his goat) are obliged to measure respectably man by burning shrubs and tree for firewood and the beast by eating young vegetation. Before the Second World War the Arabs had reclaimed large tracts of desert in their N. African colonies since the war with the encouragement of U.N.O. work has continued especially by the Fr. authorities on an increasing scale.

The S. interior districts have the highest temps. of Africa, if not of the world, after noon temps. may exceed 120° in summer, but in winter (Dec. Jan.) the mean in most districts of the interior is below 60°. Frosts are not unusual in mid-winter. Offshore from the W. Sahara cold surface water has a modifying influence on the normal desert climate, and the high levels

of the thermometer in the interior are never approached in the coastal regions of W. Africa or Libya, and usually the mean of each month of the year is lower than 70° while fogs are of frequent occurrence. Though more or less rainless the Sahara as seen above is not without subterranean water, and the wells of the oases e.g. those of the Tuat group in the N. central Sahara are conducive to agricultural wealth. This wealth, combined with the nodal position of the oases on lines of trans-Saharan communication, gave them considerable economic and commercial significance. Saharan scenery varies widely according to the character of the surface rocks and the action of frost and wind or other erosive agents. Generally there is a very meagre and sporadic vegetation of stunted shrubs but as this plant life is not perceptible at a distance the landscape appears to be uniformly barren. Here and there in the sandy wastes or *ergs* occur small shrubs including the *Salsola* in bloom and tufts of very harsh grass, but vast stretches of these wastes are devoid of all vegetation. The most extended area of unmitigated sandy waste is the Libyan desert which stretches southwards for 800 m from the Siwah group of oases. The *erg* or sandy waste is avoided by caravans which keep to the rocky or gravel desert as far as possible and where subterranean water and camel pasture are more abundant though always very rare. Rocky wastes with the bare exposure of fissured rocks as dominant features of the scene form the *hammada* type of the Sahara. Much of the central plateau of Algeria and Tibesti is of this character. Numerous shrubs of different kinds find shelter in the clefts resulting from radiation and isolation, and here too may be found rough camel pasture. Merchants cross the desert by camel caravan along recognised tracks which naturally follow the oases. Timbuctoo communicates by beaten ways with Morocco, Tunisia, Tripoli and Algeria; part of the distance by motor route and Tripoli is also connected with Kano, Zinder and Kuka (Lake Chad). The caravan traffic has long been declining in commercial importance, partly because the economic resources of the Sudan have been tapped at many points and diverted by roads and railways to ports on the gulf of Guinea. But some of the more important caravan tracks are still used. Numerous railway plans have been suggested and there are now in routes across Sahara and emergency funding demands have been made. Six explorers have risked their lives and many have lost them in the Sahara. Among long explorers Maj. F. M. T. who crossed S. to Timbuctoo 1826, John Davidson 1836 and John Richardson, 1841 may be mentioned; there was also the ill-fated expedition led by Col. Flatters 1881. Notable achievements of recent years are those of Capt. A. Buchanan who travelled from Kano to Tuggurt by camel caravan 1922, B. Khun de Trochok who between 1920 and 1940 made six motor expeditions, the Citroën expeditions which have crossed the Sahara by motor from N. to S.,

and Gen. Laperrine who lost his life in an attempt to fly the desert in 1919. In Jan. 1913 Gen. Léclerc led a mixed Fr. and native army across the Sahara from Fort Lamy to conquer Kozzan prov. (1500 m.) and to aid the Brit. to drive the Gers from Tripolitania and Tunisia. Some railways have been built in the N. by the Fr., and a trans-Saharan railway is projected. Politically three fifths of the Sahara belongs to the Fr. the rest to Britain, Italy, and Spain. The sporadic pop. of some 2,000,000 includes Moors, Tuaregs, Negroes, Bedouins and Tibbus.

See G. Nachtigal *Sahara and Sudan*, 1879; Rosita Forbes *Kufara: the Secret of the Sahara*, 1921; A. Buchanan *Sahara*, 1926; L. C. Gauthier, *Le Sahara*, 1928; B. Fotherton *Across the Great Deserts*, 1948.

Saharandpur, see SERAMITR.
Said al-Fayyumi, see SA'ID AL-BIN JOSTAN.

Saigon, cap. and prin. seaport of the autonomous prov. of Cochinchina of the independent state of Viet Nam within the Fr. Union on the S. 34 m. from the sea. With the neighbouring city of Cholon it has six rice mills and soap factories, some saw mills, and a gunpowder factory. It is at the head of two of the prin. railways of Indo-China. S. has six banks, and is important as a port. S. is connected by rail with Cholon, a native commercial city. In July 1941 the Vichy Gov. gave Japan permission to occupy a number of ports on the coast and inland in Indo-China and to exercise various forms of control within the country. On Oct. 3, 1941 the Japs seized the warehouses at S. and thereby made it clear that they intended to use Indo-China as a base for further aggression. After the collapse of the Jap resistance in 1945 the Annamese broke out into revolt against the Fr. at S. Pop. 214,000. The outcome of the revolt was the creation of the state of Viet Nam (q.v.).

Sails and Rigging The term rigging in the strict sense includes all the appliances by which a sailing vessel is enabled to make her way through the water. Masts, yards, sails, and cordage are thus comprised as are also the davits on which the boats are slung. It is the difference in rigging which determines the classification of a vessel and the various types such as schooner, barque, ship, etc. A schooner, rigged barque, rigged etc. vessels. The various kinds of rig are multitudinous; there are however two main classes: (a) square rigged, that is having various lengths of the vessel and (b) fore and aft rigged, that is having the S. stretched along the line of the keel and hence the spars appertaining to them—masts and booms, pivoted on to and abaft the mast. Many (e.g. the topsail schooner) combine the two types. A few fundamental types may be given. The simplest form

Sauma, Lake, see KINLAND

Sainfoin (*Onobrychis sativa*) handsome perennial leguminous plant bearing rosy red flowers in axillary racemes. It is a valuable fodder plant on dry calcareous soil and makes excellent hay. It is allowed to occupy the land for three to seven years but afterwards the land must have a long rest from it.

Saint, or **St** 1 or individual **ss** see under the first letter of their names.

Saint (Lat. *sanctus* O.I. *sancti*) Though St Paul uses the word *ay* or 'saints' in addressing the Christian congregations to which he writes the name is to day used in a more restricted sense. A **S** in this meaning is a person remarkable for special holiness and piety. Veneration for such persons is not a peculiarity of the Christian religion but has been a feature of it from the beginning. Such recognition of special holiness was not at first marked by judicial procedure. The holy man was famed in his own district. His memory was venerated and perhaps miracles were worked at the place where his body rested. Sometimes his fame spread far and wide. There was thus a considerable possibility of error and scandals led to a restriction of the right of canonisation to the bishop of the diocese. For the elaborate modern procedure of canonisation see **BENEDICTION CANONISATION**. See the compilation of the Benedictine monks of Augustine's Abbey Ramseye *The Book of Saints* 5th ed. 1947. The most comprehensive collection is that by E. G. Helweg *A Biographical Dictionary of the Saints* 1921.

St Abb's Head promontory with a lighthouse on the N coast of Berwickshire Scotland 4 m N.W. of Eyemouth. It is named after St Abb who found a monastery there in the seventh century.

St Aignau Island, see under LOUISIADIAN ARCHIPELAGO

St Albans, Viscount see **BACON FRANCIS**

St Albans Since 1877 city in the seat of a bishop 20 m N.N.W. of London in Hertfordshire England. The chief industries are printing, engineering, hosiery, clothing, and orchard culture. It was the successor to the important Roman Briton of Verulamium (q.v.). The place name is derived from the martyrdom in 303 of St Alban, the Roman soldier convert and the first Christian martyr in England.

Offa king of Mercia is said to have rediscovered the coffin containing his bones. The Benedictine abbey, founded by Offa in honour of the saint, c. 793, and the medieval town arose on the opposite side of the valley from the Roman town of Verulamium, that being the spot to which, according to tradition, the body of St Alban had been removed for safety. From Matthew Paris (d. 1213) the historian monk of St A we learn of the benefactions of Abbot Wulstan or Ulsinus who founded (c. 900) the three par churches, St Peter's, St Michael's and St Stephen's; the abbey school from which the present grammar school claims direct succession and the market. St Michael's church which stands on part of the site of the forum of Verulamium contains a monument of Francis Bacon (Baron Verulam and Viscount St Albans) (d. 1626). Near by are the impressive remains of the Roman theatre. The abbey church, the present cathedral has the longest Gothic nave in Europe. The tower, built of thin Roman bricks taken from the ruined buildings of Verulamium. The Saxon church was rebuilt at the end of the eleventh century by Paul of Caen the first Norman abbot whose Norman work is among the earliest in the country. In contrast to the massive unadorned foundations of the Norman arches the presbytery with its delicate late Gothic reredos and Abbot Hamlyn's (d. 1220) chantry chapel. Further eastwards are afforded by the nave arcades of various periods and owing to its great length the nave gains rather than otherwise from the piecemeal rebuilding. The series of wall paintings on the W and S sides of the Norman pier in the N arcade of the nave belong in part to the time of Walter of Colchester sacrist 121-48 and Matthew Paris. The abbey soon became a famous centre of culture. In the abbey are the tombs of Humphrey duke of Gloucester (d. 1447) and an inscription to Sir John Mandville. The abbey latchesome of stone and flint was built about 1550 supposedly from the designs of Henry VIII the king's master mason. Since 1871 it has formed part of the buildings of the grammar school for the previous 300 years housed in the 15th chapel of the abbey. The school was refounded in 1545 by Richard Berington. Among its pupils were Alexander Neckham, foster father of Richard Coeur de Lion, Matthew Paris and possibly Nicholas Breton and Sir John Mandville. The abbey and St Michael's and St Peter's churches suffered restoration and alterations by Edmund Beckett, afterwards Lord Grimthorpe. The market stall by Wulstan is still held in the market place near the abbey. In spite of modern shop fronts and some rebuilding some old houses still survive near the clock tower which has dominated the scene for more than 500 years. In 1877 the abbey church was raised to cathedral status in the formation of the new diocese though it is still widely known as the abbey. Pop 42,100. See F. Gibbs *Historical Records of St Albans*, 1885 and L. F.

Rushbrooke Williams, *History of the Abbey of St Albans* 1917

St. Albans, cap of Franklin co., Vermont, U S A 300 ft above and 3 m E of Lake Champlain. It is a centre for dairy produce and also has railroad-car shops, foundries, and cigar factories. It is a summer resort. Pop 8000

St. Alban's Head, promontory on the Eng channel 5 m from Swanage. There is a Norman chapel dedicated to St. Adhelm, the present name of the headland being a corruption of Adhelm.

St. Aldwyn, Michael Edward Hicks-Beach, first Earl (1837-1916) British statesman. He was educated at Eton and Christ Church, Oxford. In 1861 he became M P for Gloucestershire and in 1885 M P for W. Bristol. He was twice appointed chief secretary for Ireland, then secretary for the colonies and was chancellor of the exchequer 1885-86, and again from 1895 to 1902 when he resigned on account of his views on free trade. He was raised to the peerage in 1906 and in 1916 made an earl. His life was pub in 1932.

St. Amand-les-Eaux, tn with hot sulphur springs, 8 m N W of Valenciennes, in the dept of Nord, France. Pop 14,200

St. Amand-Mont-Rond, tn with Roman antiquities 39 m S E of Bourges by rail in the dept of Cher, France. Pop 1900

St. Andrews, seaport and royal burgh, 12 m S S E of Dundee by rail on St. A. Bay, Fife-shire, Scotland. Legend claims that the tn was so called because it harboured the relics of St. Andrew, which a certain bishop named St. Regulus or Rulic, brought hither from Pictavia in Achaea. There are ruins of the castle (built 1200). A fragment of wall and some archways are the only remains of the wealthy Augustinian priory which Bishop Robert founded here in 1114. The cathedral which still contains some specimens of Norman and Early Eng architecture was consecrated in 1148 in the presence of Robert Bruce, and in 1550 suffered from an outburst of iconoclasm stimulated by Knox's sermon in the parish church. A bishopric. It is said in the ninth century, St. A. was in 1526 accounted one of the six 'principal towns of merchandise of this realm' and numbered 14,000 citizens, including merchants from France and Flanders. Yet when De Witt saw the city it was a scene of desolation with many houses deserted. It is a fashionable and healthy watering place but the fame of St. A. today depends on its university and on its splendid golf links (acquired in 1894), which rank with the best in the world. The golf club was instituted in 1754 and took the title Royal and Ancient by the wish of King William IV. It is the governing power in golf, and drew up the original rules of the game. There are four courses, the Old, New, Eden and Jubilee. Pop 8700

St. Andrews University, Fife-shire was founded in 1411 by Henry Wardlaw (d. 1440), who was consecrated bishop of St. Andrews in 1403. The colleges of St.

salvator and St. Leonard, founded in 1436 and 1512 respectively, were in 1747 formed into the United College of the Univ. Univ. College, Dundee, founded in 1880, and the college of St. Mary (founded 1537, now theological) are part of the univ., as also is the conjoint medical school, Dundee. The number of students enrolled (1950) was 2196.

Saint Arnaud Jacques Leroy de (1801-1841). Fr. soldier, he obliterated the memory of his early debaucheries and debts by his valor as captain in Algeria from 1801 till his death he was wounded. He was comm. under in chief of the Fr. forces in the Crimea (1854) and was present at the battle of the Alma.

St. Arnaud 1. Municipal tn in near quartz mines in Kootenai Co., Victoria, Australia. Pop 1100. 2. In connected by rail with Seattle to the W. in the dept of Constantine, Algeria. Pop 8300.

St. Asaph, rural dist. par and tn in Flintshire, Wales. On N. by W. of Denbigh situated on an eminence between the Clwyd and the Elwy R's. The tn and diocese take their name from St. A. (471), the successor of Kentigern, who is said to have founded the see about 560. There are still a few parts of the cathedral dating from the thirteenth century, but most of it belongs to the fifteenth century. It was restored under the direction of Sir Gilbert Scott. There is a grammar school, a par. church and in old bridge across the P. Elwy. St. A. is in the centre of an agri. dist. The area of the par. is 164 sq. ac. dist. 22,300 ac. Pop par about 2000, rural dist 8,000.

St. Aubin small picturesque tn in the par. of St. Brelade, Jersey, at the W. end of St. Helier Bay. It has a small, but convenient harbour, a pier, and a market-place, and the view from the adjacent point, Noirmont, is exceedingly fine.

St Augustine, city in St John co Florida U.S.A lies 2 m distant from the coast. It is said to be the oldest tn in the U.S.A having been settled by Spaniards in Sept 1565. There are cigar artificial flowers, and engineering factories. Most of the houses and hotels are built of the local coquina rock. St A is a famous health and winter resort and fruit growing centre, while pine and cypress locally grown are the important timber. Pop 12 000.

St Austell, mkt tn and par in Cornwall England. The tn is 13 m S.E. of Truro. There is a beautiful Early Long church which has a particularly fine Perpendicular tower. St A was formerly the centre of a tin and copper mining dist. There are important china clay works here and large quantities of china stone are quarried in the dist. Part of the pul army under the Earl of Essex was quartered here during the Civil war shortly before the capture of Charles I in 1644. Pop 21 900.

St Bartholomew or St Barthelemy, is of the Fr. W. Indies lying between St Martin and St Kitts. Its 8 sq m are very mountainous and its soil despite its parched nature is not infertile. The island is volcanic and the rocks are red and dark brown. Banana, guinea, and citrus fruits are grown for export and sugar cane and maize are also produced. The cap is Gustavia and the port which is not very accessible. The island was first settled by a colony of Frenchmen from St Kitts in 1648. In 1680 it was taken by the Eng under Adm. Thornhill and remained in Eng possession till the peace of 1697 when it was restored to France. In 1746 it again fell to the Eng and was once again given up under the treaty of Aix la Chapelle 1748. In 1785 it was ceded by the Fr to Sweden and continued subject to that country until 1878 when it was purchased by France for £11 000. Pop 2 000.

St Bees, par in Cumberland 4 m S. of Whitehaven. St Bees is a lush princess from whom the name is derived and to have founded a monastery here about A.D. 650. The church belonged to a Benedictine abbey in the twelfth century. A grammar school was founded here by Archbishop Gundulf in the sixteenth century under royal charter. Pop 1 200.

St Benoît, tn on the N.E. coast of the is. of Réunion or Bourbon 19 m E.S.E. of St Denis connected by coast railway with Pointe des Galets. Pop 13 000.

St Benoît-sur-Loire, tn in the dept. of Joret France. It was once the site of the abbey of Fleury belonging to the Benedictine order. Pop 800.

St Bernard, name of two passes across the Alps. The Great St Bernard (8111 ft high 53 m long) leads from Martigny in Valais Switzerland, to Aosta in Italy, across the Pennine Alps. The Little St Bernard (7179 ft high, 39 m long) from the Isère valley Savoy France to Aosta across the Graian Alps. The first pass, Alpis Poenina, seems to have been opened

in 57 A.C. by Servius Galba for Julius Caesar, but the road, of which there are slight remains was not made till much later. It was in existence by A.D. 69. At the top of the pass was a temple to Jupiter. The famous hospice was founded or as some say refounded by St B. of Menthon (d.c. 1041) and has been served by Austin monks since the end of the twelfth century. The monks serve in saving life with the aid of their dogs has become historical (see also next article). Napoleon and his army crossed the Great St B into Italy in 1800. The construction of a carriage road was not completed till 1905. The hospice was badly damaged during the Second World War. In 1914 under the terms of the peace treaty with Italy the hospice was handed over to the Fr. The Little St B known to the Romans as Alpis Graia was the chief pass till the opening of the pass at Mont Genèvre Alpis Catin. By the road and the road in A.D. 3 traces of the Roman road still remain. Hannibal's crossing the Alps by this pass is disputed. The hospice was also founded by St B.

St Bernard Dog huge powerful picturesquely and dignified dog which originated as a breed in the Augustinian hospital at the summit of the St Bernard Pass through the Alps where it was used to act as a guide and to search for and aid travellers who had lost their way. Two varieties are bred in Britain the rough coated and the smooth coated. The

ST. BERNARD DOG

144

colour of both is orange orange tawny and various shades of buff and red with white markings on the muzzle face neck chest legs and tip of tail. The head is large and massive with rather short face and deep wide and square muzzle. The lips are loose, and the stop well defined. The eyes are dark and the lower eyelid droops a little to show the red haw. The ears are of medium size and are carried close to the cheek. The back is level as far as the haunches and rises slightly over the loins. The legs are straight fairly long and powerful and the feet large and compact. The height of a dog at the shoulder averages about 34 in and the weight 200 lb. Size is an important characteristic of the breed.

St. Blazey, mrkt tn and par of Cornwall, England, 8 m S of Bodmin. It is engaged in the china clay industry. Pop. 3000.

Rom Catholic archiepiscopal see. St. B. manufactures steel and has flour mill and laboratories. The dist. is agrie and brick clay pits occur. Much damage was done by riv floods in May 1900. Pop. 18,200.

St. Bride's, or **S. Bridget's**, church of the city of London situated on the S. side of Fleet Street. It was rebuilt by Wren in 1680, after the fire of London (1666). It was one of those left in ruins in the air raids of 1940, and only its tall steeple remains. It is one of the churches recommended by the Bishop of London's commission for restoration. See LONDON, Bomb-damaged London.

St. Brioux, tn on St. L. R. in the dept of Calvados, Nord France. 7 m W-S.W. of St. Malo. Amongst its chief buildings are a cathedral of thirteenth century work, a parish church and an eccles. college. There is iron and steel works. Agric. implements and shoes are manufactured. Pop. 367.

St. Catharines, city of Lincoln Ontario, Canada 4 m S. of Lake Ontario and 12 m N.W. of Niagara Falls. It is situated in a prosperous port and a rapidly growing dist. There are sea-line piers with bathing beaches on Lake Ontario a few miles distant. It has a new city hall, a hospital and public library. There are some twenty schools as well as a collegiate vocational institute, a business college and Bishop Ridley College on the Eng. public school model. The Canadian Henley regatta is held here on the disused canal. There is an airport. Among a

hundred industrial plants are those producing broadsilk and other silk goods, hair cloth, knitted woollen goods, rugs, agric. implements, harness, chains, lumbering tools, dynamos, transformers, electrical apparatus, motors, saws, drop forgings, castings, paper, wood products, canned fruit and vegetable products, wines and jams, meat products, and macaroni. The city was founded late in the eighteenth century by United Empire Loyalists from the U.S.A. The young community received its first impetus in 1826 with the construction of the Welland Canal from Lake Ontario to Lake Erie. Now the great new Welland Ship Canal makes St. C. a busy inland port. Pop. 35,000.

St. Catherine's Society, body of Oxford Univ. consisting of students who while members of the univ. lodge in the city. Such bodies were made possible by a relaxation of the univ. statutes in 1865. The head of St. C. is the censor. St. C. also has a number of lecturers and a dean, and offers scholarships. New buildings were opened in St. Aldate's in 1936.

St. Chamond, tn on the R. Clermont in dept. Loire, France. Its prin. manufs. include silk braid, laces and wire tools. It has deposits of coal and iron and has naval and railway workshops. Pop. 14,800.

St. Charles, tn in St. C. Co. Missouri, U.S.A., with a fine iron bridge spanning the Missouri. The Underwood College for Women is here. There are manufs. of cast steel dies, oil engines, electrical supplies and shoes. Pop. 12,000.

St. Christopher, one of the Brit. W. India is usually called St. Kitts (71).

St. Clair, a Riv. draining Ontario prov. from St. C. Co. Michigan into Lake Erie issues from Lake Huron and flows a distance of 41 m gathering on its course the surplus waters of lakes Superior, Michigan, and Huron, which it discharges into Lake St. C. This lake, situated in Michigan and the prov. of Ontario discharges into the Detroit and thence into Lake Erie. Length 30 m, breadth 2 m.

St. Claude, tn in the dept. of Jura, France, with a fine cathedral church of fourteenth century workmanship. Its industries are the manuf. of toys and brass pipe and iron cutting. St. C. is one of the tourist centres of the Jura. The Benedictine was founded in 1710. A great fire occurred in 1799 and a hurricane ravaged the tn in 1800. Pop. 10,700.

St. Clement Danes, par. of London which contains a church in which Dr. Samuel Johnson used to worship. Wren's church built in 1681 was probably the third church on the site. It was this building which, with the exception of the tower, was destroyed during German raids in 1940.

St. Cloud, 1. Tn in the dept. of Seine-et-Oise, France on the l.b. of the Seine, 6 m from Notre Dame Paris. It is a tn. rich in historical associations with the ruins of a castle once inhabited by Marie Antoinette. The celebrated Savoy factory stands in the park. Pop. 17,600. 2. Tn on the Mississippi in Minnesota, U.S.A., 60 m N.W. of Minneapolis, with granite memorial and building stone in-

dustries and numerous manufs of freight cars and motor parts paper and canned vegetables St Johns Univ is here Pop 24,200

St. Columba, College of, Dublin, founded in 1849 by Wm Sewell an Oxford don in sympathy with the High Church Oxford movement, who visited Ireland in 1840 and planned the estab of a college not only to supply an Irish speaking clergy, but to give the Irish landlords, nobility, and gentry a knowledge of the Irish language and literature and an interest in Ireland. His plans were accepted by his associates, who included some Munster landlords, and liberally supported by Lord John Balford archbishop of Armagh. The college was actually founded in 1853 on the banks of the Boyne but moved in 1849 to the foot of Kilmashogue. To day the college is used by the professional classes, including the farmers for whose benefit it offers special facilities to boys who want an education with an agric bias.

St Croix, name of two rvs in N America. One rises in the Penokee mts, and after separating Wisconsin from Minnesota for 135 m flows into the Mississippi 20 m below St Paul. The other flows out of Great Lake and finally reaches Passamaquoddy Bay between Maine and New Brunswick. Length 75 m. See also SANTA CRUZ.

St Cyran Jean du Vergier de Hauranne, Abbe de (1571-1633) Fr Jansenist theologian b at Bayonne. Studied theology at Louvain Univ being a contemporary there with Jansen whose intimate and lifelong friend he became. In 1611 he was given the canonry of Bayonne and in 1620 the abbacy of St Cyran. Imprisoned by Richelieu in 1638 he was released in 1642. To day he is regarded with Jansen as the co-founder of Jansenism and the strongest for e in the dissemination of its doctrine.

St Cyr-l'Ecole, tn in the dept of Seine et Oise France near Versailles famous for an abbey founded by Mme de Menthon who was abbess until her death in 1719. There is also a military school founded by Napoleon Pop 8300.

St Daboo's Heath see DABOOTHIA PORTORIA.

St David's, city 16 m S.W. of Fishguard and under 2 m from the sea, in Pembrokeshire Wales. The fine sandstone cathedral which contains the stone screen of Bishop Gower (1147) the carved stalls of Bishop Fully (1181) and the fan vaulting of Bishop Vaughan (1522) grew up because the pit in saint of Wales settled here in the sixth century. There are also splendid ruins of Bishop Gower's palace. The tn has become a summer holiday resort Pop 1600.

St David's Head, prominent rising 100 ft above the sea, in Whitesand Bay N.W. Pembrokeshire, Wales.

St Denis 1 Tn about 5 m N of Paris, France in the dept of S.ine. It contains a church which is a magnificent example of fourteenth century Gothic in which are the tombs of kings of France. Rail way carriages, locomotives, machinery,

chemicals, cardboard, and woollen stuffs are manufactured. There are also breweries and distilleries Pop. 70,000 2 Tn and the seat of the governor, at the mouth of the Saint-Denis, in the Fr. is. of Réunion Pop 31,000.

St. Die (ant Deodatum), tn, in the dept of Vosges France 31 m N.E. of Epinal manufs iron goods, machinery, wagons, fire pumps, and dress materials. St. D has a cathedral. In the First World War it was held against violent attacks, Oct Dec 1914, and suffered damage during the Second World War Pop (1936) 17,000.

St. Dizier, tn 12 m from Wassy, in dept Haute Marne, France with iron, steel, and copper manufs Pop 19,000.

St Domingo, see SANTO DOMINGO.

St. Dunstan's Lodge, headquarters situated in Regent's Park London of a charitable organisation, founded in 1915 by Sir Arthur Pearson caring for men in the Army Navy and Air Force who were blinded during the First World War and for those blinded in subsequent wars. By the end of 1945, over 1000 men and women blinded in the Second World War had passed through St. Dunstan's. Pensions and allowances are given and many occupations taught such as carpentering basket making rug making, typewriting etc. The organization depends upon voluntary subscriptions. See Sir C. A. Pearson *Letters from Blindness* (1911) Sir H. Master *Whereas I was Blind* (1942) and inn reports of St. Dunstan's.

Sainte Aldegonde, Philipp van Marinx, Heer van (1535-98) Dutch writer and Protestant reformer. He studied theology at Geneva. He drew up the Comp to use of Bible (1666) opposing the Inquisition and once a henchman of Philip II. As mayor of Antwerp (1581-85) he defended the city against Alexander duke of Parma. Next to William of Orange he played the chief part in the liberation of the Netherlands. His prin work is a Calvinist satire on Catholicism, *De Roomsche Beploof* (1611) pub under the pseudonym Isaac J. Bladensis. He trans the 15m into Dutch verse and with the p to launch it the folksong *W. thelmus an Vasschen* the hymn of Dutch liberty. See J. I. Motley *History of the United Netherlands* 4 chap in 1860. See also lives by P. van der Meer (1882) Dresselms 18. Brins 1885 40. 1. Ommet 1834, Jun 1868, and 1. 191m 1896.

Sainte-Beuve, Charles Augustin 1814-1889. In literary crit b at Beaulieu sur Mer. In 1838 S. B. went to Paris where he attended the College Charlemagne and resided with a free thinking prof a certain M. Leclercq, whose influence affected him considerably. From 1824 to 1827 he studied medicine at the same time he became a subscriber in the world of letters, having joined the staff of the *Globe*. To this paper, during the next three years he contributed the poems and articles afterwards collected under the title of *Premiers Lundis*. In 1827 S. B.

severed his connection with this paper for political reasons and in the same year his enthusiastic and sympathetic review of Victor Hugo's *Odes et ballades* brought him the acquaintance of the poet. With the object of spreading the Romantic movement he pub in the next year his *Tableau de la poésie française au dix-neuvième siècle*. In 1829 and 1830 he issued two works of original poetry, *Le dieu poète* de Joseph Delorme and *Les Consolations*. But his sphere was not that of original poetic creation as the reception of his third and last vol *Pensées d'adult* convinced him. From 1830 to 1836 he was under the influence of Lamennais and his mind was disturbed by religious and political questionings. He abandoned in turn, Catholicism, Saint Simonism and liberal Protestantism. In 1831 he pub *Volupté* his only novel and in 1837 delivered at Lyons his famous lectures on Port Royal which rank him not merely as a superb literary critic but as one of the best historians of his time. His period of real greatness dates from his visit to Italy in 1840 for which the early part of his life had been a preparation. He was made keeper of the Mazuin library, and during the next nine years wrote almost entirely for the *Revue des deux mondes*. In 1841 he was elected to the Academy as successor to Casimir Delavigne and received in 1843. In 1848 he was made prof of lit literature at Liège and delivered his famous course of lectures on *Chateaubriand et son groupe littéraire sous l'Empire*. In 1854 he was made prof of lit poetry at the Collège de France. From 1849 onward his chief work was the literary *causeries* which appeared every Monday first in the *Constitutionnel* (1861-63) then in the *Moniteur* then again in the *C. J. Constitutionnel* until 1863 when he finally changed to the *Temps*. The *Causers du Lundi* and *Vendredi* form twenty eight vols (1841-61 and 1863-72) and the supplementary vol to this collection Charles Lacroix's *Table générale et analytique* shows 515 enormous literary range. Other well known writings of S B are *Critiques et portraits littéraires* (3 vols 1836-39), *Éroudhé* (1867) and *Lettres* (4 vols, 1877-80). See lives by Texeire 1872, D Hanssensville 1873, also E Jégouet *La jeunesse de Sainte-Beuve* 1914, G Michaut *Ste Beuve* 1921, F Mott *Sainte Beuve* 1922, and A Bille-Sort *Sainte Beuve et le XIX^e siècle* 1927.

Sainte-Chapelle, anet palace chapel in Paris. Louis XI had it built in 1248 to house the relics of the crown of thorns and piece of the true cross he had brought from the Holy Land. It is said to be the finest example of thirteenth century architecture in the world and its stained glass is also famous. See architects style suggested that the Perpendicular have originated here.

Sainte-Claire Deville, Étienne Henri (1818-81), Fr chemist, graduated as doctor of medicine and science in Paris, and, after nine years of research in his own laboratory, became prof of chem and dean at Besançon (1843-51). In 1859

he accepted a chair at the Sorbonne. Besides developing a theory of 'dissociation to account for the phenomena of reversible reactions, he improved the preparation of pure aluminium, platinum and sodium, discovered anhydrous nitric acid (1819) and solvent and estab a new method of mineral analysis.

Sainte Croix, Swiss vil situated in the canton of Val d'Aud, at an elevation of about 3600 ft. Its inhab are engaged in making watches and musical boxes. Pop about 7000.

St. Edmund Hall, only anet hall that survives in Oxford Univ. It is named after St Edmund Rich who taught in a house that once occupied the site and was founded c 1226. From 1553 to 1937 St Edmund Hall had close connections with Queens College but in the latter year it became independent with a constitution modelled on that of the other colleges.

St Elmo's Fire, brush like electric discharge which is sometimes seen on projecting objects, particularly on ships' masts and the aerials and wing tips of aircraft. It may appear as an enveloping fire or in the form of short streamers. It is not dangerous.

St Eloi, vil in Belgium in the prov of W Flanders, 2 m from Ypres. During the First World War it was the scene of much local fighting and in March 1915 and April 1916 two battles were fought around it with largely indecisive results in which 1 th sides suffered heavy casualties.

Ste Marie, vil in 61 sq m in area under the gov of Madagascar. It is 500 ft above the coast, opposite Antsahaka. 2 m to the east and the mouth of the Ste Marie in the N of Fr Martinique.

Ste Marie-aux-Mines, tn in the dept of Haut Rhin, France, on the Rcher 36 m S W of Strasbourg. There is some mining carried on here but the chief trade of the place is now in textile fabrics. Pop 12,000.

St Emilion (so called from a native saint and hermit) vil in the dept of Gironde, France, 27 m E N E of Bordeaux. It is noted for the wine (similar in character to Burgundy) which bears its name. Pop 3400.

Santes, tn on the Charente, 47 m S E of La Rochelle in the dept of Charente Maritime, France. There are china and earthenware factories in its foundations, market gardens, and brick kilns and considerable commerce in brandy and liquors. Ruins of the huge amphitheatre which seated 20,000, and the triumphal arch of Germanicus recall the prosperity of Mediolanum - the Roman name of S - under the empire and the cathedral of St Peter commemorates the days when the city was a bishopric. The tomb of St Eutropius the first bishop, lies in the spacious crypt of the church which bears his name. Pop 23,400.

St Étienne, cap of the dept of Loire, France, on the Lurens 311 m S S E of Paris. Its oldest industry is the manuf of fire arms, and the factory was bombed by the R A F during the Second World War. St Étienne was once the first city in

the world in the ribbon trade and is noted also for its variety of trimmings. Hemp cables, chocolate and glass are also manufactured and there are important dye and chemical works. The neighbourhood of large coal fields accounts for the many busy factories where automobiles, agricultural implements, machinery, etc. are made. The line between St. Pierre and Andrézieux (constructed in 1828) was the first railway of France. Pop. 175,000.

St. Eustatius, or **St. Eustache**, is of the Dutch W. Indies with an area of 7 sq. m. situated in 17° 0' N. lat. and 62° 40' W. long. 12 m. N.W. of St. Kitts. The surface is uneven, sev. of the hills being volcanic in character. The chief tn. is Oranjestad. It exports potatoes, sugar and tobacco. It was first occupied by the Dutch W. India Company in 1634. In 1781 it was captured by Rodney but was afterwards restored to the Dutch. It is now under the gov. of Curacao. Pop. 1100.

Saint-Evremond, **Charles de Marguetel de Saint-Denis**, **Seigneur de** see FARMONT SAINT.

Saint-Exupéry, **Antoine de** (1900-44). Fr. writer and novelist. His fugitive pieces and novels mostly relate to his flights and adventures. The chief of them are *Night Flight* (1931), *Wind, Sand and Stars* (1939), first seller in the U.S.A., *Flight to Paris* (1942) and *The Little Prince* (1943), a children's book with his own illustrations. He received the Prix Littéraire Maurice in 1931 and in 1933 the Grand Prix of the Fr. Academy. He was killed in an aeroplane accident.

St. Gall, tn. and cap. of the canton of its own name, Switzerland, is seated in a narrow valley on two small streams, 35 m. E. of Zurich. It has an ancient abbey and a cathedral, the former of which has a library containing many valuable MSS. The chief industries are the manu. of fine muslin, woollen, linen, cotton and embroidery. Pop. 6,500. The canton borders N.W. in the lake of Constance, between the cantons of Appenzel and Thurgau. The industries mentioned above also apply to this canton. It joined the Swiss confederation in 1803. Watered by trib. of the Rhine, St. G. has an area of 779 sq. m. and a pop. of 286,000 of whom about three fifths are Protestants.

Saint-Gaudens, **Augustus** (1858-1907). Amer. sculptor b. in Dublin. His mother was Irish and his father a Fr. shoemaker. He settled in New York after studying at the Ecole des Beaux-Arts in Paris and in Rome (1870-73). He carved statues of Adm. Farragut (1881), Lincoln (1887) and Gen. Sherman (1903) and also of 'Hawthorne' and 'Grief'. His chief merit was the realism of his portraiture. His symbolical compositions are conceived in the classicist style, fashionable in America and Europe during his lifetime but their creative and sculptural achievement has been largely overestimated.

Saint-Gelais, **Melin de** (1481-1558). Fr. poet b. at Angoulême, who is credited, together with Marot, with the introduction of the 16-sonnet into Fr. literature, then so

much in vogue in the second half of the sixteenth century. He was an imitator of the It. and in his search for elegance, fell into sentimentalism and mannered preciousness. He was the literary purveyor of court amusements in his *rondeaux*, *quatrains* and *mascarades*, and, like Marot, he was prone to the *blason* which celebrates an eyebrow a flower or a jewel. His fame was of short duration, being eclipsed by Ronsard and the Pléiade.

St. George, name of two vils in Quebec (one in Brance, the other in Richmond) and a third in New Brunswick, Canada.

St. George del Mina, see LIMA.

St. George's, 1. In on St. George's Is. second most important is of the Bermudas lying N.E. of the main is. The is. has a spacious harbour on which stands the tn. which was founded in 1612 and was the cap. of the Bermudas until 1815. Pop. 1,000. 2. Cap. of Grenada, Brit. W. Indies. It was estab. by the Fr. in 1705 when it was called Fort Royal. It received its present name during the administration of Robert Melville (1704-71).

St. George's Church, erected soon after 1763, contains interesting tablets to the memory of the victims of the Bermudas war 1795. The main harbour (the Carenage) was so called from its lying flat in old times, a favourite place for circling ships and it is remarkably picturesque. Pop. 6,000.

St. George's Cay small is. lying 10 m. N.E. of Belize, Brit. Honduras, which is of historical interest for the memorable engagement of 1798 in which the Spaniards were defeated by the British or lumbermen settlers.

St. George's Channel separates Wales from Ireland. Its breadth varies from 50 to 90 m.

Saint-Germain Comte de d. c. 1791-94). Fr. adventurer. His origin is obscure and the date of his birth is unknown. He was commonly supposed to be of French origin, though some supposed him to be the natural son of Charles II. of Spain. In 1748 he came to France from Germany, claiming alchemist's powers and saying that he was 2000 years old. St. G. appears to have been of considerable intelligence, able to live on his wits by exploiting the credulity of the rich men of the time. He was at one time the confidential agent of the Fr. king and lived in St. Petersburg and London for some years. He took part in magical practices with the landgrave, Karl of Hesse, and may have died in Schleswig-Holstein in 1784. But travellers reported meeting him in revolutionary France as late as 1793. See A. Lang, *His torical Miracles*, 1904; J. Cooper, *Oakley, The Comte de St. Germain*, 1928.

St. Germain-en-Laye tn. in the dept. of Seine et Oise, France, situated 30 ft. above the Seine 12 m. W.N.W. of Paris. The splendid terrace is a favourite promenade for visitors from Paris. Four Fr. kings, including Louis XIV., were born in the castle, which presents much the same appearance as it did in the days of Francis I. Here dwelt James II. of England from his banishment till his death (1689-1701). Pop. 21,700.

St. Germain-en-Laye, Treaty of: concluded the state of war between Austria and the allied powers, signed at St. Germain, on Sept. 10, 1919. Ratifications were delayed but were exchanged on July 16, 1920. The draft treaty of June 2, 1919, was the subject of much controversy between the Austrian delegates and the Supreme Council of the allied powers. The Austrians held that the republic of Austria was a state *de novo* and one of the Hapsburg Succession States to be treated in like manner with Czechoslovakia and Yugoslavia. The Allies, however, maintained the new Austrian Republic to be the direct heir to the responsibilities of the old Austria. On ethnic grounds the Austrians also protested against the inclusion of 5,000,000 Austrians in Czechoslovakia, 200,000 in Italy, and seven thousand in Yugoslavia. The Allies admitted the ethnographical argument but could not allow it alone to influence them. Some concessions were made to Austria, especially in the economic clauses which the Austrian delegates declared Austria could not fulfil. The town of Radkersburg was returned to Austria but the only plebiscites allowed were those in the Klagenfurt basin and in Fieschen. The treaty established the frontiers of Austria, the major decisions being the inclusion of Ger. Tyrol S. of the Brenner in Italy and of Ger. Bohemia in Czechoslovakia while the Supreme Council vetoed the inclusion of Ger. Austria in Germany. Allowances were made for the protection of minorities but Austria renounced all claims in Egypt, Morocco, China, and Siam. Military, naval, and air forces were limited and reparations were imposed. The ceremony of signing the treaty took place in the Stone Age Hall in the Chateau St. Germain. Dr. Renner, chancellor of the Austrian Republic, was the first signatory for Austria.

St. Germans, vil. 9 m. W. N. W. of Plymouth in Cornwall, England. The seat of the bishop of the diocese till about 1050, St. G. is noted for its fine Norman church and for seventeenth century brick houses. It is the country seat of the Elliot family, earls of St. G. Pop. (par.) 3000.

St. Gilles: 1 Tn and small port 12 m. S. E. of Nîmes in the Dept. of Gard, France. Its beautiful Romanesque abbey church dates from 1116. Pop. 400. 2. Flemish Sint Gillis, a coal and manufacturing suburb of Brussels, Belgium S. of the city. There it manufactures of perfumes, soap, chemicals, shoes, pianos, lace, and canned goods. The ancient hill fort, the only remnant of the fortifications of Brussels in the fourteenth century, is now a museum. Pop. 61,300.

St. Giuliano, Monte: see F. I.

St. Gotthard, or St. Gotthard, name of a famous pass over which runs a carriage route (constructed in 1820-24) connecting the lakes Lucerne and Maggiore. There has been a hospice on the summit (6936 ft.) since 1331. The great St. G. tunnel, which extends from Göschenen to Airolo, 9½ m., was built in 1872-80.

St. Gowan's Head, or St. Govan's, promontory of S. Pembrokeshire, Wales.

St. Helena, Brit. Is. and crown colony in the South Atlantic Ocean, 700 m. S. E. of Ascension (qv) and 1200 m. from Mossamedes, the nearest African port in 15° 57' S. lat. and 5° 42' W. long. It is volcanic in origin and 104 m. long and 6½ m. broad, its area being 47 sq. m. Although situated in the heart of the S. E. trade winds and surrounded by the cold S. Atlantic current, there are considerable variations of temp. and rainfall between the coastal and hill zones. The climate is mild and equable. The island is well watered by abundant clear springs. It supplies provisions to ships, and exports flax fibre, tow rope, rice and lily bulbs. The gov. of St. H. is administered by a governor aided by executive and advisory councils. The governor alone makes ordinances, there being no legislative council but power is reserved to legislate by Order in Council. There are ten primary schools and one secondary. St. H. is an admiralty coaling station, and before the Second World War was visited by two of the Cape of Good Hope squadron every year. There is no internal post but there are about 70 m. of telephone lines. There is a cable station from which cables connect with Cape Town and Ascension thus linking the colony with all parts of the world. Jamestown (pop. 1,000) is the cap. and only town. It is a free port. Pop. in 1946: 1743.

History: St. H. was discovered by the Portuguese commander João da Nova (Castell) in 1502 on his return voyage to India from India. It was then uninhabited and seen to be well wooded. Until 1588 the situation of the island was kept a secret when it was visited by Capt. Thomas Cavendish in the *Desire* on his return from a voyage round the world. After this visit the island became a port of call for ships of various nations voyaging between the E. Indies and Europe. In 1633 Jacques Specx formally annexed it on behalf of the Dutch States General but the Dutch made no attempt to occupy it. In 1679 it was annexed and occupied by Capt. John Dutton on behalf of the E. India Company. It remained in possession of the company except for an interval between 1810 and 1821 when the Brit. Gov. took it over until 1833 when it was brought under the direct government of the Crown. With the increase in shipping from the E. the colony enjoyed thirty years of great prosperity but the opening of the Suez Canal in 1869 caused trade to be diverted to the Mediterranean. St. H. was a port of call for a vast quantity of shipping to and from India and other parts of the E., and large estates were maintained both civil and military. The island was once also a depot for liberated Africans funded from slaves captured by the W. Coast Squadron. During the S. African war (1899-1902) the island served as quarters for two to three thousand Boer prisoners, but its chief notoriety arises from the years of exile and confinement which Napoleon passed at Longwood (3 m. inland from Jamestown) from 1815 till his

death in 1821. Among the Boer prisoners was Gen. Piet Cronje (q.v.). In 1922 the is. of Ascension, till then under the control of the Lords Commissioners of the Admiralty, was transferred to the administration of the Colonial Office, and annexed to the colony of St. H.

See Olorio da Fonseca, *Narrative of the Voyage of Louisa Nova in 1502*, trans. by J. Gibbs 1752, J. Barnes, *A Tour through the Island of St. Helena*, 1817, and P. Gosse, *St. Helena 1501-1558* 1938 (a detailed hist. with full bibliography). For works on Napoleon's exile see W. N. Young, *Napoleon in Exile St. Helena* 1915, and Dormer Weston *In Search of Two Characters* 1945 1947.

St. Helens 1 Co bor and mkt tn of Lancashire England, 13 m E.N.E. of Liverpool. There is communication by canal with the Mersey. The original nucleus from which the tn has grown was the met. vil. of Hardshaw which grew up during the fourteenth century around "met. Hlyn's chappell". The modern tn church occupies the site of the old "chappell" in Hardshaw. Coal was discovered in the vicinity in the early sixteenth century. This marked the beginning of St. H.'s growth into one of the large tns of the Lancashire coal field. Progress came rapidly with the construction in 1762 of the Surrey Navigation, the canal system which connected St. H. with Warrington. Jean de la Haye introduced glass making. In 1773 a commercial company was established the Brit. Plate Glass Company. Copper and chemical works followed. The famous glassworks of the Pilkington family were estab. at St. H. in 1827 and other firms were estab. in 1840 and 1850. Metal foundries, tanneries and breweries were started. St. H. was incorporated as a bor. in 1868 and became a co. bor. in 1889. Since 1888 it has been a part of the Mersey and Mersey-Tyne A.A. Notable public buildings are the tn hall founded in 1876 and completed in 1879, the market hall the co. court and the Gamble Institute. There are good educational facilities. Victoria Park contains the Mansion House Museum. Pop. 108,000. 2 Tn. $\frac{1}{2}$ m S.E. of Hyde in the Isk of Wight England. Pop. (estimated) 1100.

St. Helier, seaside resort cap. of the Is. and also a fishing centre in St. Aubin's Bay with Channel Islands of Jersey. St. H. is a popular winter place and contains many golf schools. Pop. 6,000.

Saint-Hilaire, see BARTHÉLEMY SAINT-HILAIRE. **Saint-Gertruy**, see SAINT-GERTRUY.

St. Hilda's, women's coll. at Oxford Univ. It was founded by Dorothy Beale in 1593 as St. H. Hall and changed its title to coll. in 1926. There are scholarships and exhibitions some of which are reserved to candidates from Cheltenham Ladies' Coll.

St. Hubert, tn 30 m N.E. of Sedan in Luxembourg, Belgium. Many pilgrims yearly visit the shrine of St. H. in the fine abbey church. It was the scene of heavy fighting in the course of 1st M. von Rundstedt's great counter-offensive in the

Ardennes (Dec. 1944-Jan. 1945). Pop. 2400.

St. Hugh's, women's college at Oxford Univ. founded as St. H. Hall in 1886, and incorporated as a college in 1926. Scholarships and exhibitions are awarded.

St. Hyacinthe, tn with woollen and cotton shoe door, and clothing manufs., and two cathedrals. It is 32 m. N.E. of Montreal in Quebec, Canada. Pop. 17,800.

Saintine, Joseph Xavier Boniface (1798-1863) fr. writer of novels and plays, he won a prize for his *Pucelle* (1836), and with *Scal* (1837) maintained the high reputation he had won in his plays *L'ours et le pacha* (1827) *Richie d'amour* (1845) etc. He collaborated withSCRIBE and others.

St. Ingbert, centre for coal mining and glass manufs. 14 m W. of Zweibrücken, in Saarland. It possesses iron and steel works. Pop. 20,000.

St. Ives 1 (So called from the Irish virgin and martyr), picture postcard seaside resort with magnificent beaches on St. I. Bay on the N. coast of Cornwall England. 10 m from Lands End. An artists' colony was founded by Sickert and Whistler. Pop. 5800. 2 Bor and mkt tn in Lancashire England, on the Ir. On a canal in Birmingham. It was the site of a priory founded in the twelfth century as a cell to Ramsey abbey, but owes its importance to the great fair which takes place on the abbots. There is a fine church and a sixteenth-century bridge in the centre of which is restored two-storied chapel. Pop. 3200.

'**St. James's Gazette**,' see LONDON, STANDARD.

St. James's Palace in London, unadorned brick structure of very unpretentious exterior now only used for levees and for apartments of court officials. Before the Normans conquest the site was occupied by a hospital, later in the charge of the College which presented it to Henry VIII in 1531. This monastic building down the hospital built a palace in which in 1532 which was much enlarged by Charles II and still remains. St. J. Park. The palace which contains some fine pictures was a royal residence until 1702 when Whitehall was burnt down till its ruins were cleared away (removed) to the London site. The palace and the 14th royal were destroyed during an air raid in 1941.

St. James's Theatre in King Street London W.1. was founded in 1838 with the play *James* by T. S. Arthur, the manager of John Lubbock. It is the oldest and the theatre in London and has a long history. In 1891 it came under the management of Sir George Alexander and was the scene of many of his triumphs. *Tat. Whitechapel* was produced there in 1892 and *The Secret Mrs. Langworthy* in the following year. In 1910 Sir Arthur Olivier, as actor-manager, opened there with *Henry*.

Saint Jean d'Acre, see ACRE.
St. Jean-de-Luz, fishing tn and seaside resort of France stands on the bay of

Biscay, at the mouth of the Nivelle in the dept. of Basses Pyrenées. It lies 12 m S.W. of Bayonne. A fortified tn, with a fine old church and an interesting château and other old buildings, it is noted for its sea bathing and has a casino and a hydrothermic estab. Pop 10,200.

Saint John, cap. of St. J. co. New Brunswick, Canada, at the mouth of the St. John R. 66 m S.S.W. of Fredericton. It was discovered by Champlain on St. J. the Baptist's Day (June 24, 1604). Charles de La Tour erected a fort in the harbour in 1633, but lost his fort to the Eng. victors of Acadia in 1654. But no permanent settlement was made until 1783, when the Tories founded the present city, its original name being Parrtown, after Governor Parr of Nova Scotia. It is important fishing, railway and distributing centre for a district busily engaged in agriculture and lumber trade. Cotton goods, boots and shoes, engines, etc. are manufactured, and there are saw and grist mills. Fishing is carried on on a commercial scale. It is a summer resort and coal mines and granite and lime stone quarries are worked. St. J. is one of the winter ports of Canada for the passenger and other vessels from Europe. In exports it is second only to Montreal. Pop. 21,700.

St. John, largest (100 m long) riv. of New Brunswick, Canada, draining into the Bay of Fundy at Saint John. On its banks in Quebec the other, called the Wolf, brook, begins in the highlands N. of Maine and for 80 m forms with a S. easterly course the international boundary between the U.S.A. and Canada. The tributaries are the Abegash, Moosehock and Oromocto on the E. and the St. Francis, Madawaska, Tobique and Salmon on the W. The valley of the riv. is known for its fertility and for its picturesque features. The currents of the Grand Falls in Canada (22 m from the sea) leap down over 75 ft. At Saint John, above the mouth, are the reversible falls here the riv. is forced through a narrow opening and thereby gives the illusion of a fall which runs in either direction according to the movement of the tide. The tides (83 m up) is the limit of navigation in larger vessels.

St. John, large lake of Quebec, Canada, communicating with the St. Lawrence by way of Saguenay R.

St. John, tn, which was partially demolished by an earthquake in 1844 on the N.W. of Antigua, W. Indies, in the seat of the colonial governor. It has a good harbour for small ships and considerable commerce in fruit, esp. tully pineapples, and sugar and cotton. Pop. 10,000.

St. John, Hector, see CHATELIER MICHEL GUILLAUME JEAN DE

St. John, Henry, see BOINGBROOK HENRY ST. JOHN, Viscount

St. John, Knights of, see HOSPITALIERS KNIGHTS

St. John Lateral, Church of, see LATRAN CHURCH

Saint John of Jerusalem, order of chivalry the title of which originated in a hospital founded at Jerusalem c. 1070 by

Arabian traders who formed a religious order for helping Christian pilgrims to the Holy Land. Driven out of Jerusalem in 1290 the order went first to Limassol and then to Rhodes (1310). Driven out again in 1522 the knights of the order went to Crete and Sicily and in 1530 settled in Malta. This was granted by Charles V. to the knights who retained it until 1798, when the order became a charitable religious order its headquarters being established in Rome in 1878. The Eng. order which admits women to membership was given a charter of incorporation in 1888. It organises hospital and Red Cross work, notably the St. John Ambulance Association (see AMBULANCE, RED CROSS). The distinctions of the order are conferred in recognition of services in the cause of humanity throughout the Brit. Empire.

St. Johns, cap. of Newfoundland, Canada. It lies 20.50 m from Liverpool and 17.30 m from Cork (Ireland) on the E. shores of the riv. in the peninsula of Avalon. The centre of the white seal and cod fisheries, it has excellent harbour, wharf, and dry dock accommodation. The other industries are mainly allied to the fishing, as, for instance, oil tanning, but there are also foundries, breweries, tanneries, cordage, furniture, biscuit and boot and shoe factories. In 1810, 1810 and 1892 the tn suffered severely from fire and the old wooden houses have almost disappeared. The Roman Catholic cathedral is the largest building in Newfoundland. There is also an Anglican cathedral. Cabot tower on the summit of Signal Hill commemorates the fourth century of the discovery of Newfoundland by John Cabot (1497). The construction of the present government house was completed in 1825. The House of Assembly building is particularly fine. Pop. 62,800.

St. John's, cap. of St. J. co. Quebec, Canada. It lies on the Richelieu 27 m by rail S.E. of Montreal. Grain and lumber are exported. In 1776 it was the key to Canada, the Eng. forces gathered there under Major Preston long resisted Montgomery's advance. As a training school for Canadian cavalry the tn still has some military life. Produces dry products, sewing machinery and sugar machinery. Pop. (1931) 11,300.

Saint Johnsbury, manufacturing tn and the co. seat of Caledonia co. Vermont, U.S.A. 30 m N.E. of Montreal. The minerals include scales, machinery and tanning implements, maple sugar and dairy. Pop. 13,000.

St. John's, Eve of, or **Midsummer Eve** (June 23) celebrated with song and dance throughout Christendom in the Middle Ages. In some countries fires were kindled in the market place, and the young folk joined hands and danced around. It was an Eng. custom to fetch branches from a neighbouring wood and fasten them over doors in sign of annojement at the Baptist's birth. Sometimes the blessing of the par priest was asked as a sanction for the merry making.

St. John's College, Cambridge, founded in 1511 by the Lady Margaret Beaufort. Her executors supervised its building.

among them Bishop Fisher of Rochester. There are four courts, the most easterly with its fine gateway dates from the Tudor period, the second contains a pancelled master gallery with fine mouldings (1598-1602). The so-called Bridge of Sighs connects the third court with the fourth, which is on the other side of the Cam. The endowment includes nine sisters, sixty scholars and sixty fellows besides a master. Lord Broughley, Roger Ascham, Wordsworth, Castleknagh, Palmerston and Sir J. Herschel were students here.

St John's College, Oxford, founded in 1555 by Sir Thomas White, alderman of London. There are two quadrangles. In the first is incorporated part of St. Bernard's College (founded in 1437) which formerly occupied the site and to which the fine gateway giving on to St. Giles Street also belongs. The second was built by Archbishop Laud who has buried in the chapel together with the founder and whom his lifetime was very intimately associated with the college. This quadrangle which is interesting by reason of the fusion of Classic and Elizabethan styles overlooks the fine college gardens. Fifteen of the twenty-eight scholarships offered are reserved for the Merchant Taylors' School and Canon and Times Shirley went to St. J.

St John's River, chief riv. of Florida, U.S.A. Rising in Bravard co. it flows N. and finally at Jacksonville (15 m. from the mouth) takes an easterly turn before reaching the Atlantic. Enterprise (20 m. up) is the limit of navigation. The St. John's is 100 m. long and passes the such lakes George, Dexter and Monroe.

St Johnstoun former name of Perth in Scotland.

St John's Wood, suburb of London in the E. of St. Marylebone 4 m. N.W. of St. Paul's.

St John's Wort name for a number of plants with cymes of yellow flowers forming the genus *Hypericum* they are so called from coming into flower about the feast of St. John Baptist (O.S.). Common St. John's wort (*H. perforatum*) has its leaves dotted with pellucid glands. The larger flowered St. John's wort or St. John's Wort (*H. alchemilla*) is a trailing plant often grown in shrubberies. Most of the species are aromatic and some are.

St Joseph 1. Co. seat of Buchanan co., Missouri, U.S.A. established as trading port in 1826. It is on the Missouri 68 m. by rail N.W. of Kansas. It has large stock yards and is engaged in the industries of slaughtering, meat-packing, and the manufacturing of clothes. It has an important grain market and considerable manufs. of iron goods including boilers and ploughs. Pop. 7,700.

Centre of a peach growing dist. and the co. seat of Berrien co., Michigan, U.S.A. It is at the mouth of the St. Joseph and has commercial fisheries. It has diversified manufs. and is a summer resort. Pop. 9,000.

St. Josse-ten-Noode (Dutch: Sint Joost-ten-Noode), 1. suburb of Brussels in Brabant Belgium. It has manufs. of

lace, soap and cork and also iron foundries and breweries. Pop. 28,100.

Saint-Just, Louis Antoine Léon Florelle de Richebourg de (1767-94), fr. revolutionary leader, b. at Decize near Nevers. At the beginning of the revolution he was elected to the National Guard of the Aisne and member of the electoral assembly. Having formed a friendship with Robespierre he became deputy of the dept. of Aisne to the National Convention (1792). The following year he was appointed a member of the Committee of Public Safety and drew up the reports upon the overthrow of the Girondists and the Hébertists. He also wrote the denunciation which caused Danton's overthrow. Having proposed that the Convention should control all military operations he was sent to the armies of the Rhine and Moselle. He carried out his mission with such relentless vigour that on his return he was elected to the presidency of the Convention (Feb. 1794). He was instrumental in securing Belgium for France (May 1794) while in command of the army in the N., but was recalled to Paris by Robespierre and was eventually arrested at the sitting of the 9th Thermidor and was guillotined. See *Annales de Saint-Just*, *présidence d'un député à l'Assemblée sur sa vie* 1833 34, *Journal Historique de Saint-Just* 1859, *Œuvres de Saint-Just* 1869.

St Just 1. **St Just in Penwith**, urb. dist. about 11 W. of Looe in Cornwall and near Lands End, Cornwall. It is chiefly an agricultural town but most of the mines are now disused. It has an amphitheatre. St. Just Round where miracle plays used to be performed. Pop. approximately 4,000.

St Just-in-Roseland, vil. of Cornwall, England 3 m. N.E. of Falmouth. The church was founded in A.D. 50, taking its name from St. Just who preached the Gospel in England before the time of Augustine. The vil. and church are noted for the surpassing beauty of their surroundings. Pop. 300.

St Kilda 1. Most remote of the Outer Hebrides in the Atlantic 140 m. W. of the mainland of Scotland. It is at an elevation of 2 m. broad with precipitous cliffs and shores all round the island with the exception of the only landing place in the S.E. It is the home of immemorial wildfowl. The few inhabitants were obliged to leave St. K. for the mainland in 1930. 2. City of Bourke, Victoria, Australia, a fashionable watering place on Hobson's Bay 5 km. from Melbourne. It possesses a fine esplanade and the pier is the longest in Australia. There are special facilities for bathing, a public park and many fine buildings. Pop. (1940) 56,156.

St Kitts, or St Christopher one of the Brit. W. Indian is with an area of 61 sq. m. Discovered by Columbus in 1493 it was occupied by both the Incas and the Spaniards in 1623, but was ceded to Great Britain in 1713. This is belongs to the Leeward group of Lesser Antilles. It is 23 m. long. The central part is a range of rugged mts. culminating in Mt. Misery.

(3700 ft) The main range overlooks a fertile plain at the S.W. of which is Basseterre cap and port of the is. Sugar is the chief industry, sea is cotton tobacco, molasses, coffee and limes are also grown. There are salt ponds at the S.E. corner of the is. It is an administrative unit of the Leeward Is. St. K. was discovered by Columbus in 1493 and settled by Eng and Fr about 1625. In 1713 the Fr ceded the is to Britain and Brit rule became finally secure after 1732.

St. Kitts, Action of At the peace of Utrecht (1713) the is of St. Kitts was entirely ceded to the Brit. Crown but in 1782 it was attacked by the Fr. Admiral the comte de Grasse. Adm. Sir Samuel Hood who was then in command of the W. Indies failed in his attempt to prevent the capture but by a series of bold movements he succeeded in turning the Fr. out of the cap (Basseterre) and beat off their attacks.

Saint-Lambert, Jean François Marquis de (1716-1803) Fr. poet and philosopher b. at Nancy. He entered the service of Stanislas, king of Poland and served in the Fr. army in Germany in 1736-37 but owing to ill health he had to retire. He then pub. his poem *Les Saisons* (an imitation of Thomson's *Seasons*), and as a consequence was admitted a member of the Fr. Academy (1770). Some of his other works are *Ode sur l'Infortuné*, *Le Mal et le bien*, *Les Deux Amis* and *Les Principes des mœurs chez toutes les nations*. But he is chiefly remembered as one of the *Fin de siècle* poets and as the lover of the marquise de Boufflers, the marquise de Châtelet and Mme. d'Houdrot (known as Sophie).

St. Laurent, Louis Stephen (b. 1882) Canadian statesman b. at Compton, Quebec son of a general forekeeper his father being 11 and his mother Irish. He studied law at Laval Univ. By the time he was thirty he had established himself as one of the most successful lawyers in Quebec. In 1941 he was drafted into the Canadian Gov. for temporary wartime service though he had had no previous military experience. As leader of the Fr. Canadians and despite his previous isolationism St. L. supported conscription for overseas service (1944). As minister of justice he saw a characteristic firmness in dealing with the affair of the Russian Communist spy ring (see *Canada's History*). In 1946 he returned to Quebec and prepared for re-entrance into his wartime work at an end. But King now invited him to assume the Ministry of Foreign Affairs. By the middle of 1948 St. L. delivered speeches in the United Nations similar to King's habitual caution had deeply impressed the Canadian people and when King announced his retirement and the Liberal party called its Ang. convention the first since 1919 St. L. was chosen as leader at once. On Nov. 1, 1948, he was sworn in as Prime Minister. In the spring of 1949 in the Canadian Parliament without warning he proposed that Canada join the Brussels pact (see *BRUSSELS TREATY*) form a N. Atlantic alliance, and fight for W. Europe against

any aggressor. Thus St. L. was the first responsible N. Amer. statesman to propose the N. Atlantic defence system. His chief task subsequently was the coordination of the Canadian and American economic systems.

St. Laurent-du-Maroni, tn and port of Fr. Guiana on the Maroni R. The colony's penal settlement is here. It is the second tn of the colony has a wireless station and a pop. of 2000.

St. Lawrence 1. Large riv. of N. America issues from the Lake of Ontario and is fed by the Great Lakes, whose surplus waters are taken to the Atlantic after a N.E. course of 700 m. The St. Louis R., which flows into Lake Superior near Duluth is reckoned its head waters, and the length from the source of this riv. to the gulf of St. Lawrence is 1300 m. Between lakes Superior and Huron the riv. is known as the St. Mary. Between lakes Huron and St. Clair as the St. Clair it becomes the Detroit between St. Clair and Erie and the Niagara between Erie and Ontario. The St. Lawrence proper has an average width of 14 m. and the width of its estuary near Cape Gaspe is over 100 m. This great waterway is navigable to Fort William at the head of Lake Superior a series of canals having been constructed to avoid rapids and shoals. The Welland Ship Canal (opened in 1900) is one of the finest engineering feats of the world especially so in the outlet of the lake where are the Thousand Islands. Between two of the exclaves St. Francis and St. Louis a great canal ship and has been constructed. War time is much exploited. At Quebec the riv. is crossed by a bridge which has the widest span in the world. The fisheries of the St. L. are profitable and its basin contains excellent agric. country devoted chiefly to mixed tillary farming and to fruit growing. The total drainage area including the Great Lakes system is computed at over 1,000,000 sq. m. and the basin contains one half of the world's fresh water. From Quebec to its mouth the riv. is at least 100 ft deep. From the St. L. to the gulf of St. Lawrence the fall is over 600 ft. The gulf of St. Lawrence into which the riv. empties is almost enclosed between Quebec Prov., New England, Cape Breton Is., Nova Scotia and New Brunswick. The project of building a dam to provide hydroelectric power on a large scale to be shared by the U.S.A. and Canada was raised 5 times between 1911 and 1919 but failed to gain the approval of the Amer. Senate. In 1948 the power authority of New York State and the hydroelectric power commission of Ontario filed identical plans for the development of the project which would result in 2,200,000 h.p. hydroelectric development. The governor of New York was responsible for instructing the state power authority to undertake the task after the Amer. Senate had refused to ratify the St. Lawrence Seaway Treaty. See G. W. Brown, *St. Lawrence River*, 1905, S. B. Dawson, *The St. Lawrence in History and Borderlands*, 1905, J. Ireland, *St. Lawrence Deep*

Waterway to the Sea 1931, and C. P. Wright *St. Lawrence Deep Waterway*, 1936. 2 Ts of Alaska 100 m long 10 to 30 m wide lying across the Bering Strait between Siberia and the Seward Peninsula.

St Leger, Sir Anthony (c 1496-1559) lord deputy of Ireland. He was educated in France, Italy and at Cambridge and was active under Thomas Cromwell demolishing abbeyes. He was head of a commission inquiring into the state of Ireland, 1537-38. St L was knighted, and escorted Anne of Cleves to England, 1539. He was appointed lord deputy July 1540. K.G. June 1541. He died during investigation of charges of falsification of his accounts. He established tenures in Ireland and introduced the case.

St Leger, see under Horse Racing.
St Leonards, tn and seaside resort of Sussex, England, it forms a residential W suburb of the bor of Hastings.

St Lô (amt Briovera), cap of the dept of Manche, France, on the R. Vire, 21 m W. W. of Bayeux. Founded the astronomer was born here. Noted for manufacture of flannel, paper and druggist. Its possession was bitterly contested between Amer and Ger forces in the fighting of June-July 1944 but when finally captured by the Amer it was almost entirely destroyed. Pop 10,000.

St Louis, 1. Largest city of Missouri, U.S.A. and seat of St. Louis stands on the W bank of the Mississippi, 20 m below its confluence with the Missouri. It is the seat of St. J. and Washington univ. and contains many fine buildings including cathedrals and Protestant cathedrals, the public library, city hall, court house and a number of commerce. The municipal opera theatre has a seating capacity for 1000 persons. There are some 2700 ac of parks. St. J. is of great importance commercially and industrially. Over 50,000,000 lb of tobacco are produced annually, there are cotton mills, slaughtering yards and meat-packing establishments and it is the world's greatest raw fur market. Other industries include zinc and lead smelting, foundry, engineering, printing and publishing and the manufacture of textiles, boots and shoes and motor cars. Its modern prosperity is partly the result of the efforts of 30,000 Ger immigrants who settled there in 1850. It is served by several trunk railway lines and there is considerable river traffic. Other fine bridges afford communication with 1. St. Louis on the opposite side, one being used to accommodate more freight cars than any other bridge in the world. St. L. was named after Louis IX of France and was founded in 1764 as a fur trading post by a Frenchman, Pierre Laclède. It passed into the possession of the U.S.A. as part of the Louisiana Purchase in 1803. The forty-mile circuit of which it is the business and banking centre has a pop of over 1,500,000. Pop of city 816,000. 2. Cap. of Senegal, Fr. W. Africa, 165 m from Dakar on the is. of Sor. It is one of the four coms represented in the 1. parliament. Pop 10,200.

St. Lucia, Brit. W. Indian is. largest

of the Windward Is. 24 m due S. of Martinique and 30 m N.E. of St. Vincent with an area of 233 sq m. Being volcanic it is very mountainous but has fertile valleys. The most conspicuous peaks are the Pitons, two remarkable sugarloaf mts. on the W side, which have been for generations a landmark for sailors. Gros Piton is 2619 ft and Petit Piton 2491 ft. Near the latter is the Soufrière, a low-lying volcanic crater which is generally in a state of mild activity. There are numerous rivers. The cap is Castries which was largely destroyed by fire on June 19, 1945, 20,000 of the pop of 21,000 being rendered homeless. The climate, though humid, is favourable for Europeans. The average temp ranges from 72° to 90° F. Rainfall averages 90 in per annum. Sugar, bananas, coconuts, limes, coffee, and nutmegs are grown. There are several sugar factories and a factory for extracting oil from coconuts and castor oil seeds. The is. is governed by an administrator responsible to the governor of the Windward Is. and an executive council. There is a legislative council comprising the governor and a number of *ex officio*, nominated and elected members. On the right of the harbour of Castries is a spacious dock with a lightery and light and on the left is the Vigie, a promontory on which a military hospital and barracks were built over forty years ago. The old houses of Castries and the street names and the stories spoken by many of the inhabitants recall the former 11. occupation of the is. (see *History* below). Near the centre of the is. is Columbus Square with the Roman Catholic Church at the E. end and the Carnegie library well known.

History—St. L. formerly called St. Alouise, derives its name from the fact that it was discovered by Columbus on St. Lucy's Day in 1502. In 1633 an Englishman, Capt. Judice, brought there some 11. settlers from St. Kitts, but they were driven out the next year. For many years France and England disputed the ownership of the is. About the year 1650 the Fr. came in from Martinique. In 1664 Lord Francis Willoughby, ignoring 11. pretensions, sent 1000 Barbadians to St. L. who overpowered the 11. settlers but themselves gave in to native wars in 1685, two years later. The Fr. came again to the is. in 1667 and apart from Robert Lauck who was governor in 1664 there was a succession of thirty-six Fr. governors from 1651 until 1793. In 1713 the 11. king granted the is. to the marquis de la Roche, but when the marquis tried to colonise it the 11. rejected and later George I. granted it to John, second duke of Montagu. Neither side really wanted the is. as a truly promising venture. St. L. is valuable in its use as a fueling station and later through Rodney's advice, as a strategic base. But by way of compromise, England and France agreed to cede the is. and only to cede it for certain restricted purposes until the title could be finally settled. By the treaty of Aix-la-Chapelle, 1748, the is. was declared neutral. In the Seven Years
